ANALYSIS ON THE INFLUENCE OF COLLEGE STUDENTS' PSYCHOLOGICAL INTERVENTION ON ALLEVIATING STUDENTS' ANXIETY

Xiaojing Zhou

Students' Affairs Office, Chongqing College of Finance and Economics, Chongqing 402160, China

Background: Anxiety disorder of college students is a very complex psychological and emotional disorder. Its clinical manifestations are usually motor agitation and sympathetic hyperactivity. The causes of the disease are depression, mental stimulation, personality, congenital heredity, etc., which are manifested in negative emotions such as anxiety, shame, disappointment, anxiety, fear and so on. After entering the university, college students are facing great changes in learning styles. At the same time, with the increase of learning pressure and learning tasks and their poor psychological tolerance, their mental health problems are becoming increasingly prominent. The international health organization claimed that the number of patients with anxiety and depression among college students still showed a growing law of change, and the incidence group showed a younger trend. With the increasingly serious phenomenon of students' anxiety, colleges and universities must take corresponding measures to intervene students' anxiety. At present, college teachers do not pay attention to students' psychological needs in the teaching process, which leads to a serious phenomenon of students' anxiety.

At present, the common psychological intervention programs include seven aspects. First, investigate the students' mental health status, family situation and living habits, find the students' psychological problems, evaluate the severity of psychological problems, and find the reasons to alleviate psychological pressure. Second, establish learning associations to guide students to fully understand the main causes of psychological anxiety and the negative effects of anxiety through a good atmosphere. Third, role play, assign each person corresponding roles and identities for communication and interaction. Fourth, cooperate with students to complete the game. Fifth, build a mental health support system and regularly organize mental health knowledge publicity to enable students to change their cognition and behavior. Sixth, pay attention to the physical and psychological needs of students, guide students to learn to actively communicate and interact, and master the methods to correctly eliminate anxiety. Seventh, behavior suggestion, which has a behavioral impact on the problem population through the behavior of the intervener.

Objective: This paper analyzes the effect of college psychological intervention program on students' anxiety disorder, in order to help students with anxiety disorder alleviate anxiety phenomenon and provide corresponding ideas for the formulation of college psychological intervention program.

Research objects and methods: According to the random grouping method, college students were divided into control group and experimental group. The control group received normal routine intervention scheme, while the experimental group adopted psychological intervention scheme. The number of students in each group was 60, and the intervention time was 3 months. The intervention effects of the two groups of students were AdaBoost. The intervention effect was evaluated by different levels of anxiety. The anxiety levels were set as no anxiety, mild anxiety, moderate anxiety and severe anxiety, and the corresponding scores were < 50 points, 50-59 points, 60-69 points and more than 69 points. In order to ensure the reliability of the obtained research results, the average value of all researchers is the final result.

Methods: This study analyzes the impact of college students' psychological intervention on alleviating students' anxiety through Excel data analysis software. In order to ensure the reliability of the research results, the research subjects include freshmen, sophomores, juniors and seniors.

Results: The anxiety of the experimental group before and after the intervention of the general scheme is shown in Table 1. It can be seen from Table 1 that the anxiety of the experimental group was significantly relieved before and after the intervention combined with the intervention scheme of psychology. Therefore, the intervention program combined with psychology can be applied to the subsequent improvement of students' anxiety. Teachers take corresponding measures and methods to reduce students' anxiety in the teaching process. First, create a good and relaxed classroom environment, quickly improve the ability of communication and expression, and reduce the anxiety of students themselves. Second, in classroom teaching, we should pay more attention to cultivating students' ability to actively answer questions, and encourage and praise students who are introverted and lack of confidence.

Conclusions: College students' anxiety disorder has been widely concerned by domestic experts and scholars. Moderate anxiety can help students improve their vigilance and determination to overcome difficulties, but excessive anxiety will damage their physical and mental health. College teachers need to

improve the teaching content and learning methods, and actively apply the knowledge related to psychology to reduce students' anxiety, so as to improve the learning ability and comprehensive quality of most students.

Table 1. The anxiety of the experimental group before and after the intervention of the general scheme

Type	Before	After 2 weeks	After 4 weeks	After 8 weeks	After 12 weeks
No anxiety	0	4	6	8	10
Mild anxiety	24	19	14	12	11
Moderate anxiety	28	26	27	26	23
Severe anxiety	8	11	1.3	14	16

ANALYSIS OF PSYCHOLOGICAL OBSTACLES AND ANXIETY RELIEF STRATEGIES OF GRASS-ROOTS DISCIPLINE INSPECTION STAFF IN COLLEGES AND UNIVERSITIES

Xuefeng Fan

Disciplines Execution & Investigation Office, Suzhou Polytechnic Institute of Agriculture, Suzhou 215008, China

Background: Since the 18th National Congress of the Communist Party of China, the CPC Central Committee has strengthened its efforts to govern the party strictly, continuously promoted the policy of governing the party strictly, made it cover multi-level leadership from top to bottom, and continuously expanded and extended to the grass-roots level. The Party Central Committee and local governments have resolutely dealt with the problem of loose party governance by means of inspection and inspection. The party organization puts forward and emphasizes the core idea of strictly administering the party, that is, we need to put political discipline and political rules in the first place, strengthen the implementation of political supervision, and effectively punish corruption and relevant personnel with a strict attitude of zero tolerance on the basis of resolutely implementing and implementing the spirit of the eight provisions of the Central Committee. In this context, colleges and universities resolutely implement the guiding ideology and policy of the Party Central Committee in strictly administering the party, comprehensively strengthen strictly administering the party, and complete their basic task of Building Morality and cultivating people by maintaining the clean and positive political ecology of colleges and universities, so as to provide strong support for cultivating socialist successors. The discipline inspection staffs at the grass-roots level in colleges and universities occupy an important position in the work of strictly administering the party in colleges and universities. They should not only give play to the main responsibility of the Party committee in the construction of Party style and clean government, but also bear the corresponding supervision responsibility of the discipline inspection commission, and fully show the supervision probe role of the discipline inspection staff of grass-roots party organizations, in order to promote the in-depth development of comprehensively administering the party strictly. With the continuous reform of the discipline inspection system in colleges and universities, higher requirements are put forward for the discipline inspection staff at the grass-roots level. The discipline inspection staff at the grass-roots level in colleges and universities should not only have high political professional quality and political theoretical literacy, but also master all kinds of professional knowledge, including party rules and discipline, laws and regulations, financial audit and so on. In the daily discipline inspection work, due to the lag of professional guidance and insufficient professional training, it is difficult for the grass-roots discipline inspection staff in colleges and universities to carry out their work, and it is difficult to play a strong role in discipline inspection and supervision, which leads to the problems of psychological obstacles and anxiety of the grass-roots discipline inspection staff in colleges and universities.

Objective: The psychological obstacles and anxiety of grass-roots discipline inspection staff in colleges and universities will have a negative impact on their discipline inspection and supervision to a certain extent. In order to improve the work efficiency of grass-roots discipline inspection staff in colleges and universities, ensure the smooth development of discipline inspection and supervision, and achieve better discipline inspection and supervision results, this study will explore the causes of psychological obstacles and anxiety of grass-roots discipline inspection staff in colleges and universities, and put forward corresponding solutions, aiming to eliminate the psychological obstacles of grass-roots discipline inspection staff in colleges and universities, eliminate their anxiety and truly implement the work related to

comprehensively and strictly administering the party.

Research object and method: 120 grass-roots discipline inspection staff were randomly selected from five universities, and 24 from each university. Analyze the potential psychological obstacles and their performance of all grass-roots discipline inspection staff in discipline inspection and supervision, and compare the psychological obstacles and anxiety performance of grass-roots discipline inspection staff before and after intervention.

Research design: One-to-one psychological counseling intervention was conducted for all grass-roots discipline inspection staff on the basis of giving them traditional lectures and training on psychological disorders. After 3 months of intervention, Self-rating Anxiety Scale (SAS) was used to evaluate and analyze the relief of anxiety.

Methods: Before and after the psychological counseling experiment, the SAS scores of grass-roots discipline inspection staff in colleges and universities were collected and analyzed by Excel software and SPSS23.0 software.

Results: Before psychological counseling, the number of discipline inspection staff without anxiety was only 14, and the number of people with moderate anxiety, severe anxiety and extreme anxiety were 27, 16 and 3 respectively, which showed that the anxiety symptoms of this group were more serious. After psychological counseling, the anxiety of discipline inspection staff at the grass-roots level in colleges and universities has been significantly improved. The number of discipline inspection staff with severe and moderate anxiety has decreased significantly ($P < 0.05$), the number of extreme anxieties has decreased to 0, and the number of people without anxiety has increased to 37, accounting for 61.67%. The changes of the proportion of discipline inspection staff at the grass-roots level in different anxiety before and after the intervention are shown in Table 1.

Table 1. Anxiety status before and after the psychological counseling [n (%)]

Intervention time	Without anxiety	Mild Anxiety	Moderate anxiety	Severe anxiety
Before the psychological counseling	14(23.33)	27(45.00)	16(26.67)	3(5.00)
After the psychological counseling	37(61.67)	17(28.33)	6(10.00)	0(0.00)

Conclusions: The causes of psychological disorders of grass-roots discipline inspection staff in colleges and universities are diverse, and their psychological disorders and anxiety will have a great negative impact on Discipline Inspection and supervision. The combination of psychological disorder lectures and training with one-to-one psychological counseling can significantly reduce the number of people with severe and moderate anxiety, effectively alleviate the anxiety of grass-roots discipline inspection staff, and finally achieve the lofty goal of comprehensively administering the party strictly and developing in depth in colleges and universities.

A STUDY ON PSYCHOLOGICAL RESILIENCE AND LEARNING ENGAGEMENT OF BEHAVIOR DISORDER STUDENTS MAJORING IN PRESCHOOL EDUCATION

Lijuan Liao

School of Education Science, Baise University, Baise 533000, China

Background: Behavioral disorder refers to the abnormal behavior of individual activities under the influence of psychological disorder. According to the main manifestations of behavioral disorders, they can be divided into two types: psychomotor inhibition and psychomotor excitement. The behavioral disorder of psychomotor inhibition refers to the abnormal behavior of patients who show both action block and speech inhibition at the same time. Its main symptoms include stiffness, posture, disobedience, imitation and stereotype. The external behavior is reflected in the obvious reduction of movement, rigid and fixed posture, special expression or posture difficult to be understood by others, resistance to the required target action Keep repeating the corresponding actions or words, and be keen to imitate the words or actions of others meaninglessly. The behavioral disorder of psychomotor excitement mainly refers to the significant increase of meaningless speech actions, which can be divided into two types: coordinated and uncoordinated, which are respectively manifested in the coordination and order of speech actions and the disorder of speech actions. In their daily study and life, students majoring in preschool education often produce certain negative emotions and even psychological obstacles of different severity due to excessive

learning pressure, strong complexity of knowledge and skills, and slim employment prospects, which eventually lead to a series of behavioral obstacles. Students with behavioral disorders in preschool education major show diversified behavioral disorders, which will have a great negative impact on their training and improvement of knowledge and skills, learning initiative and enthusiasm. The learning outcomes of students with behavioral disorders in preschool education are closely related to their psychological resilience, learning investment and other factors, and their psychological resilience and learning investment will be negatively affected by behavioral disorders, which will hinder the all-round development of students with behavioral disorders in preschool education.

Objective: In the daily study and life of students with behavioral disorders majoring in preschool education, behavioral disorders will have a great negative impact on their normal learning, interpersonal communication and so on. In order to improve the psychological resilience and learning investment of students with behavioral disorders in preschool education and ensure their learning effect and rapid mastery of knowledge and skills It is necessary to carefully analyze the characteristics and causes of their behavioral disorders, and explore their specific impact on psychological resilience and learning investment, so as to eliminate their behavioral disorders and improve their mental health level. Finally, the purpose of enhancing students' psychological toughness and learning investment is achieved.

Research objects and methods: 420 students with behavioral disorders majoring in preschool education were selected from four colleges and universities. The behavioral disorders in their study and life were analyzed, and the changes of their psychological resilience and learning investment under the influence of behavioral disorders were explored. Aiming at 420 students with behavioral disorders majoring in preschool education, this paper puts forward and implements the mitigation plan of behavioral disorders, in order to accurately evaluate and analyze the impact and improvement of their psychological resilience and learning investment.

Research design: Targeted psychological counseling and behavioral disorder mitigation measures were taken for students with behavioral disorders majoring in preschool education, and the changes of students' psychological resilience and learning investment before and after intervention were counted and analyzed.

Methods: Before and after the intervention, the adolescent psychological resilience scale and learning investment scale were used to collect the relevant data of college students, and the Excel software was used for calculation and analysis to obtain the changes of psychological resilience and learning investment data of behavior disorder students in preschool education.

Results: The scores of students' Psychological Resilience Scale (PRS) and learning investment scale before and after the intervention were statistically analyzed, and the comparison results shown in Table 1 were obtained. According to Table 1, the scores of students' Psychological Resilience Scale before intervention were low. After intervention, the minimum, maximum and average scores of Psychological Resilience Scale showed significant improvement, increasing to 2.77, 5.00 and 4.13 respectively. In terms of the score of learning input scale, the average score of students' learning input scale increased from 3.09 before the intervention to 6.54 after the intervention, with an increase of 111.65%. This shows that targeted psychological counseling and behavior disorder mitigation measures can effectively improve the psychological resilience and learning investment of behavior disorder students majoring in preschool education.

Table 1. Changes of students' scores of Psychological Resilience Scale and learning investment scale before and after intervention

Comparison items	Before intervention			After intervention		
	Minimum value	Maximum	Mean value	Minimum value	Maximum	Mean value
Psychological resilience scale	1.87	2.61	2.15	2.77	5.00	4.13
Score of learning engagement scale	1.29	4.76	3.09	4.85	7.00	6.54

Conclusions: There is a certain correlation between the psychological resilience and learning investment of students with behavioral disorders in preschool education. With the effective intervention of psychological counseling and behavioral disorder mitigation measures, the scores of students' psychological resilience and learning investment scale can be significantly improved. The two interact to eliminate behavioral disorders and improve the level of mental health.

* * * * *

INVESTIGATION ON RISK COGNITION, ANXIETY AND DEPRESSION OF PATIENTS WITH FEVER DURING COVID-19 FROM THE PSYCHOLOGICAL PERSPECTIVE OF COGNITIVE IMPAIRMENT

Xinping Wang¹ & Meiling Tang²

¹*The Third Affiliated Hospital, Qiqihar Medical University, Qiqihar 161006, China*

²*School of Nursing, Qiqihar Medical University, Qiqihar 161006, China*

Background: Compared with other mental diseases, cognitive impairment diseases are often ignored in clinical practice, mainly because clinicians simply regard the cognitive impairment of college students as a cognitive psychological factor at the level of etiology category. However, as a kind of mental disease, cognitive impairment does not have more significant external manifestations like the conventional psychological, emotional, behavioral and physical disorders. On the contrary, cognitive impairment disease is to adapt to unhealthy cognition and produce the concept of maladjustment, and its clinical manifestations are more recessive. Therefore, it has a considerable challenge for clinical diagnosis. At the specific level, no matter what form of cognitive content, as long as it can cause psychological obstacles, it is cognitive obstacles. Of course, from the performance of cognitive impairment, it can not only lead to physical discomfort, but also lead to the coexistence of psychological disease and physical discomfort. Generally, cognitive psychological disorders include: primary cognitive impairment and secondary cognitive impairment. The so-called primary cognitive impairment is mainly the cognitive impairment disease before physical behavior discomfort, which is manifested in strong awareness of disease prevention, excessive anxiety and destructive bad ideas. Secondary cognitive impairment mainly refers to the cognitive impairment disease after physical behavior discomfort, which is manifested in various physical pain, digestive system symptoms, cardiovascular system symptoms and so on, which reduces the patient's psychological function and the patient's adaptability to the external environment. According to the classification of cognitive types, cognitive impairment diseases can be divided into: perception disorder and thinking disorder. Among them, sensory impairment is mainly manifested in the stimulation of the external environment, especially the stimulation understood as a threat by patients, which is in a highly sensitive state. The main manifestation of thinking disorder is that they insist that they are in a morbid state, give themselves great psychological pressure, and do not believe in the effect of their clinical treatment.

COVID-19 pandemic has caused great harm to individuals, economy and society. It has made countless lives disappear, exacerbated the existing division, and exposed that many business models are infeasible. In addition, it has had a strong impact on the seemingly solid corporate principles that have guided our thinking for decades. It's hard for our brains to fully understand what's happening. In this situation, that is to say, in the period of COVID-19 epidemic, fever patients will fall into a state of great panic because they are unable to determine whether they are infected with COVID-19, showing symptoms of anxiety and depression, and even serious cognitive impairment. In view of this, based on the perspective of cognitive impairment psychology, this study carried out an investigation on the risk cognition, anxiety and depression of fever patients during COVID-19, in order to clarify the risk factors of fever patients and cognitive impairment problems during COVID-19, so as to fundamentally alleviate the anxiety and depression of fever patients during COVID-19, and improve the risk cognition of fever patients at the same time.

Objective: Based on the perspective of cognitive impairment psychology, investigate the risk cognition, anxiety and depression status of fever patients during COVID-19, and on this basis, analyze the risk factors of fever patients and cognitive impairment problems during COVID-19, so as to improve the anxiety and depression status of fever patients and improve the risk cognition status of fever patients.

Research objects and methods: Through random sampling, 40 patients with fever during COVID-19 were selected from four hospitals, a total of 160. The fever patients who participated in this study were investigated by questionnaire. 160 questionnaires were distributed, and the questionnaire recovery rate was 100%. Based on the background of cognitive impairment, the correlation between anxiety and depression of febrile patients during COVID-19 and their cognitive impairment was studied. Among them, the depression and anxiety of fever patients were detected by SCL-90 scale, and the cognitive impairment of fever patients was detected by MOCA scale.

Methods: Through SPSS22.0 correlation between anxiety and depression and cognitive impairment of febrile patients during COVID-19 was obtained by data statistical analysis software.

Results: Figure 1 shows the correlation between anxiety and depression and cognitive impairment in febrile patients during COVID-19. On the whole, the anxiety and depression of febrile patients during COVID-19 is positively correlated with their cognitive impairment, indicating that the anxiety and depression of febrile patients during COVID-19 is easy to develop into cognitive impairment, which should be paid full attention to in the process of clinical treatment.

Table 1. Correlation between anxiety and depression and cognitive impairment in febrile patients during covid-19

Conclusions: From the perspective of cognitive impairment psychology, this paper analyzes the psychological anxiety and depression of fever patients during COVID-19 and the risk factors for the development of cognitive impairment. The results show that the anxiety and depression of fever patients during COVID-19 are positively correlated with their cognitive impairment, indicating that the anxiety and depression of fever patients during COVID-19 are easy to develop into cognitive impairment. In order to improve the anxiety and depression of febrile patients and the risk cognition of febrile patients, full psychological attention and psychological construction should be given to febrile patients during COVID-19 in clinical treatment.

ANALYSIS ON THE DILEMMA OF GRASS-ROOTS PARTY CONSTRUCTION IN COLLEGES AND UNIVERSITIES AND THE SOURCE OF STAFF ANXIETY

Min Yi, Xin Xia & Wuqin Jiang

Nanjing University of Chinese Medicine Hanlin College, Taizhou 225300, China

Background: Anxiety, as a common psychological condition of people, is usually caused by a premonition of something ominous or unpleasant. It is mainly manifested in tension, disappointment, uneasiness, fear, shame, depression and entanglement. Not only that, people's anxiety can also cause physiological changes, including uncontrollable limbs, stuttering of language expression, distortion of facial expression and so on. In short, anxiety psychology is an emotional experience closely related to the human autonomic nervous system. Excessive anxiety can easily lead to physiological and psychological abnormalities. In short, anxiety refers to the inability to achieve the expected purpose, and then fail to achieve the goals set by yourself. It is not very successful to overcome the threats from all aspects, which has caused a great blow to self-esteem and self-confidence, and formed tension, leading to upset, depression or some emotional state of psychological fear. Moreover, people's anxiety psychology is mainly composed of three parts: threatening or uncertain emotional experience, cognitive performance of fear and physiological arousal. From the perspective of psychology, the increase of anxiety value will lead to distraction and block of attention, disturb the results of brain memory and thinking, and make people show anxiety, tension, indecision and disturbing emotional changes. In severe cases, it can even lead to neurological dysfunction and mental disorders. According to people's psychological reaction, it can be divided into cognitive anxiety and physical anxiety. Cognitive anxiety refers to people's thinking or worrying about the surface of things. It is the consciousness of emotional consciousness. Physical anxiety is from a physiological and psychological point of view, such as straightforward awakening, manifested in physical stiffness, trembling, unstable heartbeat, uneven breathing, sweating of hands and feet, stomach pain and so on. In short, people's anxiety has

attracted extensive attention in various fields of work.

Some studies have pointed out that when facing the plight of grass-roots party construction in colleges and universities, staff often have anxiety. The reason is that in the actual work process, grass-roots party construction workers in colleges and universities often feel self-contradiction, which is mainly manifested in the contradiction between egoism and demand dependence, and the contradiction between strong learning desire and work ability. And the contradiction between their own negative emotions and rational knowledge. In this regard, some studies have pointed out that adding psychological education to the grass-roots party construction in colleges and universities is of positive significance to solve the anxiety of staff. In view of this, this study points out the plight of grass-roots party construction in colleges and universities and the source of staff anxiety, and analyzes the necessity of constructing the working mode of “grass-roots party construction + psychological education” in colleges and universities, in order to fundamentally alleviate or overcome the psychological problems of grass-roots party construction staff, so as to cultivate more excellent talents of grass-roots party construction for our country.

Objective: In order to fundamentally alleviate or overcome the psychological anxiety of grass-roots party construction workers, this study designed the working mode of “grass-roots party construction + psychological education” in colleges and universities, which aims to adjust the anxiety of grass-roots party construction workers, so as to ensure the sustainable and stable development of grass-roots party construction in colleges and universities and the continuous input of mental health talents for China’s socialist construction.

Research objects and methods: This study combines the methods of investigation and empirical analysis, selects a group of 100 grass-roots party construction workers in colleges and universities as the research object, and is randomly divided into the control group (50) and the experimental group (50). The psychological anxiety status of grass-roots party construction workers is measured in combination with the diagnostic test of anxiety tendency. The scale contains 100 questions, it includes eight dimensions: learning anxiety tendency, anxiety tendency towards people, loneliness tendency, self-blame tendency, allergy tendency, physical symptoms, phobic tendency and impulsive tendency. Among them, the control group implemented the working mode of “grass-roots party construction + psychological education”, while the control group did not intervene for 3 months. Compare and analyze the changes of anxiety psychology of grass-roots party construction workers in colleges and universities after march.

Methods: All data were processed using PASW18.0 software package and Excel 2007.

Results: Table 1 shows the changes of psychological anxiety of staff after the implementation of the working mode of “grass-roots party construction + psychological education” for three months. Overall, after the intervention in March, the psychological anxiety of grass-roots party construction workers in colleges and universities decreased significantly.

Table 1. Changes in psychological anxiety of staff after three months of intervention in the working mode of “grass-roots party construction + psychological education”

Project	Control group (n=50)	Experience group (n=50)	P
Anxious learning	8.17±3.71	6.15±2.32	0.000
Communication anxiety	4.19±3.25	3.63±2.23	0.000
Loneliness tendency	5.63±2.23	3.45±2.58	0.000
Self-reproach tendency	6.15±2.32	3.46±1.45	0.000
Sensitive tendency	6.42±3.71	3.45±2.58	0.000
Physical symptoms	6.88±2.23	3.46±1.45	0.000
Terrorist tendency	3.46±1.45	2.45±2.58	0.000
Impulsive tendency	3.45±2.58	1.46±3.25	0.000
Total score	41.09±17.34	35.91±19.71	0.000

Conclusions: The working mode of “grass-roots party construction + psychological education” can effectively alleviate the psychological anxiety of staff, and then is of great significance to the psychological construction of grass-roots party construction staff in colleges and universities. Therefore, in the practice of grass-roots party construction in colleges and universities, we should expand the content of psychological education, so as to ensure that the staff have healthy psychology, are not affected by negative anxiety, and well complete the important task of grass-roots party construction in colleges and universities.

* * * * *

EFFECT OF COMMUNITY PENSION ON DEPRESSIVE PSYCHOSIS IN THE ELDERLY

Chidan Ni

Shenzhen Elderly and Healthcare College, Shenzhen Polytechnic, Shenzhen 518055, China

Background: Community elderly care is a new type of elderly care model. Its essence is a home-based elderly care system based on community service, including life care, housekeeping service, spiritual support and emotional regulation of the elderly, short-term community trusteeship and door-to-door service, combined with the operation experience of professional elderly care institutions. The establishment of community pension system needs to complete the arrangement of dining tables or canteens for the elderly, the establishment of medical service institutions for the elderly, the establishment of activity centers and marriage agencies for the elderly, and the establishment of institutions for the training and employment of elderly talents. Under the community pension model, the elderly can obtain more comprehensive and detailed services and psychological support, which is of great significance for the elderly with depressive psychosis due to widowhood, less contact with their children, introverted or lonely. Because the main clinical symptoms of depressive psychosis are depression, depression, pessimistic way of thinking, cognitive impairment, memory decline, etc., community elderly care services can provide more social activities and spiritual support and comfort for the elderly with depressive psychosis, which is important to alleviate their pessimism, depression Anxiety and other negative psychological activities play a significant role. They can also improve the immunity of the elderly with depressive psychosis, so as to reduce the severity of their illness and chronic diseases, and even reduce their potential risk of self mutilation and suicide.

Objective: To explore the role of community elderly care service in the treatment of depressive psychosis of the elderly, so as to find out the deficiencies existing in China's community elderly care system and institutions and the methods that can be further popularized, so as to provide practical and feasible reference opinions for improving the quality of community elderly care service and improving the construction of community elderly care work process and laws and regulations.

Participants and methods: A sample of elderly people with depressive psychosis was purchased from a professional data processor in China. All samples were divided into young elderly people (aged 60-74 years), medium elderly people (aged 75-89 years) and long-lived elderly people (aged no less than 90 years) according to the standards of the World Health Organization. Logistic regression analysis was carried out on three types of elderly samples, the dependent variable is whether suffering from depressive psychosis, and the independent variable is gender, age, pension mode (home-based pension, institutional pension, community pension), and community pension service level (poor, relatively poor, relatively good, good). To analyze the influence of pension forms on whether the elderly have depressive psychosis in different age groups.

Results: Multivariate logistic regression was performed on the data set, and the statistical results were obtained in Table 1.

Table 1. Multivariate logistic regression results of influencing factors of depressive psychosis in the elderly

Independent variable	Independent variable subdivision category	Regression coefficient	Standard error	P
Age group	Young and old people	0.346	0.151	0.258
	Middle aged people	0.517	0.187	0.019
	The longevous	0.968	0.235	0.007
Gender	Male	0.415	0.289	0.006
	Female	0.512	0.221	0.538
Pension mode	Home care	0.880	0.317	0.297
	Institutional pension	0.214	0.334	0.020
	Community pension	-0.637	0.152	0.005

The analysis of Table 1 shows that within the 95% confidence interval, the middle-aged, the long-lived, men, institutional pension and community pension are related to the incidence of depressive psychosis of the elderly (*P* value is less than the significance level of 0.05), and the middle-aged, the long-lived, men, home pension and institutional pension are risk factors, and the community pension is a protective factor. In addition, the study also found that the older the elderly group, the lower the probability of depressive psychosis among those who take community pension. Specifically, among the young elderly, the middle-aged elderly and the long-lived elderly, the proportion of the elderly with depressive psychosis in the community pension mode is 1.5%, 1.7% and 2.3%, which are 34.2%, 47.5% and 58.6% lower than those in the other two

pension modes of the same age group, respectively.

Conclusions: This study collected the data of the elderly with depressive psychosis and different pension methods, and carried out multi factor logistic regression analysis. The analysis results show that community pension is a protective factor to judge whether they have depressive psychosis, and the older the elderly who take community pension, the lower the probability of suffering from depressive psychosis. The results show that the community pension mode helps to reduce the probability of the elderly suffering from depressive psychosis and improve the quality of life of the elderly. The relevant government departments and social charities should cooperate and integrate with each other, expand the scale of industry talents, increase the investment in social funds and material resources, and promote the community pension mode on a large scale.

PROMOTING EFFECT OF TRADITIONAL CLASSICAL MUSIC ON THE TREATMENT OF PSYCHOLOGICAL ANXIETY SYMPTOMS

Xin Yang

Art Education Center, Northwest University of Political Science and Law, Xi'an 710063, China

Background: Psychological anxiety disorder, also known as anxiety neurosis, is a common neurosis. Patients often have anxiety, accompanied by sweating, palpitation, excessive tension, excessive anxiety, shortness of breath, sleep disorders and other symptoms. When the symptoms are serious, it will even affect the social ability of patients, and patients generally cannot independently control the state of psychological anxiety disorder. The main types of a psychological anxiety disorder include panic disorder, agoraphobia, social phobia, specific phobia, generalized anxiety disorder, separation anxiety disorder, etc. The causes of psychological anxiety disorder are generally related to the psychological, physiological, social environment and other factors, including patients' diseases and external injuries, adverse health status, accumulated pressure factors such as misuse of drugs and alcohol are closely related to psychological anxiety. A large number of studies have shown that music therapy can help improve the psychological anxiety symptoms of patients, and it is speculated that the effect of classical music with a more soothing rhythm and beautiful rhythm will be more significant. Therefore, this study designs an experiment based on classical music therapy to test the practical role of classical music in psychological anxiety therapy.

Objective: Based on the data of classical music therapy experiment and the analysis of the relationship between classical music and human psychological emotion, to explore the feasibility and practical effect of using classical music in the treatment of psychological anxiety disorder, to provide practical case support and thinking results from more angles for the treatment of psychological anxiety disorder by music therapy in China.

Participants and methods: 246 volunteers willing to participate in the experiment were randomly selected from domestic volunteers, and divided into a music treatment group and routine treatment group, with 123 people in each group. The basic data related to the experiment were statistically compared between the two groups, and the experiment was started after it was determined that there was no significant difference in the basic data. In the experiment, the routine treatment group was given routine psychotherapy, including drug treatment, emotional guidance, psychotherapy and so on. The music therapy group also received classical music therapy on the basis of the treatment methods of the conventional treatment group. The specific treatment methods are as follows. Establish a music intervention group, which is composed of music therapists, psychologists and nurses with rich clinical experience. The group members need to understand the severity and main symptoms of psychological anxiety of each patient and the music preferences of the research object, and then formulate a classical music treatment plan suitable for the current patients. When performing music therapy measures, it is necessary to require patients to complete urination and defecation in advance, put on headphones to relax and close their eyes, and play classical music tracks set in advance. The volume of the music should be controlled within 25-30 dB. The time of single music therapy should not exceed 50 min and not less than 20 min. The experiment should be carried out twice a week for 3 months. At the same time, in the process of playing music, psychologists should maintain a certain degree of language communication with patients and guide patients to experience

their inner thoughts and emotions in the music background. In addition, before and after the treatment experiment, the two groups of patients need to be investigated by Hamilton Anxiety Scale (HAMA) questionnaire to understand the psychological anxiety of the subjects at each time.

Results: All the measurement data in the study were displayed in the form of mean \pm standard deviation for the *t*-test. The counting data were described in the form of number or proportion of number, and a Chi-square test was performed. The significance level of difference was set to 0.05. The statistical results show that there is no significant difference between the two groups in age, gender distribution, job type, marital status and other basic information. The HAMA questionnaire survey results of the two groups before and after the experiment are shown in Table 1.

Table 1. Statistical results of HAMA questionnaire survey of subjects before and after treatment

Statistical time	Music therapy group	Routine treatment group	Change value (%)	<i>t</i>	<i>P</i>
Before treatment	36.17 \pm 5.24	36.30 \pm 5.10	-0.36	0.345	0.882
After treatment	15.32 \pm 5.82	20.48 \pm 6.11	-25.20	5.178	0.001

Note that the “change value” column in Table 1 shows the change range of the average HAMA total score of the music treatment group compared with the conventional treatment group at each statistical time. According to Table 1, the *P* value of *t*-test of HAMA total score data of the music treatment group and conventional treatment group before treatment is greater than the significant level, and the difference is not statistically significant. After treatment, the average HAMA total score of the music treatment group is 15.32, which is 25.20% lower than that of the conventional treatment group, and the difference is statistically significant.

Conclusions: In order to explore the therapeutic effect of classical music on psychological anxiety symptoms, a treatment experiment was designed in this study. In the experiment, the personnel in the conventional treatment group only received conventional psychotherapy, and the music treatment group also received classical music therapy designed according to their preferences. The results of the treatment experiment showed that there was no significant difference in the total score of HAMA between the music treatment group and the conventional treatment group before treatment, but after treatment, the average total score of HAMA in the music treatment group was 15.32, which was 25.20% lower than that in the conventional treatment group, and the difference was statistically significant. The experimental data show that the combination of traditional classical music and modern treatment can help to improve the treatment effect of psychological anxiety disorder.

EYE MOVEMENT COGNITIVE MECHANISM OF EMOTIONAL INFORMATION OF DEPRESSION PRONE COLLEGE STUDENTS

Jinling Qi & Yunhua Cao*

Mental Health School, Qiqihar Medical University, Qiqihar 161006, China

Background: Depression belongs to mood disorder, which will have a serious impact on the physical and mental health of patients. When an individual encounters unpleasant thing in life, it will aggravate the probability of depression or aggravate depression. Relevant studies have found that the important factor causing depressive symptoms is the susceptibility to depression, which can be further divided into five kinds of depression susceptibility, such as cognitive susceptibility and personality susceptibility. In cognitive susceptibility to depression, individuals will produce a negative cognitive schema. Unpleasant things in life stimulate individuals with cognitive susceptibility to depression, resulting in depression. When dealing with information, cognitive susceptible individuals will choose negative information processing methods, which is more difficult to process positive emotions, and will look negatively at things related to themselves. When analyzing the emotional information eye movement cognitive mechanism of cognitive susceptibility to depression, it is found that among the three emotional face stimuli of negative, positive and neutral, the cognitive susceptible individuals have higher scores of attention bias in the face of negative emotional faces, and it is difficult to divert attention in the face. Using eye movement technology in the emotional picture test, according to the data recorded by the eye movement instrument, it can be seen that patients with depression look at negative emotional pictures for the longest time, and pay attention to them longer than the normal group. Moreover, through attention bias training, the depressive symptoms of patients are

constantly alleviated, and the time for depressive patients to look at negative emotional pictures is slowly decreasing, gradually approaching the time of the normal group.

College students are not fully developed and mature in physical and mental aspects, their psychological state fluctuates, their ability to control emotions is insufficient, and their adjustment ability is poor. When there are some problems that they are difficult to deal with in their study and life, they will have psychological conflict, resulting in depression and other negative emotions. If they are not intervened, they will form depression. Especially those students who are susceptible to depression cognition are more likely to form depression without effective intervention.

Objective: According to the characteristics of emotional information and eye movement cognitive mechanism of cognitive susceptibility to depression, to carry out attention bias training, to study whether it has training effect on students with cognitive susceptibility to depression, and to observe whether the attention bias of these students has changed. In order to carry out early intervention on the people susceptible to depression cognition, slow down the formation of depression and reduce the probability of depression.

Research objects and methods: The research objects were sophomores of a university. Using data mining technology, the mental health data information of sophomores was selected from the mental health database in the college students' psychological counseling room, and then 60 students susceptible to depression cognition and 61 students susceptible to non-depression cognition were randomly selected from these data. Before the experiment, the selected students have signed the informed consent form. Let the selected college students conduct rapid selection training between positive pictures and neutral pictures. Before the experiment, make relevant preparations, and then flash "+" gaze on the screen for 1000 milliseconds, and then continuously present 12 negative emotion pictures with an interval of 8000 milliseconds. Then conduct attention bias training. First, flash the "+" of 500 milliseconds on the screen again, and then randomly appear the neutral and positive pictures on the left and right sides of the screen for 500 milliseconds. Then, the trained college students judge which picture just appears in the same position according to the position where the "+" appears on the screen, and select the key number according to the neutral picture is 1 and the positive picture is 3. Under the condition of active training, 91% of the reaction targets appeared in the position of the neutral or positive picture, which attracted the selective attention of the college students, and 9% of the reaction targets in the neutral training keying position appeared in the position of the neutral or positive picture. The number of experiments in this training stage is 300 and then watch the negative emotion pictures again. This operation procedure is the same as that at the beginning of the experiment. During this period, eye movement data were recorded with eye movement instrument, and the relevant data were processed and analyzed with SPSS software to study the effect of attention bias training on college students susceptible to depression cognition.

Results: College students susceptible to depression cognition were prone to give priority to processing and amplifying negative information, while ignoring other emotional information, resulting in negative cognitive processing. Through attentional bias training for college students susceptible to depression cognition, it was found that under the condition of active training, the fixation points in the negative picture area in the depression cognition susceptible group decreased significantly ($P < 0.05$). The results are shown in Figure 1.

Figure 1. Before and after the experiment, the fixation points of depression cognitive susceptibility group in negative picture area

Conclusions: Positive attention bias training has a significant effect on college students with cognitive

susceptibility to depression, and can reduce the times of their attention to negative emotions.

Acknowledgement: The research is supported by: Humanities and Social Science Project of Heilongjiang Education Department in 2019—A study on the Cognitive Mechanism of Emotional Information by Eye Movement in College Students with Cognitive Susceptibility to Depression, Number: 2019-KYYWF-1269.

A COMPARATIVE ANALYSIS OF THE CONCEPT OF CRIME IN CRIMINAL LAW AND CRIMINAL PSYCHOLOGY

Tanghui Ruan

School of Law, South-Central Minzu University, Wuhan 430074, China

Background: Under the background of “criminal integration”, the concept of crime in criminal law and criminal psychology needs to be integrated in a certain sense. Because the concepts of the two have certain differences, directly copying the concept of crime in criminal law into the concept of crime in criminal psychology will not only lead to the loss of the uniqueness of criminal psychology, but also further restrict the research objects dominated by criminal behavior in criminal psychology. Finally, the research vision of criminal psychology has significant one-sided, limited and subjective negative results. In essence, “criminal integration” does not mean the arbitrary unification of the relevant concepts of various disciplines, but the effective integration of the relevant concepts of different disciplines such as criminal law and criminal psychology, so as to clarify the logical relationship between the theoretical definition and practical application of the crime concepts of different disciplines by exploring their individuality and consistency. Criminal psychology is a cross-border discipline based on psychology, which mainly explores the will, thought, intention and reaction of criminals. The research of criminal psychology mainly analyzes and understands all kinds of criminal problems in society from the perspective of psychology. It mainly has three remarkable characteristics: one is that the research object has strong heterogeneity and complexity. The second is that the research process and results are easily affected by personal factors. The third is that the research object has strong contingency, uniqueness and uncertainty.

In the research field of criminal law, the concept of crime mainly refers to the behavior that causes serious harm to the society and should be subject to criminal punishment on the basis of violating the criminal law. Based on this, the concept of crime in criminal law mainly includes three basic characteristics, namely, serious social harm, criminal illegality and punish ability of criminal law. Different from the concept of crime in criminal psychology, the concept of crime in criminal law mainly refers to an externalized behavior, which focuses on the identification of the perpetrator’s guilt or innocence, this crime or that crime. As a solid defense line to safeguard the social legal order and the basic interests of the public, criminal law has significant punitive and severe nature.

Objective: In the process of practical legal application, the concept of crime in criminal law is more rigid and strict, and criminal acts are judged and punished in accordance with the relevant provisions of criminal law. The concept of crime in criminal psychology mainly defines and analyzes the perpetrator’s criminal thought from the perspective of psychology. There are significant differences between the two when measuring whether the behavior constitutes a crime. This study will make a detailed comparative analysis of the concept of crime in criminal law and criminal psychology from the aspects of basic concepts and definition methods.

Research objects and methods: 18 legal experts were invited to explore by Delphi method, in order to distinguish the homogeneity and difference between the concept of crime in criminal law and the concept of crime in criminal psychology.

Research design: Take the related crime concepts of criminal law and criminal psychology as the investigation theme, draw up the investigation outline, and then ask 18 legal experts questions. After obtaining the expert opinions of the first round of correspondence, summarize and process the results. Repeat the letter inquiry until the obtained expert opinions are stable and unchanged.

Methods: IBM SPSS software was used to process and analyze the data related to expert opinions obtained from each round of correspondence.

Results: The significance test result of the inquiry result is $P < 0.001$, the approximate Chi-square value is 8167.126, and the measurement and sampling adaptability is 0.989, which shows that the inquiry result has good reliability and reliability. See Table 1 for details.

Table 1. Reliability test of inquiry results

	Kaiser-Meyer-Olkin	Bartlett's spherical test	<i>df</i>	<i>P</i>
	Measurement sampling appropriateness	Chi-square		
Value	0.989	8167.126	344	0.000

Conclusions: As a country with socialist system, China's state power and criminal law are formulated under the guidance of Marxist theory. Based on this, China adopts the concept of class standard crime, which is different from the concept of criminal law standard and social standard crime. It takes into account not only the crime concept of sociological significance, but also the crime concept of criminalist, that is, the mixed concept of the unity of form and essence. In criminal jurisprudence, it is only based on criminal law to determine whether a criminal suspect constitutes a crime. Compared with the concept of crime in criminal law, the research angle of criminal psychology on the concept of crime is more inclined to the criminal behavior carried out by individual actors based on specific psychological basis or external stimulation, which will have an impact on society and others. Based on the perspective of psychology, the study compares and discusses the concept of crime in criminal law and the concept of crime in criminal psychology. The results of expert correspondence have high credibility and reliability, which provides a certain reference for the improvement of China's criminal law and helps to improve the level of China's legal system.

THE INFLUENCE OF COLLEGE MATHEMATICS CURRICULUM REFORM ON ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY

Zhi Fang

Department of Mathematics and Information Engineering, Dongchang College of Liaocheng University, Liaocheng 252000, China

Background: As a basic subject for students from small to large, mathematics has an important impact on students. College mathematics course is the basic course of higher education. It can not only cultivate college students' mathematical thinking and practical application ability, but also play a decisive role in improving their innovation ability, exploration ability and thinking divergence ability. At present, there are some deficiencies in the training mode of mathematics curriculum in colleges and universities, mainly in four aspects: poor learning initiative of students, lack of rationality of curriculum system, outdated and rigid mathematics teaching mode, and low level of professional ability and comprehensive quality of mathematics teachers. College mathematics curriculum includes a large number of difficult mathematical knowledge points, which can easily make college students have slack psychology or fear of difficulties, thus reducing their learning enthusiasm and initiative, and it is difficult to ensure the learning effect of mathematics curriculum. The lack of rationality in the setting of mathematics courses in colleges and universities mainly means that the statistics of basic courses of mathematics theory in colleges and universities are arranged in freshman year. In the process of paying close attention to the teaching progress, it is very easy for teachers to ignore the students' understanding and mastery of mathematics knowledge. Some college mathematics teachers usually use the traditional "cramming" teaching mode in the teaching process, which is difficult to improve students' mathematical thinking ability and practical ability. Due to the lack of teaching experience and the difficulty of changing teaching ideas, college mathematics teachers will show the problem of insufficient professional ability reserve and cannot carry out effective mathematics teaching activities. Various factors will lead to the unsatisfactory teaching effect of mathematics courses in colleges and universities, which makes college students not only face the heavy pressure of schoolwork, but also bear the psychological pressure and anxiety caused by the poor effect of mathematics learning. The causes of college students' psychological anxiety are diverse, including academic pressure, employment pressure, interpersonal pressure and so on. If college students are accompanied by psychological anxiety, their learning activities and daily life will be greatly negatively affected, showing symptoms or emotions such as restlessness, tossing and turning, irritability and fear, which will seriously affect their normal life and personal development.

Objective: Under the influence of factors such as the lack of rationality of mathematics curriculum in colleges and universities and the difficulty of mathematics learning, college students are easy to have different degrees of psychological anxiety, which seriously hinders their normal learning and life. This paper

studies the different manifestations and severity of college students' psychological anxiety symptoms, and carries out targeted reform of college mathematics curriculum in order to improve their mental health level and alleviate their psychological anxiety.

Research objects and methods: 70 college students with psychological anxiety symptoms were selected from the four grades of colleges and universities, a total of 280, as the research object. Using Support Vector Machine (SVM) algorithm, this paper classifies the psychological anxiety level of college students before and after the college mathematics curriculum reform, and explores the impact of college mathematics curriculum reform on alleviating college students' psychological anxiety.

Research design: Taking Hamilton Anxiety Scale (HAMA) as the evaluation standard, this paper evaluates and analyzes the psychological anxiety of college students in college mathematics course learning. HAMA adopts grade 5 evaluation standard, and 0-4 respectively represent asymptomatic, light, medium, heavy and extremely heavy. Taking the college mathematics curriculum reform as an intervention means, SVM is used to classify the anxiety degree of college students before and after the intervention.

Methods: Organically combine SVM and HAMA, compare and analyze the anxiety of college students before and after the intervention, and explore the improvement effect of college mathematics curriculum reform on their psychological anxiety. All data are counted and analyzed by Excel software.

Results: Before the application of the intervention model of mathematics curriculum reform in colleges and universities, the HAMA rating results of the tested college students showed that there were more students with moderate, severe and extremely severe psychological anxiety, accounting for 28.21%, 55.36% and 9.64% respectively. The number of students with asymptomatic and mild anxiety is very small, accounting for 6.79%. After the intervention, the number of asymptomatic and mild anxiety increased significantly, and the total proportion increased to 56.79%. The proportion of students with moderate, severe and extremely severe psychological anxiety decreased to 33.93%, 8.21% and 1.07% respectively. This shows that the efficient mathematics curriculum reform can effectively reduce the number of students with psychological anxiety and effectively alleviate their anxiety. See Table 1 for details.

Table 1. Comparison results of college students' anxiety before and after the intervention of mathematics curriculum reform in colleges and universities [n (%)]

HAMA rating	Before intervention (%)	After intervention (%)
0	4 (1.43)	42 (15.00)
1	15 (5.36)	117 (41.79)
2	79 (28.21)	95 (33.93)
3	155 (55.36)	23 (8.21)
4	27 (9.64)	3 (1.07)

Conclusions: College students' psychological anxiety will not only have a significant negative impact on their learning progress, but also affect their normal life and interpersonal communication, making anxiety symptoms seriously endanger their mental health. After the reform of the college mathematics curriculum, it can effectively alleviate the psychological anxiety of college students and improve their mathematics learning ability and mental health level.

THE POSITIVE INFLUENCE OF ETHNIC AND MODERN FUSION MUSIC ON THE CONDITION OF PATIENTS WITH COGNITIVE IMPAIRMENT

Shun Wang

Conservatory of Music, Guangxi Normal University, Guilin 541006, China

Background: Music is an international art. Music can express some ideas that are difficult to express in language. As a classic part of music culture, national music has been included in China's cultural heritage. In China's thousands of years of cultural development, there is countless national music. With the increasing attention of the state to traditional culture, how to effectively inherit traditional national music is a problem that needs to be solved at present. With the development of society, pop music has become prominent in the torrent of the times. Inspired by the inspiration, some music creators began to try to combine national music and pop music to create more novel music. As far as the current music development is concerned, a large number of products of the combination of national music and pop music have made

remarkable achievements. According to the survey results, the known combined music includes the combination of modern musical instruments and classical operas, the combination of ethnic minority music and modern music, and the use of modern music to play traditional music. From the perspective of the development of music, music was originally used to express personal feelings, and gradually evolved into art for the public to enjoy. With the combination of folk music and pop music, music can endow more and more abilities. Some studies have even applied music to the treatment of patients with cognitive impairment.

From the existing research, we can know that music does have a certain impact on patients with cognitive impairment. In the music environment, patients with cognitive impairment will gradually return to calm, and the research found that different music combinations have different effects. When gentle songs are combined, it is easier to alleviate the mood of patients with cognitive impairment, but the efficiency of gentle music in the treatment of cognitive impairment is slow. The fusion of fast-paced songs can have a great impact on the hearts of patients with cognitive impairment and contribute to the cultivation of patients' cognitive ability, but the anxiety of patients cannot be avoided in the process of treatment. According to the basic theory of cognitive impairment, people with cognitive impairment will have a cognitive bias in learning, which is also reflected in their understanding of music. Therefore, people with cognitive impairment will have a great difference in their perception of music from ordinary people. China's national music is the product of millennium inheritance, which contains extremely rich core ideas. Therefore, we can try to combine national music and pop music and treat patients with cognitive impairment with the help of the core ideas of national music and the texture and melody of pop music, so as to alleviate the cognitive impairment of patients, promote the development of music and the inheritance of traditional national music.

Objective: Explore the possibility of the combination of national music elements and modern music, analyze the therapeutic effect of the integration of the two on people with cognitive impairment, and analyze the promoting effect of cognitive impairment on the integration of national music elements and modern music, in order to provide theoretical support for the development of music and the inheritance of traditional national music elements in China.

Study design: 60 patients with cognitive impairment were selected to evaluate the cognitive impairment of all patients, and the evaluation results were quantified to evaluate the changes of cognitive level of patients with cognitive impairment under the combination of modern music and classical opera, the combination of ethnic minority music and modern music, and the use of modern musical instruments to play traditional music. And the first evaluation results, to determine the impact of cognitive impairment on the integration of national music elements and modern music.

Results: The results of this survey use 1 to 4 levels to quantify the impact of specific factors. 1 means irrelevant, 2 means slight impact, 3 means general impact, and 4 means obvious impact. In order to reduce the large error caused by personal subjectivity in the evaluation, 60 patients were rounded to determine the results. The influence of the cognitive level of patients with cognitive impairment on the integration of national music elements and modern music is shown in Table 1, where "+" indicates positive influence and "-" indicates negative influence.

Table 1. Effects of cognitive impairment and music integration

Project	Modern music - classical opera	Minority music - modern music	Modern musical instruments - traditional music
High cognitive level	+4	+4	+3
Low cognitive level	-4	-4	-4

Conclusions: The musical elements of traditional ethnic elements can be integrated into pop music, and the combination of the two has a high degree of coordination. Under cognitive impairment, the integration of music elements and music elements in traditional national elements is affected. At the same time, the integration of music elements and music elements in traditional national elements also affects the cognitive level of patients with cognitive impairment. Therefore, in the treatment of patients with cognitive impairment, the combination of traditional music elements in pop music can effectively alleviate the cognitive impairment of patients, and patients can effectively promote the development of music and promote the protection of traditional culture in China.

CRIMINAL PSYCHOLOGICAL MOTIVATION OF MINORS IN CRIMINAL LAW UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Tianli Ding¹ & Lin Yang²

¹Law School, Northwest University, Xi'an 710127, China

²School of Humanities and International Education, Xi'an Peihua University, Xi'an 710125, China

Background: Juvenile delinquency is a social problem that will be faced all over the world. Whether it is campus violence or social homicide, juvenile delinquency has begun to appear frequently in social information. In the modern society with growing economy, the phenomenon of juvenile delinquency shows a trend of continuous growth, which has caused great harm to the society and seriously hindered the harmonious development of the society. According to the viewpoint of materialist dialectics, the emergence and change of any event are the result of the joint action of multiple factors, in which the juvenile's criminal behavior is caused by the interaction of internal and external factors. From the previous research results, it can be found that minors are often affected by their psychological effects when they commit crimes. The immature mental health system of minors leads to their wrong judgment, which leads to more serious consequences. However, it is undeniable that the incomplete construction of minors' mental health system is not only caused by its own reasons, but also affected by the surrounding environment to a certain extent. At the same time, the research points out that the root cause of minors' mental health problems is their poor cognitive ability. After being affected by both internal and external environment, their cognitive ability has growth deviation, which eventually leads to their cognitive impairment.

The theory of cognitive impairment holds that minors are in the stage of physical and mental development. In this stage, the minors' brain is in a state of extreme thirst for information. Once it is impacted, the brain changes back to the state of cognitive detachment, and some brain regions are damaged after stimulation, resulting in cognitive impairment of minors. Therefore, in the final analysis, the juvenile's crime is caused by their limited cognition. From the perspective of dialectics, the juvenile's cognitive plasticity leads to the loss of their subjective consciousness and criminal psychology in their behavior. Therefore, it is imperative to carry out cognitive protection for minors. Through the analysis of minors' cognitive impairment, understanding their criminal psychological motivation under their cognitive defects will be an important means to provide them with cognitive protection and a key step to promote the harmonious development of society. In addition, the study of minors' criminal psychological motivation can find the temptation source to stimulate minors' crime and effectively prevent and control minors' crime.

Objective: Investigate the current situation of juvenile delinquency, estimate the changes of juvenile delinquency psychology, analyze the characteristics of juvenile delinquency, and understand the impact of juvenile cognitive impairment on their criminal psychology, in order to provide theoretical support for the prevention and control of juvenile delinquency and guarantee the harmonious development of society.

Study design: Using the literature method to search the juvenile delinquency cases in China in recent 10 years, estimate the criminal psychology of the minors, understand the cognitive level of the minors through data query, evaluate the cognitive impairment level of the research objects, and finally get the psychological motivation of the juvenile delinquency under the cognitive impairment.

Results: Through the literature method, a total of 21 juvenile delinquency events were searched, and documents were established to count the criminal process and means of 21 minors, evaluate the criminal psychological characteristics of all objects, score their cognitive impairment, and then analyze the influencing factors of cognitive impairment on juvenile delinquency. The 0-4 score system is used to evaluate the impact degree, in which 0 means no impact, 1 means slight impact, 2 means general impact, 3 means obvious impact and 4 means complete impact. The final impact degree evaluation is shown in Table 1.

Table 1. The influence of cognitive impairment on juvenile delinquency

Project	Social cognitive impairment	Self cognitive impairment	Cognitive impairment of others' evaluation
Criminal psychology	4	4	3

Conclusions: The criminal motivation of minors is mainly family factors, school factors and social factors. With the change of students' cognitive ability, the criminal psychological motivation of minors will also change. The more obvious the cognitive impairment of minors, the more obvious their criminal psychological motivation is. In the analysis of cognitive impairment, social cognitive impairment and self cognitive impairment can completely affect the criminal psychology of minors, and the impact of others' evaluation of cognitive impairment on their criminal psychology is also significant. Therefore, in the face of

juvenile delinquency, all sectors of society should take the initiative to pay attention to the cognitive ability of minors, try to give positive guidance to minors, promote the formation of minors' ideological values, and avoid negative impact on minors' thoughts to avoid minors from forming negative emotions. Understanding the criminal psychological motivation of minors through cognitive impairment can effectively obtain the characteristics of juvenile delinquency, which has important practical value in the prevention and control of juvenile delinquency.

STUDY ON THE FOLLOW-UP EFFECT OF COLLEGE STUDENTS' MENTAL HEALTH EDUCATION ON THE REHABILITATION OF PATIENTS WITH MENTAL DISORDERS

Yunling Wang

School of Marxism, HangZhou Polytechnic, Hangzhou 311402, China

Background: Since the 1990s, mental health education in colleges and universities in China has been incorporated into the moral education system. Later, it gradually focuses on consultation, medical treatment and morbid orientation, emphasizes the consultation and correction of individual psychological obstacles, and hopes to alleviate the mental health problems of college students by means of diagnosis and treatment. Although most colleges and universities respond to the requirements of the education department and have their own psychological counseling rooms, what they encounter in practical work are some common psychological problems in life, such as obsessive-compulsive disorder. These kinds of psychological problems are not representative and accidental, so they should not become the focus of mental health education in colleges and universities. At present, the number of patients with mental disorders in China is increasing year by year. Some scholars began to criticize the work of mental health education in colleges and universities who did not consider the current situation of higher education and the psychological needs of college students. We must open up a new health education model for the current problem of college students' mental disorders. Mental disorder is a kind of mental disease, which refers to the disorder or abnormality of perception, emotion, thinking and other activities caused by various reasons, resulting in obvious psychological pain or social adaptation and other functional damage of patients, mainly including six mental diseases: schizophrenia, paranoid psychosis, schizoaffective disorder, mental disorder caused by epilepsy, mental retardation and so on. In the past, colleges and universities mainly focused on the medical model for the treatment of college students with mental disorders, which has seriously hindered the comprehensive development of mental health education in colleges and universities. Therefore, it is very important to build a new education model for college students' mental health problems. This study constructs the "five in one" mental health education model, which has gradually become the leading development model of mental health education in most colleges and universities.

Objective: The research of domestic and foreign scholars on college students' mental health education model tends to be scattered. Everyone studies different mental health education models from different goal orientations, which will inevitably lead to the particularity and individuality of college students' mental health education model, but not universality and integrity. Therefore, the integration of college students' mental health education model is very necessary. The purpose of this study is to study a "five in one" integrated model of mental health education, in order to provide some reference for the follow-up rehabilitation treatment of patients with mental disorders.

Research objects and methods: 800 college students with mental disorders in 10 colleges and universities in an area were selected as the research objects. According to different intervention methods, the subjects were divided into two groups. The control group was given routine drug treatment, and the experimental group was given mental health education on the basis of the control group. The mental disorder rehabilitation of the two groups of college students before and after the intervention was compared and analyzed.

Study design: The rehabilitation of patients with mental disorders was judged by Eysenck Personality Questionnaire (EPQ). The questionnaire included 88 questions, including four subscales: extroversion (E), neuroticism (N), psychoticism (P) and concealment (L). The high score of P scale indicates that the subjects have pathological personality. A high score of E scale indicates extroversion, and a low score indicates introversion. A high score of N scale indicates emotional instability, and a low score indicates emotional stability. A high score on the L scale indicates that the subject has a high ability of concealment.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The EPQ scores of college students in the experimental group were different from those in the control group, as shown in Table 1. The scores of EPQ subscales of college students in the control group were significantly different from those in the control group ($P < 0.01$). The scores of E subscale were significantly higher than those of the control group ($P < 0.01$), and the scores of P subscale, N subscale and L subscale were significantly lower than those of the control group ($P < 0.01$).

Table 1. Comparison of EPQ scores between the two groups before and after intervention

Project	Experience group	Control group	<i>t</i>	<i>P</i>
P	4.53±2.57	5.88±2.95	-7.596	<0.01
E	13.48±3.77	10.74±4.53	8.318	<0.01
N	9.23±4.91	11.37±4.14	-5.315	<0.01
L	10.34±3.73	12.25±3.68	-6.522	<0.01

Conclusions: The mode of mental health education for college students is to help students correctly understand the law of mental development and master the necessary mental health knowledge by setting up mental health education courses and giving full play to the role of the main channel of the classroom teaching. By carrying out various and colorful mental health education activities, students can improve their comprehensive quality and realize comprehensive and coordinated development. Through carrying out psychological education guidance, psychological counseling, and counseling, psychological guidance is carried out to help students dispel doubts and doubts. By carrying out psychological crisis intervention, we should take preventive measures, pay attention to students' safety, and ensure students' healthy and smooth growth. Through psychological investigation and research, we can timely understand and grasp the psychological status and characteristics of students, carry out targeted work, and enhance the pertinence and effectiveness of mental health education in colleges and universities.

SELECTION OF MEDICAL CARE COMBINED SERVICE MODE FOR ELDERLY PATIENTS WITH NEUROPATHY

Yao Wang & Panpan Yang

College of Mental Health, Qiqihar Medical University, Qiqihar 161006, China

Background: China's population aging is serious, the number of elderly people is increasing, and the incidence rate of senile neurosis is increasing year by year, which has become one of the major social problems in China. Senile neuropathy is senile psychosis, also known as senile mental disorder. It is a kind of mental disease that often occurs in the elderly. Senile psychosis is characterized by slow onset, long duration, and repeated uncertainty. Stable and aggravated conditions often occur alternately. The main manifestations of senile psychosis are thinking rupture, emotional disorder, hallucination and delusion. After the condition is aggravated, there will even be suicide, self-mutilation and other situations. The mental state of patients will also be unstable, resulting in impulse, running away, lack of self-knowledge and so on. Therefore, finding a suitable treatment method for senile psychosis and treating and intervening in senile psychosis patients are of great significance to improve the quality of life of senile psychosis patients and the harmonious development of society.

The combination of medical care and elderly care service model is a comprehensive elderly care service system integrating medical care and elderly care proposed to solve the medical and elderly care problems of China's elderly groups. It is a new concept first put forward in 2013. The combination of medical care and elderly care service mode realizes the integration of medical resources and elderly care resources, and the organic integration of medical services and elderly care services, so as to provide medical services, humanistic care and elderly care services for the elderly. In recent years, the elderly patients with psychosis are mostly cured by the combination of medical care and service mode. However, the mental state of patients with senile psychosis is unstable and often has abnormal behavior, which seriously affects the progress and effect of treatment. Behavioral psychology originated in the United States in the early 20th century. It is a branch of psychology. Behavioral psychology is a subject that studies the relationship

between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Based on the theory of behavioral psychology, the analysis of abnormal behavior of senile psychiatric patients can more accurately analyze the condition of patients, and then targeted treatment. Therefore, the research on integrating behavioral psychology into the integrated medical care service system to reform the integrated medical care service mode can effectively treat and intervene the elderly psychiatric patients, and is of great significance to improve the quality of life of the elderly psychiatric patients and the harmonious development of society.

Objective: The population aging in China is serious, the number of elderly people is increasing, and the incidence rate of senile neurosis is increasing year by year, which has become one of the main social problems in China. In recent years, the elderly patients with psychosis are mostly cured by the combination of medical care and service mode. However, the mental state of patients with senile psychosis is unstable and often has abnormal behavior, which seriously affects the progress and effect of treatment. Research on integrating behavioral psychology into the integrated medical care service system, so as to reform the integrated medical care service mode, and then effectively treat and intervene the elderly psychiatric patients, which is of great significance to improve the quality of life of the elderly psychiatric patients and the harmonious development of society.

Research objects and methods: 80 elderly psychiatric patients, aged 57-72 years, were selected from a psychiatric hospital. The Geriatric Depression Scale (GDS) was used to analyze and evaluate the emotional state of the subjects.

Study design: 80 patients were randomly divided into study group and control group with 40 people in each group. For the patients in the study group, the improved medical care combined service system based on behavioral psychology was used for treatment intervention. For the patients in the control group, the traditional medical care combined with a service system was used for treatment intervention. After three months of treatment, the GDS scores of the two groups were compared.

Methods: The corresponding data were processed and analyzed by software SPSS17.0.

Results: After 3 months of treatment, the GDS score of patients in the study group was significantly lower than that of patients in the control group ($P < 0.05$). The GDS scores of the two groups are shown in Table 1.

Table 1. GDS scores of patients in both groups

Timing	Examination results		<i>t</i>	<i>P</i>
	Research group	Control group		
Before treatment	25.3±4.2	26.1±5.8	0.147	0.852
After Treatment	10.7±3.4	15.7±4.9	8.051	0.009
<i>t</i>	9.475	4.352	-	-
<i>P</i>	0.001	0.043	-	-

Conclusions: The combination of medical care and the elderly care service model is a comprehensive elderly care service system integrating medical care and elderly care, which is proposed to solve the medical and elderly care problems of elderly groups in China. The combination of medical care and elderly care service mode realizes the integration of medical resources and elderly care resources, and the organic integration of medical services and elderly care services, so as to provide medical services, humanistic care and elderly care services for the elderly. For senile mental patients, most of them are cured by the combination of medical care and service mode. However, the mental state of patients with senile psychosis is unstable and often has abnormal behavior, which seriously affects the progress and effect of treatment. Research on the integration of behavioral psychology into the integrated medical care service system in order to reform the integrated medical care service model. The results showed that after 3 months of treatment, the GDS score of the study group was significantly lower than that of the control group ($P < 0.05$). Therefore, the reform of the service mode of the combination of medical care and nursing can effectively treat and intervene the elderly psychiatric patients, which is of great significance to improve the quality of life of the elderly psychiatric patients and the harmonious development of society.

ANALYSIS OF THE INFLUENCE OF NATIONAL MUSIC ART ON MENTAL DISORDERS IN THE ELDERLY

Lina Zhang

Department of Music, Pingdingshan Vocational and Technical College, Pingdingshan 467000, China

Background: China's economic level and scientific and technological level are developing and improving, and people's quality of life is also improving. However, the problem of population aging has become the focus of social attention. The functions of the body and organs of the elderly begin to deteriorate, the brain is more vulnerable to damage, and the probability of mental disorders is also higher. Mental disorder is a kind of mental disease that leads to individual cognitive disorder, emotional disorder, behavioral disorder and will disorder due to the disorder of brain functional activities. There are many factors leading to mental disorders, such as congenital genetic, social factors, emotional disorders and so on. The main manifestations of mental disorders are delusion, hallucination, emotional control, abnormal behavior, decline of willpower, decline of insight and so on. Most patients with mental disorders do not recognize their condition and refuse to seek help from doctors, resulting in the aggravation of their condition, which not only increases the burden on their families, but also affects the construction of a harmonious society. The traditional treatment methods of mental disorders include drug treatment and acupuncture treatment, but the above treatment methods are expensive and bring a great burden to the patient's family. In recent years, the treatment methods are more complex, which is easy to lead to the emotional control of elderly patients with mental disorders. Therefore, we need to find an economic and convenient method to intervene the condition of elderly patients with mental disorders.

Music intervention is a common treatment for mental illness. Music intervention is an intervention method that takes listening to music performance as an intervention means to improve the cognitive function, emotional state, and mental behavior of patients with mental illness. Therefore, many scholars have studied the intervention effect of music intervention on elderly patients with mental disorders. The results show that music intervention has a certain therapeutic effect on senile mental disorders, but it does not reach the expected value. Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition. Based on cognitive psychology, this study analyzes the cognitive situation of elderly patients with mental disorders, improves the traditional music intervention, and puts forward the use of national music art to intervene elderly patients with mental disorders. National music refers to the music produced and spread among the people, with the theme of reflecting folk life. It is a form of expression of China's traditional music. National music art is closer to people's life and in line with the artistic aesthetics of the elderly. Therefore, it can better arouse the emotional resonance of elderly patients with mental disorders, and then play a better intervention effect. Based on cognitive psychology, the research applies national music art to music intervention, and carries out treatment and intervention for elderly patients with mental disorders, which can effectively alleviate the degree of mental disorders of patients, improve the quality of life of patients, reduce the economic burden of patients' families, and promote the harmonious development of society.

Objective: Music intervention is a common treatment for mental diseases. Many scholars have studied the intervention effect of music intervention on elderly patients with mental disorders. The results show that music intervention has a certain therapeutic effect on senile mental disorders, but it does not reach the expected value. Therefore, based on cognitive psychology, applying national music art to music intervention, and treating and intervening elderly patients with mental disorders can effectively alleviate the degree of mental disorders, improve the quality of life of patients, reduce the economic burden of patients' families and promote the harmonious development of society.

Subjects and methods: 60 elderly patients with mental disorders, aged 60-71 years, were selected from a psychiatric hospital. The degree of mental disorder was analyzed and evaluated by the Diagnostic Schedule of Mental Disorders (DSMD).

Study design: 60 patients were randomly divided into study group and control group with 30 people in each group. For the patients in the study group, the improved music intervention method based on cognitive psychology was used for treatment. The patients in the control group were treated with traditional music intervention. After three months of treatment, the DSMD scores of the two groups were compared.

Methods: The corresponding data were processed and analyzed by software SPSS17.0.

Results: After 3 months of treatment, the DSMD score of patients in the study group was significantly lower than that of patients in the control group ($P < 0.05$). The DSMD social function scores of the two groups are shown in Figure 1.

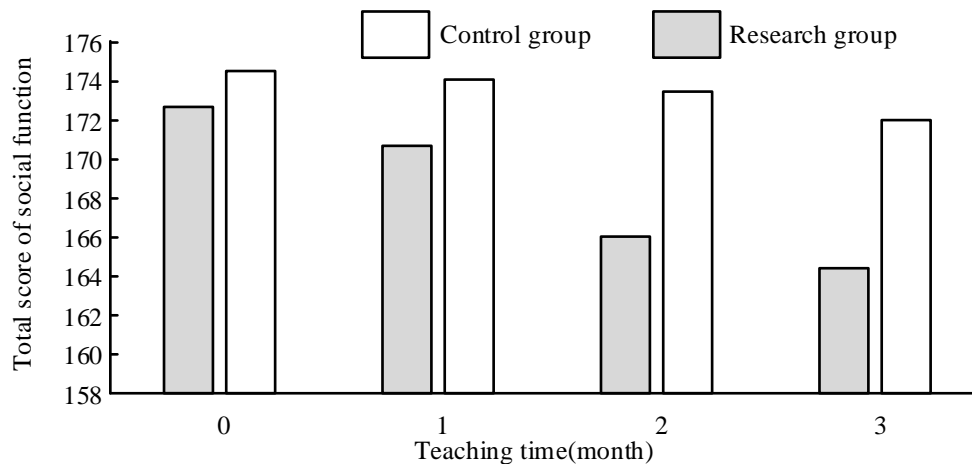

Figure 1. DSMD social function score of the two groups

Conclusions: The functions of the body and organs of the elderly begin to deteriorate, the brain is more vulnerable to damage, and the probability of mental disorders is also higher. The main manifestations of mental disorders are delusion, hallucination, emotional control, abnormal behavior, decline of willpower, decline of insight and so on. Most patients with mental disorders do not recognize their condition and refuse to seek help from doctors, resulting in the aggravation of their condition, which not only increases the burden on their families, but also affects the construction of a harmonious society. Music intervention has a certain therapeutic effect on senile mental disorders, but it does not reach the expected value. Therefore, based on cognitive psychology, this study applies national music art to music intervention to treat and intervene elderly patients with mental disorders. The results showed that after 3 months of treatment, the DSMD score of patients in the study group was significantly lower than that of patients in the control group ($P < 0.05$). Therefore, the application of national music art to music intervention and the treatment and intervention of elderly patients with mental disorders can effectively alleviate the degree of mental disorders, improve the quality of life of patients, reduce the economic burden of patients' families and promote the harmonious development of society.

CORRELATION ANALYSIS BETWEEN PERSONALITY OF PATIENTS WITH MENTAL DISORDERS AND PSYCHOLOGICAL SYMPTOMS OF COLLEGE STUDENTS

Guiyu Wang

Service Center of Enrollment and Employment, Heilongjiang University, Harbin 150080, China

Background: At the university stage, students have a wider range of contacts and more things. But at this time, college students' ideas have not changed, so they are easy to fall into a state of confusion and confusion in the face of various views and theories in society. The interpersonal communication and teacher-student relationship in universities are also very different from those in senior high schools. Some college students can not adapt to the transformation of this relationship and become silent and poor in communication. Based on the above, some college students have accumulated too many negative emotions, which leads to mental disorders. Mental disorder is a kind of mental disease that leads to individual cognitive disorder, emotional disorder, behavioral disorder and will disorder due to the disorder of brain functional activities. There are many factors leading to mental disorders, such as congenital genetic, social factors, emotional disorders and so on. The main manifestations of mental disorders are delusion, hallucination, emotional control, abnormal behavior, the decline of willpower, decline of insight and so on. Most patients with mental disorders do not recognize their condition and refuse to seek help from doctors, resulting in the aggravation of their condition, which not only increases the burden on their families and affects their normal life and study, but also may have social conflicts and affect the social order and the construction of a harmonious society. The analysis of the causes of college students suffering from mental disorders will help teachers and schools to improve teaching methods, and can play a role in preventing college students from suffering from mental disorders.

Personality psychology is a highly comprehensive branch of psychology. Its research contents include

education, personality traits, individual personality, school management, social effects and so on. Personality psychology belongs to applied psychology, which mainly studies people's learning and the role of educational intervention, teaching psychology and social psychology organized by schools under the educational background. Therefore, based on personality psychology, this study analyzes the impact of contemporary college teaching methods on college students' psychology and personality, and then analyzes the correlation between college students' psychological symptoms and mental disorders, to explore the causes of students suffering from mental disorders. The analysis of the correlation between college students' mental disorders and psychological symptoms based on personality psychology can help teachers and schools improve the teaching mode and prevent college students from suffering from mental disorders, which is of great significance to college students' learning and the development of a harmonious society.

Objective: Some college students have accumulated too many negative emotions, which leads to mental disorders, which only aggravates the burden of the family, affects their normal life and study, and may have social conflicts, affecting the social order and the construction of a harmonious society. Therefore, based on personality psychology, this study analyzes the correlation between college students' mental disorders and psychological symptoms, hoping to help teachers and schools improve teaching models, prevent college students from suffering from mental disorders, improve college students' learning efficiency and, and promote the harmonious development of society.

Research objects and methods: 80 students with mental disorders from 7 universities were selected as the research objects. The students came from different majors, aged between 18 and 22. The degree of mental disorder of the subjects was analyzed and evaluated by the Diagnostic Schedule of Mental Disorders (DSMD). The psychological symptoms of patients were evaluated by the Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS).

Study design: A questionnaire was developed based on the diagnostic scale of mental disorders, Self-rating Anxiety Scale and Self-rating Depression Scale, and 80 patients were investigated and analyzed. According to the results of the questionnaire, the correlation between mental disorders and psychological symptoms of college students was counted and analyzed.

Methods: The corresponding data were processed and analyzed by software SPSS17.0.

Results: The reliability of the questionnaire was tested. The reliability test results show that the questionnaire designed in the study has excellent reliability and high reliability, as shown in Table 1.

Table 1. Reliability test of questionnaire survey

	Kaiser-Meyer-Olkin	Bartlett's spherical test		
	Measurement sampling appropriateness	Approximate Chi-square	<i>df</i>	Significance
Value	0.971	8214.651	354	0.000

Conclusions: In the university stage, students have a wider contact area and more things. But at this time, college students' ideas have not changed, so they are easy to fall into a state of confusion and confusion in the face of various views and theories in the society. Some college students have accumulated too many negative emotions, which leads to mental disorders, which only aggravates the burden on their families and affects their normal life and study. The analysis of the causes of college students suffering from mental disorders will help teachers and schools to improve teaching methods, and can play a role in preventing college students from suffering from mental disorders. Therefore, based on personality psychology, the research analyzes the correlation between college students' mental disorders and psychological symptoms, helps teachers and schools to improve the teaching mode and prevent college students from suffering from mental disorders, which is of great significance to college students' learning and the development of a harmonious society.

EFFECT OF INTELLIGENT DESIGN OF COMMUNITY HOME NURSING ENVIRONMENT ON REHABILITATION TRAINING OF ELDERLY WITH COGNITIVE IMPAIRMENT

Tianxia Yu

School of Public Administration, Chongqing Finance and Economics College, Banan 401320, China

Background: With the advancement of the aging process of the population, the total proportion of the elderly in the social population is gradually increasing, and the number of the elderly with dementia is also

gradually increasing. Many elderly people have cognitive impairment, which seriously reduces the quality of daily life of the elderly. Cognition is the process of human acquiring and processing knowledge and information, including a series of cognitive activities and social behaviors such as learning, memory, thinking and emotion. Cognitive impairment refers to abnormal conditions in the process of cognition and processing, which hinder the development of people's normal learning and memory activities, patients with cognitive impairment often have slow perception or over sensitivity, hallucinations, memory loss and other conditions. In severe cases, they are also accompanied by pathological symptoms such as aphasia and agnosia.

At present, the elderly pension methods are gradually showing a diversified trend. Among them, the community pension model is a pension method that combines pension and community environment, so that the elderly can carry out pension life in their own environment. At home, they can not only be taken care of by their children, but also enjoy the pension services of professional community facilities. With the acceleration of social development, the combination of foreign advanced pension ideas and the actual situation and needs of domestic pension has derived the community home-based pension model under the new concept to create an intelligent pension community, combine community resources with the home-based pension, and improve the quality of life of the elderly. This new pension model with strong habitability is more suitable for the elderly with cognitive impairment. It can provide professional pension services for the elderly with cognitive impairment, and use the intelligent living environment to improve the living standards of the elderly with cognitive impairment.

Objective: To explore the design strategy of the new community home-based elderly care environment, analyze and study the challenges of building an intelligent elderly care community, provide guidance for improving the intelligent design level of the community home-based elderly care environment, expect to provide intelligent elderly care services for the elderly with cognitive impairment, and improve the quality of life of the elderly with cognitive impairment based on the community.

Research design: Using the method of correlation analysis, this study analyzes the correlation between different intelligent design aspects and the livable comfort of the elderly with cognitive impairment in the community home-based elderly care environment, and discusses the functions of intelligent elderly care community in life care, culture and entertainment, medical care the influence of intelligent design in the four directions of spirit and psychology on the elderly care life of the elderly with cognitive impairment. Based on the data results of correlation analysis, this paper puts forward the corresponding intelligent design strategy of community home-based elderly care environment, analyzes the problems and challenges faced by the environmental transformation of home-based elderly care community, and provides help for promoting intelligent home-based elderly care community and improving the comfort of elderly people with cognitive impairment.

Figure 1. Correlation analysis between community intelligent design and livable comfort of the elderly with cognitive impairment

Results: The correlation analysis results between the intelligent design of community and the living comfort of the elderly with cognitive impairment are shown in Figure 1. The intelligent design of life care, culture and entertainment, medical care and mental psychology are positively correlated with the living comfort of the elderly with cognitive impairment. In the intelligent design of home-based elderly care community, the correlation coefficient between mental and psychological intelligent design and livable

comfort is the largest. Mental and psychological environmental design can effectively improve the elderly care and living comfort of the elderly with cognitive impairment.

Conclusions: The intelligent home-based elderly care environment can effectively help the elderly with cognitive impairment in the community improve the convenience of life, and promote the elderly with cognitive impairment to improve the quality of life from the aspects of life, social, health, entertainment and so on. The intelligent design of community home-based elderly care environment should strengthen the construction of technical feasibility and economy, promote the improvement of the intelligent level of information technology of community home-based environment, combine advanced community elderly care concepts and technologies with the elderly care needs of the elderly with cognitive impairment, and rely on the community as the environment, promote the construction and development of intelligent community public health system and home-based elderly care intelligent community. Make use of the intelligent and convenient home-based elderly care community environment to help the elderly with cognitive impairment improve their quality of life and level, and create a safe, healthy and livable community home-based elderly care environment and atmosphere for the elderly with cognitive impairment.

EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGE FOREIGN LANGUAGE COURSE ON THE ALLEVIATION OF COLLEGE STUDENTS' PSYCHOLOGICAL DEPRESSION

Xuanxuan Chang

School of Foreign Languages, Henan University, Kaifeng 475001, China

Background: College students with psychological depression will be depressed, not interested in past things, feel depressed in learning and life, low learning efficiency, do not want to carry out social activities, have a low sense of self-esteem, have difficulty in paying attention in learning and life, and have suicidal thoughts in serious cases. There are different explanations for psychological depression. In the view of trait theorists, people who have suffered from depression are more likely to suffer from severe psychological depression, while humanistic schools in the interpretation of psychological depression say that the establishment of self-worth has a positive impact on depression. When psychological depression treatment is carried out, patients can be self accepted, which is helpful to the treatment of psychological depression. Behaviorist schools believe that psychological depression is related to the type of environment. If there is no positive reinforcement in life, individuals are easy to suffer from psychological depression. In college students, there are three influencing factors of psychological depression: achievement motivation, self-evaluation and interpersonal disorder. In the achievement motivation, influenced by the traditional education mode, college students have a thinking mode of judging excellence by their grades and are afraid of failure in the exam. Especially in the process of foreign language exam, when they can't reach the ideal score in the exam, they will have a strong sense of loss, think they are very failed and have no desired sense of achievement, resulting in psychological depression, which can also be called success anxiety. As college students are in a special stage of physical and mental growth, their self-evaluation will deviate. This phenomenon often occurs in the process of foreign language learning. In addition, due to the differences in personality, interests and hobbies, college students have conflicts in the process of interpersonal communication, which leads to psychological depression.

In recent years, the educational circles have put forward the concept of curriculum thought and politics. The course of ideological and political education is essentially a kind of education. Its purpose is to establish morality and cultivate people. In the process of education, it combines various subject knowledge with ideological and political theory courses. For example, in the ideological and political education of foreign language courses, help students establish correct three views and deeply excavate the ideological and political elements contained in foreign language professional courses. At present, the traditional foreign language teaching model cannot meet the needs of cultivating high-quality cross-cultural communication talents. The traditional foreign language teaching mode focuses on cultivating students' subject ability, ignoring the cultivation of students' political quality and cultural self-confidence. Some students worship foreign culture extremely, fail to see their own cultural advantages, and despise them. Therefore, it is very necessary to carry out ideological and political education in college foreign language courses. In addition, the ideological and political education of college foreign language courses has a positive significance, which will have a positive effect on college students' mental health. In this regard, the effect of ideological and political education in college foreign language courses on the alleviation of college students' psychological

depression is studied.

Objective: To understand the psychological depression of college students and study the current situation of ideological and political construction of foreign language curriculum. And on this basis, combine the foreign language teaching content with morality. Cultural comparison and language substitution are applied in the process of foreign language teaching to cultivate students' cultural communication ability, increase students' national pride and alleviate students' psychological depression in the atmosphere of cultural self-confidence. For example, in foreign language composition class, teachers combine China's cultural knowledge and habits, require students to excavate writing materials from around them, and apply them in the process of foreign language writing, which increases students' participation, makes students' learning enthusiasm better, and is conducive to the relief of students' psychological depression. Combine morality with foreign language teaching methods, and choose teaching methods according to the teaching content. For example, in Russian teaching, the relevant contents of Chinese higher education are expressed in Russian. In this process, students will feel the joy of success, so as to have a sense of achievement, and then promote the relief of students' depression.

Subjects and methods: The subjects were depressed college students majoring in foreign languages. 280 depressed college students majoring in foreign languages were randomly selected from three universities. These college students come from different grades and have different foreign language majors. Foreign languages include English, Russian and Korean. To understand students' psychological depression, foreign language learning and their political literacy, these college students were divided into Korean group (92), English group (95) and Russian group (93). These college students will receive ideological and political education in foreign language courses for one semester, two classes a week. During the experiment, the relevant experimental data were recorded, and the fuzzy evaluation method was used to study the effect of Ideological and political education of college foreign language courses on the alleviation of college students' psychological depression. The quantitative score of the relevant impact was 1-5 grades. The higher the score, the greater the impact. Through SPSS21.0 for data processing and analysis.

Results: In the process of foreign language learning, due to the influence of achievement motivation factors, college students are afraid of the exam and worry that their foreign language performance cannot reach the ideal score, resulting in a strong sense of loss and psychological depression. Or influenced by self-evaluation, college students think that they are lack of ability in foreign language learning, cannot see their own advantages, and produce psychological depression. By carrying out ideological and political education in college foreign language courses, combining morality with foreign language teaching contents, foreign language teaching methods and foreign language training objectives, college students can carry out moral education in the process of learning foreign language professional knowledge, cultivate students' democratic cultural pride and alleviate students' psychological anxiety. After the experiment, the depression score of Freshmen in the Russian group was 2 points, which was 2 points lower than that before the experiment. The relevant results are shown in Table 1.

Table 1. Psychological depression scores of college students of different grades in Russian group before and after the experiment

Grade	Time	Depressed	Fear	Low self-esteem
Freshman	Before experiment	4	4	4
	After the experiment	2	1	1
Sophomore	Before experiment	4	5	4
	After the experiment	2	2	1

Conclusions: Ideological and political education in college foreign language curriculum can alleviate college students' psychological depression, improve college students' political literacy, help college students form the habit of autonomous learning and improve their comprehensive quality.

CLINICAL NURSING COUNTERMEASURES OF INTRAVENOUS INFUSION IN PATIENTS WITH MANIC DEPRESSIVE PSYCHOSIS

Canhui Li¹, Zhengmao Pan² & Ping Chen¹

¹Department of Basic Medicine, Yueyang Vocational Technical College, Yueyang 414000, China

²*Office of Party and Government, Yueyang Vocational Technical College, Yueyang 414000, China*

Background: Manic depressive psychosis is a serious mental disease, which usually shows the characteristics of periodic and repeated attacks. Its causes mainly include the patients' emotional activity is too high or their mood is too low. The basic clinical symptoms of manic-depressive psychosis patients are mainly divided into two types, namely mania and depression. The two extreme emotional manifestations usually occur alternately or repeatedly. In the environment of increasing social competition and increasing life pressure, the prevalence of manic-depressive psychosis is rising, and the disease has become a common mental disease. Patients with manic depressive psychosis lack understanding of their own diseases and have poor treatment compliance, which is mainly manifested in non-compliance with medical advice and missing medication after discharge. For patients with manic depressive psychosis, the psychological disorder caused by pathological psychology is extremely serious and has significant uncontrollability, resulting in manic depressive psychosis patients showing different degrees of abnormal symptoms in cognition, will, emotion, behavior and other aspects, which has a great negative impact on their normal study, work and life, and even self-mutilation and suicide dangerous sexual behavior such as attacking others. The violent behavior of manic-depressive psychosis patients is difficult to predict and control, and continues to occur with the two extreme emotions of mania and depression, which has a certain high incidence. Based on this, the clinical nursing work for manic depressive psychosis patients has a strong potential risk, which is a great threat to manic depressive psychosis patients themselves and related medical staff. In order to ensure the safety of medical staff and improve the treatment compliance and clinical efficacy of patients with manic depressive psychosis, it is necessary to improve and optimize the clinical nursing mode of intravenous infusion.

Objective: The mental status of patients with manic depressive psychosis has strong variability. Under the influence of external factors or their own psychological hints, patients may show extreme emotions of mania and depression, and even violent behaviors such as hurting themselves and attacking others. In order to improve the clinical nursing and treatment effect of patients with manic depressive psychosis, reduce the incidence of violence and improve the degree of manic and depression, this study will analyze the psychological characteristics of patients with manic depressive psychosis, evaluate their aggressive behavior, and put forward improved clinical nursing countermeasures of intravenous infusion for patients with manic depressive psychosis.

Research object and method: 32 patients with manic depressive psychosis were screened from three mental rehabilitation centers, a total of 96. 96 patients with manic depressive psychosis were studied. The improved clinical nursing countermeasures of intravenous infusion were implemented, and their psychological changes were analyzed by fuzzy comprehensive evaluation method.

Research design: Based on the traditional clinical nursing model, the intervention means of language communication and psychological nursing for patients were added to form an improved clinical nursing strategy of intravenous infusion. To explore the changes of manic mood and depressive psychology of patients with manic depressive psychosis before and after the implementation of the improved clinical nursing strategy.

Methods: 96 patients with manic depressive psychosis were evaluated by Modified Overt Aggression Scales (MOAS). SPSS25.0 for statistical analysis of data, all measurement data were subject to *t*-test, and $P < 0.05$ was taken as the evaluation standard with obvious difference and statistical significance.

Results: The improved clinical nursing strategy of intravenous infusion for patients with manic depressive psychosis was applied to the nursing process of 96 subjects, and the comparison results of aggressive behavior as shown in Figure 1 were successfully obtained. According to Figure 1, before the implementation of improvement measures, the moas score level of the tested patients was high, and the score of attacking others was the highest, indicating that the patients were at high risk to others. After the implementation of the improvement measures, the aggressive behavior of all patients with manic depressive psychosis decreased, and the moas score of each evaluation item decreased significantly, and the difference was statistically significant ($P < 0.05$).

Conclusions: The improved clinical nursing countermeasures of intravenous infusion based on language communication and psychological nursing can effectively reduce the moas score of manic-depressive psychosis patients and minimize the incidence of aggressive behavior in the four evaluation levels of attacking themselves, attacking others, language attack and object attack. On the basis of building a good doctor-patient relationship, promote the rehabilitation of manic-depressive psychosis.

Acknowledgement: The research is supported by: Educational Science Planning Project of Hunan Province: Practice and research of the organic integration of information technology and contextualized teaching methods in basic nursing training courses (No. XJK20CZY025).

STUDY ON THE EFFECT OF MASS SPORTS ON ALLEVIATING PATIENTS WITH BEHAVIORAL DISORDERS

Gangsheng Liu

Department of Physical Education, Xinyang University, Xinyang 464000, China

Background: In the process of sustainable social development, people's material level has been continuously improved. On the basis of meeting the basic material pursuit, there are more spiritual needs. In this context, sports play a more and more important role in people's daily life. Mass sports, consistent with competitive sports in the concept of sports sociology, are the main components of sports. Compared with competitive sports, mass sports are not highly competitive. Its main purpose is to enhance physique and enrich leisure life. All members of the society can participate at will. In a word, mass sports have six basic characteristics: amateur time, universality of objects, randomness of projects, flexibility of forms, tradition of activities and sociality of benefits. Based on this, the audience of mass sports is very wide, which can play a certain role in ensuring people's physical and mental health.

Behavior disorder refers to that an individual's external behavior is relatively abnormal, which is obviously different from others, and the behavior may cause serious adverse effects on himself and others. The main causes of patients with behavioral disorders are mental disorders, namely delirium, manic episode, stress disorder, separation disorder, etc. The corresponding clinical manifestations include stereotyped action, forced action, imitation action, psychomotor excitement, psychomotor inhibition, etc. Stereotyped movement refers to the behavior disorder patients in the unconscious situation, aimlessly imitate the actions of others. Forced action means that the patient repeats the actions that lack the necessity of execution. If repeated processing is not carried out, the patient will show abnormal anxiety and irritability. Imitation refers to the patient's aimless imitation according to the actions and behaviors of others, usually accompanied by imitation speech. To alleviate the symptoms of patients with behavioral disorders, a series of examinations need to be carried out, including predictive examination, physical examination, laboratory examination, imaging examination, psychological test and other examinations. After obtaining the corresponding examination results, different types of treatment methods are adopted, such as psychotherapy, drug therapy, physical therapy, exercise therapy and so on. As a common form of exercise therapy, mass sports, with its diversified items and forms, can promote the emotional catharsis and physical release of patients with behavioral disorders, alleviate the impulsive and irritable behavior of patients in the process of exercise, help them establish good interpersonal relationships and eliminate behavioral disorders.

Objective: Under the influence of the etiology of mental disorders, patients with behavioral disorders will show a variety of types of behavioral disorders, mainly including abnormal behaviors such as psychomotor excitement and psychomotor inhibition, which is a threat to their normal life and personal safety. In order to alleviate the symptoms of patients with behavioral disorders and improve their mental health level, this study takes mass sports as an intervention means to explore the effect of mass sports on the symptoms of patients with behavioral disorders.

Research objects and methods: 133 patients with behavioral disorders were randomly selected to participate in mass sports. Before and after participating in mass sports for 3 months, nurses used the nurses' inpatient observation scale for inpatient evaluation (NOSIE) to study, and the NOSIE scores of all patients with behavioral disorders were recorded and analyzed.

Research design: NOSIE includes 30 evaluation items, with a total score of 120 points, including the total negative factor score and the total positive factor score, which are 64 points and 56 points respectively. The total score of NOSIE determines the severity of the disease or symptoms. The higher the score, the better the recovery of the disease or symptoms. At different time nodes before and after mass sports, the total NOSIE scores of patients with behavioral disorders were recorded.

Methods: Minitab20 software was used to process and analyze the relevant data of patients with behavioral disorders. All measurement data were expressed in the form of mean \pm standard deviation. *t*-test was used, and $P < 0.05$ was used as the standard with statistical significance.

Results: Before exercise intervention, the total score of NOSIE in 133 patients with behavioral disorders was lower, which was significantly lower than that after exercise ($P < 0.05$). The scores of total negative factors and total positive factors of patients with behavioral disorders after exercise are better than those before exercise, which shows that mass sports can effectively improve the symptoms of patients with behavioral disorders.

Table 1. Comparison of NOSIE scores of patients with behavioral disorders before and after mass sports

Evaluation time	Total negative factor score	Total positive factor score	Total score of NOSIE
Before exercise(<i>n</i> =133)	25.62 \pm 5.95	34.66 \pm 9.48	147.97 \pm 19.35
After exercise(<i>n</i> =133)	7.91 \pm 2.15	53.84 \pm 16.66	158.66 \pm 15.97
<i>t</i>	32.283	11.540	4.914
<i>P</i>	0.000	0.000	0.000

Conclusions: Mass sports can play a significant role in alleviating the of patients with behavioral disorders. Through various forms of healthy sports with free participation time, we can enhance the physique of patients with behavioral disorders, improve their mental health level and improve their performance of behavioral disorders.

ON THE INFLUENCE OF CHINESE NATIONAL DANCE EDUCATION ON ALLEVIATING COLLEGE STUDENTS' MENTAL ANXIETY

Ruiqi Peng^{1,2}

¹College of Dance, Minzu University of China, Beijing 100081, China

²School of Music, Henan University, Kaifeng 475001, China

Background: College students are in a critical stage from adolescence to adulthood. Due to academic pressure, changes in social roles and immature psychological state, college students are prone to various psychological problems such as mental anxiety. Anxiety symptoms refer to the emotional states such as physiological tension, anxiety and fear when facing an event or situation, which will lead to the damage of individual daily function and social function. In recent years, the detection rate of mental problems such as mental anxiety and depression of college students shows an increasing trend year by year, which shows that the mental health status of college students is not optimistic. Serious mental anxiety will lead to serious pessimism in college students' study or life, and it is difficult to maintain a normal state of study or life. Mental anxiety will not only have a great negative impact on college students' subjective quality of life, but

also lead to negative events that hurt others or themselves, which is an irreparable loss to college students, their families and society. The causes of college students' mental anxiety have a certain diversity. In order to eliminate their mental anxiety, targeted mitigation measures need to be taken, among which cultural edification is an effective and reliable method. Among the various means of cultural edification, dance education occupies an important position. As a practical activity that can meet individual spiritual needs, dance can accompany individual learning and life, and is deeply loved and pursued by college students. Chinese national dance education includes Chinese traditional culture and national spirit, which is an elegant artistic experience. In the process of the development of Chinese national dance culture, it has mainly experienced three different development cycles: primitive stage, ancient stage and modern stage. Dance culture has also been artistically sublimated in this process, enhancing its own cultural flavor and artistic beauty. Chinese national dance education is one of the core components for individuals to achieve all-round development. It mainly concretely deals with the education of love by expressing emotional elements through body language. Moreover, Chinese national dance education can not only improve the physical coordination and physical quality of college students, but also enhance their participation in group activities, so as to strengthen the sociality of college students' personality and promote their healthy development to a certain extent.

Objective: Chinese national dance is an art form of human movement. The education of Chinese national dance for college students can enable them to obtain the enjoyment of beauty and artistic experience on the basis of cultivating physical coordination and strengthening physique, which is helpful to alleviate their psychological pressure and improve their psychological quality. The research will explore the application effect of Chinese national dance education, in order to clearly analyze the impact of Chinese national dance education on college students' mental anxiety and effectively alleviate college students' mental anxiety.

Research objects and methods: 42 college students, a total of 126, were randomly selected from each of the three universities. Depression Anxiety Stress Scales (DASS) and Beck Anxiety Inventory (BAI) were used to evaluate and analyze their mental anxiety status.

Research design: 126 college students were educated in Chinese national dance. The intervention time of dance education was set as 4 months. Before and after the intervention, the levels of mental anxiety were evaluated and compared by DASS and BAI. DASS contains three subscales, and each subscale includes seven evaluation items. DASS uses four grade scoring criteria to quantify the evaluation results, with 0-3 indicating never, sometimes, often and always. Multiply the sum of the scores of the three subscales by 2 to obtain the total DASS score of the evaluation object. In the anxiety subscale of DASS, 8 points are the index line of whether there is mental anxiety. If the score is lower than 8 points, it means there is no mental anxiety. If the score is greater than 8, the higher the score, the more serious the mental anxiety symptoms of the evaluation object.

Methods: Fuzzy comprehensive evaluation method and SPSS25.0 software were used to make data statistics and comparative analysis on the evaluation results of mental anxiety of college students.

Results: Before the intervention of Chinese national dance education, most college students were in the state of moderate anxiety, severe anxiety and extreme anxiety, accounting for 62.70%, 19.84% and 9.52% respectively. There are fewer college students in normal and mild anxiety, accounting for only 1.59% and 6.35% respectively. After the intervention, the number of college students with normal and mild anxiety evaluated by DASS anxiety subscale increased significantly, and their proportion increased to 18.25% and 49.21% respectively. The number of college students with moderate anxiety, severe anxiety and extreme anxiety decreased significantly. The scores of DASS anxiety subscale of college students before and after receiving Chinese national dance education are shown in Table 1.

Table 1. Score distribution of DASS anxiety subscale of college students under Chinese national dance education [n (%)]

Evaluation time	Normal	Mild anxiety	Moderate anxiety	Severe anxiety	Extreme anxiety
	Less than 8 points (%)	8-9 points (%)	10-14 points (%)	15-19 points (%)	More than 19 points (%)
Before dance education intervention	2 (1.59)	8 (6.35)	79 (62.70)	25 (19.84)	12 (9.52)
Dance education intervention	23 (18.25)	62 (49.21)	31 (24.60)	7 (5.56)	3 (2.38)

Conclusions: Chinese national dance education can significantly reduce the anxiety level of college students and effectively alleviate the mental anxiety symptoms of college students.

THE THERAPEUTIC EFFECT AND PROMOTING EFFECT OF RELIGIOUS BELIEF EMOTION ON MENTAL ANXIETY

Jiangxiu Shan^{1,2}

¹School of Ethnology and Sociology, Southwest Minzu University, Chengdu 610041, China

²College of Language and Culture, Chuxiong Normal University, Chuxiong 675000, China

Background: Religious psychology is applied social psychology that specializes in the psychological activities produced by religious beliefs. Its research field covers almost all fields of psychology, and the relationship between religion and mental health has always been the research hotspot of this discipline. In real life, the vast majority of psychologists and psychological counselors engaged in mental health are atheists or anti-religious. However, in order to better treat patients' mental diseases, more and more mental health workers begin to pay attention to the relationship between religion and psychology. Bi Yi's religious concept, religious behavior and religious emotion also play a positive role, especially religion will affect the process of psychotherapy.

The contemporary social cognitive theory holds that our thinking will adopt specific strategies according to specific situations and goals, or make inferences according to specific theories to obtain enough correct understanding and judgment. Religion provides believers with a relatively complete set of thinking creeds, which constitutes the theoretical basis of believers' intuitive thinking. The consequence of this intuitive processing model is hypothesis deviation. That is, selective perception and memory prove some creeds, assumptions and schemata related to the world. The advantages of this strategy are high efficiency, fast judgment and less time-consuming. Although it is not necessarily correct, it may reduce the anxiety of patients with mental anxiety due to their addiction to unknown risks and fantasy scenes to a certain extent.

Objective: To analyze the advantages and disadvantages of various treatment methods for mental anxiety symptoms and the current situation of mental anxiety of religious people. On this basis, an experiment was designed to verify whether religious belief emotion is helpful to improve the treatment effect of mental anxiety symptoms.

Objects and methods: Collect research literature on mental anxiety and works on religious belief and mental health, and master the theoretical basis of religious belief in the treatment of mental anxiety. Then a treatment experiment was designed. The subjects were 200 adults with mental anxiety disorder. They were selected through the collection of social experiment volunteers. The subjects were divided into experimental group and control group, with 100 people in each group. The control group was given routine psychotherapy for mental anxiety disorder. On the basis of receiving the treatment scheme of the control group, the experimental group was also required to read religious works at least three times a week for no less than 20 minutes each time, watch religious lectures at least once a week, and record the viewing notes. The experiment lasted for 3 months. In addition, before and after the experiment, the subjects were required to self-evaluate the severity of mental anxiety symptoms. The evaluation method was a ten-point scale, in which 0, 2, 4, 6 and 8 respectively represented asymptomatic, mild, moderate and severe symptoms. Keep one significant digit after the decimal point of the score.

Results: The effective evaluation data of the two groups were entered into the computer and SPSS22.0 was used for statistical analysis. The quantitative data are displayed in the form of mean \pm standard deviation, and the significance test of *t*-value difference is carried out. The significance level is set to 0.05. See Table 1 for the statistical results.

Table 1. Statistics of self-assessment scores of mental anxiety severity of the two groups before and after the experiment

Self-assessment time	Experience group	Control group	Change value (%)	<i>P</i>
Before experiment	6.17 \pm 0.51	6.18 \pm 0.58	-0.16	2.440
After the experiment	2.24 \pm 0.49	4.77 \pm 0.42	-53.04	0.002

Note that “change value” in Table 1 means the change range of the average score of the experimental group at each time relative to the control group at the same time, and the unit is %. It can be seen from Table 1 that the *t*-test *P* value of the self-assessment score of mental anxiety severity of the two groups before the experiment is 2.440, which is far greater than the significance level of 0.05. It is considered that the data difference is not significant. After the experiment, the average self-assessment score of mental anxiety disorder severity in the experimental group decreased to 2.24 and that in the control group was 4.77. The former decreased by 53.04% compared with the latter, and the data difference was statistically significant.

Conclusions: In order to explore more effective non-drug treatment methods for mental anxiety, this study designed a mental anxiety treatment experiment based on the analysis of the advantages and disadvantages of various treatment methods for mental anxiety symptoms and the current situation of religious people’s mental anxiety. The experimental results show that the average self-assessment score of symptom severity in the experimental group combined with the principles of religious psychology is 2.24 and that in the control group is 4.77. The former is 53.04% lower than the latter, and the data difference is statistically significant. The data show that the method of integrating religious psychology into the treatment plan of patients with mental anxiety disorder is helpful to improve the treatment effect of patients. This is because after contacting religious works and ideas, patients will have more direct and simple things evaluation criteria, which can reduce the negative emotions of patients due to unwarranted anxiety about the current life situation and part of the future to a certain extent.

RESEARCH ON THE INFLUENCE OF ANXIETY ON CONSUMERS’ PURCHASE INTENTION

Yun Liu¹, Yubing Zu¹, Zuochang Zhang¹, Xiaokang Liu² & Qingzhe He¹

¹*School of Management Science and Engineering, Guangxi University of Finance and Economics, Nanning 530007, China*

²*Department of Management Engineering and Technology, Guangdong Jinyuan New Energy Co.,Ltd., Guangzhou 510000, China*

Background: Social anxiety is a typical irrational mentality, which refers to a widespread psychological state and emotion of tension, confusion and pessimism about the future. The anxiety psychology of people of different ages and different occupational attributes is different. For example, the anxiety psychology of teenagers is mainly based on recent and related trivia, and the consideration level is relatively narrow. Anxiety involves many aspects of age and psychology. The anxiety psychology of students mainly comes from their studies or family, while the anxiety psychology of working-class people mainly comes from work relations, human sophistication and so on. There are differences in the causes of anxiety in different groups, but it is undeniable that the tension caused by anxiety and the suspicion, irritability, fear, frustration, confrontation, as well as the accompanying confusion of thinking, mental laxity, lack of confidence and even psychological distortion will have a negative impact on people’s emotional regulation and behavior orientation. In serious cases, it will endanger personal physical and mental health and lead to antisocial behavior. Different levels of anxiety will make individual behavior different, which makes people easy to be guided by negative emotions when making things evaluation and decision-making, and make impulsive behavior and other behaviors that are not in line with reality and daily behavior. When dealing with anxiety, people often divert their attention and sight to avoid falling into anxiety for a long time, such as shopping behavior, exercise style, food decompression method and so on.

Among them, shopping behavior to alleviate anxiety refers to that people will show purchase intention and consumption behavior under the influence of consumption emotion, consumption motivation and other factors when choosing goods. Purchase intention is divided into positive purchase intention and negative purchase intention. Factors such as online word-of-mouth, selling price, service quality, logistics and price will affect consumers’ purchase intention, but the perceived value of the dominant factor in most purchase behaviors. Perceived value will affect people’s attitudes and views on purchase behavior, and then trigger purchase motivation. Emotional value plays an important role in guiding perceived value. For example, high and low emotions will make people have shopping behavior and affect their purchase intention. Merchants will also conduct emotional guidance to affect consumers’ purchase behavior. For example, the aesthetic style of “white, young and thin” advocated by businesses will the appearance anxiety of female consumers, and then drive them to produce consumption intention and consumption tendency. However, moderate

anxiety will promote people to change to the good, and consumers' purchase intention will also affect their anxiety. Therefore, exploring the relationship between it and consumers' purchase intention from the perspective of anxiety psychology will help to improve consumers' anxiety psychology from the perspective of behavior regulation and guide them to consume correctly and rationally.

Objective: In order to better explore the internal and external drivers of consumers' purchase intention, help them treat consumption behavior correctly, improve their anxiety psychology, promote the normal intervention of anxiety psychology and consumption psychology, and then improve the level of mental health.

Research objects and methods: 1000 consumers of different ages and occupations were randomly selected as the research objects, and the anxiety psychology of consumers was adjusted with the help of a self-rating anxiety scale. Then the research objects were randomly divided into groups to arrange different shopping behavior instructions and shopping intentions to guide their rational consumption. Then explore the psychological changes of consumers' anxiety under different shopping intentions.

Method design: Firstly, the degree of anxiety and willingness of daily shopping behavior of consumers were collected, and then they were randomly divided into groups according to the characteristics of subjects, and their shopping behavior intervention was carried out. After a period of four weeks, the anxiety psychology and anxiety level of consumers were collected by using the anxiety scale score.

Methods: With the help of social statistical analysis tool SPSS23.0, the changes of consumers' anxiety and purchase intention before and after the experimental intervention were statistically compared.

Results: Consumption is increasingly related to individual psychological needs, and the emotions generated by individuals will have an impact on subsequent consumption behavior. Some businesses urge consumers to buy self-improvement products by inducing consumers' anxiety. Through the influence mechanism of anxiety psychology on consumers' purchase intention, it is found that when individuals feel anxiety, individuals' self-improvement consumption intention is higher. Table 1 shows the scores of anxiety scale of consumers of different ages before and after the experimental intervention.

Table 1. Statistics of anxiety scale scores of consumers of different ages before and after experimental intervention

Before and after the experiment	Young consumers	Middle-aged consumers	Elderly consumers
Before experiment	17.65±1.98	26.37±1.68	15.14±1.72
After experiment	9.24±1.24	8.26±1.47	9.65±1.05

Conclusions: Different emotional values will affect people's different consumption tendencies and shopping intentions, and consumers' purchase behavior will be affected by consumption motivation, perception, learning stimulation and behavior attitude. Anxiety individuals often use the methods of emotional activation and psychosocial stress exposure to alleviate anxiety. Through the correct guidance of shopping behavior, they can effectively reduce consumers' psychological pressure and negative emotions, help them improve their anxiety and rational consumption, and then improve their mental health level.

THE EFFECT OF MUSIC TEACHING IN COLLEGES AND UNIVERSITIES ON PSYCHOLOGICAL RELIEF OF PATIENTS WITH ANXIETY DISORDER

Suge Wang

Academy of Music, Henan Vocational Institute of Arts, Zhengzhou 450000, China

Background: With the increase of social pressure and the limitation of individual tolerance, more and more people suffer from mental anxiety and emotional regulation difficulties, resulting in many psychological problems, such as anxiety disorder, depression, thinking disorder and so on, among which anxiety disorder is more common. Anxiety disorder can be divided into generalized anxiety and acute anxiety, and its etiology is complex and diverse, including genetic factors, stress factors, disease factors, etc. clinically, it is often manifested as motor agitation and sympathetic hyperfunction, accompanied by negative emotions such as anxiety, shame, disappointment, anxiety and fear. Anxiety experience is the main feature. According to the statistics of who, the proportion of patients with anxiety disorder receiving correct treatment in China is less than 10%. At present, the main treatment means of anxiety disorder is drug treatment, but drug treatment has compliance, and most patients with anxiety disorder are difficult to

adhere to it. Under the intervention of external environmental etiology, it is very easy to cause repeated illness. Mild anxiety disorder will not affect patients' normal life and work, and sometimes improve their accuracy and sensitivity in judging and dealing with things. However, the more serious anxiety disorder will cause a wide range of emotional fluctuations, make their mental state worse, and cause adverse effects and losses on their life and work, leading to other adverse symptoms. With the help of the power of music, we can strengthen the close contact between anxiety patients and the outside world, and different types and styles of vocal music works will bring different emotional experience and intervention mechanisms, and convey different emotional resonance and psychological feedback to the audience. Music teaching can effectively change people's mood and emotion with the help of notes and melody, so as to achieve the effect of psychological relief. Therefore, it is of great practical significance and value to explore the psychological relief effect of music teaching in colleges and universities on patients with anxiety disorder, help them improve their negative emotions and improve their mental health level.

Objective: As an effective psychotherapy method, music therapy can effectively alleviate people's negative emotions. In order to alleviate the anxiety and discomfort of patients with anxiety disorder and help them better regulate their emotions, study the intervention of patients with anxiety disorder with music teaching therapy, and explore the improvement mechanism of vocal music teaching on their anxiety, in order to relieve their psychological pressure and emotions, improve their mental health

Research objects and methods: 300 patients with anxiety disorder were randomly selected as the research object to collect their psychological status and anxiety level information, and then invited them to participate in the process of vocal music teaching in colleges and universities, with the help of vocal music performance, singing interaction the scores of Psychosomatic Tension Relaxation Inventory (PSTRI) and Hamilton Anxiety Scale before and after their participation were tested by means of music appreciation, and the experimental data were collected and sorted out.

Method design: Firstly, the correlation between vocal music therapy and anxiety disorder was analyzed by principal component analysis. Then the subjects were randomly divided into individual music therapy group (group A) and college music therapy group (group B), that is, the subjects in group A were distributed MP3 players and equipped with headphones, and the music the patients liked to listen to was stored in MP3 for 2-3 times a day. The subjects in group B were invited to participate in college music teaching activities 1-2 times a week for eight weeks. After the experiment, the treatment effect and the improvement of anxiety and depression of the subjects were statistically analyzed, and the experimental results were obtained.

Methods: The correlation between vocal music therapy and anxiety disorder was analyzed by a principal component analysis tool to analyze the experimental data.

Results: The intervention of college vocal music teaching on anxiety patients with its collectivity, diversity and richness can effectively alleviate their negative emotions and psychological pressure, help them relieve their emotions in the process of music participation, achieve the effect of emotional regulation, and improve the mental health level of anxiety patients to a certain extent. Table 1 shows the statistics of psychological and emotional scores of anxiety patients under the intervention of vocal music teaching in colleges and universities.

Table 1. Statistics of psychological and emotional scores of anxiety patients under the intervention of vocal music teaching in colleges and universities

Scoring dimension	Before intervention	After 4 weeks of intervention	After 8 weeks of intervention
Anxiety	2.45±0.63	1.37±0.45	1.03±0.41
Depression	2.35±0.39	1.24±0.39	1.05±0.46
Paranoid	1.94±0.58	1.27±0.46	1.03±0.59
Psychotic	2.63±0.46	2.34±0.12	1.69±0.43

Conclusions: Anxiety disorder is a common neurosis in clinic, and there is no complete treatment for anxiety disorder. Most patients with anxiety disorder are in a state of anxiety, worry and anxiety for a long time, which seriously affects their life and work, and some patients will have depression and other accompanying psychological diseases. Taking music teaching in colleges and universities as a psychological intervention means and exploring its psychological relief effect on patients with anxiety disorder will help to improve their anxiety and improve their mental health level.

APPLICATION OF GARDEN LANDSCAPE VISIT IN THE TREATMENT OF PATIENTS WITH DEPRESSION

Qingfeng Mo & Xixian Liang

Faculty of Science and Engineering, Guangxi University Xingjian College of Science and Liberal Arts, Nanning 530005, China

Background: Depression refers to the emotional disorder or affective disorder caused by various reasons with depression as the main symptom. In other words, depression is a clinical symptom or state-centered on self-experience of depression. Depression has the characteristics of high prevalence, high recurrence rate and high suicide rate. The domestic epidemiological survey of mental diseases shows that the lifetime prevalence of depression is 5.2%-16.2%. About three-quarters of patients are at risk of lifelong recurrence. It can be seen that the harm of depression is huge, and research is necessary. A clinical feature of patients with depression is that they will pay attention to those disturbing events. Recent cognitive studies try to clarify the essence of this phenomenon. Maybe it is just their emotions that make them experience more negative events. However, this phenomenon may also be caused by deviations in some cognitive processes. Maybe they will selectively focus on these events in life, or maybe they think too much about the details of these negative events, which makes it easier for them to remember negative events and enhance depression. So far, the etiology and mechanism of depression are not clear. Because people's thoughts, reasoning, attitudes, the way they explain things, and the way they recall information will increase the risk of depression, and the core symptoms of depression are emotional and cognitive impairment. The cognitive impairment of patients with depression is mainly the decline of attention and memory. Most patients with depression complain of memory and inattention. Even if the symptoms of depression are significantly reduced, they still can't cope with their daily work. Patients with depression have no impairment in short-term memory and recognition, but there are obstacles in free memory. Although they can encode information, specific recall processes are impaired. In short, depression has a serious impact on people's normal life, which should be paid special attention to.

Relevant studies have pointed out that garden landscape visits have important effects on alleviating the disease symptoms of patients with depression, and there are rehabilitation garden landscapes specially used for the rehabilitation treatment of patients with depression. The so-called rehabilitation garden landscape refers to that designers use the planted garden plants, the set activity places, the overall environment of the garden and other means to give full play to the regulation function of the natural environment, promote the gradual improvement of people with special rehabilitation needs, achieve the purpose of rehabilitation of depression, and make such people obtain good treatment results. In short, psychotherapy function is the main feature of rehabilitation landscape. Therefore, from this point of view, excellent rehabilitation landscape design should not only have good environmental construction, but also skillfully use people's psychology to maximize the people who need rehabilitation to obtain better environmental governance effect. In view of this, this study constructed a treatment plan for depression based on garden landscape visit, so as to promote the development of physical and mental balance of patients with depression, help patients release the pressure they bear, relax the mood of patients with depression, and realize the effective treatment of depression.

Objective: Based on the garden landscape visit, the treatment scheme for patients with depression is constructed to improve the psychological development of patients as much as possible, so as to enhance the rehabilitation effect of depression treatment.

Research objects and methods: 160 patients with depression were randomly divided into control group and experimental group, with 80 patients in each group. Combined with HAMD depression scale, the depressive symptoms of the two groups were measured. The scale has five factors: blocking factor, cognitive impairment, sleep difficulty, somatic anxiety and significant weight loss. The control group was intervened in the conventional treatment mode, while the experimental group was intervened in the garden landscape visit treatment mode on the basis of the conventional treatment mode. The intervention period was 1 month. The improvement of depressive symptoms of the two groups were compared and analyzed.

Methods: Complete the data analysis through SPSS19.0 data statistical analysis software.

Results: Table 1 shows the improvement of depressive symptoms in the two groups. Compared with the control group of routine intervention, after the intervention of garden landscape visit treatment mode, the depressive symptoms of patients in the experimental group were improved more significantly, and there was significant difference between the two groups ($P < 0.05$).

Conclusions: Depression has a serious impact on people's normal life, and all sectors of society should pay special attention to it. For the treatment of depression, this study constructed a treatment scheme based on garden landscape visits. The results show that compared with the conventional treatment scheme, the garden landscape visit treatment scheme has obvious advantages in improving the symptoms of patients

with depression, which is worthy of popularization and application.

Table 1. Improvement of depressive symptoms in the two groups (n=160)

Dimensions of anxiety measurement	Control group (n=80)	Experience group (n=80)	P
Retardation factor	23.47	17.44	<0.05
Cognitive impairment	24.34	16.49	<0.05
Difficulty sleeping	23.46	15.44	<0.05
Somatic anxiety	23.35	15.49	<0.05
Significant weight loss	23.47	16.44	<0.05

THE CURATIVE EFFECT OF ROCK COLOR PAINTING TEACHING ON PATIENTS WITH ANXIETY DISORDER

Jianyu Wang

Academy of Fine Arts, Langfang Normal University, Langfang 065000, China

Background: Modern medicine believes that anxiety is related to genetic factors. Anxiety can be found in the families of patients with anxiety. It is an organic disease with physiological and biochemical abnormalities in the brain, especially in the amygdala, hippocampus, hypothalamus and frontal cortex. The role of other brain structures in the development of anxiety. This may be the result of overactive anxiety, but it is not the result of overactive anxiety. In biochemistry, anxiety may be related to the interaction of a variety of neurotransmitters, including norepinephrine, serotonin and GABA. It may also be related to the increase of corticosteroid concentration in the blood and the disorder of central monoamine neurotransmitter metabolism or neurotransmitter system. In the treatment of depression, conventional treatment methods include: norepinephrine and serotonin reuptake inhibitors, benzodiazepines, selective serotonin reuptake inhibitors, and other drugs (antipsychotics, antiepileptics). There are many effective drugs for the treatment of anxiety disorders, mainly including Antidepressants Sertraline, Paroxetine and Venlafaxine, Escitalopram, Duloxetine and Imipramine, Buspirone in Azaspiron, Alprazolam, Diazepam, Lorazepam and Brozepam in Benzodiazepines, Antiepileptic drug Pregabalin, Antihistamines, Hydroxyzine, etc. In short, the clinical manifestations of anxiety disorder are chronic anxiety disorders such as tension, excitement of autonomic nerve function and excessive vigilance, accompanied by a series of symptoms such as muscle tension, autonomic nerve disorder and exercise anxiety, which last for a long time. It is generally believed that over compensation for negative emotions can lead to anxiety disorder. With the development of social economy, people's life and work pressure is increasing. The incidence rate of anxiety disorders is also increasing.

Rock painting refers to the painting works carried out on paper, cloth, board, metal and wall with colored grindstone or colloidal powder as the main medium. Rock paintings painted and carved on rocks all over the world vividly record the daily life and spiritual and cultural beliefs of primitive ancestors. Its existence has greatly made up for the lack of historical materials and restored the rich and colorful life pictures of primitive ancestors. It can be said that rock paintings appear in a macro form, similar to environmental art or earth art. Therefore, the accumulated space-time energy is significantly higher than that of ordinary primitive art forms. Rock painting has experienced a long historical evolution, which can be said to be the treasure of Oriental culture. Although there are ups and downs, it has achieved sustainable development in Japan and Taiwan after all. As an ancient form of painting, rock painting once again attracted the attention of Chinese painting circles and began to explore. Relevant studies have pointed out that rock color painting is of great significance in the treatment of patients with anxiety disorder because of its far-reaching spiritual connotation and long-standing cultural heritage. In view of this, this study launched the application effect of rock painting teaching on the treatment of anxiety disorder, so as to provide a new direction and new ideas for the treatment of anxiety disorder.

Objective: In order to increase the methods and schemes of clinical treatment of anxiety disorder, the research on the treatment of anxiety disorder based on rock color painting teaching is carried out, which aims to improve the treatment effect of anxiety disorder and provide a new idea and direction for the treatment of anxiety disorder in the future.

Research objects and methods: 60 patients with anxiety disorder were randomly divided into control group and experimental group, with 30 in each group. The patients' anxiety symptoms were measured with

the Self-rating Anxiety Scale (SAS). Among them, the control group adopted the conventional treatment mode, while the experimental group added rock color painting teaching content intervention in the conventional treatment mode for 6 months. The improvement of anxiety symptoms of the two groups were compared and analyzed.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the improvement of anxiety symptoms in the two groups after 6 months of intervention. Compared with the control group with routine treatment, the anxiety symptoms of patients in the experimental group improved more significantly after rock painting intervention, and there was significant difference between the two groups ($P < 0.05$).

Table 1. After 6 months of intervention, the anxiety symptoms of the two groups improved ($n=60$)

Factor	Control group ($n=30$)	Experience group ($n=30$)	P
Somatization	2.38±0.47	1.37±0.48	0.00
Obsessive compulsive symptoms	2.64±0.59	1.62±0.58	0.00
Interpersonal sensitivity	2.75±0.61	1.66±0.61	0.00
Depressive status	2.69±0.59	1.52±0.60	0.00
Anxiety state	2.47±0.43	1.39±0.43	0.00
Hostile situation	2.54±0.55	1.45±0.56	0.00
Psychological state of terror	2.36±0.41	1.25±0.43	0.00
Paranoid mental state	2.44±0.56	1.43±0.57	0.00
Psychotic	2.29±0.42	1.28±0.43	0.00

Conclusions: The accumulated space-time energy of rock painting is significantly higher than that of ordinary primitive art forms. Rock painting has experienced a long historical evolution and can be said to be the treasure of Oriental culture. In order to increase the methods and schemes of clinical treatment of anxiety disorder, the research on the treatment of anxiety disorder based on rock color painting teaching was carried out. The results show that after the implementation of rock painting teaching intervention, the anxiety symptoms of patients with anxiety disorder have been significantly improved, because it can provide new ideas and new directions for clinical treatment of anxiety disorder. In short, because of its profound spiritual connotation and long-standing cultural heritage, rock color painting is of great significance in the treatment of patients with anxiety disorder.

INFLUENCE OF PROJECT-BASED TEACHING OF “PHOTOGRAPHY” COURSE ON STUDENTS’ PSYCHOLOGICAL COGNITIVE IMPAIRMENT IN HIGHER VOCATIONAL COLLEGES

Ling Xue

Department of Digital Media, Sichuan Vocational College of Culture & Communication, Chengdu 611230, China

Background: According to psychological theory, cognitive disorder is a psychological disorder developed from the perspective of cognitive psychological disorder. Psychological cognitive disorder can be called a neurocognitive disorder. Patients mainly have psychological disorders in problem solving, perception, memory, learning and so on. In the field of medicine, psychological cognitive impairment is defined as six cognitive impairments: social cognition, complex attention, language, perceptual motor function, learning and memory, and executive function. Individuals usually have a decline in these cognitive abilities, and in severe cases, they can have a brain decline. At present, the pathogenesis of the disease is still controversial. Mature theories believe that the cognitive neural process of patients with psychological cognitive impairment can analyze the relationship between psychological impairment and behavioral inhibition. These psychological and emotional responses related to stimuli include a variety of cognitive neural processes, such as attention process, working memory, consciousness and so on. Some studies believe that mental problems such as social anxiety, social fear, panic disorder, compulsion and depression are caused by psychological cognitive impairment. Psychological cognitive impairment is a disease that clinical

psychologists and psychiatrists must understand. Patients usually need timely and effective psychological intervention, which plays a very important role in their healthy development. In the educational management of higher vocational colleges, the project-based teaching reform of “photography” course has certain practical significance for the research of students’ psychological cognitive impairment.

In view of students’ psychological cognitive impairment, there are very prominent problems in the project-based teaching of “photography” course in higher vocational colleges, which can be embodied in the following aspects. First, the curriculum construction is relatively backward, and there is no perfect teaching equipment and corresponding necessary measures. Professional photography facilities and equipment have high investment funds and occupy more training venues. Therefore, many colleges and universities cannot meet the normal teaching objectives and the supply of corresponding equipment. Third, the teaching mode is single and the assessment system is simple. The important place for most colleges and universities to carry out photography learning is the classroom. There are too many theoretical explanations of traditional photography technology, and the practical operation courses are mainly technical exercises. Students’ awareness of the importance of photography learning and their enthusiasm for learning are not high, the teaching mode is conservative and outdated, and the knowledge points taught in the course are not practical, cutting-edge and forward-looking. Third, there are few teaching hours and the rationality of curriculum is poor. The learning content of photography course is complex, and the technical and operational skills are high. When there are few class hours, teachers cannot complete the teaching tasks with quality and quantity. In terms of time arrangement, the teaching objectives of “photography” course in higher vocational colleges only consider the outline requirements, while ignoring the ideological expression effect and visual effect of the final image presentation. The project-based teaching scheme of “photography” course in higher vocational colleges needs to be reformed according to the problems. The emergence of these problems aggravates students’ psychological cognitive impairment. Educators urgently need to provide a project-based teaching reform scheme of “photography” course in order to comprehensively and eradicate psychological cognitive impairment.

Objective: This paper analyzes the effect of project-based teaching of “photography” course on students’ psychological cognitive impairment in higher vocational colleges, in order to improve students’ psychological cognitive impairment.

Research objects and methods: Students from two schools were selected to analyze the impact of project-based teaching of “photography” course on psychological cognitive impairment in Higher Vocational Colleges through grey comprehensive evaluation method. The number of students was 100 and the cycle was 6 months. The evaluation indexes include social cognition, complex attention, language, perceptual motor function, learning and memory, and executive function. The evaluation results quantify the degree of improvement through the five score ranges of 0-20, 21-40, 41-60, 61-80 and 81-100, indicating no improvement, slight improvement, improvement, obvious improvement and serious improvement respectively. In order to avoid the interference of personal subjective influence on the results in the evaluation process, the average value of the research object is selected and the data after rounding is taken as the final result.

Methods: Through Excel statistical, this paper analyzes the influence value of psychological cognitive impairment before and after the improvement of project-based teaching of “photography” course in higher vocational colleges.

Results: Table 1 refers to the influence value of the project-based teaching of “photography” course in higher vocational colleges on psychological cognitive impairment before and after the improvement. It can be seen from Table 1 that after improving the project-based teaching scheme of “photography” course in higher vocational colleges, students’ social cognition, complex attention, language, perceptual motor function, learning and memory and executive function have been effectively improved.

Table 1. Influence value of project-based teaching of “photography” course on psychological cognitive impairment before and after improvement in higher vocational colleges

Category	Before	After 4 weeks	After 8 weeks	After 16 weeks	After 24 weeks
Social cognition	18	26	35	48	68
Complex attention	12	34	48	68	89
Language	25	36	46	72	86
Perceived motor function	16	26	35	46	68
Learning and memory	32	46	58	63	71
Performing function	28	52	65	71	78

Conclusions: The optimized project-based teaching scheme of “photography” course in higher

vocational colleges can alleviate students' psychological cognitive impairment, especially in complex attention and language. The scheme can be applied to the intervention treatment scheme of students with psychological impairment.

INFLUENCE OF INTEGRATING REGIONAL DIFFERENCES INTO MUSIC CULTURE IN MUSIC EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS WITH AFFECTIVE DISORDER

Bin Liu

School of Music and Dance, Xuchang University, Xuchang 461000, China

Background: Affective disorder, also known as manic depressive disorder, is characterized by depression and high mood. It is a common clinical disease. Fear, external motivation, indifference, inferiority, depression and anxiety are the most common clinical manifestations. Anxiety is mostly closely related to learners' past experience, especially when learners suffer negative evaluation and personal injury from people around them. Inferiority complex is a psychological phenomenon. It refers to the emotion that individuals underestimate their abilities and experience failure in the process of learning. The sense of inferiority not only affects students' academic performance, but also has a significant impact on individual ability and potential. The main pathogenic factors are psychosocial factors and zoological factors. The more mature pathogenesis is neuroendocrine disorder hypothesis and central neurotransmitter metabolism disorder hypothesis. Authoritative medical journals believe that emotional factors are closely related to motivation, self-confidence, will quality and so on. If we do not take appropriate measures for effective emotional disorder intervention, it will have very serious consequences, and even hurt others or commit suicide. Therefore, taking active intervention measures for patients with affective disorder is of great significance for the treatment of patients. At present, the effective intervention methods are combination therapy of traditional Chinese medicine and behavioral therapy. Common clinical treatment methods need targeted treatment according to the clinical disease type of patients.

The integration of college music education into regional differences and music culture can improve students' emotional barriers. Students with emotional barriers need to be prevented from the aspects of emotional attitude, learning strategies, cultural background, cognitive style and so on. College music educators need to accumulate more cultural backgrounds and cultural characteristics of countries all over the world, constantly improve their learning strategies, adjust and optimize their emotional attitudes, and ensure that the music they deliver can deliver positive information, so as to help students alleviate emotional disorders. At present, the research on the integration of music culture into college music education combined with regional differences has been widely valued by teaching scholars. The current situation of the integration of regional difference culture into college music classroom is as follows, which is mainly reflected in three aspects: curriculum, teacher arrangement and teaching status. For the curriculum, the current music culture is lower than the difference, there is no systematic teaching system, and there are omissions in the form of expression and historical period. In terms of teacher arrangement, there are few teachers specializing in music teaching. Most teachers need to participate in other types of music teaching and other social activities. For the current situation of teaching, teachers have no new ideas in the teaching process, and the teaching method is single, which cannot arouse the curiosity of students. In the process of learning, students do not pay attention to regional differences in the study of music culture courses, and students generally show a lack of understanding of the courses. The conclusion that integrating regional differences into music culture in music education in colleges and universities can improve students' emotional barriers has been confirmed in most studies.

Objective: To explore the role of integrating music education into regional differences and music culture in the improvement of students' affective disorder, in order to analyze the risk factors affecting the improvement of affective disorder, and provide scientific suggestions for music education in colleges and universities to improve affective disorder.

Research objects and methods: Select the students with affective disorder from two schools to analyze the effect of music education in colleges and universities after integrating regional differences into music culture. Through the single factor comparative analysis of the factors related to the improvement of affective disorder, and setting the improved affective disorder as the dependent variable, the risk factors with statistical significance are obtained by logistic regression analysis. The relative risk is determined by Odds Ratio (OR), and the 95% confidence interval is determined. If the or value is greater than 1, it indicates

that the influencing factor is a risk factor. $P < 0.05$ means the difference is statistically significant.

Methods: Through SPSS22.0 statistical to sort out and analyze the improvement of affective disorder, and obtain the influencing factors of integrating regional and local culture into music teaching in colleges and universities.

Results: Table 1 refers to the analysis results of influencing factors of emotional disorder relief after music education in colleges and universities is integrated into regional differences and music culture. The results of multivariate logistic regression analysis show that curriculum, teaching staff and teaching mode play an obvious role in the alleviation of students' affective disorder, which are the risk factors of affective disorder alleviation.

Table 1. Analysis of influencing factors of affective disorder after music education in colleges and universities integrate regional differences into music culture

Independent variable	Regression coefficient	Standard error	Chi square value	OR	Lower limit of 95% confidence interval	Upper limit of 95% confidence interval	<i>P</i>
Gender	0.349	0.077	20.551	1.705	0.606	0.826	0.059
Curriculum	1.569	0.798	3.863	0.812	1.004	22.943	0.000
Teaching staff	2.326	1.22	3.633	1.239	3.036	6.358	0.004
Major	0.113	0.025	0.278	1.987	6.041	3.036	0.032
Teaching mode	1.284	1.320	9.865	1.365	4.261	13.264	0.005
Grade	0.131	0.695	0.821	11.032	1.065	4.028	0.000

Conclusions: After the music education in colleges and universities is integrated into the music culture of regional differences, the influencing factors of emotional disorder relief are curriculum, teaching staff and teaching mode. The follow-up research can intervene the emotional disorder of music education students in colleges and universities from these three aspects.

THE CONSTRUCTION OF ENGLISH AESTHETIC CLASSROOM IN SENIOR HIGH SCHOOL UNDER COGNITIVE NEUROSCIENCE

Wenjuan Fan^{1, 2}

¹*School of Educational Science, Yangzhou University, Yangzhou 225002, China*

²*Department of Foreign Languages, Nanchong Vocational and Technical College, Nanchong 637131, China*

Background: Cognitive neuroscience is a combination of neuroscience and cognitive psychology. It integrates neuroscience, computer science, cognitive science, psychology and other fields. Cognitive neuroscience analyzes the brain mechanism of human cognitive activities from the perspectives of cognition, behavior, brain and gene. The related research is divided into micro and macro aspects. In the micro aspect, the multi-level neurobiological research of neural circuits and cells is analyzed by molecular biology methods. From the macro level, the research contents involved are normal human brain function imaging and neuropsychological research of brain injury patients. Cognitive psychology is a subject that analyzes the law of human psychological activities. Its research object is the cognitive status of internal psychology, including language, thinking, memory, perceptual learning, attention, perception and so on. Cognitive psychology can be divided into two types: broad sense and narrow sense. The narrow sense of cognitive psychology holds that it is a science of information processing. In a broad sense, cognitive psychology includes information processing psychology, psychologism school and structuralism psychology. Structural cognitive psychology originated from the cognitive development process of children obtained by psychologists in continental Europe. Psychologism refers to the speech of behaviorist psychologists. They analyze the memory and perception of complex phenomena such as words and sentences, and study the influencing factors of memory function. Cognitive psychology theory attaches importance to the role of knowledge and points out that the main influencing factor of human behavior is knowledge. There is long-term memory in cognitive process. Long-term memory is determined by emotion and attention. It can also stimulate short-term memory and make it valuable.

At present, most scholars combine practical teaching with cognitive neuroscience in order to innovate

educational ideas and teaching technology. At present, there are many problems in the construction of senior high school English classroom, which is mainly manifested in that teachers only pay attention to the indoctrination of students' basic knowledge. Aesthetic education is the most easily ignored requirement of modern teachers, which plays a very positive role in promoting students' all-round development and growth into a sound high-quality talent. Combined with the background of cognitive psychology, the construction of English aesthetic curriculum in senior high school needs to meet students' aesthetic feelings. High school English classroom needs let students feel beauty and classroom needs let students find beauty. For students to feel the beauty in senior high school English classroom, teachers need to let students find the beauty of language through reading aloud and text through analysis. Reading aloud is of great significance in English teaching. It not only reflects the comprehensive strength of students, but also helps students enter the learning state quickly. In the process of reading aloud, students can perceive the beauty of rhythm and rhythm of language, as well as the beauty of structure and rhetoric of reading articles. When students are exposed to different text types such as sound, picture and text in the course, they can not only obtain the necessary information, but also obtain the beauty displayed in different forms of expression. For the aesthetics outside the senior high school English curriculum, teachers can make reading cards and perform textbook plays to make students form an aesthetic feeling.

Objective: This paper analyzes the construction ideas and strategies of senior high school English aesthetic classroom under cognitive neuroscience, in order to provide a new research direction for the formulation of senior high school English aesthetic teaching plan in colleges and universities.

Research objects and methods: The students of two schools are selected to evaluate the English aesthetic curriculum in senior high school through fuzzy comprehensive evaluation method and analytic hierarchy process. The number of students is 50 and the cycle is 6 months. The first level evaluation index includes aesthetics outside the curriculum and aesthetics inside the curriculum. Aesthetics outside the course includes reading aloud, text analysis and communication. The internal audit of the course includes reading cards, playing textbook plays and activities. The evaluation results quantify the aesthetic effect of the course through the five scoring ranges of 0-20, 21-40, 41-60, 61-80 and 81-100, indicating no improvement, slight improvement, improvement, obvious improvement and serious improvement respectively. In order to facilitate the expression of the research results, the average value of all objects is selected and the data after rounding is taken as the final result.

Methods: The evaluation results of English aesthetic courses in senior high schools of different schools are obtained through jmppro15 data statistical analysis software.

Results: In high school, P refers to the aesthetic effect of neuroscience curriculum in high school. As can be seen from Table 1, the score of aesthetic course effect in the three courses is 81-100, and the evaluation grade is serious improvement. Therefore, the designed high school English aesthetic course combined with cognitive neuroscience can achieve very obvious improvement in reading aloud, text analysis and communication. The aesthetic course combined with cognitive neuroscience can meet the aesthetic requirements of high school students.

Table 1. Effect of school P on English aesthetic curriculum in senior high school under cognitive neuroscience

Category	No improvement	Slightly improved	Improve	Significant improvement	Serious improvement
Reading aloud	2	3	9	12	24
Text analysis	2	4	10	11	23
Communication	1	3	14	10	22
Reading card	4	3	18	9	16
Play a textbook play	6	3	15	9	17
Activity	3	5	16	8	18

Conclusions: The high school English aesthetic curriculum combined with cognitive neuroscience constructed by the institute has a high effect on the aesthetic curriculum inside and outside the curriculum. This scheme can be applied to the construction scheme of follow-up English aesthetic curriculum, which has very important value.

ROLE OF THINKING OBSTACLES IN MODERN ART DESIGN INTEGRATING

TRADITIONAL AESTHETICS

Yili Wang

Recruitment and Employment Office, Chuzhou Vocational and Technical College, Chuzhou 239000, China

Background: Human thinking has gradually changed from the initial intuitive image thinking to abstract logical thinking. This change process stems from continuous practice and continuous learning, as well as the improvement of brain structure and function. Thinking is the indirect reaction and generalization reaction of human brain to objective things. It includes epiphany thinking, logical thinking and image thinking. Individual logical thinking has different modes, such as theoretical and empirical. Logical thinking is an advanced form of thinking. It refers to the form of thinking that reflects reality through reasoning, judgment and concept in the process of cognition. Its characteristic is to reflect the essential attributes of things through abstract forms. Thinking logic disorder is an important and common symptom of mental illness, which mainly includes thinking content disorder and thinking form disorder. Thinking form obstacles refer to the obstacles generated through the process of association. Common thinking form obstacles include logical inversion of thinking, new words, symbolic thinking, thinking diffusion, thinking sound, thinking insertion, thinking interruption, pathological paraphrase, loose thinking, lack of thinking, slow thinking, overflow of thinking, etc. Thinking content disorder is a pathological distorted idea, which is mainly manifested in the sense of insight, jealousy delusion, love delusion, hypochondriac delusion, sin delusion, exaggeration delusion, physical influence delusion, relationship delusion, victimization delusion, etc.

If people have thinking obstacles, it will have a very negative effect on people's life, work and study. There are many problems about cognitive impairment in the combination of modern art and design with traditional aesthetics, which can be reflected in the poor integration effect of modern art and design, the narrow application scope of traditional aesthetics and so on. Paper cutting art is a very important folk art. It has obvious and strong modeling characteristics, regional characteristics and mass universality. As a traditional Chinese aesthetic art, paper-cut art has become a work in line with people's aesthetics through funeral etiquette and festival customs. It is of great positive significance to combine paper-cut art with modern art design for development and inheritance. The combination of traditional art in modern art design has the characteristics of diversified forms of expression and extensibility in other design fields. In the process of modern art design, the integration of traditional art paper-cut is reflected in the following aspects: modern illustration and paper-cut art, film and television creation and paper-cut art, advertising design and paper-cut art, packaging design and cutting art, book design and paper-cut art. In recent years, the design of books has developed rapidly. The printing methods include embossing, gravure and so on. Hollowing out technology in paper-cut art is also widely used. Adding paper-cut elements in the process of book cover design can form a unique visual impact.

Objective: This paper analyzes the integration effect before and after the integration of traditional aesthetics practitioners' thinking logic barriers in modern art design, in order to improve the aesthetic value of modern art design and better reflect the unique charm of modern art design.

Research objects and methods: Select authoritative websites to obtain the fusion data of modern art design integrating traditional art. The data mining types are modern illustration, film and television creation, advertising design, packaging design and book design. Analyze the thinking logic obstacles of modern art design practitioners through association rule data mining algorithm to improve the fusion effect of traditional aesthetics before and after. The fusion effect is aesthetic value, cultural heritage and local characteristics. The evaluation indexes of fusion effect are confidence, promotion and support. The higher the value, the better the fusion effect.

Methods: Through Minitab data analysis software to analyze the thinking logic, improve the front and rear modern art design and integrate the traditional art.

Results: Table 1 refers to the mining results of the improvement of thinking logic and the integration of postmodern art design with traditional art. According to Table 1, the confidence of local characteristics, cultural heritage and aesthetic value is 0.89, 0.92 and 0.93. Therefore, thinking logic barrier plays a very important role in the integration of modern art design and traditional art. In the subsequent analysis of the research on the integration of modern art design and traditional art, designers without thinking logic obstacles need to be selected, which not only ensures the effective integration of modern art design and traditional art to a certain extent, but also improves the aesthetic value of artistic works.

Conclusions: Under the background of the improvement of thinking barriers, the integration of traditional aesthetics and modern art design has an excellent effect, which is embodied in the high local characteristics, cultural inheritance and aesthetic value of art works. The proposed scheme of integrating traditional aesthetics with modern art design has certain popularization value.

Table 1. Thinking logic improves the mining results of post-modern art design integrating traditional art

Mining itemset	Confidence	Promotion	Support
Local characteristics	0.89	0.90	0.91
Inherit culture	0.92	0.93	0.94
Aesthetic value	0.93	0.94	0.95

Acknowledgement: The research is supported by: 2021 Wanjiang Pilot Zone Project-Industry Education Integration Mechanism System Innovation Project: Exploration of modern apprenticeship talent training mechanism based on post certificate competition education integration. No. WJ-TZJZ-011.

THE IMPACT OF REGIONAL ECOTOURISM DEVELOPMENT ON CONSUMERS' COGNITIVE IMPAIRMENT FROM THE PERSPECTIVE OF CIRCULAR ECONOMY

Yongqiang Zhang

School of Digital Commerce, Nanjing Vocational College of Information Technology, Nanjing 210023, China

Background: Circular economy, also known as “resource circular economy”, is an economic development model characterized by resource conservation and recycling and harmonious development with the environment. It emphasizes organizing economic activities into a feedback process of “resource product renewable resources”, which is characterized by low exploitation, high utilization and low emission. All materials and energy can be reasonably and sustainably utilized in this continuous economic cycle, so as to reduce the impact of economic activities on the natural environment to the smallest extent possible. Ecotourism is a comprehensive industry relying on ecotourism resources and tourism facilities to create convenient conditions for ecotourism activities of ecotourists and provide required goods and services. Ecotourism resources, tourism facilities and tourism services are the three elements of ecotourism operation and management. The development and utilization of ecotourism resources provides the possibility to meet the needs of ecotourists and is the basis for the survival and development of ecotourism. Tourism service system is the living labor that tourism operators provide convenience to ecotourists with the help of tourism facilities and certain means, it is a new tourism industry to create theoretical necessary conditions for using and giving full play to the effect of ecotourism resources, provide services for ecotourism activities through the implementation of certain tourism economic entities and ecotourism policies, and realize the four functional modes of tourism, protection, poverty alleviation and environmental education. Regional ecotourism from the perspective of circular economy is to develop tourism activities in the regional carrying capacity and realize economic benefits and sustainable development of tourism without damaging the ecological environment.

Cognition is an intelligent processing process for the body to recognize and acquire knowledge, involving a series of learning, psychological and social behaviors such as learning, memory, language, thinking, spirit and emotion. Cognitive impairment refers to the pathological process of abnormal brain advanced intelligent processing related to the above learning, memory and thinking judgment, resulting in serious learning and memory impairment, accompanied by aphasia or apraxia, or agnosia or disability. Consumer cognitive disorder refers to the psychological disorder that consumers show when shopping, such as difficult choice, emotional anxiety, slowness and other symptoms, which makes their sense of consumption experience decline. The richness of goods and services, the difference of individual demand and consumption power will cause consumers to have a certain degree of cognitive impairment. In serious cases, it will make it difficult for consumers to carry out normal consumption behavior, so as to reduce their quality of life.

Objective: In order to better improve consumers' cognitive impairment symptoms and improve their consumption experience and quality of life, this paper studies the impact of regional ecotourism development on consumers' cognitive impairment from the perspective of circular economy, so as to meet consumers' needs and help them improve their living standards.

Research objects and methods: 500 consumers with cognitive impairment were selected as the research objects. The questionnaire was designed by using statistical analysis method and self-assessment scale of problem-based learning (SSPBL). The experimental objects made statistics on the cognition of ecotourism from different perspectives.

Method design: The subjects were divided into experimental group and control group. The control group did not use any perspective to analyze ecotourism. The experimental group counted the cognitive situation

of regional ecological economics from the perspective of circular economy, and evaluated the cognitive level of the subjects from different perspectives with the help of the questionnaire scoring results. All the questionnaires and effective questionnaires were 500 and 498, the effective rate of the questionnaire was 99.6%.

Methods: Excel was used to statistically analyze the cognitive scores of subjects on ecotourism from different perspectives.

Results: After analyzing the regional ecotourism industry from the perspective of circular economy, it is found that the symptoms of consumers' cognitive impairment are relieved, their emotional level and cognitive level are more stable, and there are statistical differences in the scale scores of the two groups of subjects. Figure 1 shows the relationship between the development of regional ecotourism and cognitive impairment from the perspective of circular economy.

Figure 1. Relationship between regional eco-tourism development and cognitive barriers from the perspective of circulation

Conclusions: Under the background of green development and circular economy development, regional ecotourism pays more attention to the sustainable development of ecological environment. Changes in the combination of tourism resources, the formulation of tourism policies and the innovation of tourism methods can improve consumers' cognitive barriers and improve their sense of tourism experience, further meet the spiritual needs and consumption of consumers.

INTEGRATION OF HOMESTAY CHARACTERISTICS AND CULTURAL TOURISM FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT PSYCHOLOGY

Peng Jiang^{1*} & Hao Sun²

¹*Faculty of Business and Technology, Stamford International University, Bangkok 10250, Thailand*

²*School of Law, Shangdong University, Qindao 266000, China*

Background: With the continuous development of China's modern economy, people's requirements for tourism and the quality of tourism have also increased to a certain extent. China's tourism industry has gradually changed from low-level to high-level, and has become a truly modern tourism service industry, which is of great positive significance to the improvement of China's national economy. In the development of tourist attractions, the protection of cultural landscape and natural scenery makes ecotourism come into people's sight. Therefore, when developing tourism, there should be a type that conforms to leisure cultural tourism and takes into account ecotourism. Such requirements have led to the modern homestay tourism industry. The emergence of this type of tourism can not only protect the local culture to the greatest extent, but also effectively develop and carry forward the characteristic culture, which plays a positive role in the progress of China's tourism industry. Homestay tourism not only includes accommodation, but also represents the local folk customs or folk customs, which is also the special landscape contained in China's vast territory. Therefore, it is necessary to integrate the unique locality and folklore into tourism to form a real homestay tourism, so as to reflect the cultural nature of homestay tourism. Research shows that the integration of homestay characteristics and cultural tourism can not only make travelers relax physically and mentally, but also bring unique feelings to travelers through accommodation. Some scholars predict

that the number of patients with cognitive impairment will increase to more than 80 million in 2030. Although there is no effective drug to improve the symptoms of patients with cognitive impairment, they can alleviate the symptoms of cognitive impairment in the form of cultural tourism. In the process of cultural tourism, people enjoy the soul and integrate with nature through the aesthetics of the landscape, so as to reduce the psychological pressure of transformation to a great extent, especially the problem of cognitive impairment. The benefits of tourism to mental health can be judged by conventional experience. However, the impact of the integration of homestay characteristics and cultural tourism on various elements of cognitive impairment has never been discussed. The purpose of this study is to explore the impact of the integration mode of homestay characteristics and cultural tourism on patients with cognitive impairment, and to provide some reference for the rehabilitation treatment of patients with cognitive impairment.

Objective: The problem of mental health has received great attention in today's society. The integration of homestay characteristics and cultural tourism is helpful to improve people's mental health, which has been discussed in the academic circles. The purpose of this study is to explore the impact of the integration of homestay characteristics and cultural tourism on patients with cognitive impairment, in order to provide a non-drug treatment for patients with cognitive impairment.

Research objects and methods: In this study, a questionnaire survey was used to analyze the changes of patients with cognitive impairment under the development of the integration of homestay characteristics and cultural tourism. 150 patients with cognitive impairment were divided into control group (78 cases) and study group (72 cases). The treatment scheme of the integration mode of homestay characteristics and cultural tourism was given to the control group. The treatment plan of vocal music in the observation group was given.

Research design: Before and after the integration of homestay characteristics and cultural tourism, the Mini-mental State Examination (MMSE) was used for evaluation, including memory, attention, understanding and time orientation, with a total score of 0-30, which is directly proportional to ability. The ability of daily living is used for evaluation, which involves eating, dressing, grooming, toilet and other dimensions. The total score is 0-100, and the score is directly proportional to the ability. Judge the effect of the integration of homestay characteristics and cultural tourism on patients with psychological cognitive impairment.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: There was no significant difference in MMSE score and ADL score between the two groups before intervention ($P > 0.05$), however, after the intervention, the score of the observation group was significantly higher than that of the control group ($P < 0.05$). As shown in Figure 1.

Figure 1. Comparison of MMSE and ADL scores between the two groups

Conclusions: In the context of cultural tourism integration and rural revitalization strategy, rural homestay characteristics and cultural tourism should shoulder the responsibilities and responsibilities given by the new era, solve various problems and constraints on the development road, further tap regional culture, highlight local customs, and create more new artistic conception of rural homestay with characteristics, personality, connotation and inheritance. In the process of cultural tourism. Through the aesthetic appreciation of the landscape, the mind is happy and integrated with nature, so as to reduce and transform the psychological pressure to a great extent and improve the problem of cognitive impairment.

* * * * *

INFLUENCE OF COLLEGE STUDENTS' PHYSICAL EXERCISE ON ALLEVIATING STUDENTS' ANXIETY

Yefei Zhang

College of Physical Education, Shanghai University of Electric Power, Shanghai 200090, China

Background: At present, many college students in China have different degrees of mental diseases. Mental diseases have seriously threatened the lives of college students, and patients with mental diseases may have suicidal tendencies. Various behavioral disorders of adults generally come from anxiety caused by social pressure, mainly manifested in dependence, eating disorder and Internet addiction. Anxiety disorders are common mental disorders. This disease has a very high incidence rate and disability rate, which will bring great burden to patients and their families. "Anxiety reaction" is a normal psychological phenomenon. When a person's wish is not realized for a long time, or the possibility of realization is estimated to be very small, anxiety will occur, but excessive anxiety will cause anxiety disorder. In the heart of anxiety disorder, there is often a psychological problem that can't be rid of and unwilling to face. Anxiety is only a manifestation of contradiction and conflict, which can be used as a defense mechanism to avoid deeper troubles. Therefore, it is particularly important to pay attention to and explore the prevention and treatment of adult anxiety disorder in time. Research shows that physical exercise can improve the speed of fat decomposition. The main mechanism is to improve the activity of key enzymes of fat decomposition in muscle, liver and other tissues. It can also improve the level of protective factors against arteriosclerosis, reduce lipid peroxidation and reduce the harm of free radicals to human body. Physical exercise can also enhance self-confidence, improve personality, enhance happy experience, and reduce the incidence of mental diseases such as anxiety and depression. Besides, physical exercise plays an important role in the prevention and treatment of aging, obesity, cardiovascular disease, diabetes and respiratory diseases, and can improve the excessive anxiety of patients with diet disorders on weight and body type, effectively transfer the attention of Internet addicts, and reduce network dependence.

Objective: There are many researches on the mental health of college students in China, but there are few researches on the mental health and educational methods of college students majoring in physical education. Based on investigating the stress level of college students, starting from the consensus that "physical exercise can improve mental health", physical exercise is regarded as a method and means to alleviate stress. This paper discusses how to relieve the pressure of college students through physical exercise and improve the mental health level of college students, to provide an effective way to solve the mental health problems of college students in China, and provide a basis for treating and solving the mental health problems of college students.

Research objects and methods: This paper mainly investigates and analyzes the relief degree of aerobic exercise on adult psychological anxiety, and statistically analyzes the effect of aerobic exercise in the form of questionnaire. Using stratified cluster random sampling method, a questionnaire survey was conducted on 200 college students in a university. The questionnaire was required to be completed at one time. A total of 200 copies were distributed and the number of valid copies was 200.

Research design: All college students were subjected to outdoor aerobic exercise for 1 hour every day. Physical education teachers formulated outdoor jogging, walking, football and other aerobic exercise training plans and supervised their implementation. The experiment lasted for 8 weeks. SCL-90 scale was used for investigation and analysis. The scale has a total of 90 self-evaluation items. The test factors include somatization, obsessive-compulsive symptoms, depression, anxiety, psychosis, etc., through the 5-level scoring method, the higher the score, the lower the level of mental health.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The scores of somatizations, interpersonal sensitivity, anxiety and depression in SCL-90 were significantly improved after 8 weeks of treatment ($P < 0.05$).

Conclusions: Aerobic exercise can improve the ability of behavior disorder students to change their thinking and deal with problems, to eliminate inferiority complex, anxiety and depression, show self-confidence and vitality, and have a positive impact on the health of adults. Regular participation in aerobic exercise can improve physical quality and enhance the disease resistance of the body, so that college students can actively invest in daily study, work and life, shape healthy physique, and lay a solid physiological foundation for college students' mental health.

Table 1. Comparison of SCL-90 test results with those before intervention

Factor	Before	2 weeks after	4 weeks after	8 weeks after
Somatization	2.09±0.17	2.14±0.23	2.2±0.43	1.94±0.47
Obsessive compulsive symptoms	1.68±0.75	1.72±0.83	1.71±0.75	1.74±0.57
Interpersonal sensitivity	1.82±0.73	1.83±0.75	1.76±0.82	1.51±0.46
Depressed	1.62±0.64	1.65±0.62	1.51±0.67	1.42±0.35
Anxious	2.39±0.44	2.37±0.48	2.26±0.40	2.20±0.24
Hostile	1.41±0.83	1.42±0.85	1.43±0.76	1.63±0.65
Terror	1.53±0.56	1.41±0.40	1.50±0.43	1.44±0.46
Paranoid	1.50±0.38	1.46±0.55	1.51±0.41	1.43±0.30
Psychotic	1.32±0.45	1.31±0.46	1.32±0.47	1.40±0.29

ANALYSIS OF LONELINESS AND MENTAL HEALTH OF RURAL LEFT-BEHIND ELDERLY FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Yuandong Liu

Law School, Zhongyuan University of Technology, Zhengzhou 450007, China

Background: In the process of China's rapid economic and social development, the process of urbanization and industrialization is accelerating. In this context, in order to obtain higher economic income, a large number of rural young and middle-aged labor force migrate to cities. However, restricted by various factors such as economic pressure, cultural differences and living habits, the vast majority of the elderly can only stay in their hometown in rural areas. Therefore, there is a large number of socially vulnerable groups left-behind in rural areas. Due to the lack of economic support and emotional comfort, the quality of life of the left-behind elderly in rural areas is generally not high. Now it has become a social problem that people from all walks of life focus on. In recent years, the number of rural lefts behind elderly is still growing. Therefore, many scholars have conducted in-depth research on the living conditions of rural left-behind elderly. In the relevant research of the rural left-behind elderly, the mental health status of the left-behind elderly is the focus of the research. Good mental health can improve the mental state of the rural left-behind elderly and improve the quality of life of the rural left-behind elderly.

Many studies have shown that the vast majority of the rural left-behind elderly have a strong sense of loneliness, and their mental health is extremely unsatisfactory, which not only greatly affects the quality of life of the rural left-behind elderly, but also may lead to the decline of the cognitive function of the rural left-behind elderly, which will increase the prevalence of cognitive impairment, increase the family burden and affect the construction of a harmonious society. The analysis of the loneliness and mental health of the rural left-behind elderly is conducive to the society to provide targeted assistance to the rural left-behind elderly and improve the mental health level of the rural left-behind elderly. Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The focus of cognitive reasoning is to use the cognitive orientation and reasoning mode. Based on cognitive psychology, this study analyzes the cognition and thinking mode of the rural left-behind elderly, discusses the factors that easily lead to the cognitive impairment of the rural left-behind elderly, and then provides theoretical support for the mental health care of the rural left-behind elderly and the improvement of the quality of life, alleviates the loneliness of the rural left-behind elderly and improves the mental health level of the rural left-behind elderly, reduce the prevalence of cognitive impairment of the rural left-behind elderly. Based on cognitive psychology, this study analyzes the relationship between personality traits, self-esteem and the loneliness of the rural left-behind elderly, hoping to provide theoretical support for improving the mental state of the rural left-behind elderly and improving the quality of life of the rural left-behind elderly, so as to promote the construction and development of a harmonious society in China.

Objective: In the process of China's rapid economic and social development, the process of urbanization and industrialization is accelerating. In this context, in order to obtain higher economic income, a large number of rural young and middle-aged labor forces migrate to cities. Therefore, in recent years, the number of rural lefts behind elderly people is still growing. Due to the lack of economic support and emotional comfort, the quality of life of the rural left-behind elderly is generally not high. Most of the rural

left-behind elderly have a strong sense of loneliness and their mental health is very unsatisfactory. Based on cognitive psychology, this study analyzes the relationship between personality traits, self-esteem and the loneliness of the rural left-behind elderly, hoping to provide theoretical support for improving the mental state of the rural left-behind elderly and improving the quality of life of the rural left-behind elderly, so as to promote the construction and development of a harmonious society in China.

Research objects and methods: 200 rural lefts behind elderly people in rural areas of a city were selected as the survey objects. The questionnaire was compiled by using Loneliness Scale (LS), Eysenck Personality Questionnaire-Revised, Short Scale (EPQ-R S) for Chinese, Self-Esteem Rating Scale (SERS) and other scales to investigate the rural left-behind elderly people.

Research design: After obtaining the consent of the rural left-behind elderly, a questionnaire survey was conducted on the rural left-behind elderly. After completing the questionnaire, check and recover it on the spot.

Methods: The relevant data were processed, analyzed and tested by software SPSS22.0.

Results: The factors affecting the loneliness of the rural left-behind elderly were analyzed by regression. Taking the loneliness of the rural left-behind elderly as the dependent variable, the stepwise regression method was used for multiple regression analysis. The results of regression analysis showed that three factors, including extraversion, neuroticism and self-care for mental health, cumulatively explained 50.2% of the total variation, as shown in Table 1.

Table 1. Multiple regression analysis on the loneliness of the left-behind elderly in rural areas

Variable	Standard value	R	Adjusted R ²	Added R ² value	t	P
Extraversion	-0.496	0.642	0.411	0.409	-11.172	<0.001
Nervous	0.310	0.701	0.486	0.074	7.065	<0.001
Self-mental health concerns	-0.315	0.714	0.501	0.019	-3.395	0.001

Conclusions: In order to obtain higher economic income, a large number of rural young and middle-aged labor force migrate to cities. However, restricted by various factors such as economic pressure, cultural differences and living habits, the vast majority of the elderly can only stay in their hometown in rural areas. Therefore, there is a large number of socially vulnerable groups left-behind in rural areas. Therefore, many scholars have conducted in-depth research on the living conditions of the rural left-behind elderly. Due to the lack of economic support and emotional comfort, the quality of life of the rural left-behind elderly is generally not high. Most of the rural left-behind elderly have a strong sense of loneliness and their mental health is very unsatisfactory. Based on cognitive psychology, this study analyzes the relationship between personality traits, self-esteem and loneliness of the rural left-behind elderly. The results showed that extroversion, neuroticism and their own mental health concerns accounted for 50.2% of the total variation. The research provides theoretical support for improving the mental state of the rural left-behind elderly and improving the quality of life of the rural left-behind elderly, so as to promote the construction and development of a harmonious society in China.

ANALYSIS OF THE INFLUENCE OF IDEOLOGICAL AND POLITICAL EDUCATION ON COLLEGE STUDENTS' COMMUNICATION AND ADAPTATION BARRIERS

Lianying Zhou

College of Marxism, Xiangnan University, Chenzhou 423000, China

Background: There is a close relationship between college students' ideological understanding and mental health level, and it is difficult to distinguish a clear boundary between them. Exploring the integration of ideological and political education and mental health education has become an important topic for college educators. College students are in a critical period of life growth, and their ideological and political understanding and development have great plasticity. Strengthening the ideological and political education of college students is conducive to the formation of college students' good ideological and political quality. However, the problem of college students' ideological and cognitive development does not exist in isolation, but has a close relationship with college students' mental health. College students' psychological development is in a critical period of transition from immature level to mature level. When

facing environmental changes or social instability factors, they are prone to anxiety, panic, tension, worry and other emotions, as well as behavioral problems caused by cognitive bias. These problems include both ideological and psychological problems. It is difficult to draw a clear boundary between the two. At present, due to the imbalance of college students' physical and mental development, many college students often face psychological confusion and psychological conflict, and some develop into serious psychological obstacles such as weariness, loneliness and inferiority, and even lead to psychological diseases. According to statistics, the number of college students with communication and adaptation barriers is increasing year by year. Therefore, exploring the integration of ideological and political education and mental health education has become an important topic for college educators.

Objective: In previous studies, more scholars mainly focused on analyzing the consistency of college students' thoughts and psychology in terms of objectives, methods and contents, and emphasized the significance or importance of integration. On the path of integration, either mental health education is infiltrated into ideological and political education, or ideological and political education is infiltrated into mental health education, and the integration mode of ideological and political education and mental health education has not been constructed. Ideological and political education and mental health education are two parallel disciplines, not the relationship between inclusion and inclusion. Therefore, this study takes the "learning community" in constructivism theory as the theoretical support to find the coincidence point of its integration.

Subjects and methods: 400 college students with communication adaptation disorder in 10 schools in a certain area were randomly selected to conduct a questionnaire survey, and the students were randomly divided into two groups. The experimental group, composed of 196 students, was given ideological and political education for 8 weeks. The control group consisted of 204 students. The group received no special education and only daily education within 8 weeks.

Study design: After the experiment, all subjects were investigated on the improvement of communication adaptation disorder symptoms. Among them, the significant effect is that cognition, emotional behavior and will are significantly improved, effectively improve cognition, emotion and will, ineffective means that the mental state is still abnormal or no improvement.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: Before and after the intervention, the total effective rate of the experimental group was significantly higher than that of the control group, and the difference was statistically significant ($P < 0.05$). For patients with communication adaptation disorder, the ideological and political education model has higher effect and application value compared with routine daily education. As shown in Figure 1.

Figure1. The improvement effects of the two groups after intervention were compared

Conclusions: The integration model of "learning community of ideological and political education and mental health education" for college students is an innovative application in college students' ideological and political education and mental health education. This model changes the traditional methods of students' ideological work and psychological adjustment, and integrates the four elements of "situation", "cooperation", "conversation" and "meaning construction". By creating diverse learning situations, combine offline teaching with online activities, and combine case analysis with emotional interaction. By cultivating the integration and cooperation mechanism, we can provide students with effective support in ideology, study, psychology and life. This model pays more attention to the common development of student groups, gives full play to the positive role of the collective, helps each other, and individuals exercise

themselves in the group, which is both fruitful and dedicated. At the same time, individuals gradually cultivate their subjective initiative, improve their sense of self-efficacy, and are willing to take the initiative to grow for their own future. The construction of this model not only creates a new idea of ideological and political education and mental health education, but also provides theoretical support and reference value for the development of college students' ideological and political education and the improvement of college students' mental health level in the new era.

EFFECTIVE EFFECT OF SCL-90 ON ALLEVIATING COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Xun Gong & Min Yi

Mental Health Education Center, Changsha University of Science & Technology, Changsha 410114, China

Background: In recent years, the number of college graduates in China is increasing. The research points out that from 2021 to 2025, the employment prospect of college students is not optimistic, college students will bear great psychological pressure, and employment anxiety will become a common psychological phenomenon among contemporary college students. Employment anxiety is a restless emotional experience caused by college students' bad cognition of employment goals, processes and results, and this negative emotional experience is often accompanied by various physiological reactions, such as insomnia, tension, fear, anxiety and so on. Even if the employment anxiety is eliminated after employment, it will still have a certain impact on the physiology and psychology of college students. Although it is normal for college students to have slight anxiety in the process of employment, excessive anxiety will cause psychological disappointment and depression, and even extreme behavior. The main reason for the employment pressure of college students is that under the current social situation, the number of college graduates is increasing year by year, so that the established jobs cannot meet the needs of graduates. Secondly, when college students are employed, they are facing the pressure from families, schools and other aspects, which will inevitably cause college students to have negative emotions and psychological pressure. For college students themselves, their psychological ability to bear pressure is usually low, and they can't face up to the difficulties and setbacks in the process of employment. In addition, due to the long-term study of theoretical knowledge on campus and poor practical ability and hardship bearing ability, college students will feel that they are discouraged from job opportunities due to high work intensity or low salary in the process of job hunting. These reasons have led to the employment pressure and even employment anxiety of college students.

Objective: In view of the employment anxiety of college students, this study proposes to use cognitive therapy combined with group counseling to alleviate the employment anxiety of college students. Cognitive therapy believes that maladaptive behaviors and emotions are related to maladaptive cognition. Psychological counselors need to find this bad cognition and take appropriate measures to correct them in time. The psychological problems of college students' employment not only seriously affect the physical and mental health of college students and their future self-development, but also provide effective countermeasures to solve the employment anxiety of college students and improve the mental health level of graduates through exploratory intervention experiments.

Research objects and methods: Among the experimental volunteers of 8 colleges and universities in an area, 500 college students with medium and low-level anxiety were selected by SAS test. 120 students who clearly expressed employment confusion were selected through interview and randomly divided into experimental group and control group, with 60 students in each group.

Study design: The experimental group was given cognitive therapy combined with group counseling, and the control group was given routine treatment. The intervention plan of the experimental group includes unit topics such as ice breaking, theoretical knowledge learning, cognitive others, cognitive self, cognitive career, cognitive anxiety, cognitive job search, cognitive self-confidence, follow-up discussion and so on. After the experiment, SCL-90 scale was used to investigate and analyze the two groups. The scale has a total of 90 self-evaluation items. The test factors include somatization, obsessive-compulsive symptoms, depression, anxiety, psychosis, etc. through the 5-level scoring method, the higher the score, the lower the level of mental health.

Methods: The relevant data were analyzed by Excel and SPSS20.0 for calculation and statistics.

Results: The scores of somatizations, interpersonal sensitivity, anxiety and depression in SCL-90 in the experimental group were significantly better than those in the control group ($P < 0.05$).

Table 1. Comparison of SCL-90 test results between the two groups

Factor	Control group	Experience group
Somatization	2.2±0.43	1.94±0.47
Obsessive compulsive symptoms	1.71±0.75	1.74±0.57
Interpersonal sensitivity	1.76±0.82	1.51±0.46
Depressed	1.51±0.67	1.42±0.35
Anxious	2.26±0.40	2.20±0.24
Hostile	1.43±0.76	1.63±0.65
Terror	1.50±0.43	1.44±0.46
Paranoid	1.51±0.41	1.43±0.30
Psychotic	1.32±0.47	1.40±0.29

Conclusions: Through cognitive therapy combined with group counseling program, members show a high sense of belonging and happiness. In addition to learning some useful emotion regulation techniques and paying more attention to the establishment of cognitive model, members find self-worth and sense of belonging in the group. Interpersonal relationship has been improved, more willing to communicate and cooperate with others. Self-confidence has been improved and have more positive expectations for the future. Members are more positive than before, more willing to take the initiative to face their negative emotions and more willing to solve problems by themselves. More introverted students are more cheerful.

Acknowledgement: The research is supported by: Hunan Educational Science Planning Project Construction of SCL-90 Norm for Freshmen in Colleges and Universities in Hunan (XJK016BXL004).

INFLUENCE OF CHINESE FOLK-DANCE EDUCATION ON ALLEVIATING COLLEGE STUDENTS' MENTAL ANXIETY

Hanghai Yu

School of Music and Dance, Chengdu University, Chengdu 610106, China

Background: With the population growth and aging, 3.5 billion people around the world are affected by mental diseases. Anxiety is a common mental disorder. This disease has a very high incidence rate and disability rate, which will bring great burden to the patients and their families. The economic burden of anxiety and depression in the United States is more than 210 billion US dollars, which poses a serious threat to the health systems of developed and developing countries. For Chinese contemporary college students, due to the pressure from school, family and society, college students will have some bad emotions. Research shows that dance education can effectively control the mood of anxiety patients and improve their social communication ability. Therefore, it is of great significance to analyze the impact of Chinese folk-dance education on college students' mental anxiety. Chinese folk-dance is a required core course for Dance Majors in colleges and universities, as well as an elective course for other majors. To learn national dance well, we need not only the ability to dominate the body, the ability to imitate and remember movements, but also the understanding and mastery of national culture, national spirit and national psychology, so as to learn the real essence of national folk-dance. National psychology is an interdisciplinary subject based on Ethnology and social psychology, which studies the life, emotion, behavior, psychology and other aspects of a certain ethnic group under certain conditions. This paper hopes to find out the coincidence between Chinese national folk-dance and national psychology, and apply the theory of national psychology to the study of national dance in colleges and universities, so as to alleviate the mental anxiety of college students.

Objective: Dance intervention is a common treatment for mental diseases, but there are still many deficiencies in the current research on the intervention effect of Chinese folk-dance education on college students' mental anxiety. Research shows that dance intervention has a certain therapeutic effect on college students' bad emotions such as anxiety and depression, but it does not reach the expected value. Therefore, based on the theory of national psychology, the research applies Chinese national folk-dance education to the treatment and intervention of college students' mental anxiety, hoping to effectively alleviate the anxiety of college students and improve their learning and quality of life.

Research objects and methods: In this study, Chinese folk-dance education was used to intervene the

anxiety treatment of college students, and the influencing factors of bad emotions were analyzed. 500 college students with anxiety symptoms were investigated. The patients were divided into control group and observation group, with 250 cases in each group. After the intervention, the patients with anxiety disorder were investigated by questionnaire. According to the survey results, the cognitive ability and living ability, anxiety and depression of the two groups were mainly analyzed.

Study design: The observation group was given the intervention method of Chinese folk-dance education mode, and the control group was given the general drug treatment scheme. After three months of treatment, the anxiety and depression of the two groups were compared before and after treatment. Anxiety status: the Self-rating Anxiety Scale (SAS) was used to evaluate before and after the intervention (3 months). The score limit was 50 points. More than 50 points indicated anxiety status. The lower the score, the healthier the psychology. Depression: Self-rating Depression Scale (SDS) was used to evaluate before intervention and after intervention (3 months). The score limit was 53 points. More than 53 points indicated depression. The lower the score, the healthier the psychology.

Methods: Using SPSS17.0 process and analyze the corresponding data.

Results: In terms of SAS score and SDS score, the scores of the two groups after intervention were lower than those before intervention ($P < 0.05$). After the intervention, the score of the observation group was significantly lower than that of the control group ($P < 0.05$).

Table 1. Comparison of anxiety and depression between the two groups

Group	SAS		SDS	
	Before intervention	After intervention	Before intervention	After intervention
Control group	56.41	45.08	58.85	58.84
Observation group	55.77	41.31	58.52	41.04
χ^2	0.192	2.474	0.388	2.142
P	0.840	0.009	0.686	0.000

Conclusions: Integrating national psychology into the study of national dance in colleges and universities, and fully affirming the value of national psychology in the study of national dance in colleges and universities, through the study of national psychology theory and the analysis of factors affecting national psychology can not only effectively give play to the function of inheriting and protecting national folk culture in colleges and universities, but also make colleges and universities become an important carrier, it is conducive to the scientific construction of the curriculum system of dance choreographer and director specialty and enhance the school running characteristics of the specialty, it also helps to alleviate the anxiety of college students and improve their learning and quality of life.

ANXIETY PRESSURE OF YOUNG TEACHERS IN PRIVATE COLLEGES AND ITS MITIGATION COUNTERMEASURES

Huixiong Hu

The Personnel Department, Guangdong University of Science and Technology, Dongguan 523083, China

Background: In recent years, private higher education in China has developed rapidly. The proportion and number of young teachers are increasing, which has gradually formed the main force of private higher education. Young teachers in private colleges and universities will encounter many problems in work, society and family at the beginning of their employment. These problems affect their emotions, disturb their psychology and have an important impact on their future career. The psychological distress of young teachers in private colleges and universities mainly comes from three situations: the psychological distress encountered in the transformation from students to teachers, the psychological distress in the face of heavy teaching and scientific research tasks, and the psychological distress in interpersonal communication at work. Young teachers in private colleges and universities have a special identity psychology. The identity of teachers gives them a sense of pride and self-improvement. The title and treatment of private colleges and universities add a trace of sadness to them. The high-intensity work pressure makes teachers nervous and anxious, and the lack of time keeps them away from social interaction and becomes sensitive and withdrawn. Some scholars pointed out that the psychological problems of young teachers in private colleges and universities need to be adjusted from both external and internal aspects. Society and schools should pay

high attention to this problem from the outside, and young teachers in private colleges and universities should also be highly alert to this psychological phenomenon from the heart. Whether this problem can be highly valued and properly solved will directly affect the overall quality of young teachers in private colleges and universities, the quality of running private colleges and universities and the future development of education.

Objective: Teachers' mental health is a necessary condition for teachers to maintain their own healthy life, then engage in education, and finally ensure the development of students' mental health. It is a basic task for colleges and universities to care about the psychological status of young teachers and maintain their physical and mental health. The purpose of this study is to investigate and analyze the mental health status of young college teachers, and then put forward targeted suggestions, in order to provide some guidance for the improvement of the psychological quality of this specific social group.

Research objects and methods: The survey objects are young teachers under the age of 40 in 25 colleges and universities in a province, as well as administrative personnel working for students, but excluding other non teaching personnel. 40 people were randomly selected from each school to participate in the survey. 943 questionnaires were recovered and 875 valid questionnaires were obtained. Among them, there were 439 females and 436 males, aged between 24 and 39 years, with an average age of 30.3 ± 5.7 years. 847 people have bachelor degree or above, accounting for 96.8%; 238 teaching assistants, 515 lecturers, 111 associate professors and 11 professors. There were 604 teachers without teaching and scientific research awards, accounting for 69.0%, 628 people are married, of which 506 have children, and 27.5% are unmarried.

Research design: All subjects were intervened, including self stress maintenance, improving mental health education, creating an atmosphere of caring for young teachers, and observing the changes of young teachers before and after intervention. SCL-90 was used as a test tool. SCL-90 includes 90 items, which are divided into 9 symptom factors and total average score. Each item is scored at level 1-5, and a score of more than 3 indicates obvious psychological problems.

Methods: After the questionnaire was collected and sorted out, SPSS22.0 was used for statistical analysis of data.

Results: As shown in Table 1, compared with the national norm, it can be seen that the standardized score of SCL-90 scale of young college teachers is significantly higher than the norm ($P < 0.05$). Among them, somatization, obsessive-compulsive symptoms, interpersonal sensitivity, depression, anxiety, terror, paranoia and psychosis were significantly higher than the national norm ($P < 0.05$).

Table 1. Comparison between the total score and factor score of SCL-90 scale for young college teachers and the national norm

Dimension	Domestic norm	Young teachers	t
Somatization	1.38	1.49	4.49*
Obsessive compulsive symptoms	1.63	1.76	4.69*
Interpersonal sensitivity	1.66	1.59	-2.84*
Depressed	1.51	1.60	3.13*
Anxious	1.40	1.53	5.47*
Hostile	1.49	1.53	1.53
Terror	1.24	1.34	4.59
Paranoid	1.44	1.50	2.29*
Psychotic	1.30	1.44	6.44*
Total score	1.45	1.53	4.02*

Conclusions: The management, reform and development of private colleges and universities are inseparable from the selfless dedication of young teachers, and the social status and social influence of private colleges and universities are inseparable from the positive and progressive teaching and scientific research atmosphere of young teachers. Solving the psychological pressure of young teachers has become an important factor in the realization of these wishes. The countermeasures for young teachers to adjust psychological pressure are to establish a good social environment, a scientific assessment mechanism and teachers' correct understanding.

* * * * *

COGNITIVE IMPAIRMENT IN ADOLESCENT DRUG ABUSE AND LEGAL COUNTERMEASURES

Xiaowen Dong

College of Law, Liaoning Police College, Dalian 116036, China

Background: The incidence of cognitive impairment is very high in schizophrenia. About 85% of patients will have a cognitive impairment, such as information processing and selective working memory, short-term memory and learning, executive function and so on. There is a certain correlation between cognitive deficit symptoms and other psychotic symptoms. For example, patients with obvious thinking form disorder will have more obvious cognitive deficit symptoms, and patients with obvious positive symptoms will also have more obvious cognitive deficit symptoms. Drug addicts often have schizophrenic symptoms. The treatment of this disease should be systematic and standardized, emphasizing early, sufficient and sufficient treatment, and paying more attention to the principle of single drug use and individualized drug use. Therefore, for this symptom of schizophrenia, it is suggested to go to a professional drug treatment institution for drug treatment as soon as possible. Drug abuse is a very serious social problem perplexing the world today. It affects social stability, national security, national prosperity, family harmony and individual health. Drugs not only destroy the body of drug addicts, but also lead to serious psychological problems, indirectly change people's personality, cognition, values, and emotional control. Only by understanding the psychological problems of drug addicts, can we carry out psychological symptomatic treatment and restore correct cognition and ideas. Some teenagers usually have strong curiosity and exploration desire. If they catch the bad habit of taking drugs, they are mainly ignorant and curious about the harm of drugs and go to the abyss of taking drugs.

At present, most of the public figures in China's performing arts industry take drugs out of curiosity, seek stimulation, and even think that taking drugs can find inspiration for artistic creation. There are four main reasons for teenagers to take drugs: one is the bad influence of bad friends, the other is the influence of family members, the third is spiritual emptiness and the pursuit of "fashion", and the fourth is rebellious psychology. In the past, the education of young people paid attention to the physiological factors affecting health and ignored the psychological factors affecting health. In the process of educating young drug addicts, it is inevitable that there is a one-sided emphasis on biomedical treatment, physical detoxification or improper reliance on ideological education and means of production and labor. Although the role of moral and legal education cannot be ignored, for young drug addicts, strengthening their mental health education can get better educational results. Drug addicts, especially young drug addicts, have some moral barriers, such as truancy, theft, fighting and poor academic performance. During their study, the school gave up their education, and family members despised or held a hostile attitude towards them, thus losing their family affection, warmth and confidence in life. In the case of loneliness, helplessness and lack of social care, they are very prone to drug addiction once they are tempted by the outside world. Therefore, it is necessary to carry out active psychological intervention and treatment for young drug addicts, so as to improve their psychological cognitive ability, so as to receive a better educational effect.

Objective: At present, there are few research reports on the psychology of young drug addicts in China, so this study selected 60 young drug addicts in a drug rehabilitation center to investigate their psychological status, and analyzed and discussed the survey results, so as to carry out psychological health care and treatment for the psychological problems of young drug addicts during drug rehabilitation, eliminate "heart addiction" psychologically as soon as possible, and put forward some educational measures.

Subjects and methods: 60 young drug addicts in a drug rehabilitation center were selected by random selection to observe their cognitive impairment in drug abuse, including 47 males and 13 females.

Study design: SCL-90 was used for the collective test. The subjects filled in the questionnaire independently, and 60 questionnaires were recovered. The effective rate was 100%. After the test, the content of the questionnaire was analyzed and discussed to put forward targeted countermeasures for teenagers' drug abuse.

Methods: The relevant data were analyzed by Excel and SPSS20.0 for calculation and statistics.

Results: The somatization, obsessive-compulsive symptoms, interpersonal sensitivity, depression, anxiety, hostility, terror, paranoia, psychosis and dozens of positive items of adolescent drug users were significantly higher than those of the domestic norm youth group, and the differences of all factors were very significant ($P < 0.05$).

Conclusions: The visible harm of adolescent drug abuse to individual physical health seems to cover up its threat to individual mental health. Most drug treatment institutions mostly use acute detoxification and drug detoxification therapy in drug treatment methods, ignoring the role of psychotherapy in drug treatment. As we all know, the strong psychological dependence (heart addiction) caused by drug abuse cannot be stopped by drugs alone. Psychological detoxification is the key to the success of drug addicts.

While giving physical rehabilitation to heavy drug addicts, drug treatment institutions should pay more attention to psychological treatment and psychological support for various mental diseases of different severity caused by drug abuse, which is a necessary condition for achieving real psychological drug treatment.

Table 1. Comparison of SCL-90 factor between adolescent drug addicts and domestic norm youth group

Project	Domestic norm	Drug addicts	P
Somatization	1.34±0.45	2.48±0.94	<0.05
Obsessive compulsive symptoms	1.69±0.61	2.48±0.80	<0.05

ANALYSIS AND COUNTERMEASURES OF COMPETITION ANXIETY OF COLLEGE SPORTS ATHLETES

Lin Guo

BUPT Department of Physical Education, Beijing University of Posts and Telecommunications, Beijing 100876, China

Background: In the important period of vigorously developing campus football throughout the country, the college students' football competition system has been further improved. Domestic colleges and universities pay more attention to the cultivation of college students' athletes. At the same time, the training methods, techniques and tactics of campus football teams in colleges and universities have been constantly updated, and the level of college football competition in China has been correspondingly improved. With the faster and faster pace of football matches, the competition degree is becoming more and more intense. Therefore, in the current environment, football players need to have higher psychological tolerance, and how to strengthen psychological training has gradually become an important topic concerned by domestic researchers. Pre-competition anxiety, also known as competition anxiety, refers to that in the preparation stage of the competition, the state anxiety level of athletes has a significant impact on their behavior. Pre-competition anxiety usually shows an emotional state of anxiety, tension or fear. High or low pre-competition anxiety will make the body in a state of low cognitive and behavioral functions, which makes it difficult for athletes to play their normal competitive level before or during the competition. This abnormal anxiety state is very unfavorable to the sports performance of participating athletes and greatly affects the athletes' on-the-spot ability. The psychological problems of athletes such as pre-competition anxiety have attracted the attention of scholars, and have become the most popular research topic in the field of sports psychology. At present, Spielberg's State-Trait Anxiety theory has a great influence in many anxiety theories. He believes that state anxiety is a temporary emotional state formed by individuals in a specific situation. It is a kind of subjective consciousness and sensory tension and fear. It is usually accompanied by highly autonomous nervous system activities, with different intensities and changes with the environment.

Objective: Through the research on the pre-game state anxiety and its influencing factors of college campus football players, this study analyzes the causes and main influencing factors of their pre-game anxiety, and then puts forward adjustment measures for the existing problems, so as to improve the pre-game state anxiety and improve the competitive level of college campus football players.

Research objects and methods: This study analyzes the competition anxiety of sports athletes in a university by means of questionnaire, and takes 200 sports students in the university, aged 20-22 years old. 200 questionnaires were distributed to 200 college students, and 200 were recovered, with a recovery rate of 100%.

Research design: The EFI scale was used to study the psychological feeling of athletes after the competition. There were 12 survey questions, which were divided into four subscales: vitality stimulation, physical and mental calm, physical fatigue and active investment. Each subscale consisted of three questions, and the score of each question was 0-5, which were no feeling, slight feeling, medium feeling, strong feeling and strong feeling. The highest score of each subscale is 15 and the lowest score is 0.

Methods: The relevant data were calculated and counted by Excel and SPSS20.0.

Results: Before and after the intervention, by paired t-test, the subjects showed significant differences in four aspects: vitality stimulation, physical and mental calm, active involvement and fatigue compared with those before the experiment ($P < 0.05$). As shown in Figure 1.

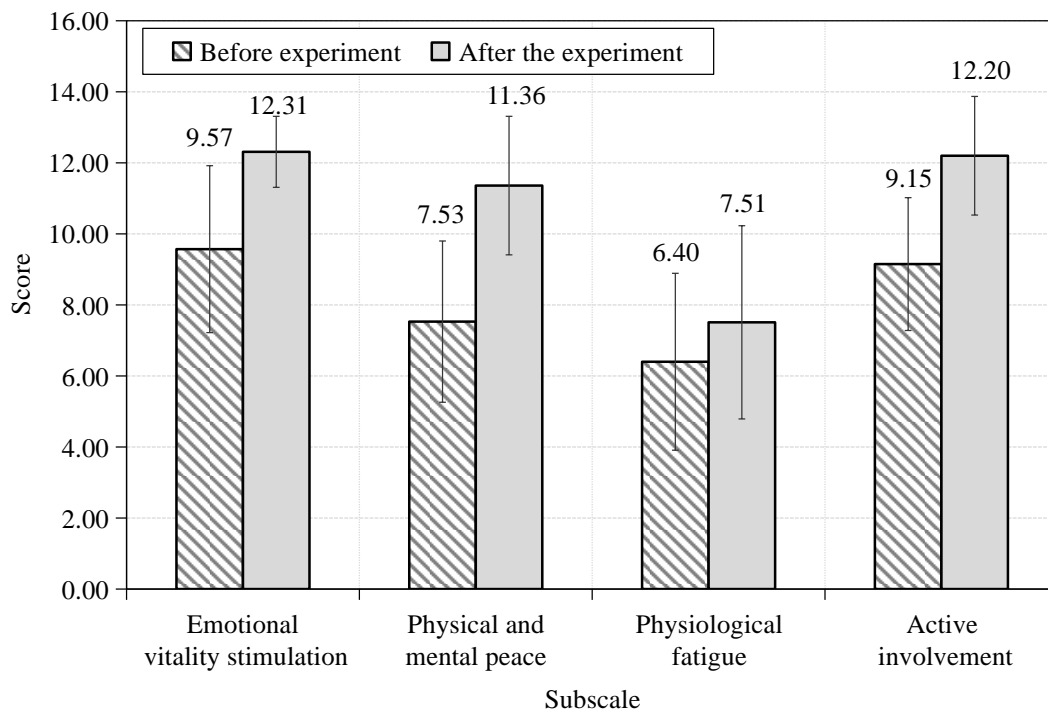

Figure1. Comparison of EFI scores before and after intervention training

Conclusions: For short-term players, in daily training, coaches will irregularly carry out competition experience exchange meetings to let experienced players impart field experience to other players, so that we can not only learn from each other, but also enable new players to speed up their integration into the team and reduce the anxiety of football players about strange competition environment. Let athletes devote themselves to training and competition, enhance athletes' self-confidence and improve athletes' psychological state. Before the formal competition, coaches should adopt correct ideas to guide athletes to establish a reasonable cognitive level, scientifically use relaxation methods for "Relaxation" training, reduce athletes' inner pressure and reduce athletes' pre competition anxiety level.

ANXIETY PHENOMENON AND COUNTERMEASURES OF COMPANY FINANCIAL MANAGERS

Ying Lei

School of Business, East China University of Science and Technology, Shanghai 200237, China

Background: Anxiety refers to the tension, uneasiness, worry, worry and other unpleasant complex emotional states caused by an individual's upcoming danger or threat. Anxiety is a kind of irritability caused

by excessive worry about the safety of relatives or their own lives, future and destiny. It contains worry, worry, sadness, tension, panic, uneasiness and other components. It is related to critical situations and events that are difficult to predict and cope with. When things change, anxiety may be relieved. Some people are in a state of anxiety for a long time without objective reasons. They are often afraid of great disaster for no reason, and worry about suffering from incurable serious diseases, resulting in symptoms such as restlessness and panic. This abnormal anxiety is a manifestation of psychosis. The offender will be accompanied by anxiety in the process of crime, trial and prison reform. In serious cases, it can also cause emotional and emotional disorders. Anxiety is the emotional reflection of people's serious deterioration of the value characteristics of reality or future things. On the contrary, the emotional form is an expectation, that is, the emotional reflection of people's obvious positive trend towards the value characteristics of reality or future things.

With the rapid development of China's social economy, great changes are taking place in the social structure. The competition is becoming more and more fierce, and the problem of interest distribution is prominent, which makes the role of corporate financial management in China's economic development more and more important. At present, small and medium-sized enterprises do not have a deep understanding of the intelligent fiscal and tax system, are not familiar with the specific practical operation, and their awareness of financial risk is relatively backward. Financial managers are facing the pressure of technological innovation, leadership, employees, taxation and audit, which makes the psychological quality of enterprise financial managers have some problems, which will seriously affect the production, operation and long-term development of enterprises. Optimizing the psychological quality of financial managers can bring many benefits to enterprises, accountants and society. The evaluation of the psychological quality of financial managers will help to optimize their psychological quality, improve work efficiency and enterprise benefits, reduce the brain drain of enterprises and reduce the risk of human resources. The quality of financial management personnel mainly includes political and ideological quality, professional ethics quality, professional quality, comprehensive cultural quality, communication and coordination ability and physical and mental quality. The financial managers of small and medium-sized enterprises will face great pressure in the era of intelligent finance and taxation. In order to better adapt to the development pace of the times, they should constantly learn new knowledge and constantly improve their quality requirements, including self-learning ability, information nursing ability, ability to control finance and taxation risks, etc., in order to better carry out financial management.

Objective: In recent years, under the background of fiscal and tax intelligence, the change of social environment of financial managers has led to the decline of their psychological quality. Therefore, the purpose of this study is to put forward the improvement plan of anxiety psychology of corporate financial managers, hoping to provide some reference for relevant research.

Research objects and methods: In order to improve the psychological quality of enterprise financial managers and improve their anxiety symptoms, taking smart finance and taxation as the background, 200 questionnaires were distributed to financial managers with bad emotions in different small and medium-sized enterprises to test their psychological characteristics. In this study, 186 questionnaires were collected with a recovery rate of 93%, and the enterprise financial managers were divided into observation group and control group, with 93 people in each group.

Research design: The observation group was given an intelligent fiscal and tax training program, and the experimental duration was 2 months. The control group did not receive special training within 2 months, but only routine work training. After the experiment, the training effect was evaluated according to the rehabilitation of the subjects. Among them, the significant effect is that cognition, emotional behavior and will are significantly improved. Effectively improve cognition, emotion and will. Ineffective is that the bad mood is still abnormal or has no improvement.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: The total effective rate of anxiety relief in the observation group was significantly higher than that in the control group, and the difference was statistically significant ($P < 0.05$), indicating that the psychological quality improvement scheme of enterprise financial managers based on intelligent finance and taxation has higher effect and application value compared with routine training.

Conclusions: The mental quality improvement scheme of enterprise financial managers based on intelligent finance and taxation has a great impact on the physical, psychological and behavior of employees. In view of the above survey results, this study puts forward the countermeasures to optimize the psychological quality of financial managers, including: (1) Strengthening the psychological quality education and training of financial managers, guiding financial managers to establish noble life goals and professional ethics, standardize their behavior in strict accordance with the financial management standards and professional ethics, and enhance their psychological endurance, better adapt to the working environment. (2) Improve the corporate governance structure and internal control mechanism, strengthen work authorization, improve the status of financial managers in the governance structure, and ensure their

independence and “intermediary” role. (3) Improve the construction of financial management institutions. First, improve the way of leadership, build a warm and harmonious working environment and enhance the sense of belonging of financial managers. Second, improve the incentive mechanism, formulate scientific and reasonable incentive policies, and create a fair and just competition environment. Third, improve the authorization mechanism and increase the discretion of financial managers. Fourth, improve the communication mechanism and establish harmonious interpersonal relationships. The communication mechanism includes information communication and interpersonal communication. Information communication must follow the principles of timeliness and accuracy to ensure the authenticity and reliability of information transmission and effectively promote information and emotional communication among members.

Figure 1. The improvement effects of the two groups after intervention were compared

IMPACT OF THE INNOVATIVE DEVELOPMENT OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS’ SPIRITUAL AND EMOTIONAL PRESSURE UNDER THE PATTERN OF “GREAT THINKING AND POLITICS”

Jingchao Liu

College of Marxism, Henan University of Science and Technology, Luoyang 471023, China

Background: At present, there are some problems in Ideological and political education in colleges and universities, such as low attention to curriculum, single teaching form, lack of “great ideological and political” thinking and so on. As a new mode of ideological and political education in colleges and universities, “great ideological and political education” is an educational system involving the innovation of ideological and political curriculum system and the combination of theory and practice. Its characteristics are paying attention to the improvement of students’ overall political quality, wide teaching content and established work system. Under the “great ideological and political” pattern, the ideological and political education in colleges and universities needs to face new requirements, as follows: the current politics of ideological and political course teaching, the practicality of ideological and political course teaching, and the innovation of ideological and political course teaching. The innovative development strategy of ideological and political education in colleges and universities under the pattern of “great ideological and political education” can be reflected in optimizing the evaluation mechanism of ideological and political education courses, constructing the practice platform of ideological and political education courses, improving the teaching methods of ideological and political education courses, strengthening the construction of teachers’ team of ideological and political education courses, and paying attention to the teaching of ideological and political education courses.

With the continuous improvement of social and family requirements for students, students are facing more and more mental and emotional pressure. The main mental and emotional pressure of college

students mainly comes from learning pressure, economic pressure, employment pressure, family pressure, competition pressure and interpersonal pressure. This long-term huge pressure will lead to the overload of students' mood and spirit, which is manifested in memory loss, inattention, slow response, introversion, self-confidence, easy to be negative, tension, depression, anxiety, addiction to the Internet, etc. How to face the pressure from all aspects positively and correctly is a topic of great concern to many educators at this stage. Some foreign experts have pointed out that college students' physical and mental health and learning will be greatly affected by mental and emotional stress. Some experts advocate that the innovative mode of ideological and political education in colleges and universities can alleviate the mental pressure of students, help students establish good and correct values, outlook on life and world outlook, and then fundamentally eliminate the negative impact of mental and emotional pressure on students.

Objective: This paper explores the impact of the innovative development of ideological and political education in colleges and universities on students' spiritual and emotional pressure under the pattern of "great thinking and politics", in order to make corresponding contributions to the mental health growth of college students.

Research objects and methods: The study selected 400 students from four schools as the research object, and divided them into control group and experimental group according to the random grouping method, with 200 students in each group. The control group used the traditional ideological and political education mode to teach students, while the control group used the innovative development mode of ideological and political education in colleges and universities under the pattern of "great thinking and politics" to intervene students' emotional and mental pressure. Three months later, the Density-Based Spatial Clustering of Application with Noise (DBSCAN) was used to compare the attention, memory, psychological emotion, self-evaluation and stress of the two groups of students. The evaluation results quantify the degree of impact through five levels of 1-5. 1 indicates no impact, 2 indicates slight impact, 3 indicates impact, 4 indicates obvious impact and 5 indicates serious impact.

Method design: This study uses Excel statistical software to make statistics on the mental and emotional pressure of students before and after the intervention of the innovative development model of ideological and political education in colleges and universities under the pattern of "great ideological and political education". The survey results quantify the degree of impact through five levels of 1-5. 1 indicates no impact, 2 indicates slight impact, 3 indicates impact, 4 indicates obvious impact and 5 indicates serious impact.

Results: The influence of different ideological and political education modes on students' mental and emotional stress is shown in Table 1. After the intervention of the innovative development model of ideological and political education in colleges and universities under the pattern of "great thinking and politics", the three indicators of memory, psychological emotion and stress of the students in the experimental group have been significantly improved.

Table 1. Psychological and emotional pressure of students after the intervention of ideological and political education model in colleges and universities

Factor	Attention	Memory ability	Mental emotion	Self-evaluation	Pressure condition
Control group	3	3	3	1	1
Experience group	4	5	5	3	3

Conclusions: Under the pattern of "great thinking and politics", the innovative development of ideological and political education in colleges and universities has an excellent intervention effect on students' emotional and mental pressure. The daily ideological and political educators of college students need to establish a correct political direction, strengthen their ideological and moral cultivation, enhance their sense of social responsibility, and strive to become the guide and direction for the healthy growth of college students.

* * * * *

ON THE INFLUENCE OF COGNITIVE IMPAIRMENT FACTORS ON THE CLASSIFICATION OF HORTICULTURAL HEALING LANDSCAPE SYSTEM AND ELEMENT ATTRIBUTES

Yida Liu

School of Architecture and Urban Planning, Shenyang Jianzhu University, Shenyang 110168, China

Background: As a novel environmental model, garden healing landscape is an important part of horticultural therapy. It has a significant impact on the spirit, psychology and physiology of patients with psychological problems, and can help people obtain health, especially in mental recovery, rehabilitation medicine, education of mentally retarded children and elderly care, this can be confirmed by the research of many scholars at home and abroad. Garden healing landscape can also be regarded as a system, which has three characteristics: system dynamics, relevance and integrity. There is a very close relationship of opposition and unity between system and elements. Elements are the important material basis of system research, and the system needs to be analyzed with elements as the purpose and premise. The elements of horticultural healing landscape system need to consider the dependence, specificity and particularity of the whole system, including ground feature elements, ecological elements and material core. Material core refers to the identifiability of elements. It is the main material core of horticultural healing landscape elements. It has the characteristics of artistry, knowability, panorama, quietness, sociality and so on. Ecological elements refer to the vegetation community, sustainable development prospect and ecological succession process displayed by horticultural healing landscape at medium and small scales. Feature elements refer to the landform and topography that embody the landscape of horticultural healing. The attributes of horticultural healing landscape system elements can be divided into biological attributes and abiotic attributes. Biological attributes can be divided into non intervention, high degree of intervention, low degree of intervention and nonintervention. Abiotic attributes can be divided into artificial non intervention, partial artificial manufacturing and artificial manufacturing.

Cognitive impairment is a state between normal aging and dementia. It is mainly characterized by mild memory and intellectual impairment, but the overall life ability and cognitive function remain intact, mainly manifested in understanding and judgment, calculation, execution, visual space, language, memory and so on. Cognitive impairment can be divided into perception impairment, memory impairment and thinking impairment. Perceptual disorders include perceptual synthesis disorder, hallucination and so on. Memory impairment includes memory error, memory defect and strong memory. Thinking obstacles include delusion, thinking logic obstacle, association process obstacle and abstract generalization process obstacle. The manifestations of cognitive impairment are emotion, spirit, creation, thinking, movement, language, memory, learning and so on. Some scholars at home and abroad pointed out that people with cognitive impairment will have a significant impact on the landscape system and element attribute classification of horticultural therapy, and this impact will in turn promote the recovery of psychological problems of patients with cognitive impairment.

Objective: This paper analyzes the influence of cognitive impairment factors on horticultural healing landscape system and element attribute classification, in order to provide a more scientific basis for horticultural healing landscape system and element attribute classification.

Research objects and methods: 300 patients with mild cognitive impairment diagnosed by Mini Mental State Examination (MMSE) were selected. They were divided into three groups according to the types of cognitive impairment: perceptual impairment, memory impairment and thinking impairment. 100 normal people were selected as the control group to analyze the influence of patients in different groups on the attribute classification of elements of horticultural healing landscape system, it includes 3 elements and 2 attributes in total.

Methods: The effects of three cognitive impairment factors on the attribute classification of elements of horticultural healing landscape system were analyzed through the corresponding evaluation indexes of two kinds of confusion matrix.

Results: The accuracy of three cognitive impairment factors in the classification of elements of horticultural healing landscape system is shown in Table 1. The accuracy rate of six-factor attribute classification of patients with mild cognitive impairment in the three groups of perceptual impairment (group A), memory impairment (group B) and thinking impairment (group C) was about 80%, while that of the normal population was about 98%. Cognitive impairment will directly affect the element attribute classification of horticultural healing landscape system.

Table 1. Accuracy of three cognitive impairment factors on the attribute classification of elements of horticultural healing landscape system

	Feature elements		Biological properties		Abiotic attribute	
	Biological properties	Abiotic attribute	Biological properties	Abiotic attribute	Biological properties	Abiotic attribute
Group A	78.63	82.13	79.32	83.26	84.12	81.23
Group B	79.36	80.21	81.23	82.21	81.26	81.03
Group C	80.21	79.36	79.31	81.26	83.26	81.02
Control group	98.36	99.26	99.36	99.63	99.84	98.97

Conclusions: Three cognitive impairment factors will directly affect the classification results of elements of horticultural healing landscape system. In order to efficiently realize the attribute classification of elements of horticultural healing landscape system, employees need to adjust and intervene their cognitive impairment, so as to avoid the inaccurate attribute classification of elements of horticultural healing landscape system caused by perception impairment, memory impairment and thinking impairment to the greatest extent.

THE DEVELOPMENT OF CULTURAL COMMUNICATION THEORY IN BOOK MANAGEMENT OF UNIVERSITY LIBRARY FROM THE PERSPECTIVE OF PSYCHOLOGY

Xiang Meng

Library of Chongqing Open University, Chongqing 400052, China

Background: Cognitive psychology is a science that explores the laws of thinking, memory, learning, attention and perception in the process of cognition. Its research object is the cognitive status of internal psychology, including language, thinking, memory, perception and so on. Cognitive psychology believes that there is long-term memory in cognitive process. Long-term memory is determined by emotion and attention. It can also stimulate short-term memory and make it valuable. At this stage, most scholars combine cultural communication with psychology, hoping to carry forward valuable cultural knowledge with ancient and modern Chinese and foreign characteristics. The cultural communication theory combined with cognitive psychology has extremely outstanding contribution and value in the actual process of cultural communication. As an important place to spread knowledge, university library management plays an important role in cultural communication. The goal of library management in university libraries is to serve society, cultural communication, teaching and scientific research guarantee and resource recommendation. The book resource recommendation of university library has begun to develop in the direction of diversification of reading promotion mode. There are great differences in the development trend, activity innovation, promotion mode and so on.

At present, the main problems of library management in university libraries are as follows. First, the informatization and digitization level of the library is low, and some books have been inconsistent with the cognitive needs of college students. Second, the library management system is not perfect, which makes the realization of modern library very difficult. Third, the quality of library managers cannot meet the post standards. Library managers need to have corresponding qualities to meet the basic service requirements of teachers and students. At present, most library managers in university libraries do not have management ability, limited cultural knowledge, relatively older age and so on. If the library wants to achieve rapid and stable development in modern society, it must formulate a perfect management system, improve the service quality of library managers, and enrich the library's book resources and equipment.

Objective: This paper analyzes the influence of cultural communication theory combined with cognitive psychology on the management of university library, in order to improve the quality of university library management and provide favorable material conditions and resource guarantee for students and teachers' learning and scientific research.

Research objects and methods: Library managers from five universities are selected as the research object, with 100 people in each university, a total of 300 people. Through the self-made questionnaire analysis, combined with the cultural communication theory of cognitive psychology, the work situation of library managers in university libraries before and after the implementation, including service quality, management level, professional ability, work attitude, seriousness and mental health. A total of 500 questionnaires were distributed and 485 copies were effectively recovered.

Methods: This paper uses excel statistical software to make statistics on the work of Library librarians before and after the implementation of cultural communication theory combined with cognitive psychology. The survey results quantify the degree of impact through five levels of 1-5. 1 indicates no impact, 2 indicates slight impact, 3 indicates impact, 4 indicates obvious impact and 5 indicates serious impact. In order to avoid the interference of personal subjective influence on the results in the evaluation process, the average value of the research object is selected and the data after rounding is taken as the final result.

Results: The work of library librarians before and after the implementation of the cultural communication theory combined with cognitive psychology is shown in Table 1. It can be seen that after the implementation of the cultural communication theory combined with cognitive psychology, the work of

Library librarians has been significantly improved, especially in professional ability, work attitude, seriousness and mental health. Therefore, the cultural communication theory combined with cognitive psychology has great promotion value. In the follow-up, this theory can be applied to library book resource management, so as to adjust the working state of managers, and then improve the quality and level of library management in university libraries.

Table 1. The work of library librarians before and after the implementation of cultural communication theory combined with cognitive psychology

Factor	Service quality	Management level	Professional ability	Working attitude	Serious and careful	Mental health
Before implementation	3	2	1	3	2	2
After implementation	4	3	5	5	5	5

Conclusions: Combined with the cultural communication theory of cognitive psychology, after the intervention of library management in university library, the work of management staff is better, which shows that cognitive psychology can build a more feasible cultural communication theory. In the book management of university library, we should actively promote the cultural communication theory combined with cognitive psychology, improve the digital construction of library, formulate a relatively comprehensive and perfect management system, and improve the quality of university library managers.

THE IMPACT OF URBAN AND RURAL GREEN INFRASTRUCTURE ON PATIENTS WITH BEHAVIORAL DISORDERS

Jun Ying^{1,2,3}, Yiqi Zhang¹, Xiaohua Wu¹, Zhangyu Shao¹ & Ruiwu Zhang¹

¹College of Landscape Architecture, Zhejiang Agriculture & Forestry University, Hangzhou 311300, China

²Institute of Ecological Civilization, Zhejiang Agriculture & Forestry University, Hangzhou 311300, China

³Zhejiang Provincial Key Laboratory of Germplasm Innovation and Utilization for Garden Plants, Zhejiang Agriculture & Forestry University, Hangzhou 311300, China

Background: Compared with traditional infrastructure, green infrastructure has the characteristics of fast implementation, low cost, low impact and small scale. It can be improved on the basis of existing land use types. Green infrastructure refers to the replacement of traditional rainwater management methods through adaptive measures such as rainwater harvesting tree boxes, permeable square pavement and residential rainwater harvesting facilities, and the realization of rainwater management through natural processes such as vegetation and soil, so as to maximize the function and value of preserving the natural ecosystem. Some studies have pointed out that green infrastructure can not only realize the management of rainstorm and waterlogging, but also provide residents with green space, provide places for people's daily life, provide people's quality of life, and ensure mental and physical health through aesthetic value. Green infrastructure includes four concepts: green space, green space, ecological space and ecological land, which will have a positive effect on people's psychology. Some studies have pointed out that green infrastructure can relieve people's pressure and improve people's mental health due to the characteristics of green environmental protection.

Behavioral disorder refers to the disorder of psychological process caused by various reasons. The main reasons are psychomotor inhibition and psychomotor excitement. Psychomotor inhibition is not only speech inhibition, but also movement block, which is mainly manifested in postures, mimicry, stereotyped speech and movement or stereotype, numbness and so on. Psychomotor excitement is divided into uncoordinated psychomotor excitement and coordinated psychomotor excitement. Most of human behavior is controlled by will, a few are not controlled by will, and some are instinctive behavior, but human behavior disorders can be alleviated through some intervention measures. In addition, behavioral disorders can also be manifested as forced movements, other movements and behavioral abnormalities. Compulsive action refers to an action that is not controlled by consciousness. An individual knows he can't do it, but consciousness is not controlled. Other movement abnormalities include imitation and imitation language, continuous speech,

stereotyped movement and stereotyped speech. Another kind of behavior disorder belongs to instinctive behavior disorder. The common ones are movement disorder, movement disorder, life preservation instinct disorder, sexual behavior disorder, diet disorder and so on. In this context, it is very important to analyze the impact of urban and rural green infrastructure on patients with behavioral disorders.

Objective: To analyze the effect of urban and rural green infrastructure on patients with behavioral disorders, in order to provide new treatment ideas for the recovery of patients with behavioral disorders.

Research objects and methods: Patients with behavioral disorders in a certain area were selected as the research object. According to the random grouping method, they were divided into control group and experimental group. The control group used urban infrastructure for intervention, while the experimental group used urban green infrastructure for intervention. The total number is 100. The intervention period was 4 weeks, and the final result was the average of all subjects.

Methods: The impact of urban and rural green infrastructure on patients with behavioral disorders was analyzed by Excel. The effects of urban and rural green infrastructure on patients with behavioral disorders were analyzed by Mini-mental State Examination (MMSE) and Activities of Daily Living (ADL). MMSE is a simple dementia screening scale at home and abroad. The scale includes seven dimensions: visual space, language, delayed memory, attention and computational power, time orientation, immediate memory and place orientation. MMSE scores range from 0 to 30. 0-9 points refer to severe cognitive impairment, 10-20 points refer to mild cognitive impairment, 21-26 points refer to mild cognitive impairment, and 27-30 points refer to normal cognitive function. ADL includes instrumental ADL assessment and basic ADL assessment. The score range of ADL is 0-100 points, below 40 points refers to severe dependence, 41-60 points refers to moderate dependence, 60-99 points refers to mild dependence, and 100 points refers to no dependence.

Results: Table 1 refers to the MMSE scores of patients with behavioral disorders before and after the implementation of the two urban infrastructure. It can be seen from Table 1 that under the urban green facility intervention scheme, the MMSE score of patients with behavior disorders is significantly improved, while under the urban facility intervention scheme, the MMSE score of patients with behavior disorders is not particularly obvious. Therefore, under the intervention program of urban green facilities, the improvement effect of patients with behavioral disorders is very obvious. The follow-up study can apply the urban green facility intervention program to patients with behavioral disorders, and then have an effect on the behavior of patients.

Table 1. Refers to the treatment effect of college autistic patients before and after music treatment

Type	Before	After 1 week	After 2 weeks	After 4 weeks
Urban infrastructure	13.25±0.98	14.63±3.21	18.56±2.98	21.56±3.56
Urban green infrastructure	12.36±1.26	15.54±2.14	20.56±3.26	28.56±1.23

Conclusions: MMSE and ADL scores of patients with behavioral disorders show that urban and rural green infrastructure can improve the problems of patients with behavioral disorders. The follow-up research can intervene the behavior disorder through the urban green infrastructure, which can not only restore the basic behavior disorder of patients, but also improve the mental health level of patients.

A STUDY ON THE INFLUENCE OF COLLEGE ENGLISH TRANSLATION TEACHING INNOVATION ON STUDENTS WITH COMMUNICATION COGNITIVE IMPAIRMENT FROM THE PERSPECTIVE OF MULTICULTURALISM

Li Zhao

Department of Language, Sichuan Tianyi College, Deyang 618215, China

Background: Communication disorder is a very common psychological problem. Patients will lead to bad emotions such as spirit, tension and anxiety. According to different manifestations, communication barriers can be divided into physical barriers, psychological barriers, language barriers, cultural barriers, environmental barriers, status barriers and number barriers. Among them, psychological disorder is an

obstacle in the process of communication caused by poor expression. This kind of communication disorder can be divided into two types: long-term persistent psychological disorder and stress psychological disorder. The communication barrier of sender and receiver is the source of communication barrier. The obstacles of information transmission are mainly manifested in the filtering of information, the limitation of knowledge and experience, the untimely transmission of information and the low integrity of information transmission. The obstacles of the receiver are early evaluation of emotion, psychological obstacles, tolerance of information, screening of information and inaccurate information decoding. Communication channel obstacles mainly include external interference, long communication channel, conflict between multiple media and improper selection of communication media. There are cognitive barriers to communication between college students and teachers, which will lead to problems in college English translation teaching. With the development of multicultural communication and globalization, English translation teaching has gradually become the basis of national foreign exchange and cooperation. At present, the improvement of English translation level and the cultivation of talents are the topics of great concern to teaching scholars. College students' English translation is an important course in college students' English teaching, which plays a very important role in college English teaching. It is of practical value to explore the innovative model of college English translation teaching from the perspective of multiculturalism. At the same time, there are cognitive barriers to communication between college students and teachers, which will lead to problems in college English translation teaching.

For students with communication cognitive impairment, although the goal of the current college English translation teaching model has begun to change from the training of professional talents to the training of applied talents, the model still faces the following very prominent problems. First, it does not pay enough attention to the English translation teaching curriculum, and the teaching model is lack of innovation. In college English teaching, the teaching mode is still mainly cramming teaching, students passively accept knowledge and cultivate students' application ability less. In the daily teaching process, teachers ignore the in-depth analysis of English translation theories and skills, and the content taught is only a simple English-Chinese translation practice. Second, college English translation teaching methods are relatively traditional and simple, ignoring the cultivation of students' English translation application ability. At present, in the process of college English translation teaching, teachers completely ignore students' subjective initiative. In classroom teaching, teachers carry out teaching in the teaching method of "students do first and teachers explain". Under this teaching method, students cannot make use of the knowledge they have learned. In the process of translation, students usually use Chinese thinking to stack words, ignoring the characteristics of English sentence patterns and grammar. After the application of multimedia in teaching, teachers did not give students extracurricular English translation teaching through network resources. In the face of these problems, the college English translation teaching model needs to be improved from several aspects: strengthening the cooperation and communication between schools and enterprises, changing the English translation teaching model as a whole, optimizing the English translation teaching methods and classroom contents, building a network teaching platform, preparing reasonable and comprehensive teaching contents, and setting up a student translation level evaluation system.

Objective: This paper analyzes the impact of college English translation teaching innovation on students with communication cognitive impairment from the perspective of multiculturalism, in order to improve students' communication cognitive impairment.

Research objects and methods: Two college students with communication cognitive impairment were selected to analyze the influence of college English translation teaching before and after innovation through Support Vector Machine (SVM). The experimental period was 4 weeks, and the influence content included five aspects: situation, semantics, understanding, perception and emotion. The study uses five grades 1-5 to quantify the degree of improvement. 1 indicates no improvement, 2 indicates slight improvement, 3 indicates improvement, 4 indicates significant improvement and 5 indicates serious improvement. In order to avoid the interference of personal subjective influence on the results in the evaluation process, the average value of all research objects is selected and the data after rounding is taken as the final result.

Methods: This study analyzes the influence value statistics of college students with communication cognitive impairment before and after the innovation of college English translation teaching through Excel data analysis software.

Results: Table 1 refers to the influence values of students with communication cognitive impairment in a university before and after the innovation of college English translation teaching model. It can be seen from Table 1 that four weeks after the innovation of college English translation teaching mode, the situation, semantics, understanding, perception and emotion of patients with communication disorders have been significantly improved, and the corresponding impact values are 4, 5, 4, 4 and 4 respectively.

Table 1. Influence value of college students with communication cognitive impairment before and after college English translation teaching innovation

Time	Situation	Semantics	Understand	Perception	Emotion
Before	2	2	1	2	2
After 1 week	2	3	2	3	3
After 2 weeks	3	4	3	4	3
After 4 weeks	4	5	4	4	4

Conclusions: The innovative scheme of college English translation teaching model constructed by the Institute can improve the patients with communication and cognitive impairment. The research provides suggestions for the teaching of English translation in colleges and universities, and trains high skilled talents suitable for the development of the industry.

THE SOLUTIONS TO ANXIETY PROBLEMS IN THE PROCESS OF PROFESSIONAL TRAINING OF COLLEGE STUDENTS

Yajian Zhou

School of Cyberspace Security, Beijing University of Posts and Telecommunications, Beijing 100876, China

Background: Anxiety is an abnormal psychological bad emotion produced by the human body. Most patients are disappointed and sad. Medical psychologists believe that anxiety usually refers to people's adverse feelings such as risk, pressure and pain that exceed their acceptable range. At the same time, it is difficult for people to face and solve these problems. In the training process of different majors, college students need to have a variety of knowledge and skills, which will aggravate students' anxiety to a certain extent. At present, the common intervention measures are offering lectures on professional knowledge of mental health and targeted personalized psychological intervention. The former popularizes common psychological problems and the adverse effects of psychological problems to students through regular lectures on mental health knowledge, and provides students with channels to obtain psychological assistance. The latter alleviates and improves students' psychological problems through active psychological intervention measures, and sets up a special psychological counseling room to complete psychological counseling. However, these anxiety intervention programs are difficult to implement, poor effect and low real-time, so it is difficult to fundamentally solve the anxiety problems of middle school students in the process of professional training.

In this context, the anxiety improvement program must be combined with information network technology. The formulation of psychological intervention plan needs to hire professional psychological counselors. First, determine the learning objectives of professional courses and upgrade the teaching methods to a diversified and innovative model. When constructing the teaching system of professional courses, the makers need to combine the social situation and teachers' characteristics, and strive to achieve the integration of production, learning and research. School teachers need to determine and cultivate innovative compound talents with artistic cultivation and technical ability. Teachers need to efficiently achieve teaching objectives with the help of new media technology, train students' working ability through simulating enterprise working mode, and ensure that they have mature professional skills. Teachers and students need to teach in a flexible way to enable students to complete their learning in an independent environment. Second, improve the construction of teaching staff in colleges and universities. College teachers need to recruit double qualified teachers, which requires them not only to have very professional theoretical knowledge, but also to have the corresponding abilities of other majors. Teachers and students need to actively promote cooperation with enterprises. Schools should also hire new media professionals to participate in students' teaching according to the actual situation. Third, build a training base and implement a cooperative innovation model.

Objective: To explore the improvement measures of anxiety in the process of professional training of college students in the field of psychology, and complete the effect evaluation of psychological intervention program, in order to alleviate students' anxiety formed in the process of professional training and improve the overall quality education in colleges and universities.

Research objects and methods: Through the random grouping method, college students are divided into control group and experimental group. The control group carries out the general intervention scheme, while the experimental group adopts the intervention scheme combined with psychology. The number of students in each group was 100, and the intervention period was 2 months. After the intervention, the mental health

status of the subjects was analyzed by Self-rating Anxiety Scale (SAS). SAS score ≥ 50 is defined as anxiety state. The score range of mild anxiety, moderate anxiety and severe anxiety is 50-59 points, 60-69 points and more than 69 points.

Methods: The purpose of this study is to analyze the effect of anxiety intervention program in the professional training process of college students in the field of psychology through Excel data analysis software. In order to ensure the credibility of the research results, the survey subjects selected by the research institute are students of different grades in five schools.

Results: The anxiety situation of the experimental group before and after the psychological intervention of anxiety in the training plan of college specialty is shown in Figure 1. Before the intervention, the number of students with no anxiety, mild anxiety, moderate anxiety and severe anxiety in the experimental group were 34, 32, 18 and 16 respectively. With the increase of intervention cycle, the number of people in the experimental group without anxiety increased gradually. This shows that the anxiety of the students in the experimental group will be greatly improved after the intervention of anxiety psychology.

Figure 1. The anxiety of the experimental group before and after the psychological intervention in the training plan of college majors

Conclusions: The training plan of college specialty anxiety psychological intervention program can improve students' anxiety. The psychological intervention program constructed by the research institute can be applied to the intervention of school students' bad emotions. This program has certain promotion value and feasibility.

APPLICATION OF SOCIAL PSYCHOLOGY IN NEW MEDIA ADVERTISING COMMUNICATION

Yihan Jin

School of Journalism and Communication, Hubei University, Wuhan 430062, China

Background: Social psychology is an important science closely related to people's daily life. It can not only cover the advantages of all disciplines, but also add vitality to the long-term development of all disciplines. Social psychology was first proposed by Irving psychologist. This discipline mainly analyzes the instincts, communication, reactions, habits and other behaviors of groups. As a new category of language marginalization, sociopsychologists follow the guiding principle of human standard, and the research object is people in society. Social psychology plays a very important role in the process of social development and interpersonal communication. In the new era, the advertising communication effect of media cannot reach a very ideal state. Under the environment of personalized consumption and enhanced consumer awareness, residents are not particularly satisfied with the communication effect of enterprises and products. Some studies have pointed out that there is a big gap between the current advertising communication effect of enterprises and the expected results. Under this background, the enthusiasm of advertising users will

continue to decline, which will eventually affect the development of the whole advertising industry, including mass advertising media such as mobile phone, TV, elevator, car body and road signs, as well as traditional industries such as radio and television, magazines and newspapers, and new media such as mobile phones and the Internet.

At present, the problem of new media communication is very serious. For rural areas, apart from traditional media advertising, the form of advertising media is relatively single and scattered, which is mainly manifested in mass media advertising in the fields of automobile advertising, gift advertising, wall advertising and so on. For urban areas, there are significant differences between urban residents' use habits and urban media exposure and rural residents, and there are obvious differences in the communication effect of media advertising investment. In this context, it is of great significance to construct a new media advertising communication strategy combined with social psychology. The new media advertising communication strategy needs to be optimized in combination with social psychology, which not only helps enterprises, businesses and other advertising investors to achieve sustainable development in the fierce market, but also promotes consumers to efficiently obtain commodity information and buy goods that satisfy themselves in a short time. At present, scholars at home and abroad believe that the combination of social psychology in new media advertising communication can not only promote the embodiment of individual value in society, but also promote businesses to publicize and sell products according to human psychology.

Objective: Explore the new media advertising communication scheme combined with social psychology, and analyze the impact of the introduction of social psychology on the new media advertising communication, in order to provide new development ideas for the new media advertising communication.

Research objects and methods: Through a self-made questionnaire to analyze the impact of social psychology on the communication of new media advertising before and after the introduction of social psychology, 100 residents were selected and divided into control group and experimental group according to the random grouping method, with 50 people in each group. The investigation includes three aspects: the rational choice of media forms, giving full play to the role of media and the effective utilization of resources. The investigation cycle is 3 months.

Methods: Through PageRank Data mining Algorithm, this paper analyzes the impact of social psychology on new media advertising communication before and after the introduction of social psychology. The research object is 100 residents. The influence content includes three aspects: the rational choice of media forms, giving full play to the role of media and the effective utilization of resources. The experimental cycle is 3 months.

Results: This study analyzes the impact of social psychology on new media advertising communication through Excel data analysis software. In order to ensure the credibility of the research results, the subjects selected in the study are residents of different ages, genders and occupations. The impact result quantifies the impact degree through five levels of 1-5. 1 indicates no impact, 2 indicates slight impact, 3 indicates impact, 4 indicates obvious impact and 5 indicates serious impact. In order to avoid the interference of personal subjective influence on the results in the evaluation process, the average value of the research object is selected and the data after rounding is taken as the final result.

Table 1. The effect of social psychology on new media advertising communication before and after its introduction

Category	Before	After 1 week	After 3 weeks	After 6 weeks	After 12 weeks
Resource utilization	2	2	2	4	5
Media role	1	1	2	3	4
Media selection characteristics	2	2	3	3	5

Conclusions: The new media advertising communication scheme combined with social psychology constructed by the Institute has strong implementation value. The scheme can not only make a rational choice of media forms, but also make full use of resources. The scheme can be applied to new media advertising communication in the future.

THE OPERATION AND MANAGEMENT OF STADIUMS AND GYMNASIUMS BASED ON THE INFLUENCE OF CONSUMER PSYCHOLOGY

Weihua Gong

Sports Department, Guizhou University of Finance and Economics, Guiyang 550025, China

Background: Consumer psychology is an important branch of psychology. It studies the behavior laws and psychological phenomena of consumers in the process of consumption, including consumer psychology and marketing communication, consumer psychology and commodity factors, consumer psychology and consumption trend, consumer behavior and consumption psychology, the influence of social environment on consumer psychology, the influencing factors affecting consumer behavior, consumers' personality psychological characteristics the psychological process of consumers. The common consumption psychology includes convenience psychology, benefit psychology, quality psychology, personality psychology and worry psychology. Convenience psychology refers to saving labor cost and time cost to the greatest extent. Affordable psychology means that consumers are extremely sensitive to the price of goods and pursue products with the highest cost performance. Quality seeking psychology refers to the three psychological demands of high brand, reputation and quality of online goods. Personality psychology refers to that users pay attention to their own personalized needs and try to reflect different characteristics in consumption characteristics, personality, psychology and so on. Discount activities are reflected in the psychology of consumption as worry and benefit, price goods in the psychology of consumption as worry, benefit and quality, grade goods in the psychology of consumption as worry and quality, and sales goods in the psychology of consumption as personality, worry and quality. Evaluation goods are embodied in the psychology of convenience, worry and quality, distance goods are embodied in the psychology of convenience, brand goods are embodied in the psychology of convenience, personality, worry and quality, and unique goods are embodied in the psychology of consumption.

With the continuous integration of consumer psychology into market analysis, the research on various marketing behaviors has also become a very hot topic. At present, with the proposal of the national fitness theory, the construction of stadiums and gymnasiums has become an imperative trend. The operation and management of stadiums and gymnasiums is of great significance, which is embodied in the following aspects. First, develop national sports culture. At this stage, the operation and management of most stadiums and gymnasiums is relatively loose, and their function is to provide venues for literary and artistic performances, sports activities and sports teaching. Few stadiums and gymnasiums can undertake large-scale sports events, naming right development and other fields, and the income of stadiums and gymnasiums is greatly limited. Through reasonable operation and management of stadiums and gymnasiums, we can actively promote the regional development of college sports events, which can not only give play to the core functions of stadiums and gymnasiums, but also improve the effective utilization rate of stadiums and gymnasiums. Second, promote the sustainable development of stadiums and gymnasiums. University stadiums and gymnasiums have the problem of low return on investment for a long time, which will lead to a large waste of state-owned assets. At present, through the mode innovation of entrusting professional enterprises to operate and university sports venue management center, we can bring comprehensive benefits and promote the sustainable development of stadiums and gymnasiums.

Objective: This paper analyzes the operation and management effects of stadiums and gymnasiums combined with different consumer psychology, in order to make corresponding contributions to the operation and management of stadiums and gymnasiums in the later stage.

Research objects and methods: The operation and management effects of stadiums and gymnasiums under different types of consumer psychology in three cities are analyzed by naive Bayesian classification algorithm. The effect of stadium operation and management can be expressed in three aspects: digitization, all-round development and team construction. Consumer psychology adopts five common psychologies: convenience psychology, benefit psychology, quality psychology, personality psychology and worry psychology. The effect evaluation value is expressed by 0-10 points. The higher the score, the better the effect of stadium operation and management.

Methods: Through SPSS23.0 data statistical analysis software to obtain the operation and management effects of stadiums and gymnasiums under different types of consumer psychology.

Results: Table 1 refers to the effect of stadium operation and management under the consumption psychology of city A. It can be seen from Table 1 that the operation and management effects of stadiums and gymnasiums with different types of consumer psychology are quite different. However, the operation and management of stadiums and gymnasiums under the psychology of seeking quality has the best effect. The operation and management scheme of stadiums and gymnasiums in the future can be combined with the psychology of seeking quality, which can promote the sustainable development of stadiums and gymnasiums.

Table 1. The effect of stadium operation and management under the consumption psychology of city A

Category	Digitization	Comprehensive development	Team building
Convenient psychology	6	7	6
Affordable psychology	7	8	7
Quality seeking psychology	8	9	8
Personality psychology	6	5	7
Worry psychology	7	5	6

Conclusions: The operation and management effects of stadiums and gymnasiums under different consumer psychology have good effects, but the operation and management effect of stadiums and gymnasiums is the best under the background of quality seeking psychology. The quality seeking psychology in consumer psychology can be combined when making the operation and management scheme of stadiums and gymnasiums in the follow-up.

STRATEGIES OF IDEOLOGICAL AND POLITICAL EDUCATION FOR HIGHER VOCATIONAL COLLEGE STUDENTS IN THE FIELD OF PSYCHOLOGY

Liya Ji

College of Intelligent Manufacturing, Yangzhou Polytechnic Institute, Yangzhou 225127, China

Background: The main research fields of positive psychology are positive experience, positive personal characteristics and positive environment, which provides new research ideas for the development of ideological and political education in colleges and universities. As a humanistic psychology, the development of positive psychology has a great relationship with Asian culture and philosophy. It can help people gain personal happiness through their own advantages. The research purpose of positive psychology is to reduce the emergence of people's psychological problems. The main content of the research includes three aspects. First, a positive organizational environment that plays a decisive role in personal growth and development. Second, including positive personal qualities such as optimism and virtue. Third, the individual's positive life experience of the past, present and future. Positive experience includes positive emotional experience and positive emotion. Positive emotions can bring people a short sensory experience. Positive emotion is a kind of stable emotional experience. Experience the emotional experience brought by activities through your own strength, such as realizing goals and ideals and solving problems that perplex you.

Ideological and political education in colleges and universities includes education and management, including ideological and political education, academic guidance, daily affairs management, mental health education and consultation, crisis response, theory and practice, network ideological and political education, career planning and employment guidance. Colleges and universities are the main place of ideological and political education in colleges and universities, which plays an important role in the process of talent training in higher vocational colleges. Under the background of the continuous development of the times, the current means, methods and ideas cannot meet the timeliness of daily ideological and political education. The main problem is that teachers focus on work problems and ignore the positive aspects in the teaching process.

Under the background of positive psychology, the ideological and political education of higher vocational college students needs to improve the following aspects. First, create an educational concept focusing on student development. Emotional experience and positive emotions will play a very important role in personal well-being, which will not only help students improve their creative thinking, but also improve students' productivity. Through social practice, discussion, heart to heart talk and other forms of activities, students can improve their ability to solve various learning and life problems, so as to produce positive emotional experience. During this period, it is also necessary to enhance students' independent initiative, improve their own sense of responsibility and mission, enhance their self-management ability, improve their subjective well-being and enhance their positive emotional experience. Second, enhance teachers' positive cognition of learning education. Positive cognition refers to the positive cognition and evaluation of self and others. In the process of looking at things, we not only see the negative effects, but also need to make corresponding positive evaluation. Educators should pay attention to the positive quality of students in the teaching process and constantly tap their own potential. At the same time, educators can guide students to form good quality by creating a positive learning environment.

Objective: This paper analyzes the implementation effect of higher vocational college students' ideological and political education program combined with positive psychology, in order to create a good environment for the improvement of college students' ideological quality.

Research objects and methods: Select the real data of ideological and political education of students and teachers in two colleges and universities to analyze the implementation effect of ideological and political education combined with positive psychology. The evaluation method is grey comprehensive evaluation method. The number of students in each school is 100, and the cycle is 3 months. The evaluation indicators include the external environment, teachers' positive cognition, teaching ideas and teaching methods. The evaluation results quantify the degree of improvement through the five score ranges of 0-2, 2-4, 4-6, 6-8 and 8-10, indicating no improvement, slight improvement, improvement, obvious improvement and serious improvement respectively. In order to avoid the interference of personal subjective influence on the results in the evaluation process, the average value of the research object is selected and the data after rounding is taken as the final result.

Methods: Through JMP data analysis and statistical software, this paper analyzes the teaching effect before and after the introduction of positive psychology in ideological and political education.

Results: Table 1 refers to the effect of ideological and political education after the introduction of positive psychology. It can be seen from Table 1 that the evaluation effect of external environment and teaching concept is good. Therefore, after the introduction of positive psychology, ideological and political education can significantly improve the external environment of students' learning and teachers' teaching ideas.

Table 1. The effect of Ideological and political education after positive psychology

Category	Before	After 2 weeks	After 4 weeks	After 8 weeks	After 12 weeks
External environment	1	3	5	6	7
Teachers' positive cognition	2	3	5	8	9
Teaching concept	2	3	4	6	7
Teaching methods	1	3	4	7	9

Conclusions: After the introduction of positive psychology, ideological and political education has a good effect on ideological and political education. This scheme can be applied to the improvement and optimization of ideological and political teaching scheme, which can improve the overall level of students' ideological and political education in the future.

PROFESSIONAL LEADERSHIP DEVELOPMENT OF COLLEGE FOREIGN LANGUAGE TEACHERS BASED ON THE IMPROVEMENT OF COGNITIVE IMPAIRMENT

Luobin Jin¹, Huafeng Wang¹, Ming Zhong² & Lin Jiang³

¹*Business School, Shaoxing University, Shaoxing 312000, China*

²*School of Management, Zhejiang University, Hangzhou 310058, China*

³*College of Translation and Interpreting, Sichuan International Studies University, Shapingba 400031, China*

Background: With the improvement of information technology, cultural leadership has become the most basic core competitiveness of a country. College students' foreign language leadership level undoubtedly best reflects the national cultural leadership. College students' foreign language leadership is closely related to teachers' professional leadership. The professional leadership and cognitive level of college foreign language teachers and students are closely related, but at present, college teachers and students usually have different degrees of cognitive impairment. Cognitive impairment refers to the abnormal processing of human brain advanced intelligent knowledge in the process of thinking judgment and learning. In most cases, the body can have the decline of memory function and learning function, and even serious behavioral disorders such as loss of line, recognition and use. The causes of cognitive impairment are the following aspects: chronic brain injury, chronic systemic diseases, mental and psychological abnormalities. It has been proved that mental and psychological abnormalities are the most important reason at present. According to different types, cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment. The clinical manifestations of thinking disorder include delusion,

thinking logic disorder, association process disorder, abstract generalization stage disorder and so on. In clinical practice, memory impairment mainly includes memory error, memory fragment loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on.

Based on this, it is of great significance to build a scheme that can improve the professional leadership of college foreign language teachers at the individual, social and national levels. The professional leadership of foreign language teachers in colleges and universities is not only reflected in knowledge structure, ideas and cultural vision, but also reflected in students' attitude towards teachers, communication strategies, literary and artistic characteristics and thinking mode. In addition to having a unique personal style, foreign language teachers also need to adopt highly targeted personalized teaching programs according to the specific situation of students, which are embodied in the following two aspects. First, take the cultural leadership acceptable to students as the starting point to help students form a good value concept and improve students' English communication ability and cultural literacy from multiple dimensions. Second, teachers pay attention to the cultivation of students' cognitive ability and enhance their innovative ability and independent consciousness. Third, teachers need to broaden their cultural vision to affect students' thinking level and vision pattern.

Objective: This paper analyzes the professional leadership level of college foreign language teachers before and after the improvement of cognitive impairment, in order to lay the foundation for the improvement of college English teaching ability and provide teaching guarantee for students' English skill learning.

Research objects and methods: Students from two colleges and universities are selected as the research object. Through the k-Nearest Neighbor (KNN) classification algorithm, the professional leadership level of college foreign language teachers before and after the improvement of cognitive impairment ability is analyzed. The time period is set as 3 months. In order to ensure the reliability of the results, the authenticity of the results is confirmed by two professional evaluators. The professional leadership level of teachers can be evaluated from four aspects: students' attitude towards teachers, communication strategies, literary and artistic characteristics and thinking mode. The evaluation result quantifies the leadership ability through five levels of 1-5. 1 indicates that it is very weak, 2 indicates that it is weak, 3 indicates that it is general, 4 indicates that it is strong, and 5 indicates that it is very strong.

Methods: This study uses Excel data analysis software to count the cognitive impairment ability and improve the professional leadership level of college foreign language teachers before and after.

Results: Table 1 shows the professional leadership level of foreign language teachers in a university before and after the improvement of cognitive impairment ability. It can be seen from Table 1 that three months after the implementation of the professional leadership training program for college foreign language teachers, students' attitude towards teachers' classes, communication strategies, literary and artistic characteristics and thinking mode have changed significantly, which shows that the professional leadership level of college English teachers has been greatly improved.

Table 1. The professional leadership level of foreign language teachers in colleges and universities before and after the improvement of cognitive impairment ability

Category	Before	After 1 week	After 3 weeks	After 6 weeks	After 12 weeks
Class attitude	1	2	2	3	4
Communication strategy	1	2	2	3	4
Literary and artistic characteristics	1	1	2	3	4
Mode of thinking	1	2	3	4	5

Conclusions: The professional leadership training program of college foreign language teachers under the promotion of cognitive impairment constructed by the institute plays a good role. The program can be widely used in the professional leadership training of college foreign language teachers to help teachers form a high level of leadership.

EFFECT OF COLLEGE MUSIC EDUCATION ON STUDENTS' LANGUAGE COGNITIVE IMPAIRMENT

Haicheng Wang & Yuqian Zhang*

College of Arts, Shandong Agricultural University, Taian 271018, China

Background: Cognitive impairment refers to the abnormal processing of human brain advanced intelligent knowledge in the process of thinking judgment and learning. In most cases, the body can have the decline of memory function and learning function, and even serious behavioral disorders such as loss of line, recognition and use. According to different types, cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment. Thinking obstacles can be manifested as delusions, thinking logic obstacles, association process obstacles, abstract generalization stage obstacles, etc. Memory impairment is mainly manifested in memory error, memory fragment loss, memory enhancement and so on. Perceptual disorder is manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. These three kinds of cognitive impairment are closely related to language cognitive impairment. Language cognitive impairment is a common problem among students at this stage. The main intervention methods are music therapy, behavior therapy, psychological correction, special education and so on. Autism is a common disorder of nervous system development, which can be characterized by limited interest and behavior activities, communication defects and social communication disorders. The current pathogenesis of autism is not particularly clear. The main manifestations of the disease are cognitive impairment and language development disorder. A large number of studies have pointed out that if the brain of autistic students is specially trained and intervened, it will improve their cognitive function.

Music therapy is a comprehensive treatment system combining music education, psychology and special education. It combines body movement, music, language and cognition, so as to mobilize students' enthusiasm in learning and life. Some scholars pointed out that music therapy can treat students with intellectual impairment and autism to a certain extent. Some scholars also pointed out that music therapy can significantly improve students' cognitive impairment. Some scholars pointed out that after music therapy, students with language cognitive impairment can pay more attention to learning and pay more and more attention. It is trustworthy that a large number of clinical medicines points out that students' language cognitive impairment is a common phenomenon, and intervention methods such as music therapy will alleviate students' cognitive impairment. Therefore, it is of far-reaching significance to apply music therapy to the improvement of cognitive impairment in patients with autism.

Objective: This paper analyzes the role of music education in colleges and universities on students' language cognitive impairment, in order to improve the language cognitive impairment of autistic students and improve students' language cognitive ability and language understanding ability.

Research objects and methods: College autistic patients in two regions were selected as the research objects, and the research objects in each region were 100 people. The treatment period was 12 weeks. The subjects were autistic patients in five regions. The final result was the average of all subjects. Music therapy lasts for 30 minutes each time, four times a week. The treatment contents are divided into playing music, listening to music, selecting musical instruments, following the music rhythm and ending the performance.

Methods: The effect of college autistic patients before and after music treatment was analyzed by Excel statistical software, and the treatment effect of autistic patients with cognitive impairment was analyzed by K-Means Algorithm. The evaluation dimensions include visual space, language, delayed memory, attention and computational power, time orientation, immediate memory and place orientation. The total score of the evaluation is 30 points. 0-9 points refer to severe cognitive impairment, 10-20 points refer to severe cognitive impairment, 21-26 points refer to mild cognitive impairment, and 27-30 points refer to normal cognitive function. In order to ensure the reliability of the research results, the average score of the two regions was taken as the final result.

Results: Table 1 refers to the treatment effect of college autistic patients before and after music treatment. Table 1 shows that the proportion of autistic students without cognitive impairment before and after music treatment is 47.0% and 5.25% respectively. This shows that music therapy can improve the cognitive impairment of patients with autism. Follow up research can enhance the memory function and learning ability of patients with music therapy. At the same time, the MMSE scores of autistic students in five regions increased significantly after treatment, which further confirmed that the language cognitive impairment of autistic students has been significantly improved. Therefore, autistic patients can alleviate language cognitive impairment through music therapy.

Table 1. Therapeutic effect of college autistic patients before and after music therapy

Intervene	No cognitive impairment	Mild cognitive impairment	Moderate cognitive impairment	Severe cognitive impairment
Before intervention	235	124	102	39
After intervention	26	125	201	148

Conclusions: Music therapy can significantly improve the cognitive impairment of autistic patients. In the follow-up, this treatment can be used to intervene students with language cognitive impairment, so as to improve their social communication ability and memory function.

ANALYSIS ON THE EFFECT OF FOOTBALL ON ALLEVIATING COLLEGE STUDENTS' BEHAVIOR DISORDER

Xianrui Chen¹, Kunlan Chen² & Hua Liang¹

¹*Institute of Physical Education, Guizhou University, Guiyang 550025, China*

²*College of Foreign Languages, Guizhou University, Guiyang 550025, China*

Background: The continuous advancement of social development puts forward higher requirements for the quality and ability level of college students. Therefore, college students are prone to mental illness due to excessive pressure, and then show different types of behavioral disorders. Behavior disorder mainly refers to the obvious abnormal behavior of patients, which will even have a serious impact on themselves and others. Therefore, it is imperative to explore the causes and mitigation measures of college students' behavior disorder. Football, as a collective project integrating comprehensiveness and wholeness, is widely sought after all over the world. It is well deserved to be the largest sport in the world. In the process of developing football in colleges and universities, its basic purpose is to enrich college students' after-school life and improve college students' physical quality. However, in the process of actual activities, it is found that football has a certain positive impact on college students' mental health. The level of college students' mental health, their way of looking at problems and their ability to withstand external pressure. If the level of college students' mental health is low, they are prone to a variety of mental disorders, including schizophrenia, autism spectrum disorder, obsessive-compulsive disorder, emergency disorder and so on. Under the negative influence of mental disorders, college students are prone to show different types of behavior disorders, mainly including psychomotor excitement, psychomotor inhibition, imitation action, stereotyped action, forced action, posture and so on.

Objective: In the process of talent training in colleges and universities, physical education including football not only undertakes the responsibility of physical training for students, but also contains a lot of profound spiritual connotation. As a vital collective activity in physical education, football has a positive impact on college students' physical training and mental health training to a certain extent. The smooth progress of football is conducive to the all-round development of college students. It can improve their physical quality and temper their will at the same time, so as to alleviate the behavioral obstacles of college students. The main purpose of this study is to explore the specific effect of football on alleviating college students' behavior disorders.

Research objects and methods: 180 college students were randomly selected from five universities to explore their physical performance and psychological quality in the process of football. Give regular running training combined with football training to college students participating in this topic.

Research design: Give running training combined with football training to college students participating in this subject. At different time points before and after the exercise intervention experiment, through the corresponding physical fitness test and psychological test, this paper compares and analyzes the mental health and physical quality of college students before and after the experiment, especially the improvement of their behavior disorders.

Methods: Before and after different exercise experiments in the two groups, the psychological and physical quality data of college students were collected and analyzed by Excel software and SPSS22.0 software. The grade of college students' behavior disorder is divided into five grades, from 1 to 5, indicating the severity of behavior disorder symptoms from low to high.

Results: The severity of behavior disorder of college students before and after the experiment was compared and analyzed. The results showed that before the exercise experiment, there were more college students with behavior disorder grade of 4 or 5, indicating that they had more serious behavior disorder before the experiment. In the exercise experiment, the change of the severity of college students' behavior

disorder is small. At different time points after the exercise experiment, the number of college students with behavior disorder levels of 4 and 5 decreased significantly, and the number of students with lower behavior disorder levels increased significantly. This shows that the football training received by the college students can effectively improve their behavior disorder performance and reduce the severity of behavior disorder. The grade change of behavior disorder is shown in Figure 1.

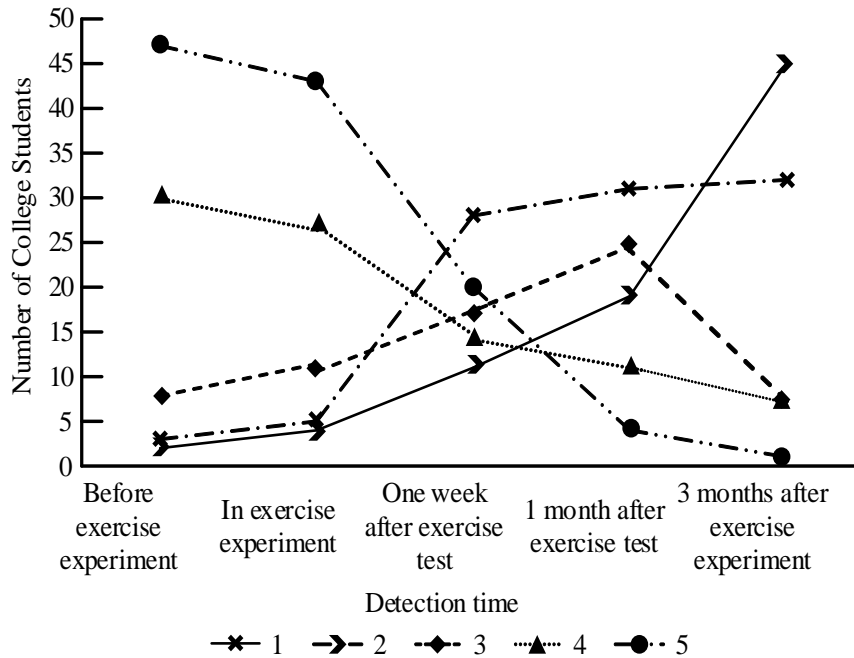

Figure 1. Comparison of the improvement of college students' behavior disorder

Conclusions: With the maturity of treatment theory and experience at home and abroad, football training is regarded as one of the measures to improve patients' behavior disorders. Exercise therapy can improve the blood circulation of the central nervous system and enhance the physical fitness of patients, and has achieved remarkable curative effect. As a collective project integrating comprehensiveness and wholeness, football is widely sought after all over the world. It is the world's largest sport. As an effective way for college students to improve their physical quality and enhance their physique, the development of football has an important positive impact on college students. Football training can not only significantly improve the level of college students' psychological disorders, but also effectively improve their physical and mental health.

THE TRAINING MODE OF INNOVATIVE TALENTS IN THE CONSTRUCTION OF "DOUBLE FIRST CLASS" FROM THE PERSPECTIVE OF PSYCHOLOGY

Fei Tang

Department of Development Planning and Discipline Construction, Nanjing Forestry University, Nanjing 210037, China

Background: Under the background of "mass entrepreneurship and innovation", the deployment and implementation of the national innovation-driven strategy have achieved good results, and put forward higher requirements for the cultivation of innovative talents. Since the reform and opening up, China has put forward relevant policies on innovation and entrepreneurship education, and carried out pilot work on entrepreneurship education in the stage of basic education, which has promoted the development of the education industry. Although over the years, innovation and entrepreneurship education has achieved

certain development results and showed a rapid development trend, due to its late start, it is still in the primary stage and has certain potential problems to be solved urgently. Compared with the education and training of professional knowledge and skills, the main purpose of innovation and entrepreneurship education is to enhance students' all-round development ability. At present, the innovation and entrepreneurship education courses carried out in colleges and universities often focus only on the relevant professional courses, but ignore the cultivation of students' psychological quality and comprehensive ability, which is difficult to significantly enhance their innovation consciousness and entrepreneurship ability. The innovative talent training mode of "double first-class" construction should abandon the disadvantages of traditional classroom teaching methods, and reform and optimize the examination method based on examination and the training means centered on knowledge indoctrination. The traditional talent training mode is lack of innovation and practicality, which mainly reflects the rigid teaching characteristics of the trinity of teachers, classrooms and teaching materials, and cannot effectively stimulate students' subjective initiative and self-efficacy in autonomous learning. The learning mode and learning effect of students in the learning process are closely related to their internal psychological characteristics. From the perspective of psychology, it can cultivate students' innovative consciousness and learning initiative, and help to ensure the application effect of innovative talent training mode under the construction of "double first-class".

Objective: After the issuance of relevant guiding policies such as several opinions on deepening system reform and accelerating the implementation of innovation-driven development strategy and opinions on several policies and measures to vigorously promote mass entrepreneurship and mass innovation, China has accelerated the improvement of entrepreneurship curriculum and the construction of entrepreneurship training system, it aims to bring entrepreneurship cultivation and entrepreneurship quality education into the national education system, so as to improve and optimize the training mode of innovative talents in the construction of "double first-class", and provide strong support for training more innovative talents. This study will focus on the psychological perspective, explore the learning behavior and psychological characteristics of college students in innovation and entrepreneurship education, and hope to put forward effective innovative talent training measures.

Research object and method: 120 college students were randomly selected from each of the four universities, a total of 480. The intervention experiment was carried out for all college students, the training mode of innovative talents was given, and the corresponding training effect was analyzed.

Research design: The duration of intervention was set to 4 months. For all college students, the innovative talent training model from the perspective of psychology was used for intervention. Before and after the intervention, the training effects of college students under different innovative talent training modes were collected and statistically analyzed.

Methods: Before and after the intervention experiment, the subjective initiative, self-efficacy, innovation consciousness and entrepreneurial ability of college students were evaluated. Five evaluation dimensions are set, from 0 to 4, representing extreme difference, poor, average, good and excellent respectively. Excel and SPSS23.0 were comprehensively utilized to analyze the evaluation data in detail.

Results: Before the intervention, the effect of innovation and entrepreneurship education of the tested college students was not ideal. The evaluation values in the four dimensions of subjective initiative, self-efficacy, innovation consciousness and entrepreneurial ability were low, which was in a very poor or poor evaluation level. After the intervention, the evaluation values of the tested college students in the four dimensions increased to 4, 5, 4 and 5 respectively, which showed that their subjective initiative, self-efficacy, innovation consciousness and entrepreneurial ability were significantly enhanced.

Table 1. Innovative talent training effect of college students before and after intervention

Evaluation time	Subjective initiative	Self-efficacy	Innovative consciousness	Entrepreneurial ability
Before intervention	1	1	0	1
After intervention	4	5	4	5

Conclusions: From the perspective of psychology, improving the traditional innovative talent training mode of "double first-class" construction can obtain better training results and significantly improve the subjective initiative, self-efficacy, innovation consciousness and entrepreneurial ability of college students. Compared with the traditional talent training mode, the innovative talent training mode of "double first-class" construction from the perspective of psychology can organically combine the national and school talent training plan with the personal growth and development of college students, so as to improve the innovation and entrepreneurship ability of college students and promote the realization of their self-worth.

EVALUATION OF TEACHING INTERVENTION EFFECT ON ANXIETY DISORDER OF NAVIGATION MAINTENANCE STUDENTS

Xiaoke Guo, Yanxiu Ren & Kun Gao

Aviation Electromechanical Equipment Maintenance College, Changsha Aeronautical Vocational and Technical College, Changsha 410124, China

Background: As an important guarantee of national security and the core embodiment of the level of economic and social development, the aviation industry has developed rapidly. In the field of aviation industry, the rapid development of general aviation occupies an important position. With the proposal of the 13th five-year plan, general aviation has become one of the six main objectives of civil aviation, which indicates that general aviation is ushering in a golden period of vigorous development. However, in this process, as an important supporting force for the safe operation of general aviation, navigation maintenance practitioners show the disadvantages of long-term shortage. The main reasons for the lack of navigation maintenance practitioners are the lack of profitability and difficult working environment of general aviation enterprises. At present, the shortage of professional maintenance personnel has become the main factor affecting the sound and rapid development of general aviation in China. Under the main influence of poor employment prospects, students majoring in navigation maintenance are prone to varying degrees of psychological problems, especially anxiety disorder. Anxiety is a very common negative emotion. It usually refers to a state of anxiety and fear in which one's self-esteem and self-confidence suffer setbacks due to failure to achieve goals or overcome the threat of obstacles, or an increased sense of failure and guilt. Anxiety disorder will have a certain negative impact on the individual's daily behavior and life enthusiasm, and exists in the individual for a long time as a negative emotion. The causes of anxiety disorder of navigation maintenance students have a certain diversity, including poor employment prospects, difficult working environment, poor matching between learning content and actual work needs, lack of practical resources and so on. The anxiety disorder of navigation maintenance students will have a great negative impact on students' learning initiative and mastery of knowledge and skills, resulting in the poor educational effect of navigation maintenance courses, and it is difficult to cultivate a large number of qualified high-quality navigation maintenance professionals.

Objective: In the process of the rapid development of general aviation in China, there are still some restrictive factors, including the small number of navigation maintenance personnel, the low level of engineering and technical ability of navigation maintenance personnel, and the lack of familiarity of navigation maintenance personnel with relevant laws and regulations. In the training of navigation maintenance professionals, students often have certain anxiety due to various factors. This study will take certain intervention measures to eliminate the anxiety of navigation maintenance students and ensure the teaching effect of navigation maintenance.

Research object and method: 126 students majoring in navigation maintenance were randomly selected from two civil aviation colleges to investigate their anxiety and mastery of professional knowledge. The relevant data of anxiety symptoms and mastery of professional knowledge were collected before and after the intervention to analyze the teaching intervention effect of anxiety disorder of navigation maintenance students.

Research design: This study is aimed at 126 students majoring in navigation maintenance, all of whom adopt the improved teaching mode of navigation maintenance professional knowledge. At different time points before and after the teaching intervention, the data related to the degree of anxiety and mastery of professional knowledge of the two groups of students were collected.

Methods: Self-rating Anxiety Scale (SAS) was used to count and analyze the anxiety level of navigation maintenance students before and after intervention. The self-made assessment scale for professional knowledge and practice of navigation maintenance was used to evaluate the mastery of professional knowledge and practical ability of all students. All data were collected by Excel software and SPSS24.0 software for calculation and analysis.

Results: According to the comparison of the average SAS score, the SAS score of the students remained at a high level before the intervention, indicating that they were accompanied by moderate anxiety symptoms. After the intervention, the average SAS score of students decreased significantly from 64.72 to 43.64, and there was no anxiety. In terms of the average score of navigation maintenance professional knowledge, the average score of professional knowledge of all the students tested has increased significantly, which shows that the improved teaching and training mode of navigation maintenance

professional knowledge has good application effect and can enhance students' mastery and practical ability of navigation maintenance professional knowledge. The comparison of students' professional knowledge of SAS and navigation maintenance before and after the intervention is shown in Figure 1.

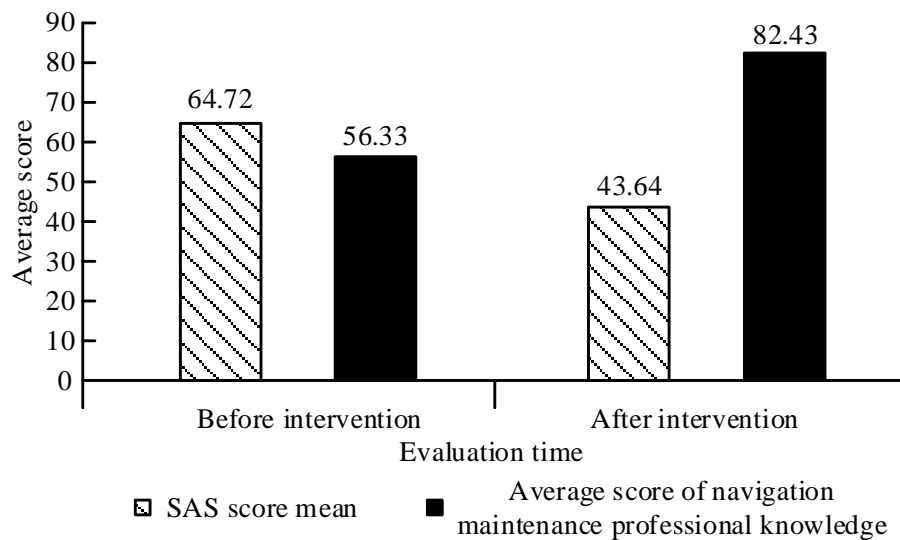

Figure 1. Evaluation results of anxiety and professional knowledge level

Conclusions: The optimization of the teaching and training mode of navigation maintenance professionals is helpful to improve students' anxiety, make them master the professional knowledge of navigation maintenance and have excellent practical operation ability. The improved teaching intervention effect of anxiety disorder of navigation maintenance students is good, which helps to expand the training scale of general aviation maintenance talents, and then promote the coordinated development of navigation maintenance industry.

PERFORMANCE AND ADJUSTMENT STRATEGIES OF COLLEGE STUDENTS' ENGLISH LEARNING ANXIETY

Liping Huang

School of Foreign Languages, Fuzhou University of International Studies and Trade, Fuzhou 350202, China

Background: In foreign language teaching activities in colleges and universities, there is a common phenomenon of foreign language learning anxiety. This phenomenon is a unique complex of self-perceived beliefs, emotions and behaviors that arises in the process of language learning and is closely related to classroom language learning. Among foreign language learning anxiety, the most common type is English learning anxiety. English learning anxiety is a specific situational anxiety derived from English classroom environment, which mainly presents psychological characteristics such as tension, anxiety or worry. The manifestations of English learning anxiety are mainly divided into three dimensions: communication anxiety, test anxiety and fear of negative evaluation. In the process of college students' English learning, once there is English learning anxiety, their learning motivation, achievement, self-esteem and self-confidence will be greatly negatively affected. Under the negative influence of English learning anxiety, college students usually show a variety of signs of external anxiety, including sweaty palms, memory loss, accelerated heartbeat and pulse, abdominal pain, voice tone change, stiff expression and so on. In severe cases, they even show autism, refuse to learn, refuse to communicate with English teachers or classmates and so on. Under the negative effect of English learning anxiety, some college students will have serious fear and negative thoughts on English course learning. In the long run, a single English learning anxiety will expand the scope of influence, turn into inner anxiety, and eventually suffer from serious mental illness. Serious psychological anxiety is mainly manifested in excessive anxiety about daily trivia and excessive worry or fear of future or uncertain events. Therefore, the negative impact of college students' English learning anxiety is very serious, which will not only hinder college students' daily learning, but also make it difficult

for them to live a normal life and maintain a positive mental health.

Objective: In view of the various manifestations of college students' English learning anxiety, corresponding solutions and adjustment strategies should be taken to improve their anxiety and eliminate the fear of English learning or negative evaluation. If college students' English learning anxiety is not adjusted, it will cause college students to fear all things related to English, and even cause great harm to their daily learning and life. This study will make an in-depth analysis of the various manifestations of college students' English learning anxiety, and put forward targeted, scientific and feasible adjustment strategies in order to alleviate college students' English learning anxiety.

Research objects and methods: 268 college students with English learning anxiety symptoms were randomly selected, and their anxiety performance and causes in the process of English learning were analyzed by means of evaluation and interview. To explore the improvement of college students' English learning anxiety under the positive influence of adjustment strategies.

Research design: The self-made English learning anxiety scale is mainly used in the evaluation. The scale has been modified and improved on the basis of the foreign language classroom learning anxiety scale. There are 10 questions, and each question contains 4 options, namely very disagree, disagree, agree and very agree. The scores of these four options are expressed by 1-4. The higher the score, the more serious the symptoms of English learning anxiety. Moreover, the Self-rating Anxiety Scale (SAS) is used to evaluate the level of college students' English learning anxiety. The higher the SAS score, the more serious their anxiety psychology is.

Methods: By means of evaluation and interview, this paper explores the main manifestations of college students' English learning anxiety, and puts forward the adjustment strategies of different anxiety manifestations. Application of Excel software and SPSS22.0 software to compare and analyze the scale scores of college students before and after adjustment.

Results: Table 1 shows the selection of college students for the English learning anxiety scale before and after adjustment. Before adjustment, most college students choose to agree or very agree, indicating that they have high scores on the scale and serious symptoms of English learning anxiety. After adjustment, most students tend to choose very disagree or disagree among 10 different topics, indicating that their scale score is significantly reduced, which shows that college students' English learning anxiety has been effectively alleviated after adopting corresponding adjustment strategies.

Table 1. Evaluation scores of college students' English learning anxiety scale before and after adjustment(n)

Subject	Before adjustment				After adjustment			
	Very disagree	Disagree	Agree	Totally agree	Very disagree	Disagree	Agree	Totally agree
A	17	31	141	79	56	145	45	22
B	23	27	147	71	64	156	29	19
C	15	26	135	92	59	153	40	16
D	19	29	137	83	67	149	31	21
E	20	25	129	94	65	161	22	20
F	18	31	150	69	63	158	29	18
G	21	32	144	71	58	152	40	18
H	21	34	136	77	69	157	25	17
I	11	16	143	98	64	153	32	19
J	19	24	145	80	67	162	18	21

Conclusions: College students' English learning anxiety will not only have a negative impact on their learning effectiveness, but also seriously endanger their daily life and interpersonal communication, and significantly reduce their learning ability and mental health level. The use of targeted conditional strategies can significantly improve college students' English learning anxiety.

THE IMPACT OF HOUSEHOLD DEBT ON MACRO ECONOMY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY – AN EMPIRICAL ANALYSIS BASED ON CHFS DATA

Nan Jiang, Hujijiletu & Xin Su

School of Economics and Management, Inner Mongolia Normal University, Hohhot 010022, China

Background: In the field of psychology, social psychology, as a main branch field, plays an important role in the study of the psychological phenomena of social individuals and groups. Different individuals and groups usually show different psychological and behavioral changes in society. Therefore, the main research objects of social psychology are divided into individual level and group level. Individual level includes individual socialization process and speech development, while group level covers group communication structure, racial prejudice and so on. As an academic concept, the research object of social psychology is social psychological phenomenon, which mainly refers to the psychological and behavioral changes in the process of interaction between individuals and groups in society. Analyzing problems from the perspective of social psychology can significantly enhance people's ability to understand themselves, make people's own behavior more reasonable and appropriate, and help to realize individual development or group development. The relationship between household debt and macro-economy can just be equivalent to the relationship between individuals and groups. China's economic and social development is in the stage of transforming from high-speed development to medium and high-speed development. Moreover, economic and social development is also in the digestion period of early stimulus policies and the painful period of structural adjustment. The three different types of development stages are superimposed on each other, which promotes the high-quality development of consumption to a certain extent, and then can promote economic vitality, the quality of economic development enhancing the resilience of economic development. The growth of household consumption is mainly due to the annual growth trend of household disposable income, and the concept of "ahead of consumption" is prevailing in the current society. Therefore, household debt continues to rise and its scale continues to increase. In the process of the continuous expansion of household debt, it can not only accelerate the development rate of macro-economy, but also produce a certain negative effect, which hinders the sustainable development of macro-economy. The main reason for this phenomenon is the expansion of household debt, which will gather debt risks to a certain extent, resulting in the gradual increase of loan overdue and default. From the perspective of social psychology, exploring the concept of individual and group is helpful to deeply understand the impact of family debt on macro-economy.

Objective: To realize the sustainable development of macro economy, it is very important to understand the situation of household debt and consumption power. When household debt increases to a certain scale, it will produce great debt risk and have a huge negative impact on the development of macro-economy. This study will explore the impact of family debt on macro-economy from the perspective of social psychology, in order to achieve the common development of individuals and groups through psychological related knowledge and empirical analysis, and achieve the purpose of sustained and high-quality growth of family economy and macro-economy.

Research objects and methods: Based on the development relationship theory of individual and group in social psychology, this study puts forward five indicators of the interaction between family debt and macro-economy as the main variables for empirical analysis. Taking the individual psychology in social psychology as the main research object, this paper explores its attitude towards the impact of family debt on macro-economy.

Research design: Select the commonly used indicators to measure investment, determine GDP, fixed asset investment, household consumption, public debt and household debt as five indicators, take them as the main variables and establish an analysis model. Then, the corresponding data of each index are obtained from relevant information sources such as China financial information network and national balance sheet research center, so as to analyze the impact of household debt on macro-economy. In addition, the influence of household debt on macro-economy is graded, and 1-4 respectively represent the influence considered by individual psychology.

Methods: Using Excel and SPSS22.0 makes statistics and analysis on the relevant data of five main variables.

Results: According to Table 1, the logarithmic mean value of GDP and fixed asset investment is significantly higher than that of the other three indicators, which shows that the average level of GDP and fixed asset investment is higher than that of household consumption, public debt and household debt. By observing the logarithmic standard deviation in Table 1, we can see that the volatility of fixed asset investment and household debt is large, and they are very vulnerable to external factors.

Table 2 shows the influence level judged in individual psychology. From the observation of Table 2, it can be seen that in individual psychology, the amount of family debt will have a certain impact on the macro-economy. More family debt will lead to the improvement of individual work motivation and the release of consumer demand. The influence of the two in individual psychology is 3 and 4 respectively.

Table 1. Descriptive statistical results of five main variables (logarithmic data)

Variable	Number of samples	Minimum value	Maximum Value	Mean value	Standard deviation
Gross domestic product	94	10.95	12.36	11.77	0.38
Investment in fixed assets	94	9.58	12.18	11.29	0.67
Resident consumption	94	9.94	11.54	10.83	0.47
Public debt	94	9.59	11.35	10.66	0.47
Household debt	94	9.26	11.70	10.58	0.70

Table 2. The influence of family debt and macro-economy on individuals from the perspective of social psychology

Comparison items	Less household debt		More household debt	
	Promoting macroeconomic development	Hindering macroeconomic development	Enhance work motivation	Release consumer demand
Effect	2	2	3	4

Conclusions: Household debt will have a certain impact on the macro economy, so households should enhance their awareness of household debt risk management and reasonably control debt by optimizing investment structure and controlling consumption expenditure. Banks and other financial institutions should accurately assess the solvency of residents, strengthen risk control and management, and ensure that the macro economy will not be greatly affected by household debt.

Acknowledgement: The research is supported by: The Natural Science Foundation of Inner Mongolia Autonomous Region Project “Research on the Measurement of Household Debt Burden and Long-lasting Risk Control Path of Herdsmen in Inner Mongolia Grassland Pastoral Area” (No. 2021MS07023).

THE DEVELOPMENT HISTORY OF CHINESE TRADITIONAL FOLK MUSIC ALLEVIATES THE PSYCHOLOGICAL ANXIETY OF MIDDLE SCHOOL STUDENTS IN THE PROCESS OF MODERN MUSIC TEACHING

Yuchun Kang

College of Music, Fujian Normal University, Fuzhou 350117, China

Background: Chinese traditional folk music has a long history, has a long historical connotation and profound cultural heritage, and is one of the core contents of China’s traditional cultural system. The essence of Chinese traditional folk music is a music form with unique national form created under the inherent methods and forms; Moreover, Chinese traditional folk music integrates the unique characteristics and forms of the Chinese nation, transforms it into the essence of music, spreads through the ages and enjoys a good reputation at home and abroad. In the long river of historical development, the forms and types of Chinese traditional folk music have also been fully developed, which mainly includes five categories: opera music, rap music, folk instrumental music, folk songs and folk song and dance music. The five categories can be subdivided again. Taking opera music as an example, it also includes Sichuan Opera, Beijing opera, Yue opera, Henan Opera and other types. In addition, each different dynasty had its own unique traditional folk music forms at that time, including Song Ci, Yuan Qu, Ming and Qing operas, etc. In the process of modern music teaching, there are mainly some problems, such as the simplification of music curriculum, students’ lack of enthusiasm for music learning, outdated music teaching mode and so on. A variety of problems will have a great negative impact on students’ learning interest and learning effect, and even lead to students’ anxiety due to poor music performance and other reasons. Anxiety psychology refers to people’s emotional reflection caused by the serious deterioration trend of the value characteristics of real things or unknown things in the future. In other words, anxiety is a kind of negative psychological emotion generated by individuals for unknown or dangerous things, mainly including tension, worry, uneasiness, annoyance and so on. Anxiety is mainly divided into two types: realistic anxiety and pathological anxiety. The former refers to people’s basic emotional reflection in the process of adapting and solving problems, which will disappear with the disappearance of realistic threats or problems. The latter refers to anxiety without specific reasons, usually accompanied by obvious autonomic nerve dysfunction,

continuous subjective pain, impairment of social function and other symptoms. Students' anxiety psychology will have a great negative impact on their own learning and normal life. Integrating Chinese traditional folk music into the teaching process of modern music can improve the teaching effect of modern music to a certain extent. The impact on students' anxiety psychology remains to be explored.

Objective: The current teaching mode of modern music mainly focuses on western music and modern music, ignoring the cultural heritage and historical accumulation of traditional music. In the process of modern music teaching, there are often problems that deviate from the essence and culture of Chinese traditional folk music, which makes it difficult to inherit Chinese traditional music, and the potential cultural connotation in its development history is difficult to be absorbed and understood by students. The lack of cultural connotation in the process of modern music teaching can easily lead to students' psychological anxiety. This study will explore the causes of students' anxiety, and integrate the development history of Chinese traditional folk music into the teaching process of modern music, in order to explore its alleviating effect on students' psychological anxiety.

Research objects and methods: 184 music majors with psychological anxiety symptoms were randomly selected as the research object, given them a modern music teaching model integrating into the development history of Chinese traditional national music, and explored their performance and anxiety in the process of music teaching.

Research design: The study will be aimed at all the students to carry out modern music teaching integrated into the development history of Chinese traditional folk music. Before and after the experimental intervention, the effective acquisition of relevant data was completed by means of scale evaluation, and the changes of anxiety psychology of college students were compared and analyzed.

Methods: Self-rating Anxiety Scale (SAS) was set up to make all the students self evaluate the anxiety level before and after the intervention. SPSS22.0 and Excel software were used for statistical analysis of data, and $P < 0.05$ was used as the basis for comparing the difference with statistical significance.

Figure 1. Comparison of SAS scores of students before and after intervention

Results: The changes of students' psychological anxiety under the intervention of improved music teaching mode are shown in Figure 1. It can be seen from Figure 1 that before the intervention, the average SAS score of the tested students was high, indicating that they were accompanied by moderate anxiety. After the intervention, the average SAS score of all students decreased significantly to less than 40, indicating that they were no longer accompanied by anxiety, and the difference was statistically significant compared with that before the intervention ($P < 0.05$). This verifies the effectiveness of the music teaching model accepted by students. Integrating the development history of Chinese traditional folk music into modern music teaching can significantly reduce the SAS score of students in the group and alleviate their anxiety symptoms.

Conclusions: In the process of modern music teaching, adding the teaching of Chinese traditional national music and its development history can significantly enhance students' interest and initiative in music learning and improve their effectiveness in music learning. Moreover, the integration of Chinese traditional folk music into modern music teaching can also effectively reduce students' SAS score and significantly alleviate their anxiety.

EXPLORATION ON INNOVATIVE EDUCATION OF BUSINESS ADMINISTRATION SPECIALTY UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Rong Li

School of Management, Wuhan College, Wuhan 430212, China

Background: Cognition refers to the process in which the human brain processes information intelligently to obtain corresponding theoretical knowledge or applied knowledge when receiving various external information. In the whole process of cognition, it will involve learning, memory, emotion, language, execution, thinking, understanding and other complex social behaviors and activities. When the human cerebral cortex is damaged due to various factors, the brain's intelligent processing process will be affected and limited to some extent, resulting in abnormal or damaged cognitive function, and finally leading to cognitive impairment. Cognitive impairment mainly includes three types: perceptual impairment, memory impairment and thinking impairment. The causes are significantly diverse. In addition to organic diseases, mental disorders such as neurasthenia, obsessive-compulsive disorder, mental classification, bipolar disorder, paranoid or reactive psychosis will lead to cognitive impairment. The main manifestations of patients with cognitive impairment are learning and memory impairment, aphasia, agnosia, loss of use, dementia and so on. It not only has a huge negative impact on their normal learning and life, but also a heavy burden on others and society. Under the background of "Internet plus", business management has been well developed. As a discipline with strong practice and wide application, business management specialty occupies an important position in higher education. With the proposal of the concept of "mass entrepreneurship and innovation", China has also accelerated the strategic deployment of innovation and entrepreneurship education. However, at present, the smooth development of innovation education of business administration specialty is restricted and hindered by some factors, mainly including four influencing factors: the lack of soundness of innovation and entrepreneurship system, weak teachers, urgent improvement of curriculum system and too single teaching mode. Under the background of cognitive impairment and the perspective of psychology, analyzing students' psychological characteristics and organically combining business administration with innovation education can effectively alleviate students' cognitive impairment and maximally eliminate the negative impact of cognitive impairment on innovation education of business administration.

Objective: In order to comply with the trend of teaching reform, the current teaching management system of industrial and commercial enterprise management has carried out the optimization of diversified education modes, and continuously improved and improved the innovative education system, in order to determine the scientific direction of talent training. Based on the background of cognitive impairment and the perspective of psychology, the research will explore the innovative education model of business administration, in order to alleviate the symptoms of students' cognitive impairment and ensure the teaching effect of innovative education of business administration.

Research objects and methods: This study will take 172 students with cognitive impairment majoring in business administration as the research object, carry out innovative education of business administration major, collect corresponding education effect data before and after education intervention for comparative analysis, and explore the improvement of students under the background of cognitive impairment under the innovative education of business administration major.

Research design: 172 students with cognitive impairment were given innovative education in business administration, mainly in four different ways. One is to actively carry out various forms of innovation and entrepreneurship competition, which is designated as A. Second, to build a high-level teacher team and enhance the reserve of teachers, this method is B. The third is to change the teaching mode and method, which is set as C. The fourth is to strengthen the cooperation between schools and enterprises, which is set as D.

Methods: After the intervention, the students' satisfaction with the implementation of innovative education in business administration was analyzed, and the choice of five dimensions was set, including extremely dissatisfied, dissatisfied, general, satisfied and extremely satisfied. All the data obtained are SPSS23.0 and Excel software for analysis.

Results: According to Table 1, after the implementation of innovative education in business administration, 172 students with cognitive impairment had good evaluation results on the satisfaction of different innovative education implementation paths. Very few students were extremely dissatisfied and dissatisfied, and most students focused on general, satisfied and extremely satisfied. Comparing the

number of people satisfied with the four education methods, we can see that mode a and mode C have the highest satisfaction, as shown in Table 1.

Table 1. Satisfaction of students with cognitive impairment majoring in business administration with the implementation path of innovation education

	Extremely dissatisfied	Dissatisfied	Commonly	Satisfied	Extremely satisfied
A	0	4	9	94	65
B	0	17	48	64	43
C	0	2	11	102	57
D	2	13	75	51	31

Conclusions: Under the background of cognitive impairment, the most effective way to explore the path of innovative education of business administration major is to actively carry out various forms of innovative and entrepreneurial competition activities and change teaching modes and methods. These two methods can effectively alleviate the symptoms of students' cognitive impairment and ensure that students can achieve better learning results in innovative education of business administration major, realize their all-round personal development.

* * * * *

INTERMODULATION INTERFERENCE OF VHF WIRELESS COMMUNICATION SYSTEM UNDER COGNITIVE IMPAIRMENT

Xia Liu

Merchant Marine College, Shanghai Maritime University, Shanghai 201306, China

Background: With the rapid development of China's civil aviation industry, people's mode of transportation has become more convenient and faster, making people's daily travel and long-distance tourism more and more convenient. However, with the planning, construction and operation of a large number of airports, the difficulty of aviation safety management is increasing, and aviation safety has been affected to a certain extent. The main reason for this phenomenon is the application of communication equipment and its system. Communication equipment has an important impact on the long-term development of aviation industry. If the communication equipment fails or operates abnormally, it will cause great harm to the flight safety of aircraft. In aviation control, it is necessary to strictly supervise the high-frequency ground to air communication to ensure the normal operation of the communication system. In recent years, wireless communication technology has been continuously applied and popularized, and has become one of the mainstream communication technologies. Under this background, various wireless communication signals are increasing day by day, which has caused varying degrees of interference to VHF ground to air communication in civil aviation communication system, seriously threatening the flight safety of aircraft and the safety and stability of VHF Wireless communication system, it is an urgent problem to be solved at present. Eliminating the signal interference of VHF Wireless communication system can effectively ensure the flight safety of civil aircraft on the other hand. Based on this, effective measures must be taken for VHF Wireless communication system to solve the problem of communication interference, so as to ensure the flight safety of aircraft, promote the further development of China's civil aviation and improve the construction level of China's transportation. Cognitive impairment is a disease with impaired high-level neurological response in the cerebral cortex. Any factor that may lead to chronic damage to the structure or function of the cerebral cortex can lead to individual cognitive impairment. In the high-voltage working environment of intermodulation interference of VHF Wireless communication system, or when social status and economic living conditions are negatively affected, wireless communication personnel are prone to certain negative psychological emotions, resulting in cognitive impairment. From the perspective of cognitive impairment, this paper analyzes the cognitive impairment and working state of wireless communication personnel based on the theory of cognitive psychology, and on this basis, explores the influence of intermodulation interference of VHF Wireless communication system, and puts forward effective measures to alleviate the cognitive impairment of wireless communication personnel, so as to improve the reliability of VHF communication system.

Objective: The normal operation of communication system determines aviation safety, so communication plays a vital role in the development of aviation industry. Once the communication

equipment fails or is abnormal, which makes it difficult to carry out normal communication work, it will immediately act on the aircraft and have an irreparable negative impact on its flight safety. In the air control work of civil aviation, the core content of the work is to strictly control the quality of high-frequency ground to air communication, explore the intermodulation interference of VHF Wireless communication system, and put forward some solutions to ensure the normal operation of communication.

Research objects and methods: Based on cognitive psychology and VHF Wireless communication technology, four reliability improvement measures are proposed to ensure the safety and stability of VHF communication system. Under the background of cognitive impairment, this paper explores the attitude and practical results of wireless communication personnel towards promotion measures.

Research design: The positive effects of different communication system improvement measures on the elimination of intermodulation interference are classified into five levels, expressed by 0-4. The influence is positively correlated with the number.

Methods: The study will use Excel and SPSS19.0 to count and analyze the attitudes of wireless communication personnel towards four improvement measures under cognitive impairment, that is, the positive influence of improvement measures on eliminating intermodulation interference.

Results: Among the four measures to improve the operation of wireless communication system, the positive influence of building remote backup, building communication trunk line and reducing the number of signal transmission nodes was 4. The influence of using different facilities for business acceptance is slightly lower, which is 3.

Table 1. Evaluation results of positive influence of promotion measures on eliminating intermodulation interference under cognitive impairment

Promotion measures	Effect
Build offsite backup	4
Construction of communication trunk line	4
Use different facilities for business acceptance	3
Reduce the number of signal transmission nodes	4

Conclusions: Although the VHF communication system is becoming more and more perfect and its communication quality has been improved, there are still some omissions in the actual operation process. It is necessary to strengthen technical research, optimize its anti-interference ability and ensure the stability of the operation of the communication system. On the whole, the four wireless communication system operation improvement measures proposed under cognitive impairment have a good impact, which can effectively eliminate intermodulation interference.

TOURISTS' PERCEPTION DIFFERENCE OF TOURISM HOME STAY PROJECTION IMAGE BASED ON MOBILE SOCIAL NETWORK INTERACTION FROM THE PERSPECTIVE OF CONSUMER PSYCHOLOGY

Lin Qi

School of Tourism Management, Wuxi Vocational Institute of Commerce, Wuxi 214153, China

Background: As an important branch of psychology, consumer psychology plays an important role in the application of psychology. Its main research object is the psychological phenomenon and behavior law of consumers in consumer activities. Consumer psychology is a new subject. Its research purpose is to explore the laws of people's psychological activities and personality psychological characteristics in the process of life and consumption. The learning content of consumer psychology covers a wide range, including the process of consumers' psychological activities, consumers' individual psychological characteristics, psychological factors affecting consumers' behavior, the impact of social environment on consumer psychology, consumer psychology and consumer behavior of consumer groups, consumer state and consumer psychology, commodity factors and consumer psychology, marketing communication and consumer psychology, etc. Consumer psychology is the core component of consumer economics. Accurate analysis of consumer psychology can improve consumption efficiency and business efficiency at the same time. Consumer psychology refers to what people think when they are consumers. Consumer behavior refers to the consumption needs of people as consumers for goods or services and the activities that transfer goods or

services from the market to consumers from the perspective of market circulation. Any kind of consumption activity includes both consumers' psychological activities and consumers' consumption behavior. Accurately grasping the psychological activities of consumers is the premise of accurately understanding consumer behavior.

China's tourism development has gradually changed from resource orientation, market orientation and product orientation to image orientation. The quality of tourism image has become a major reason for tourists to go to tourism destinations. With the popularity of smart phones, the advent of 4G network era and the advent of 5g network, people spend more and more time on the network. Major social applications contain a large number of travel logs and photos, shaping a diversified image of tourism destinations, which has a significant impact on tourists' travel behavior decision-making. Travel plans based on mobile social network interaction are increasingly sought after by people. From the perspective of consumer psychology, the projected image of tourism home stay based on mobile social network interaction is often different from the actual perception of tourists, and the relationship between them remains to be studied.

Objective: Driven by the increasing diversification of tourism demand, tourism home stay has become the most popular innovative model at present. Especially in recent years, with the support of relevant national policies, various types and styles of tourism home stay came into being. However, in the process of construction, it is still unknown whether the tourist home stay is really consistent with the pictures in social media. There are some differences between the projected image of the tourist home stay based on the interaction of mobile social networks and the image actually perceived by tourists. The construction of tourist B & B should face up to the deviation and constantly adjust and improve the decoration scheme, so that the B & B in social media is the same as that in reality.

Research objects and methods: 86 tourists were randomly selected in the social network, and the corresponding tourism home stay questionnaire was issued to explore the tourists' perception differences of the projection image of tourism home stay based on the interaction of mobile social network, and analyze the tourists' satisfaction with the home stay they have lived in from the perspective of consumer psychology.

Research design: The questionnaire was collected immediately after the 15-minute questionnaire filling time. 86 questionnaires were distributed and 83 were successfully recovered. The effective recovery rate of the questionnaire was 96.51%.

Methods: The satisfaction of tourists was counted and analyzed by Excel software and SPSS22.0 software. The satisfaction index has five different dimensions: very dissatisfied, dissatisfied, average, satisfied and very satisfied.

Results: According to Table 1, driven by the psychology of seeking beauty and conformity of consumer psychology, tourists will choose tourist accommodation in social network media. However, there are often great differences between the projected image of tourist accommodation based on mobile social network interaction and the tourism image actually perceived by tourists. Only 11 tourists chose to be satisfied or very satisfied, and a total of 45 tourists chose to be very dissatisfied or dissatisfied.

Table 1. Survey results of tourist's satisfaction with tourist accommodation

Degree of satisfaction	Very dissatisfied	Dissatisfied	Commonly	Satisfied	Very satisfied
Number of people	11	34	27	9	2

Conclusions: From the perspective of consumer psychology, there are great differences in tourists' perception of the projection image of tourism home stay based on the interaction of mobile social networks, and most tourists of tourism home stay are dissatisfied. The main reasons for this phenomenon are the psychology of seeking beauty, comparison and conformity in consumer psychology, which makes tourists easily attracted by the tourism home stay in the interaction of mobile social network.

* * * * *

THE INFLUENCE OF COLLEGE STUDENTS' EDUCATIONAL MANAGEMENT ON ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY IN THE NETWORK ERA

Suyu Rao

Enrollment and Employment Office, Zhejiang Technical Institute of Economics, Hangzhou 310018, China

Background: Colleges and universities are the dividing point between students' campus career and social life. In colleges and universities, the learning environment, interpersonal relationship and teaching mode are different from those in the past. Some students can't adapt to these changes, resulting in mental health problems and anxiety disorders. Anxiety is a kind of negative emotion caused by the inconsistency between expectation and reality, or uneasiness, fear and anxiety about the future. When this emotion is excessive, or the backlog time is too long, it will lead to students suffering from psychological diseases and affect students' physical and mental health. Many experts have pointed out that moderate anxiety can help students set goals, study harder and improve learning efficiency. However, if anxiety is excessive, it will affect the physiological function of some organs of students, thus reducing the quality of life of students, affecting students' normal life and learning, and even making students have negative psychology such as learning weariness and world weariness. Therefore, finding an effective way to alleviate college students' psychological anxiety is of great significance to the future development of college students.

Since the 20th century, with the rapid development of computer technology and Internet technology, the network has gradually integrated into all walks of life and played an important role. At the same time, it also marks that China has entered the network era. The network era provides new modes and ways for the education industry, such as distance teaching, online teaching, online class teaching and so on. In addition to the new teaching mode, the network era also provides a driving force for the innovation of school education management mode. Colleges and universities are the main venues for cultivating higher talents for the society. Therefore, the educational management of colleges and universities has attracted the attention of people from all walks of life. Educational management refers to the activity process that school managers provide organization and coordination of educational teams, so as to maximize the information role of educational human resources, educational capital and educational material resources, and make use of the internal favorable conditions of education to realize the efficient educational management of students. The application of network not only improves the efficiency of college students' education and management, but also becomes an important means to alleviate students' anxiety. However, there are some defects in the education management under the background of the network age, and the alleviating effect on college students' psychological anxiety is not ideal, which needs to be further improved. School psychology is a kind of applied psychology and the application of psychology in school education practice. The main research content of school psychology is to scientifically and reasonably evaluate the students' mental health level and the school's psychological education level, improve the education mode according to the evaluation results, and carry out psychological intervention on students. Therefore, combined with school psychology, the research improves the education management under the background of the network era, hoping to find an effective way to alleviate college students' psychological anxiety and transport high-quality and high-level talents for the society.

Objective: In colleges and universities, the learning environment, interpersonal relationship and teaching mode are different from those in the past. Therefore, some students have problems in their mental health and suffer from anxiety disorder. Anxiety will affect students' normal life and study. Therefore, finding an effective way to alleviate college students' psychological anxiety is of great significance to the future development of college students. The application of network not only improves the efficiency of college students' education and management, but also becomes an important means to alleviate students' anxiety. However, there are some defects in the education and management under the background of the network era, and the alleviating effect on college students' psychological anxiety is not ideal. Combined with school psychology, the research improves the education management under the background of the network era, hoping to find an effective way to alleviate college students' psychological anxiety and transport high-quality and high-level talents for the society.

Research objects and methods: 80 students with different degrees of anxiety were selected by random sampling in five colleges and universities, including 43 boys and 37 girls. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the degree of psychological anxiety of students.

Research design: 80 students were randomly divided into research group and control group with 40 people in each group. Among them, the students in the research group used the improved model based on school psychology to carry out educational management. The control group used the traditional model for education management. After 3 months, the degree of psychological anxiety of the two groups of students was compared.

Methods: The relevant data were processed and analyzed by software SPSS22.0.

Results: After 3 months of education management, the anxiety level of students in the study group decreased significantly compared with that before education management ($P < 0.05$). The anxiety level of students in the study group was significantly lower than that of students in the control group ($P < 0.05$), as shown in Figure 1.

Figure 1. Anxiety changes of two groups of students

Conclusions: Colleges and universities are the dividing point between students' campus career and social life. In colleges and universities, the learning environment, interpersonal relationship and teaching mode are different from those in the past. Some students can't adapt to these changes, resulting in mental health problems and anxiety disorders. The application of network not only improves the efficiency of college students' education and management, but also becomes an important means to alleviate students' anxiety. However, there are some defects in the education management under the background of the network age, and the alleviating effect on college students' psychological anxiety is not ideal, which needs to be further improved. Combined with school psychology, this study improves the educational management under the background of the network era. The results showed that after 3 months of education management, the anxiety level of students in the study group decreased significantly compared with that before education management ($P < 0.05$). The anxiety level of students in the study group was significantly lower than that of students in the control group ($P < 0.05$). Therefore, based on school psychology, improving the education management under the background of the network era can effectively alleviate the psychological anxiety of college students and transport high-quality and high-level talents for the society.

EXPLORATION AND REFLECTION ON COLLEGE ENGLISH INFORMATION TEACHING PRACTICE UNDER COGNITIVE IMPAIRMENT

Chengwei Wang

School of International Education, Yellow River Conservancy Technical Institute, Kaifeng 475004, China

Background: Cognition refers to the brain's intelligent processing of acquired information and skills. In the process of cognition, it will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The clinical manifestations of cognitive impairment are mainly divided into three aspects: perception impairment, memory impairment and thinking impairment. Sensory impairment includes sensory retardation, sensory allergy, sensory deprivation, sensory deterioration, internal discomfort, pathological illusion, etc. Memory impairment mainly refers to memory errors or defects, as well as strong memory and other symptoms. Thinking obstacles mainly include thinking logic obstacles, delusions, association process obstacles, abstract generalization process obstacles and so on. Under the negative influence of different

symptoms of cognitive impairment, patients' learning, memory and quality of life will be reduced. If college students are accompanied by cognitive impairment, their daily activities such as learning and life will be hindered, which will not only restrict the improvement of college students' English learning level and all-round development ability, but also have a great negative impact on the harmonious development of society.

With the accelerating process of globalization, colleges and universities pay more and more attention to English curriculum teaching. The teaching quality and efficiency of English curriculum in colleges and universities directly affect the training progress of English talents. In this context, many scholars have deeply studied the college English teaching model, hoping to find a new breakthrough for the college English teaching model, and promote the improvement of college students' English level on the basis of improving the teaching quality and efficiency of college English courses. The rapid development of computer technology and Internet technology has had a great impact on all walks of life, including the education industry. The information-based teaching mode has become the mainstream at present. As one of the main courses in colleges and universities, the teaching of English courses in colleges and universities has basically realized informatization. However, there are still many defects in college English information teaching, such as teachers' teaching ability is slightly insufficient. The informatization hardware facilities of English informatization teaching in colleges and universities are not perfect. The information-based teaching environment needs to be optimized. For various reasons, the current information-based English Teaching in colleges and universities is not ideal, and the English performance of some students is difficult to be improved, resulting in excessive anxiety and cognitive impairment to varying degrees. In order to alleviate the cognitive obstacles of college students, it is imperative to effectively improve the college English information teaching model.

Objective: Due to various reasons, there are still many defects in college English information teaching, so its teaching effect is not ideal. The learning, memory and life of students with cognitive impairment will be affected, which makes it difficult to improve their English learning level. This study analyzes students' psychology and improves college English information teaching according to their different manifestations of cognitive impairment, in order to improve college English teaching efficiency, alleviate students' anxiety in English learning, and then treat students' cognitive impairment.

Research object and method: 60 students with cognitive impairment were randomly selected from 8 colleges and universities. The students came from different majors, aged 18-22 years, including 32 males and 18 females. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate students' emotional state; The cognitive impairment of patients was evaluated by the concise Mini-mental State Examination (MMSE), the Mental Health (MH), and 36-Item Short Form Health Survey questionnaire (SF-36).

Research design: The students were randomly divided into study group and control group, with 30 people in each group. Among them, the students in the research group adopted the improved college English information-based teaching model based on cognitive impairment analysis. The students in the control group accepted the traditional college English information teaching model. After 3 months of teaching, the degree of cognitive impairment and emotional state of the two groups of students were compared.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: There was no significant difference in MMSE score between the two groups before teaching ($P > 0.05$). After teaching, the MMSE scores of patients in both groups increased significantly ($P < 0.05$), and the MMSE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. MMSE scores of patients in both groups

Timing	MMSE Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	14.3±5.2	14.9±4.7	0.162	0.733
After teaching	24.8±1.9	17.6±3.5	6.451	0.024
<i>t</i>	8.275	1.214	-	-
<i>P</i>	0.001	0.142	-	-

Conclusions: Analyzing the symptoms of students with cognitive impairment, and putting forward the corresponding improvement of English information teaching mode can effectively improve the mental health level of college students, improve their cognitive impairment, and then improve their English learning efficiency and level.

Acknowledgement: The research is supported by: Henan Higher Education Teaching Reform Research

and Practice Project in 2019: “Research and Practice on the Integration and Innovation of Information Technology and Foreign Language Teaching in Higher Vocational Colleges” (No. 2019SJGLX695).

PRAGMATIC FAILURE IN CROSS-CULTURAL COMMUNICATION UNDER THE BARRIER OF THINKING LOGIC

Jiabao Wang & Qunfang Zhang

South China Business College, Guangdong University of Foreign Studies, Guangzhou 510545, China

Background: With the acceleration of internationalization, cultural and economic exchanges among countries are becoming more and more in-depth, and cross-cultural communication is becoming more and more frequent. In cross-cultural communication, due to the differences in cultural background, living habits and education, there are some differences in the understanding of the same thing and information between the two sides of cross-cultural communication, which leads to pragmatic failure in cross-cultural communication. Pragmatic failure can only be reflected in the language itself. It refers to the pragmatic failure caused by the speaker applying a word or sentence structure in his mother tongue to the target language, so that he cannot accurately express his thoughts and emotions. After summarizing the pragmatic failure, British scholars believe that the reason for pragmatic failure is the wrong cognition of the pragmatic meaning of dialogue. There are many factors leading to pragmatic failure, which can be roughly divided into surface cultural transfer and deep cultural transfer. Pragmatic failure and non-pragmatic failure are divided into three types: pragmatic failure and non-pragmatic failure. Pragmatic failure will lead to the misinterpretation of the language expression of both sides in cross-cultural communication, resulting in misunderstanding and unnecessary conflict and misunderstanding. In addition, pragmatic failure will also attack users' self-confidence, cause negative emotions such as anxiety, embarrassment and regret, and then lead to thinking logic obstacles, which will seriously affect daily life, work and study.

Thinking logic barrier refers to the phenomenon that individuals violate the form and law of logical thinking when thinking and processing something by using thinking modes such as concept, judgment and reasoning. Patients with thinking logic disorder have defects in social function or individual development, which will greatly affect their normal integration into society, not conducive to the harmonious development of society, but also greatly affect their daily life, study and work. Therefore, finding an appropriate method to reduce pragmatic failures in cross-cultural communication and avoid the thinking logic obstacles of cross-cultural communicators is of great significance to the harmonious development of society and the economic and cultural exchanges between China and other countries. Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The focus of cognitive reasoning is to use the cognitive orientation and reasoning mode. Therefore, based on cognitive psychology, this study analyzes the self-cognition of cross-cultural communicators, and puts forward some strategies to avoid pragmatic failure in cross-cultural communication, so as to alleviate the thinking logic obstacles of cross-cultural communication and promote the cultural and economic exchanges between China and other countries.

Objective: Pragmatic failure often occurs in cross-cultural communication due to various reasons. Pragmatic failure will also attack users' self-confidence, cause negative emotions such as anxiety, embarrassment and regret, and then lead to thinking logic obstacles, which will seriously affect daily life, work and study. Therefore, based on cognitive psychology, this study analyzes the self-cognition of cross-cultural communicators, and puts forward some strategies to avoid pragmatic failure in cross-cultural communication, so as to achieve the goal of avoiding the thinking logic barrier of cross-cultural communication.

Research objects and methods: In eight universities, 80 students with thinking logic barriers were selected from foreign language majors as the research objects. Using the thinking disorder and social function in the Diagnostic Scale for Mental Disorders (DSMD), a Mental Disorder Assessment Scale (MDAS) was developed to evaluate the degree of students' thinking logic disorder.

Research design: 80 students were randomly divided into study group and control group, with 40 students in each group. Among them, the students in the research group use the strategy based on cognitive psychology to carry out cross-cultural communication. The students in the control group used the traditional way of cross-cultural communication. After 3 weeks, the degree of thinking logic disorder and the frequency of pragmatic failure were compared between the two groups.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: The students were investigated and counted after two weeks. The statistical results showed that the number of daily language errors of the students in the study group decreased significantly compared with that two weeks ago ($P < 0.05$), and was significantly lower than that of the students in the control group ($P < 0.05$), as shown in Figure 1.

Figure 1. The daily average number of pragmatic failures of the two groups of students

Conclusions: With the acceleration of internationalization, cultural and economic exchanges among countries are becoming more and more in-depth, and cross-cultural communication is becoming more and more frequent. In cross-cultural communication, due to the differences in cultural background, living habits and education, there are some differences in the understanding of the same thing and information between the two sides of cross-cultural communication, resulting in pragmatic failure in cross-cultural communication. Pragmatic failure will attack the user's self-confidence and lead to the obstacle of thinking logic. Based on cognitive psychology, this study analyzes the self-cognition of cross-cultural communicators, and puts forward some strategies to avoid pragmatic failure in cross-cultural communication. The results showed that the number of daily language errors of the students in the study group decreased significantly compared with two weeks ago ($P < 0.05$), and was significantly lower than that of the students in the control group ($P < 0.05$). Therefore, the strategies proposed in this study can alleviate and avoid the logical barriers of thinking in cross-cultural communication and maximize the negative effects of pragmatic failure.

APPLICATION OF NEW DRUG PREPARATION TECHNOLOGY IN THE MODERNIZATION OF TRADITIONAL CHINESE MEDICINE PREPARATION UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Lei Wang¹, Bin Wang¹ & Ruochen Wang²

¹School of Pharmacy, Henan University of Chinese Medicine, Zhengzhou 450046, China

²School of Traditional Chinese Medicine (Zhongjing School), Henan University of Chinese Medicine, Zhengzhou 450046, China

Background: Traditional Chinese medicine refers to the medicine for treatment made under the guidance of traditional Chinese medicine theory. The production process of traditional Chinese medicine preparation is relatively complex and the production efficiency is relatively low, which leads to some staff members having negative emotions such as anxiety and depression, which leads to staff suffering from cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. In the process of cognition, it will involve a series of complex social behaviors and

activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to patients themselves and social development. Therefore, many experts have carried out in-depth research on cognitive impairment.

Cognitive psychology is an important school of contemporary psychological research. It explains how people deal with information in cognitive activities. The basic principles of cognitive psychology mainly include five points: emphasizing the structural and organizational principles in the process of cognition; Emphasize the internal process, that is, the processing of symbol information. Emphasize the driving role of ideas. Emphasize the role of cognitive feedback. Emphasize the individual differences of cognitive style. Combined with the theory of cognitive psychology, the study deeply analyzed the causes of cognitive impairment of staff, and found that there was a strong correlation between the production efficiency of traditional Chinese medicine preparations and the prevalence of cognitive impairment of staff. Therefore, based on cognitive psychology, the research applies the new technology of pharmaceutical preparation to the modernization of traditional Chinese medicine preparation, and puts forward the corresponding measures. The new technology of pharmaceutical preparation includes solid dispersion technology, micro encapsulation technology, liposome technology, transdermal technology and film coating technology. When it is applied to the production of traditional Chinese medicine preparation, it can effectively improve the production efficiency of traditional Chinese medicine, reduce the complexity of traditional Chinese medicine preparation, and then alleviate the negative emotions of staff such as anxiety and depression, Treat cognitive impairment of staff.

Objective: The production process of traditional Chinese medicine preparation is relatively complex and the production efficiency is relatively low, which leads to some staff members' negative emotions such as anxiety and depression, and then leads to staff members suffering from cognitive impairment. Cognitive impairment reduces the quality of life of patients and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to patients themselves and social development. Based on cognitive psychology, the research applies the new technology of pharmaceutical preparation to the modernization of traditional Chinese medicine preparation, and puts forward corresponding measures to effectively improve the production efficiency of traditional Chinese medicine, reduce the complexity of traditional Chinese medicine preparation, so as to alleviate the negative emotions such as anxiety and depression of staff, and treat the cognitive impairment of staff.

Research objects and methods: In a traditional Chinese medicine preparation enterprise, 60 patients with cognitive impairment were selected as the research objects. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the emotional state of patients. The cognitive impairment of patients was evaluated by the Mini- mental State Examination (MMSE) and the Mental Health (MH) part of the quality-of-life assessment scale (SF-36).

Study design: The patients were randomly divided into study group and control group, with 30 people in each group. Among them, the patients in the study group were produced by the improved preparation technology of traditional Chinese medicine based on cognitive psychology. The patients in the control group were produced by traditional Chinese medicine preparation technology. After working for 3 months, the degree of cognitive impairment and emotional state of the two groups were compared.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: There was no significant difference in MMSE score between the two groups before treatment ($P > 0.05$). After treatment, the MMSE scores of patients in both groups increased significantly ($P < 0.05$), and the MMSE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. MMSE scores of patients in both groups

Timing	MMSE Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before treatment	15.1±4.9	15.3±5.2	0.157	0.721
After treatment	25.0±2.8	20.3±4.7	6.417	0.028
<i>t</i>	7.263	3.214	-	-
<i>P</i>	0.001	0.035	-	-

Conclusions: The production process of traditional Chinese medicine preparation is relatively complex and the production efficiency is relatively low, which leads to some workers' negative emotions such as

anxiety and depression, and then leads to cognitive impairment. Cognitive psychology is an important school of contemporary psychological research. It explains how people deal with information in cognitive activities. Therefore, based on cognitive psychology, the research applies the new technology of pharmaceutical preparation to the modernization of traditional Chinese medicine preparation, and puts forward the corresponding measures. The results showed that there was no significant difference in MMSE score between the two groups before treatment ($P > 0.05$). After treatment, the MMSE scores of patients in both groups increased significantly ($P < 0.05$), and the MMSE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$). To sum up, the application of new drug preparation technology to the modernization of traditional Chinese medicine preparation can effectively improve the production efficiency of traditional Chinese medicine, reduce the complexity of traditional Chinese medicine preparation, alleviate the staff's negative emotions such as anxiety and depression, and treat the staff's cognitive impairment.

RELATIONSHIP BETWEEN MANAGERS' OVERCONFIDENCE AND MERGERS AND ACQUISITIONS PERFORMANCE FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Nan Wang

School of Business, Nanjing University of Information Science & Technology, Nanjing 210044, China

Background: Mergers and Acquisitions (M & A) an important strategy for enterprises to achieve rapid expansion. With the continuous development of China's economic level, the financial transaction market is becoming larger and larger, and the transaction of China's M & A market is becoming more and more active. Therefore, China has launched various policies on M & A market transaction, improved the laws and regulations of M & A market, and the process of M & A reorganization is becoming more and more simple, which has greatly improved the success rate of M & A transactions, and the enthusiasm of many listed companies for M & A continues to rise. However, in the wave of M & A of listed enterprises, the performance growth of M & A transactions is not ideal, but leads to the loss of the wealth of enterprise shareholders. The traditional financial theory cannot give a reasonable explanation for this phenomenon until the proposal and development of behavioral finance theory. Some scholars have discussed the impact of the psychological cognitive bias of these enterprise executives on management activities, and concluded that overconfidence in management is the most important factor affecting enterprise decision-making. Behavioral finance theory cannot fully explain this phenomenon, so it is necessary to introduce new theories. Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition. Therefore, using cognitive psychology theory to study the psychological cognitive bias of enterprise executives can effectively explain the phenomenon that M & A transactions do not increase the performance of enterprises satisfactorily, but lead to the loss of the wealth of enterprise shareholders under the wave of M & A of listed enterprises. Based on cognitive psychology, overconfident enterprise managers have very typical psychological characteristics, that is, they are optimistic about the investment prospect, overestimate their investment success rate, and hate investment losses. Overconfidence will make enterprise managers have psychological deviation, which makes managers mistakenly overestimate their management ability and wealth creation ability, and then urge managers to implement M & A activities with negative net present value, resulting in enterprise losses. Based on cognitive psychology, this study puts forward several hypotheses: managers' overconfidence will have a negative impact on M & A performance. The employment of independent directors in colleges and universities can improve the M & A performance of the enterprise to a certain extent. Independent directors of colleges and universities can inhibit the overconfidence of enterprise managers and manage M & A activities with negative net present value. In the same area, the independent directors of colleges and universities and enterprises can more effectively manage the M & A activities with negative net present value caused by the overconfidence of enterprise managers. Based on the above contents, the research uses the M & A events of A-share private listed companies in Shanghai and Shenzhen as data samples, and then makes empirical analysis, deeply analyzes the relationship between managers' overconfidence and M & A performance, and then governs it, so as to provide theoretical data support for the development of China's listed enterprises and M & A market.

Objective: Under the wave of M & A of listed enterprises, the performance growth of M & A transactions

is not ideal, but leads to the loss of the wealth of enterprise shareholders. Behavioral finance theory holds that overconfidence in management is the most important factor affecting enterprise decision-making. However, behavioral finance theory cannot fully explain this phenomenon, so it is necessary to introduce new theories. Therefore, the study uses cognitive psychology theory to study the psychological cognitive bias of enterprise executives, effectively explain this phenomenon, and provide theoretical data support for the development of listed enterprises and M & A market in China.

Research objects and methods: Based on cognitive psychology and behavioral finance theory, this study puts forward four hypotheses, and uses the M & A events of A-share private listed companies in Shanghai and Shenzhen as data samples for empirical analysis.

Research design: Define explanatory variables and explained variables, and establish a model to verify the impact of enterprise managers' overconfidence on M & A performance. The size of influence is graded, and from 0 to 4 represent five different levels of influence from small.

Methods: Using Excel and SPSS20.0 to process and analyze relevant data.

Results: It can be seen from Table 1 that cognitive psychology mainly includes four contents: treating the human brain as an information processing system similar to computer, emphasizing the decisive role of existing knowledge and knowledge structure in human brain on its current behavior and cognitive activities, emphasizing the integrity of cognitive process and production system. The influence levels of the four on managers' overconfidence are 4, 4, 3 and 2 respectively, which are at a high level. It emphasizes the decisive role of people's existing knowledge and knowledge structure on their current behavior and cognitive activities, and the final impact on M & A performance is negative. The remaining three main contents have a positive role in promoting M & A performance.

Table 1. Effects of cognitive psychology on managers' overconfidence and M & A performance

Main contents of cognitive psychology	Manager overconfidence	M & A performance
Think of the human brain as an information processing system similar to a computer	4	+
It emphasizes that the existing knowledge and knowledge structure in people's mind play a decisive role in their current behavior and cognitive activities	4	-
Emphasize the integrity of cognitive process	3	+
Production system	2	+

Conclusions: This study provides theoretical data support for the development of China's listed enterprises and M & A market. The four main contents included in social psychology will have varying degrees of impact on managers' overconfidence and significantly promote M & A performance. Only the decisive role of personal knowledge on current behaviors and activities hinders the improvement of M & A performance.

* * * * *

THE INFLUENCE OF COLLEGE PHYSICAL EDUCATION ON ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY FROM THE PERSPECTIVE OF CURRICULUM IDEOLOGY AND POLITICS

Wen Yan¹, Peng Ye² & Xiaojing Cao²

¹College of Business Administration, Xuzhou College of Industrial Technology, Xuzhou 221140, China

²Physical Education and Arts Department, Xuzhou College of Industrial Technology, Xuzhou 221140, China

Background: Anxiety is a complex emotional response caused by psychological conflict or frustration. It is an unpleasant emotion, usually intertwined with anxiety, tension, disappointment, uneasiness, fear, anxiety and shame. When people are angry, this is a natural emotion of human beings. Excessive anxiety can easily lead to physical and psychological abnormalities. College students are in a specific stage of physical maturity and psychological immaturity. They are facing more and more social challenges, learning pressure and employment pressure, which leads to students' long-term tension and psychological obstacles. According to the relevant survey data, the mental health status of college students is not optimistic. At present, about 30% of college students in China have varying degrees of mental health problems, mainly manifested in anxiety, depression, paranoia, compulsion, tension and so on. In addition, the incidence rate

of mental disorders is increasing year by year. It can be seen that college students' mental health has become an important problem affecting college students' health. The teaching mode of physical education in colleges and universities from the perspective of curriculum ideology and politics can regulate emotions, stimulate spirit, help students vent their bad emotions, cultivate students' strong will and good ability to adapt to the environment, and improve their interpersonal skills. It is an important means to improve the mental health level of college students and eliminate mental diseases. It will play a more and more important role in students' physical and mental health.

The current situation of college students' mental health is not optimistic, and the psychological anxiety caused by excessive pressure on learning and employment has become an important issue that cannot be ignored in current college education. Because college physical education plays an important role in promoting college students' mental health, that is, it plays a unique role in promoting mental health with its unique nature and function. At the same time, ideological and political education in colleges and universities is the key path and main position of modern college students' education. It is the main channel to help higher vocational students establish correct three views, and college students' ideological and political course includes the content and requirements of mental health teaching. In view of this, this study designs the teaching mode of physical education in colleges and universities from the perspective of curriculum ideological and political education, organically integrates the psychological characteristics of ideological and political education and the biological characteristics of physical education, explores the implicit needs, motives, interests, emotions and other psychological activities of contemporary college students, patiently inspires students and sets noble goals through physical education teaching. Through ideological and political teaching, actively cultivate students' self-confidence construction and stimulate the spirit of self-improvement, so as to enhance the psychological adaptability of contemporary college students, alleviate students' anxiety, and then fully ensure the comprehensive and all-round development of modern college students.

Objective: To explore the positive role of the teaching mode of physical education in colleges and universities from the perspective of curriculum ideology and politics in regulating the positive emotions of contemporary college students, stimulating spirit, venting bad emotions, cultivating strong will and good environmental adaptability, so as to provide new research ideas and directions for the innovative development of college education. The educational direction and path to fully ensure the comprehensive and all-round development of modern college students.

Research objects and methods: Taking the teaching mode of physical education in colleges and universities from the perspective of curriculum ideological and political education as an intervention method, this paper discusses the impact of the teaching mode of combining ideological and political education with physical education on college students' anxiety response. 100 college students were selected as the research object, 50 in the experimental group (the teaching mode of the organic integration of ideological and political education and physical education) and 50 in the control group (the traditional physical education teaching mode). The self-anxiety scale was used to test the degree of students' psychological anxiety, and the repeated measurement was used to carry out the specific experimental design. The intervention period was 10 weeks, The changes of psychological anxiety of the two groups of students before and after the intervention were compared.

Methods: All data were processed using PASW18.0 software package and Excel 2007.

Figure 1. Changes of students' psychological anxiety after the intervention of college physical education

teaching mode from the perspective of curriculum ideology and politics

Results: Figure 1 shows the changes of students' psychological anxiety after 10 weeks of intervention in the teaching mode of physical education in colleges and universities from the perspective of curriculum ideology and politics. On the whole, after the intervention of college physical education teaching mode from the perspective of curriculum ideological and political education for 10 weeks, the psychological anxiety of students decreased significantly. This shows that the organic integration of ideological and political education and physical education can effectively alleviate students' psychological anxiety, and then is of great significance to improve students' psychological development.

Conclusions: The teaching mode of physical education in colleges and universities from the perspective of curriculum ideology and politics can effectively improve students' psychological anxiety, which is of great significance to enhance students' psychological development, and is worthy of popularization and application in the practice of teaching reform in colleges and universities.

EFFECT OF ORAL ENGLISH LEARNING ON REHABILITATION OF PATIENTS WITH AFFECTIVE DISORDER

Jing Zhang

School of Humanities and Law, Zhejiang Agriculture & Forestry University, Hangzhou 311300, China

Background: There are many patients with affective psychosis, including bipolar disorder, depression and mania. Bipolar disorder was originally called "bipolar disorder", which belongs to a kind of mood disorder. In the whole process of the disease, there are both manic episodes and depressive episodes. These episodes are periodic and completely normal during this time. When manic attacks occur, you will feel very happy, energetic, irritable, reckless, and reduce your sleep needs. During the onset of depression, patients are depressed, unhappy, do not want to contact people, prone to fatigue, self-blame, hopeless life, and even have negative world weariness. In affective disorder, the core manifestations of manic episode and depressive episode are thinking escape and thinking retardation respectively. Thinking out of control refers to the rapid association of thinking, the continuous emergence of new concepts and the leap of thinking. They are often attracted by changes in the environment, divert the topic, distract their attention, and can't carry it out to the end. Slow thinking is manifested in association difficulty, slow response and difficult thinking. The conscious brain seems to rust and cannot rotate. When talking with him, his voice is low, low volume, slow and difficult to answer, which will affect his social and working ability. From the perspective of phenomenology, patients with unhurried thinking will continue to transfer from one thing to another, with fast speed and great jump. Patients with mental retardation will repeatedly think about the cause, process, result and influence of something, and be fixed in a specific thinking and behavior environment. From these clinical phenomena, it can be inferred that their distraction, namely cognitive flexibility, is problematic, that is, affective psychosis also has cognitive impairment. Over the past decade, people's in-depth laboratory research on affective disorders has revealed the key role of amine, cholinergic, peptidergic system transmitters and endocrine changes in its pathogenesis and prognosis. At the same time, relevant studies have pointed out that in addition to drug treatment, affective disorders can also be treated through other external ways, such as art therapy and decentralized therapy. So as to provide a good entry point and better breakthrough for better understanding and prevention of the disease.

English self-concept is a self-concept subdivided into specific skills, including pronunciation, grammar, vocabulary, listening, speaking, reading and writing. The self-concept at the top of the hierarchy is relatively stable. The lower the hierarchy, the weaker the stability of self-concept. The self-concept of each level restricts and affects each other, which means that the change of one level will inevitably lead to the change of another level. At present, many psychologists and scholars have studied oral English learning and pointed out the positive role of oral English learning in the treatment of patients with affective disorders, that is, they can help patients with affective disorders get rid of psychological diseases through the factors such as emotion, belief and motivation generated in oral English learning, so as to move towards a normal life with sound psychology and strong goals. Based on this, this study carried out the research on the positive role of "oral English learning" treatment model in patients with affective disorders, in order to

provide corresponding theoretical basis for clinical treatment of patients with affective disorders.

Objective: This study is committed to the self-concept ability in the “oral English learning” model, and extracts an effective model for the treatment of patients with affective disorders, and then provides a new perspective and strategy for the clinical treatment of patients with affective disorders.

Research objects and methods: 90 patients with affective disorders were selected as the research object, including 30 patients with bipolar disorder, depression and mania. 100 patients were treated with “oral English learning”, and the improvement of symptoms of patients with affective disorder before and after “oral English learning” treatment was compared and analyzed.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the improvement of symptoms of patients with affective disorder before and after the treatment of “oral English learning”. On the whole, compared with before the treatment of “oral English learning”, the psychological symptoms of patients with bipolar disorder, depression and mania were significantly improved ($P < 0.05$).

Table 1. Improvement of symptoms of patients with affective disorder before and after treatment of “oral English learning”

Variable	Max	Min	M	SD
Psychological symptoms of patients with bipolar disorder	6.00	1.00	3.04*	1.56
Psychological symptoms of patients with depression	6.00	1.00	2.62*	1.30
Psychological symptoms of manic patients	6.00	1.00	2.06*	1.20

Note: * $P < 0.05$ indicates the comparison with that before oral English learning treatment.

Conclusions: The treatment of affective disorders based on “oral English learning” can effectively improve the psychological symptoms of patients with bipolar disorder, depression and mania, and then provide a theoretical basis for the clinical treatment of affective disorders, which is worthy of clinical application.

INCENTIVE MECHANISM IN ENTERPRISE VALUE RELATIONSHIP MANAGEMENT TO ALLEVIATE EMPLOYEES’ PSYCHOLOGICAL ANXIETY

Baiyu He

School of Economics and Management, Chengdu Normal University, Chengdu 611130, China

Background: Anxiety is an emotional state of tension and fear caused by failing to achieve goals or threatening human beings to overcome these obstacles, self-esteem and self-confidence, or increasing the sense of failure and guilt. It includes three main parts: emotional experience, threat, uncertainty, cognitive expression of fear and physiological arousal. From the perspective of psychology, the increase of anxiety value will lead to distraction and block of attention, disturb the results of brain memory and thinking, and make people show anxiety, tension, indecision and disturbing emotional changes. For example, a bad mood can lead to neurological dysfunction and mental illness or abnormalities. As for the research on anxiety, most domestic scholars pay attention to practical research, while theoretical research is relatively few. Most domestic scholars study anxiety. Many scholars focus on research in the field of medicine rather than research and development in the field of medicine. Employee anxiety mainly focuses on more specific anxiety problems, such as examination, emotion, society and other influencing factors to analyze employee anxiety. They did not perfectly combine theory with practice, but they paid too much attention to some superficial problems and did not explore the deep-seated reasons under the background of the times. This is the actual work level behind these problems. Therefore, there are relatively few data on employee anxiety and its influencing factors. The research of summarizing anxiety generally includes qualitative research theory and empirical research results, which respectively study the current situation of human anxiety and the relationship between anxiety and enterprise, society, environmental change, personality, cultural

background, self-cognition, interpersonal communication, interpersonal communication, interpersonal relationship, mental health, family disputes and so on. Anxiety is particularly prominent in employees' mental health problems, but if these performances are excessive, they will evolve into anxiety disorder, even physical and language stiffness, mental collapse, or common mental related diseases in medicine, which will bring great inconvenience to people's body and mind, work or study. With the gradual enhancement of the awareness of market competition pressure, more and more workplace employees are troubled by anxiety, which directly affects the employees' work efficiency, life law and physical and mental health level.

Reward is usually associated with motivation, which mainly refers to an internal state of human activities. Robbins, an American management scientist, defines the reward mechanism as an individual's hope to achieve organizational goals through high-level efforts. At the same time, such efforts can meet some individual needs. Whether motivation or motivation, there are three key factors: effort, organizational goals and needs. Therefore, the reward mechanism is a psychological state driven by motivation. It can stimulate, promote and strengthen people's behavior. A large number of studies have pointed out that enterprise value relationship management based on reward mechanism is of great significance in promoting enterprise development and regulating employees' negative psychology. In view of this, this study launched the construction of enterprise value relationship management for reward mechanism, which plays a positive role in alleviating employees' psychological anxiety, so as to provide a solution to ensure employees' physical and mental health, work efficiency and enterprise development.

Objective: This study is committed to building an enterprise value relationship management scheme based on the reward mechanism and applying it to solve the psychological anxiety of employees, so as to inject comprehensive talents with sound body and mind into the development of the enterprise for a long time on the basis of ensuring the psychological coordination and soundness of employees.

Research objects and methods: Select 100 employees of an enterprise as the research object, measure their psychological anxiety respectively, and then apply the enterprise value relationship management scheme based on the reward mechanism. The intervention cycle is 3 months. Compare and analyze the changes of employees' psychological anxiety before and after the reward system intervention for 3 months.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the changes of employees' psychological anxiety under the intervention of enterprise value relationship management scheme based on reward mechanism. On the whole, after the intervention, employees' job-hunting anxiety tendency, anxiety tendency towards people, loneliness tendency, self-blame tendency, allergy tendency, physical symptoms, phobia tendency and impulse tendency were effectively improved, with statistical difference ($P < 0.05$).

Table 1. Changes of employees' psychological anxiety under the intervention of enterprise value relationship management scheme based on reward mechanism

Project	Before intervention	After intervention	P
Anxious learning	6.15±2.32	3.45±2.58	0.000
Communication anxiety	6.42±3.71	3.46±1.45	0.000
Loneliness tendency	6.88±2.23	2.45±2.58	0.000
Self-reproach tendency	3.46±1.45	3.46±1.45	0.000
Sensitive tendency	3.45±2.58	2.45±2.58	0.000
Physical symptoms	6.15±2.32	1.46±3.25	0.000
Terrorist tendency	6.42±3.71	3.46±1.45	0.000
Impulsive tendency	6.88±2.23	1.46±3.25	0.000
Total score	41.09±17.34	35.91±19.71	0.000

Conclusions: The intervention of enterprise value relationship management scheme based on reward mechanism can effectively improve the psychological anxiety of employees, and then it should be paid enough attention in enterprise management. In short, in the era of knowledge economy, managers need to know how to use ingenious management means to strengthen communication with employees and understand the changes of employees' psychological anxiety. When employees have psychological anxiety problems, they should find out the causes and take remedial measures in time. In short, only by ensuring the psychological integrity of employees can the enterprise develop continuously and stably.

PSYCHOLOGICAL IMPACT OF MANUFACTURING TRANSFORMATION ON EMPLOYEES AND THE INNOVATION PATH OF RELATED TALENT TRAINING

Haijiang Huang & Lizhu Ying

Commercial College, Jinhua Polytechnic, Jinhua 321007, China

Background: People are the foundation of society and employees are the foundation of enterprises. The 21st century has entered the era of global competition. With the rapid development of economy, technology and society, people's pace of life and work is faster and faster, the pressure is greater and greater, and the psychological characteristics of various social groups have also undergone significant changes. Among them, as the main force of social productivity, the psychological problems of enterprise employees are becoming more and more prominent, and some have become the key factors affecting the growth of enterprises. Anxiety is an emotional state of tension and fear caused by failing to achieve goals or threatening human beings to overcome these obstacles, self-esteem and self-confidence, or increasing the sense of failure and guilt. It includes three main parts: emotional experience, threat, uncertainty, cognitive expression of fear and physiological arousal. From the perspective of psychology, the increase of anxiety value will lead to distraction and block of attention, disturb the results of brain memory and thinking, and make people show anxiety, tension, indecision and disturbing emotional changes. For example, bad mood can lead to neurological dysfunction, mental illness or abnormal anxiety, which is particularly prominent in the mental health problems of employees. However, if these manifestations are excessive, they will evolve into anxiety disorder, even physical and language stiffness, mental collapse, or common mental illness in medicine, which will bring great inconvenience to people's body and mind, work or study. With the gradual enhancement of the awareness of market competition pressure, more and more employees are troubled by anxiety, which directly affects the work efficiency, life law and physical and mental health level of employees.

With the disappearance of China's demographic dividend, the decline of land dividend and the increasingly prominent environmental problems, the labor-intensive traditional manufacturing industry is facing many challenges. There is still a big gap between China and developed countries in terms of industrial structure level, independent innovation ability, resource utilization efficiency and informatization degree. China's manufacturing industry is facing the double squeeze of low-cost countries and developed countries. In order to maintain sustainable development and competitive advantage, the traditional manufacturing industry must be transformed and upgraded. In the process of transformation and development from "made in China" to "made in China", it has brought varying degrees of pressure and distress to employees, and even produced psychological anxiety that cannot adapt to the transformation of manufacturing industry. Practice at home and abroad shows that anxiety mental illness is a great enemy that threatens personal life and health and destroys the organizational efficiency of enterprises. The psychological problems of enterprise employees have become an important factor restricting the construction of enterprises. Therefore, people-oriented, paying attention to and paying attention to the mental health status of enterprise employees, constantly improving their mental health level and making them work and live with dignity, happiness and value are extremely important aspects of the development and growth of enterprises. Based on this, this paper studies the psychological impact of manufacturing transformation on employees and the innovation path of related talent training.

Objective: Analyze the psychological anxiety of enterprise employees under the transformation of manufacturing industry, and measure the psychological health of employees. On this basis, plan the innovative path or innovative scheme of enterprise development talent training under the transformation of manufacturing industry, so as to help the government and enterprises strengthen the psychological construction of enterprise employees in the process of manufacturing industry transformation and promote the harmonious and stable development of society.

Research objects and methods: 4563 employees were randomly selected from 45 manufacturing transformation enterprises as the research object, and the statistical analysis of employees' psychological anxiety was carried out in combination with the mental health Symptom Checklist-90 (SCL-90). According to the employees' psychological anxiety in the face of manufacturing transformation, a targeted talent training path was constructed. SCL-90 has 90 items in total, and adopts 5-level score. If the score of each item is greater than 2, it is regarded as psychological abnormality, and if the score is greater than 3, it is regarded as having psychological anxiety disease.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the detection rate of psychological anxiety of enterprise employees under the transformation of manufacturing industry. Overall, under the transformation of manufacturing industry, the number of employees with at least one factor score ≥ 3 in SCL-90 scale is 902, accounting for 22.2%, which shows that the transformation of manufacturing industry has an important impact on employees'

psychological anxiety.

Table 1. Detection rate of psychological anxiety of enterprise employees under the transformation of manufacturing industry n (%)

Factor	≥2.5 score	≥3 score
Somatization	149 (3.7)	-
Force	149 (3.7)	45 (1.1)
Interpersonal sensitivity	504 (12.4)	162 (4.0)
Depressed	386 (9.5)	129 (3.2)
Anxious	324 (8.0)	120 (2.9)
Hostile	269 (6.6)	87 (2.1)
Terrorist tendency	378 (9.3)	134 (3.3)
Terror	112 (2.8)	34 (0.8)
Paranoid	267 (6.6)	75 (1.8)
Psychotic	158 (3.9)	47 (1.2)
At least one factor score ≥3	902 (22.2)	358 (8.8)

Conclusions: By analyzing the psychological anxiety of enterprise employees under the transformation of manufacturing industry and measuring the mental health of employees, it is found that the transformation of manufacturing industry has an important impact on the psychological anxiety of employees. Therefore, in the face of the transformation of manufacturing industry, the government, society and enterprises should attach great importance to the mental health of enterprise employees, put people first, and gradually integrate the mental health education of employees into the work agenda of modern talent training and innovation path, so as to jointly promote the positive development of employees' psychology in the period of transformation of manufacturing industry and create a good foundation and atmosphere for the development of society and enterprises.

Acknowledgement: The research is supported by: Zhejiang Province Philosophy and Social Science Planning Routine Topic: Research on the Coordinated development of the transformation and upgrading of manufacturing industry and the supply-side reform of higher vocational talents - Based on the perspective of digital economy, this paper is supported by Zhejiang Provincial Philosophy and Social Science Planning Project (22NDJC316YBM).

POSITIONING OF TRAFFIC ENGINEERS IN THE PROCESS OF AUTONOMY OF MODERN TRAFFIC TECHNOLOGY IN CHINA UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Yuanlong Ye¹ & Linghe Ma²

¹*School of History, Anhui Normal University, Wuhu 241002, China*

²*School of Economics and Management, Anhui Normal University, Wuhu 241002, China*

Background: As a mental disease, cognitive impairment mainly refers to the disorder of learning and memory function caused by abnormal processing of human intelligent knowledge, and leads to pathological behaviors such as loss of line, recognition and use. The diagnostic criteria of cognitive impairment include normal overall cognitive function, main complaints of memory impairment and behavioral disorders inconsistent with age. The main causes of cognitive impairment are chronic brain injury, chronic systemic diseases and mental and psychological abnormalities, of which mental and psychological abnormalities are the most important. According to the latest research, the number of patients with cognitive impairment in China is increasing year by year, which has a serious negative impact on the patients themselves and their families. Timely intervention for patients with cognitive impairment can actively change their cognitive function, and then it is very important to reduce the quality of life of patients and their families. In recent years, many researchers at home and abroad have conducted intervention research on mild cognitive impairment. The intervention measures mainly include nutrition intervention, drug intervention, physical exercise, cognitive training, traditional Chinese medicine and acupuncture intervention. In a word,

cognitive impairment, as a common psychological disease in modern society, should be paid special attention to. At the same time, relevant research points out that under the background of cognitive impairment, traffic engineers will have a series of problems, which are mainly reflected in the positioning and construction affecting the process of autonomy of modern traffic technology in China, including incomplete system scheme, nonstandard product certification, unscientific system, and unclear R & D ideas. Therefore, it is necessary to link cognitive impairment with traffic engineers to carry out the specific positioning and development research of traffic technology autonomy.

The development direction of urban rail transit technology is very important for the independent development of urban rail transit technology in China. China's urban rail transit has entered a period of rapid development. Mileage and operation lines are close to developed countries. Relevant data show that the total mileage of subway and light rail in China's megacities has exceeded 1500 kilometers. At present, China has become the largest urban rail transit market in the world. Therefore, the research and development of traffic signal technology have become an important link to promote the development of urban rail transit in China. In view of the negative impact of cognitive impairment on traffic engineers, combined with the necessity and urgency of the independent development of signal technology, this paper carries out the research on the independent development strategy of urban rail transit signal technology in China.

Objective: In order to analyze the positioning status of traffic engineers in the process of modern traffic technology autonomy in China under cognitive impairment, this paper discusses the key elements affecting the development of autonomy, in order to provide new ideas and research directions for the development of modern traffic technology autonomy in China.

Research objects and methods: Select the traffic engineers of China's modern traffic technology localization as the research object, and intervene the cognitive impairment of the traffic engineers, and then use the fuzzy comprehensive evaluation method to evaluate the specific current situation of China's modern traffic technology localization. The evaluation content includes four aspects: system scheme integrity, product certification, system and R & D ideas. 50 traffic engineers are randomly selected for satisfaction evaluation: dissatisfied, satisfied and very satisfied. The corresponding scores are 1-9 points, 10-19 points and 20-30 points, so as to evaluate the development and construction of the localization of modern traffic technology in China.

Methods: Through SPSS23.0 data statistical analysis software to obtain the positioning effect of China's modern transportation technology autonomy under the intervention of cognitive impairment.

Results: Table 1 shows the positioning effect of China's modern transportation technology autonomy under the intervention of cognitive impairment. On the whole, in terms of system scheme integrity, product certification, system and R & D ideas, compared with before the intervention of cognitive impairment, the positioning effect of China's modern transportation technology autonomy after the intervention is relatively ideal ($P < 0.05$).

Table 1. Localization effect of China's modern transportation technology autonomy under the intervention of cognitive impairment

Category	Dissatisfied	Satisfied	Very satisfied
System scheme integrity	23*	21*	23*
Product certification	24*	23*	24*
TV system	25*	24*	25*
Research and development ideas	23*	25*	23*

Note: * $P < 0.05$, compared with that before the intervention of cognitive impairment.

Conclusions: After the intervention on cognitive impairment of traffic engineers, the localization of modern traffic technology in China has achieved good results in system scheme integrity, product certification, system and R & D ideas. Subsequently, the cognitive impairment intervention program can be applied to the localization and development of transportation technology autonomy.

* * * * *

A STUDY ON THE PSYCHOLOGICAL TYPOLOGY OF “PEOPLE SUING OFFICIALS”

Ying Qi

Law Department, Henan Police College, Zhengzhou 450046, China

Background: Can the administrative litigation system work well in China? A few administrative litigation cases have confirmed the existence of this advantage from one aspect. For people’s unwillingness to file administrative litigation, many scholars often look for reasons from China’s history, culture and tradition. Few people specially study the specific psychological type of “people suing officials”. The psychological reasons why farmers do not file administrative litigation may be that they are “afraid to sue”, “unwilling to sue” and “don’t know how to sue”. Among them, “don’t know how to sue” is the main reason, not what people usually think of as “afraid to sue”. Why do you have this psychological type? This psychological factor must be found out from the complex political, economic and cultural aspects of most farmers’ lives.

Economic reasons for psychological typology: China’s rural economy has been dominated by agriculture since ancient times, which is a self-sufficient natural economy. This self-sufficient natural economy usually exists in the family. It is easy to imprison farmers on the land, leading to attachment to the land and family. At this time, when there is a dispute between villagers, they often turn to their parents or moral people in their families rather than bring a lawsuit to the government. It takes too much time and money to file a lawsuit, and the poor family economy can’t afford the high litigation cost. Therefore, ancient Chinese farmers generally had the psychology of being tired of litigation, which continues to this day.

Political reasons for psychological typology: China, is a country with thousands of years of feudal autocratic rule. There is a patriarchal hierarchy. The idea of “officials are important and the people are inferior” is very serious. In order to meet the needs of feudal rule, the rulers advocated the so-called “morality first, punishment second” and “the combination of etiquette and law”. In a society based on officials, the political structure must be based on obligations. Farmers are not used to suing the government. Under this “political system”, the prosecution is an “act of treason”. This shows that China lacks the political and ideological soil that breeds “people’s sovereignty”, “separation of powers and checks and balances” and “limited government” like the west, which is the basis of administrative litigation.

Cultural reasons for psychological typology: Chinese traditional culture is a “no litigation” culture. The Confucian culture, which has long occupied the ruling thought of feudal society, advocates “no litigation”. This is the Confucian pursuit of “no litigation” to stabilize social order. Similarly, feudal rulers regarded “no lawsuit” as one of their political achievements. Pay attention to mediation when handling cases and try to stop litigation. In the long run, the Chinese people have formed a mentality of “peace is precious” and “fierce litigation”. In ancient China, litigants were often called “litigants”, which profoundly showed the disgust of the whole society to litigation. Although people’s legal awareness and culture have changed greatly compared with the past due to economic development and social changes, this thought is still deeply rooted in the hearts of many farmers.

In order to verify the three psychological types of “people suing officials”, this paper makes a multidimensional perspective on the “three noes” psychology of “people suing officials”, so as to find a solution for better implementing the administrative litigation system in rural areas.

Objective: To explore the reasons why the rural administrative litigation system encounters the psychological obstacles of “three noes”, in order to verify the psychological type of “people suing officials”, so as to find appropriate solutions and better implement the administrative litigation system in rural areas.

Research objects and methods: 400 villagers were randomly selected from a township in our city as the research object. The questionnaire survey method was used to investigate the specific situation of “people suing officials”. The questionnaire has 20 questions, mainly including three contents: Do farmers dare to sue? What are the psychological reasons? Why farmers do not file administrative litigation? How much do farmers trust the impartiality of the court?

Methods: Excel software was used for statistical data analysis.

Results: Table 1 shows the survey results of the psychological type of “people suing officials”. It can be seen from Table 1 that in the “Do farmers dare to sue?” Level, a total of 53.5% chose to find the government to resolve disputes, and 11.5% chose to swallow it. What are the psychological reasons why farmers do not file administrative litigation at the level of, villagers believe that their legitimate rights and interests have been violated and do not sue, mainly because they do not understand the relevant laws, accounting for 56.6%? In “the degree of farmers’ trust in the impartiality of the court?” At level of, farmers’ lack of trust and complete distrust of the court accounted for 53%.

Conclusions: There are many reasons why the rural administrative litigation system encounters litigation psychological obstacles. Through the research on the psychological classification of “people suing officials” farmers, it will help us see the essence of some problems and find appropriate methods to better implement the administrative litigation system in rural areas.

Table 1. Survey results of psychological types of “people suing officials” [n (%)]

Psychological type: question 1	Reason with the government at that level (%)	Find a superior government to solve or petition (%)	Go to the people’s court and sue the government (%)	Swallow one’s breath and admit bad luck (%)
Dare farmers Sue?	80 (20)	154 (33.5)	120 (30)	43 (11.5)
Psychological type: question 2	No time and energy	Fear of government retaliation	Worried about the protection of officials	Because I don’t know the law
Psychological reasons why farmers do not file administrative litigation	44 (11)	32 (8)	98 (24.5)	226 (56.6)
Psychological type: question 3	Complete trust	More trust	Lack of trust	Total distrust
Farmers’ trust in the impartiality of the court	88 (22)	100 (25)	160 (40)	52 (13)

THE INFLUENCE OF ANXIETY ON CONSUMER BEHAVIOR IN THE E-COMMERCE ENVIRONMENT

Ying Huang

College of Business Administration, Chengdu Jincheng College, Chengdu 611731, China

Background: Since entering modern society, anxiety has become a common problem in daily life due to the gradual aggravation of social competition. The so-called anxiety belongs to the category of psychological diseases. The tension and fear caused by the inability to achieve their own goals or overcome external threats will not only frustrate people’s self-esteem and self-confidence but also distract people’s energy and attention, thus affecting people’s healthy life. From the physiological level, the increase of anxiety value is the result of disturbing brain memory and thinking, making people show anxiety, tension, indecision and disturbing emotional changes. Anxiety can lead to neurological dysfunction, mental illness, or abnormal anxiety. However, if these manifestations are excessive, they will evolve into anxiety disorders, even physical and language stiffness, mental breakdown, or common mental diseases in medicine, which will bring great inconvenience to people’s body and mind, work or study. It can be said that anxiety is not only a psychological disease, but also affects people’s judgment and form. That is to say, people in a state of anxiety will not be able to deviate from the normal track of daily life, but fall into an uncontrollable self-depression, so it is difficult to practice their own goals and linger in place in depression. Relevant studies have pointed out that anxiety will also have an impact on people’s consumption behavior, mainly manifested in extreme or irrational consumption, and produce depression and pessimism after consumption. In short, anxiety has spread to all areas of people’s daily life, which should be paid attention to.

During the 12th Five-Year Plan period, China’s e-commerce development has made remarkable achievements and achieved rapid development. E-commerce is developing fastest in the field of circulation. With the advantage of scale, it has won three world firsts: the first online shopping transaction volume, the first number of online shopping users and the first daily online shopping volume. While making remarkable achievements, China’s e-commerce development still has different regional development steps, the market development level is not high, and the market order needs to be further standardized. This is not only a major challenge for the development of the 13th Five-Year Plan, but also an important development focus. In recent years, online shopping has become a new way of life for more than 1 billion college students,

especially for those who are familiar with it. However, college students are in a specific stage of physical maturity and psychological immaturity. They are facing more and more social challenges, learning pressure and employment pressure, which leads to students' long-term tension and anxiety. According to the relevant survey data, the mental health or anxiety of college students is not optimistic. At present, about 30% of college students in China have varying degrees of mental health problems, mainly manifested in anxiety, depression, paranoia, compulsion, tension and so on. Therefore, taking college students as the research object, this paper focuses on the correlation between college students' emotional anxiety and their consumption behavior in the e-commerce environment, determines the psychological factors affecting college students' consumption, and provides corresponding suggestions to ensure college students' mental health and rational consumption.

Objective: Based on the era environment of e-commerce, this paper analyzes the impact of college students' anxiety on their consumption behavior, and provides guidance for college students' mental health and rational consumption based on the correlation between college students' anxiety and their consumption behavior.

Research objects and methods: 500 college students were randomly selected from five colleges and universities in our city. At the level of college students' anxiety emotion measurement: carry out college students' anxiety psychological measurement in combination with the diagnostic test of anxiety tendency. The scale contains 100 questions, including eight dimensions: learning anxiety tendency, anxiety tendency towards people, loneliness tendency, self-blame tendency, allergic tendency, physical symptoms, phobic tendency and impulsive tendency. Whether it is recorded as 1 point or not is recorded as 0. In the evaluation of college students' consumption behavior, the amount, frequency and quantity of consumption are used as indicators. So as to determine the correlation between college students' anxiety and their consumption behavior.

Methods: Excel software analysis was used for statistical data processing.

Results: Table 1 shows the correlation between college students' anxiety and their consumption behavior. On the whole, college students' anxiety psychology is positively correlated with their consumption amount, consumption frequency and consumption quantity, which indicates that college students will have extreme or irrational consumption behavior when they are in a state of anxiety.

Table 1. Correlation between anxiety and consumption behavior of college students

Factor	Consumption amount	Consumption frequency	Consumption quantity
Anxious learning	0.65	0.55	0.67
Communication anxiety	0.62	0.55	0.63
Loneliness tendency	0.43	0.33	0.54
Self-reproach tendency	0.34	0.44	0.34
Sensitive tendency	0.47	0.49	0.44
Physical symptoms	0.34	0.44	0.49
Terrorist tendency	0.46	0.49	0.44
Impulsive tendency	0.35	0.44	0.36
Total score	0.49	0.47	0.49

Conclusions: In the era of e-commerce, college students are the main force of online shopping. However, when college students are in anxiety, they will have extreme consumption or irrational consumption behavior. In this regard, special attention should be paid to ensure the coordinated development of college students' mental health and rational consumption.

RESEARCH ON ADVERTISING PHOTOGRAPHY FUNCTION AND COMMUNICATION ADVANTAGE BASED ON AUDIENCE PSYCHOLOGY

Hong Mu¹, Yutong Shen¹ & Shuo Zhang²

¹School of Public Administration, Hohai University, Nanjing 213022, China

²School of Art and Communication, Nanhang Jincheng College, Nanjing 211156, China

Background: People's psychological activities are not only colorful, but also extremely complex.

According to the explanation of psychology, psychology is the dynamic reflection of the human brain to the external objective world. It is the general name of psychological activity and personality process. It mainly includes feeling, perception, memory, imagination, emotion, will, interest, ability, character and so on. Human psychology is developed on the basis of animal psychology. It is the highest stage of psychological development, which is essentially different from animal psychology. It is the product of social practice and has the characteristics of consciousness and initiative. As an organic part of human psychology, audience psychology has the commonness of human psychology. At the same time, audience psychology is closely related to human communication activities, and accompanied by the formation and development of human communication activities. In this sense, audience psychology is the dynamic reflection of information dissemination in the minds of the audience. It includes the acceptable behavior and psychological activities of the audience. Psychological research shows that simple psychological activities and complex psychological activities are not illusory, but have their own characteristics and foundation. This feature is based on the human brain. The communication effect is realized by spreading information and acting on the human brain. Without the human brain and the brain of normal people, the communication of information will lose its vitality and function, and the communication effect will be impossible. As far as psychology is concerned, it is the objective premise for the formation of human brain, but it cannot reflect the reality of the human brain. Main social conditions, such as natural conditions, social customs and social reality. Without objective reality, people's psychology will become water without source and trees without roots. From the perspective of audience psychology, this "objective reality" is the communication information transmitted by communicators through specific communication tools and methods. Only when people constantly exchange information with the outside world can people think normally for a long time. Complete isolation from external information is the beginning of losing reason. External information that stimulates thinking is as important as food. Therefore, information dissemination is the source of audience psychology. Without the dissemination of information, the normal acceptance psychology of the audience cannot be produced.

Any communication activity, whether mass communication or interpersonal communication, is inseparable from the audience. Only by understanding the characteristics of the audience can we help to grasp the psychology of the audience. For advertising photography, modern advertising photography technology, especially digital image processing technology, enables people to manipulate photographic images at will, so that the creativity of advertising designers can get rid of constraints and gallop freely. Advertising photography has entered a creative era, which has brought more visual impact and enjoyment to people. However, if modern advertising photography wants to give full play to its functions and communication advantages, it is inseparable from the grasp of the audience's psychology. Relevant research points out that advertising photography based on audience psychology has important advantages in the application of advertising media, which is mainly reflected in the following aspects: the advantages of visual information dissemination, the coexistence of practical and aesthetic functions, and the advantages of authenticity, credibility and convenience. In view of this, this paper launched the research and design of advertising photography function and communication based on audience psychology, in order to bring more convenient and efficient work efficiency for advertising photography.

Objective: Based on the psychology of the audience, carry out the research and design of the function and communication of advertising photography, in order to shorten the psychological distance between advertising photography and the audience, so as to bring more convenient and efficient work efficiency.

Research objects and methods: Randomly select 100 audiences as the research object, and compare and analyze the audience's satisfaction with the advertising photography function and communication before and after the implementation of the audience's psychological intervention. The evaluation indicators include visual information communication, the coexistence of practical and aesthetic functions, authenticity, credibility, convenience and effectiveness.

Methods: The data are analyzed by Minitab20 latest version of data statistics software.

Results: Table 1 shows the audience's satisfaction with the function and communication of advertising photography before and after the implementation of audience psychological intervention. On the whole, compared with before and after the implementation of audience psychological intervention, the satisfaction of the audience has been improved in the four dimensions of advertising photography function and communication, which is statistically significant ($P < 0.05$).

Conclusions: The research and design of advertising photography function and communication based on audience psychology can effectively improve the audience's satisfaction with advertising photography function and communication, and then have significant advantages in advertising photography function and communication, which is worthy of promotion and application in the field of advertising photography.

Table 1. Audience satisfaction with advertising photography function and communication before and after the implementation of audience psychological intervention [n (%)]

Category		Dissatisfied (%)	Satisfied (%)	Very satisfied (%)
Before intervention	Visual information dissemination	40	50	10
	Practical and aesthetic functions coexist	47	43	10
	Credibility and effectiveness	60	32	8
After intervention	Visual information dissemination	20*	20*	40*
	Practical and aesthetic functions coexist	10*	20*	70*
	Credibility and effectiveness	8*	30*	62*

Note: * $P < 0.05$, compared with the satisfaction of the audience before the intervention.

THE EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION REFORM ON COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Xiuyun Chang

School of Computer and Information Science, Boda College of Jilin Normal University, Siping 136000, China

Background: Individuals expect vague and uncertain internal and external stimuli to pose a threat to their self-esteem and feel unable to cope, which constitutes an anxiety experience. Employment anxiety is a special, tense, uneasy, strong and lasting emotional experience caused by the whole employment situation, and causes corresponding physiological and behavioral changes. The main manifestations are: I think employment is a threat. I am very worried about the possible consequences of not finding a job or a good job. In the process of employment, there will be some physical reactions, such as decreased sleep quality, accelerated heartbeat, inattention and confusion of thinking, which have a great impact on my study, work and life. College students' employment anxiety can be defined as: college students' employment anxiety refers to that college students do not make psychological preparations in the face of employment, feel unable to grasp their own destiny, and do not know how to face employment competition, resulting in psychological conflicts or setbacks in employment. At present, affected by the international financial crisis, it is an indisputable fact that college students are facing a severe employment situation. In order to reduce costs, many enterprises have laid-off workers, which has exacerbated the employment anxiety of college students. Long-term anxiety is not conducive to the mental health development of college students, but also directly affects their employment effect. Therefore, the anxiety of college students has attracted the great attention of national leaders, university staff and researchers. So far, the research on college students' employment anxiety has achieved some results, which provides reference and support for college employment guidance.

Relevant research shows that the employment problem is an important factor leading to graduates' anxiety, that is to say, it reflects the universality of college students' employment anxiety. The researchers discussed the factors affecting the employment of college graduates and the reasons for employment difficulties. In the case of widespread employment anxiety among college graduates, the explanation of the huge differences between individuals is not detailed enough. Previous studies on employment anxiety are mostly aimed at college graduates and cannot cover all college students, which obviously cannot fully explain this problem. In this study, we believe that college students' employment anxiety refers to a complex emotional response that college students do not make psychological preparations in the face of employment, feel unable to grasp their own destiny, and do not know how to face employment competition, resulting in employment psychological conflict or frustration. College students have expectations and anxiety about employment. Employment anxiety is a kind of state anxiety, which gradually intensifies with the approaching of job selection and employment problems. After this problem is solved, employment anxiety will be reduced. Therefore, employment anxiety can be measured and studied as general anxiety. In short, in the case of an unsatisfactory employment environment, college students are facing greater employment pressure and challenges than ever before, showing varying degrees of anxiety. Their own regulation ability, cognition and coping style will greatly affect their emotional state. Therefore, this study studies the employment situation of college students from the perspective of psychological elasticity, in order to provide a new perspective for the development of employment psychological counseling in colleges and universities. Colleges and universities strive to cultivate college students' positive psychological quality and cultivate their healthy personality traits such as competitiveness, adaptability and stability.

Objective: This study aims to explore the relationship between psychological resilience and employment anxiety, and reveal the impact of students' psychological resilience construction on their employment anxiety, so as to take positive cognitive evaluation and coping styles to alleviate students' employment anxiety.

Research objects and methods: In order to ensure the representativeness of the sample, different universities were selected from five provinces. The types of schools include national key undergraduate colleges, provincial ordinary undergraduate colleges, independent colleges and junior colleges. Using the method of cluster stratified random sampling, 760 college students were selected from several universities. After deleting the invalid questionnaire, 658 valid questionnaires were obtained. Combined with the Ego Resiliency Scale (ER89), the level of students' psychological elasticity is measured. The scale has 14 items and adopts the 4-point scoring method. The higher the score, the better the students' psychological elasticity. At the same time, the employment anxiety of students is measured with the State-Trait Anxiety Inventory (STAI). The scale consists of 9 items and adopts the 4-point scoring method. The higher the score, the more serious the employment anxiety of students.

Methods: SPSS16.0 was used for all data's statistical processing.

Results: Figure 1 shows the correlation between college students' psychological elasticity and their employment anxiety. On the whole, college students' psychological elasticity is negatively correlated with their employment anxiety. The better their psychological elasticity is, the lower their employment anxiety is. This shows that in order to effectively alleviate students' employment anxiety, we should pay attention to the construction of students' psychological elasticity.

Figure 1. Correlation between students' psychological elasticity and their employment anxiety

Conclusions: When the employment environment is not ideal, college students are facing greater employment pressure and challenges than ever before, showing varying degrees of anxiety. The psychological elasticity of college students is negatively correlated with their employment anxiety. The better their psychological elasticity is, the lower their employment anxiety is. Therefore, all sectors of society should pay attention to the construction of students' psychological flexibility and cultivate their healthy personality traits such as competitiveness, adaptability, and stability, so as to effectively solve the employment anxiety of contemporary college students.

THE APPLICATION OF TRADITIONAL CALLIGRAPHY ART IN FASHION DESIGN AND ITS INTERVENTION EFFECT ON PEOPLE WITH COLOR VISUAL IMPAIRMENT

Xiuqin Hu & Wenxia Shan

College of Art and Design, Jiangsu University of Technology, Changzhou 213001, China

Background: 83.5% of the external information obtained by normal people depends on vision. For people with visual impairment, the obstacle of obtaining external information has brought many difficulties to their life, study and work. The difficulties they face are beyond the understanding of ordinary people. Color

vision disorders include color blindness or color weakness, which can be divided into congenital and postnatal according to the etiology. Congenital is mainly caused by heredity and less acquired. It is usually caused by some fundus diseases. In patients with color blindness, the most common are red and green color blindness, yellow and blue color blindness, and a few are panchromatic color blindness, that is, monochromatic vision. Colorblind people cannot recognize specific colors. Take red and green blindness as an example. Red and green blind people cannot distinguish between red and green. Color weakness is mainly due to the low color recognition function, which is lighter than color blindness. It is mainly divided into red weakness and green weakness. People with weak colors can see the colors seen by normal people, but their ability to recognize colors is very slow or poor. When the light is dark, some people are almost color blind or show color fatigue. For people with weak color and color blindness, the lightness and saturation of color have a great impact on their perception and discrimination of things. For high brightness and high saturation colors, their discrimination ability is very strong, but for low brightness and low saturation colors, their perception is more difficult. People with visual impairment are a group that needs special attention in today's society. In addition to the common psychological characteristics of normal people, they also have some unique psychological phenomena. Due to the differences of their own defects, living environment and visual defects, the psychology of people with visual impairment is also very different, but the main psychological manifestations are as follows: loneliness, inferiority complex, lack of sense of security, one-sidedness, doubt, dependence, and willfulness. In addition, among people with visual impairment, people with complete blindness and low vision are psychologically different from those with congenital visual impairment. Blind people and people with low vision have difficulty adapting to the sense of self-loss caused by impaired vision. In terms of self-identity, they were neither healthy nor able to attribute themselves to people with impaired vision. They are less willing to learn skills such as learning, travel, and daily life. At the same time, they don't want people to know that their eyesight is damaged, which makes them lonelier and more sensitive to losing themselves.

China's current economic development level is improving day by day, and the living standards of the majority of citizens have gradually stepped to a new level. In this case, people have higher standards for clothing. In today's society, fashion design, as a practical art, has gradually entered the public view, and can even become the focus of public opinion. At the same time, with the further improvement of cultural self-confidence, the proportion of excellent traditional culture and traditional element symbols in people's aesthetic and daily needs is gradually increasing. As a representative cultural and artistic treasure in Chinese traditional culture, calligraphy not only has strong aesthetic value but also has unique practical value and collection value. Chinese calligraphy has a profound historical origin. Inheriting Chinese calligraphy is an important responsibility of every Chinese. Therefore, the combination of traditional calligraphy art and fashion design has the creativity and skill of design. Relevant studies have pointed out that the integration of traditional calligraphy and fashion design is of positive significance for people with color vision impairment, which can significantly enhance the psychological development of people with color vision impairment. Based on this, this study constructs an intervention model integrating traditional calligraphy and fashion design, in order to solve the psychological problems of people with color vision impairment, and open another "colorful" art window for people with color vision impairment.

Objective: This study constructs an intervention model integrating traditional calligraphy and fashion design, which aims to solve the psychological problems of people with color vision impairment, promote the self-adaptation and self-identity ability of people with color vision impairment, and meet their future life with a new attitude.

Research objects and methods: 100 patients with color vision impairment were randomly selected as the research object. A scheme integrating traditional calligraphy and fashion design was adopted to carry out psychological intervention on patients with color vision impairment. The intervention period was 3 months. The psychometric scale, designed by ourselves in combination with the psychological characteristics of patients with color vision impairment, includes seven dimensions: loneliness, inferiority complex, lack of security, one-sidedness, doubt, dependence, and willfulness. The higher the score, the more serious the psychological problems of patients with color vision impairment.

Methods: The data were analyzed by SPSS20.0 data statistics software.

Results: Table 1 shows the psychological changes of patients with color vision impairment before and after the intervention of integrating traditional calligraphy and fashion design. It can be seen from Table 1 that compared with before the intervention, the psychological problems of patients with color vision impairment were alleviated after the intervention of integrating traditional calligraphy and fashion design ($P < 0.05$).

Conclusions: The intervention mode integrating traditional calligraphy and fashion design can effectively improve the psychological problems of patients with color vision impairment, which is worthy of popularization and application in the specific treatment of patients with color vision impairment.

Table 1. Psychological changes of patients with color vision impairment before and after the intervention of integrating traditional calligraphy and fashion design

Dimensions of psychological problems	Before intervention	After intervention	<i>P</i>
Loneliness	4.15±0.67	1.72±0.71	<0.05*
Inferiority	3.03±0.61	1.95±0.70	<0.05*
Lack of security	4.06±0.79	2.28±0.64	<0.05*
One sidedness	3.34±0.76	2.39±0.67	<0.05*
Doubt	4.65±0.81	1.97±0.64	<0.05*
Dependence	3.78±0.66	1.97±0.67	<0.05*
Willfulness	4.00±0.59	2.12±0.77	<0.05*

Note: **P* < 0.05, comparison of psychological changes before and after the intervention.

THE CULTIVATION OF COLLEGE STUDENTS’ INNOVATION AND ENTREPRENEURSHIP ABILITY BY IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Fujin Hao

Changzhou Vocational Institute of Industry Technology, Changzhou 213164, China

Background: Educational psychology is a branch of psychology that studies the educational process. The emergence of educational psychology is a historical process in which psychology and education are combined and gradually form an independent branch. In short, educational psychology is a science that studies the laws of all aspects of the learning and teaching process. Specifically, it has the following aspects: first, the characteristics of educators. Educational psychology first needs to understand the characteristics of the executors of the educational process, that is, teachers, and the impact of these characteristics on the teaching process. Every educator has his own set of teaching ideas and methods, and the personality characteristics of educators will also affect the educational process. For example, strict educators prefer traditional teaching methods, and the response of educational objects is more constrained. In front of democratic and lively educators, educational objects can express themselves more freely. Second, the characteristics of educational objects. As educational objects, most of them have their own learning philosophy. In education, they advocate “teaching students according to their aptitude”, that is, according to the different characteristics of educational objects, giving different education, putting forward different requirements, and adopting different teaching methods and methods. Therefore, educators must understand the personality characteristics of the educational object and its learning motivation, learning ability and learning habits. Only in this way can education be targeted and education can give full play to its effectiveness. Therefore, educational psychology must also understand the other half of the participants in the educational process, that is, the educational object, and pay attention to teaching students according to their aptitude. Third, educational methods. The influence of different educational methods on different subjects and different teaching contents, and how educators cooperate with teaching methods to achieve good teaching results are also the research content of educational psychology.

Innovation and entrepreneurship are parallel. All successful entrepreneurs have experienced systematic innovation practice, so we can’t talk about innovation without entrepreneurship. Relevant studies have pointed out that there is a positive correlation between innovation and entrepreneurial sharing and economic growth. Promote the virtuous circle effect, better entrepreneurship and innovation will promote economic activities, and economic activities will also have a positive impact on innovation and entrepreneurship activities. Innovation and entrepreneurship education is a new concept education method that combines innovation education and entrepreneurship education. At the same time, give consideration to the cultivation of students’ thought and practice, pay attention to cultivating students’ innovative spirit, entrepreneurial consciousness, entrepreneurial thinking and practical ability, constantly tap students’

potential and realize students' innovative and entrepreneurial behavior. The speed of social development is gradually accelerating, and the speed of social multiculturalism entering the campus is beyond imagination. Under the background of the gradual deepening of domestic comprehensive education reform, mental health education has been highly valued by colleges and universities. In view of this, this study constructs a new ideological and political education model based on the perspective of educational psychology, so as to investigate the positive role of the ideological and political education model facing educational psychology in cultivating college students' innovation and entrepreneurship ability.

Objective: From the perspective of educational psychology, this paper comprehensively and systematically summarizes the psychological characteristics, existing problems and related influencing factors of university innovation and entrepreneurship ability, and constructs the ideological and political education model based on educational psychology, in order to point out the path for improving university innovation and entrepreneurship ability, in order to achieve the innovation and entrepreneurship behavior of college students.

Research objects and methods: 100 students were randomly divided into the control group and experimental group, with 50 students in each group. Among them, the control group adopted traditional ideological and political education, while the experimental group adopted ideological and political education based on educational psychology for one month. The innovation and entrepreneurship ability of students is measured in combination with the innovation and entrepreneurship ability scale of college students. The scale has 13 items and adopts the 5-level scoring method. The higher the score, the higher the innovation and entrepreneurship ability of students.

Methods: SPSS16.0 software was used for statistical processing.

Results: Table 1 shows the comparison of the scores of innovations and entrepreneurship ability between the two groups of college students. On the whole, compared with the traditional ideological and political education model, after the implementation of the ideological and political education intervention based on educational psychology for one month, the total score of students' entrepreneurial ability and the scores of all dimensions are improved, which shows that the ideological and political education model based on educational psychology can effectively improve students' innovative and entrepreneurial ability.

Table 1. Comparison of scores of innovations and entrepreneurship ability between the two groups of college students (*n*=100)

Project	Control group (<i>n</i> =50)	Experience group (<i>n</i> =50)	<i>P</i>
Achievement motivation	2.15	4.63	<0.05
Opportunity recognition ability	2.17	4.59	<0.05
Interpersonal skills	2.44	4.39	<0.05
Be quick-witted	2.26	4.15	<0.05
Professional knowledge	2.18	4.17	<0.05
Willpower	2.63	4.44	<0.05
Self-confidence	2.59	4.26	<0.05
Self-management ability	2.39	4.18	<0.05
Independence	2.15	4.78	<0.05
Organizational consciousness	2.17	4.43	<0.05
Adaptability	2.63	4.29	<0.05
Service consciousness	2.59	4.23	<0.05
Total score	39.46	55.46	<0.05

Conclusions: In the process of building a national innovation system and creating an innovation and entrepreneurship atmosphere, college students' innovation and entrepreneurship education is important work. Through innovation and entrepreneurship education, cultivate innovation and entrepreneurship talents, drive and promote the innovation and entrepreneurship activities of the whole society, and promote the development of the national economy. The ideological and political education model based on educational psychology can significantly improve the innovation and entrepreneurship ability of contemporary college students, which is worthy of popularization and application in college education.

ON THE REFORM OF LOGISTICS MANAGEMENT IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF COMMUNICATION PSYCHOLOGY

Meiyan Xu

Logistics Department, Nanjing Tech University, Nanjing 210009, China

Background: As the name suggests, communication psychology is an interdisciplinary subject of communication and psychology. It is not only a branch of applied psychology, but also a branch of communication. It has the dual nature of natural science and social science. It relies more on the research methods of social science, but it also has humanism. Communication psychology is called interdisciplinary because its parent disciplines mass communication and psychology are interdisciplinary. As a branch of applied psychology, psychology has two modes of communication. First, from the perspective of general psychology, communication psychology is divided into a branch of psychology. Second, from the perspective of applied psychology, communication psychology is classified into the category of applied psychology. The so-called applied psychology refers to the general name of disciplines that apply the principles and rules of psychology to various practical fields. In short, communication psychology can be divided into a branch of psychology or applied psychology, whether in the field of large communication perspective or in the field of applied psychology. In short, communication is a subject that studies how human beings use symbols to transmit social information. Psychology generally believes that the definition of symbols is a science that studies the occurrence, development and change law of psychological phenomena. In the process of the formation of communication, psychology is used to study the law of psychological activities as psychology. It enriches and enriches the research content of communication by excavating the internal driving force and emotional factors of communication phenomena, so that communication-based on macro research and process research can learn from micro research and psychological research. As one of the most humanized and humanized social activities, communication also adds new research content and discourse space to psychological research. The psychological phenomena and activity laws of communicators, gatekeepers, intermediaries and audiences in communication activities are also what people want to understand, which also makes psychological research more realistic and practical. Relevant research points out that since the new era, communication psychology has covered all fields of life. In recent years, the reform of the management model based on communication psychology has become one of the research hotspots.

The refined management of logistics in colleges and universities refers to comprehensively implementing responsibilities, clarifying responsibilities, refining and optimizing the whole management process, realizing the specialization of organizational structure, the institutionalization of management mode and the standardization of work mode on the basis of paying attention to standards and norms. It mainly includes two aspects: on the one hand, the implementation of full staff management. In daily work, each employee participates in the implementation and organization of enterprise management activities, and determines appropriate standards for post quantification, workflow and compounding, so as to achieve the best work effect. On the other hand, realize the whole process management. In every link of work management, we should pay attention to each link to make each link interrelated and realize detail management. Relevant research points out that communication psychology plays an important role in promoting the fine management of logistics in colleges and universities, which not only meets the requirements of modern management, but also meets the needs of the reform and development of colleges and universities. In view of this, this study constructs a refined management model of university logistics based on communication psychology, in order to make the university logistics service more detailed and comprehensive.

Objective: To explore the application effect of the refined management mode of university logistics based on communication psychology, in order to provide new ideas and methods for improving university logistics management.

Research objects and methods: 250 college students were randomly selected as the research object to carry out the intervention of refined management mode of college logistics based on communication psychology for one month. The application effects of refined management mode of college logistics based on communication psychology before and after the intervention were compared and analyzed. The application effect is carried out by satisfaction evaluation, including dissatisfaction, satisfaction and very satisfaction.

Methods: Obtain student satisfaction before and after the intervention of the refined management mode of logistics in colleges and universities based on communication psychology through SPSS21.00 data statistical analysis software.

Results: Table 1 shows the student satisfaction before and after the intervention of the refined management model of logistics in colleges and universities based on communication psychology. It can be seen from Table 1 that compared with the implementation of the refined management mode of logistics in colleges and universities based on communication psychology before the intervention, the dissatisfaction

rate of students is only 10% one month after the intervention, while the proportion of satisfaction and very satisfaction is 90%. There is a statistical difference before and after the intervention ($P < 0.05$). This shows that the refined management model of logistics in colleges and universities based on communication psychology has a good application effect.

Table 1. Students' satisfaction before and after the intervention of refined logistics management model in colleges and universities based on communication psychology [n (%)]

Category	Dissatisfied (%)	Satisfied	Very satisfied
Before intervention	50 (20)	125 (50)	75 (30)
After intervention	25* (10)	50* (20)	175* (70)

Note: * $P < 0.05$, compared with the satisfaction of students before intervention.

Conclusions: The intervention of refined management mode of university logistics based on communication psychology has achieved good application results. Compared with before the intervention, students have higher satisfaction, so it is worth popularizing and applying in university logistics management.

* * * * *

ON THE TEACHING REFORM PATH OF HIGHER VOCATIONAL ART EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaoju Ye

School of Software, Sichuan Vocational College of Information Technology, Guangyuan 628017, China

Background: "Educational psychology" is a science that studies the basic psychological laws of situational learning and teaching in schools. It is also a branch of psychology, which studies the psychological activities of educators and students and their generation and change laws in the process of education and teaching. It is a marginal subject between educational science and psychological science. At present, in order to meet the needs of the continuous development of education, the task of educational psychology is also increasing, and the research object is also gradually expanding. With the increasing attention of education to people's all-round development, educational psychology has shifted from the initial focus on the research of learning psychology and the discussion of learning laws to the cultivation of moral behavior, independent thinking and practical ability. Specifically, educational psychology includes three aspects: first, the characteristics of educators. Educational psychology first needs to understand the characteristics of the executors of the educational process, that is, teachers, and the impact of these characteristics on the teaching process. Every educator has his own set of teaching ideas and methods, and the personality characteristics of educators will also affect the educational process. Second, the characteristics of educational objects. As the object of education, educators must understand the individual characteristics of the object of education and its learning motivation, learning ability and learning habits. Only in this way can education be targeted and play a full role. Third, educational methods. The influence of different educational methods on different subjects and different teaching contents, and how educators cooperate with teaching methods to achieve good teaching results are also the research content of educational psychology.

As an art form, the fundamental purpose of art education is to further improve and even sublimate people's psychological quality and even ideological realm, and promote the all-round development of personality through the cultivation of aesthetic sentiment. Human education is comprehensive. As a form of education, it is not enough to explore the educational function only from the perspective of art theory or painting skills. Under the diversified educational concept, higher vocational art education should also explore the fundamental function of art education from the perspective of educational psychology, realize the combination of art education and psychological education, and explore the mutual influence and promotion relationship in the process of education is the development trend of future education. Combining higher vocational art education and educational psychology into teaching practice is the best way to promote the development of art education and educational psychology. Higher vocational art education should abandon the previous closed teaching methods, adopt open teaching methods, be people-oriented, guide students to think and create independently, and grasp the connotation of art as a whole. The change of teaching methods is inseparable from the subjectivity of students. Educating students to respect, share

and cooperate with rich and diverse teaching methods, effectively adjusting personal psychological changes and maintaining a healthy and good state of mind is also a powerful weapon for students to face the complex and changeable social reality. In view of this, starting from the essence of higher vocational art education and from the perspective of educational psychology, this paper discusses the role of higher vocational art education in the cultivation of people's psychological quality, as well as the relationship between educational psychology and higher vocational art education, in order to help shape higher vocational art psychology education in the future.

Objective: From the perspective of educational psychology, this paper summarizes the psychological characteristics, existing problems, and influencing factors of the traditional higher vocational art education curriculum, and constructs the curriculum reform mode of higher vocational art education based on educational psychology, which aims to improve the positive personality of higher vocational students in the process of art learning, in order to reshape the emotion and psychological cognition of higher vocational students for art curriculum.

Research objects and methods: 100 students majoring in fine arts in a higher vocational college were randomly divided into control group and experimental group, with 50 students in each group. Among them, the control group took the traditional art education curriculum, while the experimental group took the art curriculum based on educational psychology for 3 months. The positive personality of students is measured in combination with the positive personality scale. The scale has 88 items, including 24 dimensions. The higher the score, the more stable the corresponding positive personality is. Finally, it analyzes and compares the changes of students' positive personalities under the two teaching methods of art courses in higher vocational colleges.

Methods: All data were statistically processed by SPSS22.0 software.

Table 1. Comparison of positive personality scores between two groups of higher vocational art students ($n=100$)

Factors of positive personality	Before intervention	After intervention	<i>P</i>
Creativity	3.15±0.67	5.12±0.77	<0.05*
Curiosity	3.03±0.61	6.38±0.77	<0.05*
Judgment	3.06±0.79	6.51±0.84	<0.05*
Studious	3.34±0.76	6.72±0.71	<0.05*
Insight	3.65±0.81	6.01±0.62	<0.05*
Brave	3.78±0.66	6.59±0.63	<0.05*
Insist	4.00±0.59	5.97±0.67	<0.05*
Sincere	3.09±0.65	5.12±0.77	<0.05*
Enthusiasm	3.09±3.60	6.38±0.77	<0.05*
Love	3.66±0.74	6.51±0.8	<0.05*
Kindhearted	3.56±0.68	6.72±0.71	<0.05*
Intelligence	3.77±0.73	5.95±0.70	<0.05*
Team	3.78±0.69	4.28±0.64	<0.05*
Fair	3.15±0.67	6.39±0.67	<0.05*
Leadership	3.03±0.61	6.97±0.64	<0.05*
Tolerant	3.06±0.79	5.97±0.67	<0.05*
Modest	3.34±0.76	5.12±0.77	<0.05*
Cautious	3.65±0.81	6.38±0.77	<0.05*
Autonomy	3.78±0.66	5.12±0.77	<0.05*
Appreciate	4.00±0.59	6.38±0.77	<0.05*
Gratitude	3.09±0.65	6.51±0.84	<0.05*
Hope	3.09±3.60	6.72±0.71	<0.05*
Humor	3.66±0.74	6.01±0.62	<0.05*
Faith	3.56±0.68	6.59±0.63	<0.05*

Note: * $P < 0.05$, comparison of positive personality before and after the intervention.

Results: Table 1 shows the comparison of positive personality scores between the two groups of higher vocational art students. On the whole, compared with the traditional higher vocational art curriculum, after the implementation of the higher vocational art reform curriculum based on educational psychology, the students' positive personality scores have improved in all dimensions ($P < 0.05$). This shows that the higher vocational art curriculum reform model based on educational psychology can effectively improve students' positive personalities.

Conclusions: The reform model of higher vocational art curriculum based on educational psychology can

significantly improve the positive personality of art students, and then it is of great significance to reshape students' psychological cognition of art curriculum.

ANALYSIS ON THE IMPORTANCE OF MEDICAL NURSING IN THE TREATMENT OF CENTRAL NERVOUS SYSTEM DISEASES

Qi Mu & Guowei Zhang

Mongolian Dementia Institute, Inner Mongolia Minzu University, Tongliao 028000, China

Background: The central nervous system is an important nervous system of the human body. It is mainly composed of human brain nervous system and spinal cord nervous system. It organically combines the nerves in the human body to realize the transmission and reception of all information in the human body. The pathology of central nervous system diseases mainly occurs in the neural tube, neural crest, spinal cord or brain. The clinical symptoms are as follows: in recent years, with the rapid development of neurological technology in the medical field, new breakthroughs have been made in the research of human central nervous system diseases, such as high fever, headache and dizziness, blurred consciousness, nausea and vomiting, difficulty in movement, hemiplegia, language disorder, partial limb weakness, neck stiffness, epilepsy and so on. In recent years, the research and development of central nervous system (CNS) drugs is particularly active in the medical community at home and abroad. At present, there are more than 180 kinds of central nervous system drugs in clinical use in China. Among central nervous system drugs, antipsychotics include antipsychotics, antidepressants and anxiolytics. Among them, antipsychotics are mainly used to treat schizophrenia, so they are also called schizophrenia drugs. After the advent of such drugs, about 2/3 of patients can get different degrees of improvement, but 1/3 of patients are in a non-reactive state. In terms of pharmacological effects, the dopamine hypothesis has attracted the most attention in the past 30 years. All antipsychotics can block dopamine receptors, and blocking the dopamine D2 receptor is the basis of the curative effect. Antidepressants treat depression. Its symptoms are characterized by sadness, disappointment and depression. In addition, there are anxiety, slow action, slow thinking, self-blame and inferiority delusion, insomnia, headache, loss of appetite and so on. Studies have shown that depression is associated with an imbalance in the levels of various neurotransmitters in the brain, including norepinephrine, monoamine oxidase and serotonin. According to the pharmacological mechanism of drugs, new antidepressants can be divided into four categories: serotonin reuptake inhibitors. Serotonin-norepinephrine reuptake inhibitor. Reversible monoamine oxidase-A inhibitor. Antidepressants with dual effects on serotonin. The main treatment objects of anti-anxiety drugs are anxiety and panic disorder, including obsessive-compulsive disorder, hysteria and crowd phobia. The prevalence of anxiety disorder abroad is about 5%, lower than that of neurasthenia in China. Methyl alanine is the first listed anti-anxiety drug, which has been gradually eliminated and replaced by later developed benzodiazepines. The diagnosis of central nervous system diseases can be determined by the combination of CT, Magnetic Resonance Imaging (MRI), superconducting Magnetic Resonance Spectroscopy (MRS) and other basic examinations.

Relevant studies have pointed out that neurology nursing plays an important role in the treatment of central nervous system diseases. The traditional neurology nursing management model and concept have been difficult to meet the needs of social development. Therefore, reforming the existing nursing management methods and introducing the latest nursing management model plays an important role in improving the quality of nursing work in neurology. The application of fine management mode in the nursing management of neurology department can not only effectively reduce the cost of medical service, but also greatly improve the quality of hospital medical service, which is of positive significance to promoting the healthy and sustainable development of the hospital in the future. In view of this, this paper will discuss in detail the clinical application effect of neurology nursing based on refined management in the treatment of central nervous system diseases.

Objective: This paper explores the application effect of neurology nursing based on detailed management in the treatment of central nervous system diseases, in order to ensure the life, health and safety of patients with central nervous system diseases and improve patients' satisfaction with the nursing effect of neurology, so as to provide a new nursing strategy for the treatment of central nervous system diseases.

Research objects and methods: 110 patients with central nervous system diseases treated in the Department of Neurology of our hospital from January 2019 to January 2020 were randomly divided into

control group and intervention group, with 55 cases in each group. The control group was treated with routine nursing, and the intervention group was treated with neurology nursing with fine management. The recovery of central nervous system diseases was assessed by the National Institutes of Health Stroke Scale (NIHSS), with a full score of 42. The specific evaluation criteria are: 0-1 points are normal or close to normal, 2-4 points are mild symptoms, 5-15 points are moderate symptoms, 16-20 points are moderate to severe symptoms, and 21-42 points are severe symptoms. The changes in neurological function before and after nursing were compared between the two groups.

Methods: SPSS16.0 software was used for data statistical processing.

Results: Table 1 shows the application effects of two nursing methods in the treatment of central nervous system diseases. According to Table 1, there was no significant difference in NIHSS scores between the two groups before nursing ($P > 0.05$). After nursing, the NIHSS score of the two groups decreased ($P < 0.05$), and the NIHSS score of the intervention group was lower than that of the control group. This shows that neurology nursing based on detailed management has a good nursing effect in the treatment of central nervous system diseases.

Table 1. Application effect of two nursing methods in the treatment of central nervous system diseases ($n=110$)

Group	Number of cases	NIHSS score		<i>t</i>	<i>P</i>
		Before nursing	After nursing		
Intervention group	55	16.50±3.50	5.20±1.00	26.514	0.000
Control group	55	16.00±3.22	8.50±1.50	15.478	0.000
	<i>t</i>	0.485	13.575	-	-
	<i>P</i>	0.400	0.00	-	-

Conclusions: As a scientific modern management technology, the application of fine management in the nursing management of hospital neurology department can effectively reduce the NIHSS score of central nervous system diseases, so as to improve the nursing quality of central nervous system diseases, which is worthy of clinical application.

THE INFLUENCE OF THE INTEGRATION OF RED CULTURE INTO IDEOLOGICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS' MENTAL HEALTH QUALITY IN THE CONTEXT OF NEW MEDIA

Xian Xia¹ & Yang Nie²

¹*Propaganda Department of Party Committee, Changzhou Institute of Technology, Changzhou 213032, China*

²*Electromechanical College, Changzhou Vocational Institute of Textile and Garment, Changzhou 213164, China*

Background: College students are a new force in the construction of China's socialist cause. They shoulder a very important mission in the great rejuvenation of the country and nation. Their own physical and mental health is the premise for them to complete their mission and give full play to their value. However, influenced by various subjective and objective factors, the current situation of college students' physical and mental health is not optimistic. In terms of mental health, many college students have more or less psychological problems, and even develop mental diseases. The reason for this situation is not only closely related to the fact that most contemporary college students are only children, spoiled from childhood, have weak psychological quality and are vulnerable to external influence, but also closely related to the weak development of college students' mental health education. What is college students' mental health education? Or what is the content of college students' mental health education? It is the cornerstone of college students' mental health education research. Only on the premise of clarifying the content of mental health education can mental health education be carried out in an orderly manner. Generally speaking, the content of college students' mental health education mainly includes the following

two points: first, the correction of psychological problems. Influenced by various subjective and objective factors such as family environment and employment situation, the incidence of college students' psychological problems is rising, which seriously affects the healthy growth of college students. Second, the development of mental health. Mental health is not only an important part of physical and mental health, but also an indispensable part of college students' learning, growth and life. The mental health of college students directly determines the final result of college education and their own development prospects. The core content of college students' mental health education is to guide college students to cultivate a positive and healthy mental outlook and living state with different forms of educational methods and means. In short, as an important part of higher education, mental health education is not only an important link in the growth and development of college students, but also the objective need for colleges and universities to practice the concept of quality education and fulfill the responsibility of talent training. At the same time, college students' mental health education also plays an inestimable role in the country.

Facing the new media environment of value diversification, political multi-polarization and economic globalization, in order to fully broaden the teaching resources and teaching ideas of ideological and political education and promote the psychological development of college students in the right direction, it is necessary to incorporate the red culture containing rich cultural value, historical material value and political value into the construction of contemporary ideological and political education, in the process of realizing the healthy and sustainable development of red culture, we should achieve the goal of stabilizing the mental health of modern college students. Because the shock and appeal beyond time and space contained in the advanced red culture is not only the voice and theme of contemporary ideological and political education, but also the key to boost the Chinese spirit and infuse the cultural gene. It can be said that the ideal and belief fire of red culture is good medicine to solve the physical and mental problems of contemporary college students facing the complex new media environment. In view of this, facing the complex new media context, this study constructs a new ideological and political education model in colleges and universities based on red culture, and on this basis, analyzes the mental health problems of modern college students, so as to continuously output the main force of all-round physical and mental development for the construction of China's socialist cause.

Objective: In order to accurately grasp the psychological changes of college students and improve the mental health level of college students, starting from the background of the new media environment, this study constructs a teaching mode of ideological and political education in colleges and universities based on red culture, in order to carry forward China's excellent red culture on the basis of ensuring the physical and mental health of college students.

Research objects and methods: 300 students from a university were randomly divided into control group and experimental group, with 150 students in each group. Among them, the control group adopted traditional ideological and political education, while the experimental group adopted ideological and political education based on red culture for half a semester. The mental health status of college students was assessed with SCL-90, which includes 10 factors such as somatization, interpersonal sensitivity, depression, paranoia and anxiety. Each factor item is evaluated with a five-level scoring standard of 1-5 points. Finally, the mental health changes of the two groups of college students before and after the intervention were compared and analyzed.

Methods: All data were statistically processed by SPSS18.0 software.

Table 1. Comparison of self-assessment scores of mental health between the two groups of college students ($n=300$)

Project	Control group ($n=150$)	Experience group ($n=150$)	<i>P</i>
Somatization	2.15	1.28	<0.05
Obsession	2.17	1.85	<0.05
Sensitive	2.44	1.70	<0.05
Depressed	2.26	1.51	<0.05
Anxious	2.18	1.40	<0.05
Hostile	2.63	1.45	<0.05
Fear	2.59	1.32	<0.05
Paranoid	2.39	1.53	<0.05
Psychotic	2.15	1.44	<0.05
Ad-items	2.17	1.47	<0.05

Results: Table 1 shows the comparison of self-assessment scores of mental health between the two

groups of college students. On the whole, compared with the traditional ideological and political education model, the scores of students' self-assessment of mental health decreased half a semester after the implementation of ideological and political education intervention based on educational red culture ($P < 0.05$). This shows that the ideological and political education model based on red culture can effectively improve students' mental health.

Conclusions: Facing today's society of value diversification, political multi-polarization and economic globalization, red culture, as the witness and recorder of the historical development of Chinese revolution, contains rich cultural value, historical material value and political value. This undoubtedly determines the status and role of the integration of red culture into contemporary ideological and political education, that is, to broaden the teaching resources of ideological and political education, guide the all-round and healthy development of students' body and mind, and promote the construction of socialist core value system.

THE INNOVATION OF COLLEGE ENGLISH INFORMATION TEACHING UNDER THE BACKGROUND OF DIVERSIFICATION AND ITS IMPACT ON COLLEGE STUDENTS' ANXIETY

Fang Li

Public Course Department, Changde Vocational Technical College, Changde 415000, China

Background: With the continuous progress of social and economic development, the application of the "informatization" action plan under the diversified background has gradually expanded to all aspects of daily life, promoting the innovation and development of all walks of life. The industrial platform of diversification + informatization mainly combines the Internet industry with other traditional industries through the information network platform, makes full use of the advantages and advantages of information and communication technology, and opens up a new development ecology. Under the background of "informatization", the education industry has ushered in new opportunities for innovation and development, and the college English teaching model is also significantly innovated and optimized. From the perspective of "informatization under diversified background", the innovation and upgrading of college English teaching ideas and models can effectively improve the effectiveness of college English teaching, enhance college students' enthusiasm and initiative in learning English, ensure that college English teaching conforms to the trend of the times and meet the needs of college students' English learning and all-round development. In the process of daily study and life, college students often face pressure from study, employment and interpersonal communication. Because their psychological development is in a key stage, anxiety is very common among college students.

In China, college English education is a very important part of the higher education system. As an important compulsory subject in higher vocational colleges, modern college students' English foundation is generally weak and their English level is relatively low. Most college students have a certain fear and weariness of English learning. They have great psychological pressure and anxiety in the English classroom. This is because language learning is a very complex psychological process. The whole process of language learning is bound to be deeply affected by psychological and emotional factors. Among all affective factors, anxiety is a major factor affecting students' English learning and is considered to be one of the most critical psychological variables. Studies at home and abroad have shown that affective factors have a great impact on students' foreign language learning. As an important factor in emotional factors, anxiety is considered to be the most important and one of the most critical psychological variables. In the whole process of foreign language learning, foreign language anxiety has a great impact on learning results. Foreign language anxiety is a psychological term put forward by American psychologist Horwitz in 1986. Horwitz believes that foreign language anxiety is related to foreign language learning. Foreign language anxiety exists in the whole process of students' foreign language learning, from acquiring knowledge to applying knowledge. As a result, the level of anxiety plays an important role in one's foreign language learning. Compared with the commonly used traditional teaching methods, a more effective teaching method to alleviate students' foreign language anxiety is worth exploring. In view of this, based on the teaching background of "diversification + informatization", this paper carries out the innovation and optimization of college English teaching, in order to alleviate the anxiety of college students, shape their healthy personality and improve their psychological quality.

Objective: Based on the teaching background of "diversification + informatization", this paper launches the innovative design of college English informatization teaching, aiming to enrich the diversity and interest

of college English informatization teaching. At the same time, it actively discusses the role of college students' English informatization innovation teaching under the diversified background in alleviating college students' English learning anxiety, so as to improve the learning ability and learning level of college students while shaping college students with sound body and mind.

Research objects and methods: 300 students from different universities were divided into two groups by random number table method, namely control group and experimental group. There are 150 college students in each group. The control group adopted the traditional college English teaching mode. The experimental group adopted the innovative education model of college English information teaching under a diversified background. After one semester of intervention, the Self-rating Anxiety Scale (SAS) was used to compare the anxiety of the two groups of college students. The higher the score of SAS, the more obvious the anxiety of college students and the more serious the anxiety symptoms. Finally, the changes in English learning anxiety levels of the two groups of college students before and after the intervention are compared and analyzed.

Methods: All data were statistically processed by SPSS18.0 software.

Results: Table 1 shows the comparison of English learning anxiety between the two groups of college students. On the whole, compared with the traditional college English education model, after the implementation of the innovative education model of college English information teaching based on the diversified background for one semester, the students' English learning anxiety level decreased ($P < 0.05$). This shows that the innovative education model of college English information teaching based on a diversified background can effectively improve college students' English learning anxiety.

Table 1. Comparison of English learning anxiety between the two groups ($n=300$)

Project	Control group ($n=150$)	Experience group ($n=150$)	<i>P</i>
Anxious learning	8.17±3.71	6.15±2.32	<0.05
Communication anxiety	4.19±3.25	3.63±2.23	<0.05
Loneliness tendency	5.63±2.23	3.45±2.58	<0.05
Self-reproach tendency	6.15±2.32	3.46±1.45	<0.05
Sensitive tendency	6.42±3.71	3.45±2.58	<0.05
Physical symptoms	6.88±2.23	3.46±1.45	<0.05
Terrorist tendency	3.46±1.45	2.45±2.58	<0.05
Impulsive tendency	3.45±2.58	1.46±3.25	<0.05
Total score	41.09±17.34	35.91±19.71	<0.05

Conclusions: In the process of college English learning, college students often face great learning pressure. Due to the fear or resistance to English learning difficulties, college students have a certain degree of anxiety, which affects their mental health level. Under the background of “diversification + informatization”, the reform and optimization of college English teaching mode can be realized by making rational use of Internet technology. It can abandon the disadvantages of traditional college English teaching mode, eliminate college students' fear and psychological pressure on English learning, and effectively improve college students' classroom awareness and English learning enthusiasm.

* * * * *

DESIGN AND IMPLEMENTATION OF XINJIANG MINORITY MUSIC EDUCATION RESOURCE BANK FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Guojun Sun & Qiuli Liang

Conservatory of Music, Xinjiang Normal University, Urumqi 830054, China

Background: China is a country with multi-ethnic and multi-cultural coexistence. With the social development and progress, the protection and inheritance of ethnic minority traditional culture have been paid more and more attention by the state. As an important gathering place of ethnic minorities in China, Xinjiang has given birth to a large number of ethnic minority traditional cultures. Among them, ethnic minority music culture, as a key part of Chinese national culture, has extremely important value. The inheritance of minority music culture in Xinjiang is a systematic project. In order to carry out long-term inheritance and protection of minority music culture in Xinjiang, China has put forward a large number of

protection measures, including the construction of inheritance mode, among which the education mode is the most convenient. The educational inheritance of Xinjiang minority music culture is to cultivate professionals with minority music literacy and skills through teaching. Building a perfect teaching resource library in education and teaching can improve teaching efficiency. As the key to the construction of digital campus, in order to realize the correct distribution of teaching materials and avoid the unsatisfactory teaching effect caused by blind query, cognitive psychology theory is introduced to guide the construction of teaching resources.

Cognitive psychology theory includes perceptual processing theory, central energy theory, cognitive memory structure and process theory and problem-solving theory. The above four theories need to be applied interactively in the design of Xinjiang minority music education resource database. Firstly, cognitive psychology believes that human knowledge and experience are closely related to human perception. The perceptual processing theory suggests that the construction of educational resource database needs a large number of examples to eliminate wrong ideas in teaching. According to the central energy theory, attention is limited. In education, students will pay attention to the distribution of different resources when facing a large amount of data, resulting in students' inability to concentrate on learning. According to the cognitive memory structure and process theory, teaching resources should be situational, construct significant memory points, and promote students' memory transformation in music education. Problem solving theory holds that in music education and teaching, we need to find problem representation according to students' cognitive memory points and solve it at the same time. In a word, cognitive psychology starts from human cognition and follows people's cognitive psychology when accepting foreign objects, so as to put forward corresponding communication means, which can achieve the effect of common progress in education.

Objective: To construct the educational resource database through the relevant theories of cognitive psychology, and use the educational resource database to realize the music education and inheritance of ethnic minorities in Xinjiang.

Methods: A questionnaire was constructed to investigate the current situation of minority music teaching in three schools in Xinjiang, analyze the students' cognitive psychology in minority music education in Xinjiang, and build a teaching resource database with personalized cognitive psychology characteristics. At the same time, the constructed minority music education resource database is applied to music teaching in three colleges and universities to evaluate the implementation effect of Xinjiang minority music education resource database from the perspective of cognitive psychology.

Results: A total of 200 students in the three schools participated in the questionnaire survey, 198 questionnaires were recovered and 194 valid questionnaires were obtained. Quantify the influence value of specific factors in the questionnaire as level 0-4. 0 means irrelevant, 1 means slight impact, 2 means general impact, 3 means obvious impact and 4 means complete impact. The questionnaire shows that the impact of four cognitive psychological theories, namely perceptual processing theory, central energy theory, cognitive memory structure and process theory and problem-solving theory, on the construction of Xinjiang minority music education resource bank is level 4, 3, 4 and 4 respectively, as shown in Table 1.

Table 1. The influence of cognitive psychology on the construction of educational resource database

Index	Perceptual processing	Central energy	Cognitive memory structure and process	Problem solving
Educational resource bank	4	3	4	4

Conclusion: The construction of educational resource database is the basis of ensuring school education and teaching. In order to improve teaching efficiency, we need to start with teaching practice and pay attention to the cognitive psychology of students and teachers on the basis of following the guidance of scientific educational theory. By following the cognitive psychology of students and teachers, the construction of Xinjiang minority music education resource bank will help to realize the protection and inheritance of Xinjiang minority music culture. And the application of cognitive psychology in Xinjiang minority music education can provide reference value for college education and teaching, stimulate colleges and universities to give full play to their own strength in the inheritance of traditional culture, and improve students' enthusiasm for the protection of China's minority culture.

NEW PATH OF EMPLOYMENT GUIDANCE IN HIGHER VOCATIONAL COLLEGES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaohui Ma^{1,2}

¹Human Resource Department, Yellow River Conservancy Technical Institute, Kaifeng 475004, China

²Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

Background: The development of social economy not only provides jobs for the employed, but also brings many challenges. Among them, higher vocational college students, as the main employment group, how to choose the employment direction is the key guidance content needed by the school. In the employment guidance of higher vocational colleges, the main content emphasized by the college is to meet the employment needs of students, the second is to meet the professional needs of students. Although this employment guidance method has improved the overall employment rate of students, it is undeniable that a large number of students will not adapt to psychology after employment, and even choose to reemploy. The main reason is that the existing employment guidance in higher vocational colleges is lack of systematicness and pertinence, and the teacher team participating in the guidance is unreasonable. In order to avoid the students' employment problems caused by the above problems, a large number of colleges and universities began to apply educational psychology to employment guidance and build a new path by using the basic theory of educational psychology.

Educational psychology is one of the main research contents in psychology. Its core idea is to carry out educational reform from the perspective of psychology. Educational reform includes college teaching system, teachers' teaching plan and students' school strategy. Under the category of educational psychology, the purpose is to deeply grasp students' learning psychology by analyzing students' psychological behavior, stimulate students' motivation in the learning process, induce students to actively give full play to their self-study ability in learning, and then improve the learning effect. In addition, educational psychology can also make the teaching plan more scientific by grasping the psychological changes of teachers. For teachers in higher vocational colleges, according to educational psychology, teachers can be fully encouraged to use innovative teaching methods, exercise students' learning thinking and effectively transform employment strategies. And it is worth noting that from the perspective of educational psychology, teachers' teaching behavior will also be affected. Therefore, in curriculum teaching, teachers can constantly improve their teaching level and achieve the result of common progress with students. Finally, educational psychology can fully coordinate teaching and learning, and play a balanced role in it. Specifically, in students' learning, educational psychology can transmit students' learning situation to the perspective of teachers through feedback, teachers can put forward teaching plans, and students can also learn new knowledge from the changes of teachers' teaching level and means.

Objective: To analyze the role of educational psychology in employment guidance in higher vocational colleges, and construct a new path of employment guidance in higher vocational colleges from the perspective of educational psychology, so as to provide reference for students' employment.

Research design: Regression analysis was used to determine the relevant factors affecting the employment guidance of higher vocational colleges. Starting from the influencing factors, a new strategy for employment guidance was formulated. 200 students from each of the three schools were selected. Each school was divided into experimental group and control group, with 100 students in each group. The experimental group was guided by the new strategy, and the control group was guided by the traditional scheme. After the students were employed, a questionnaire was used to understand the employment situation of the students.

Results: Learning motivation, psychological differences, teacher groups and teacher level are important factors affecting employment guidance. A questionnaire survey was conducted on 600 graduates from three colleges and universities. The results show that after receiving the new strategy of employment guidance of educational psychology, the employment rate of students has been significantly improved, and their employment satisfaction has also been significantly improved, as shown in Table 1.

Table 1. Student employment

	Index	School A (%)	School B (%)	School C (%)
Rate of employment	Before the new strategy	77	81	80
	After the new strategy	89	90	92
Employment satisfaction rate	Before the new strategy	69	71	77
	After the new strategy	86	94	92

Conclusions: Educational psychology is the core foundation of higher vocational colleges' educational reform. With the continuous improvement of students' independent consciousness, higher vocational colleges should pay more attention to students' psychological changes in educational reform. Moreover, teaching psychology in the educational reform not only promotes students' school enthusiasm, but also improves the teaching system of higher vocational colleges. In the employment guidance of higher vocational colleges, the employment guidance for students is directly related to the future development of students. How to use educational psychology to promote students' learning population and improve students' employment satisfaction to a certain extent. In the research, it is proposed that the teaching quality of employment guidance can be greatly improved from four aspects: students' motivation, psychological differences, teachers' group and teachers' level. Therefore, in the choice of employment guidance path in higher vocational colleges, we should fully consider students' learning psychology and teachers' teaching psychology, and formulate corresponding strategies to ensure the normal development of employment guidance.

SPECIALTY GROUP ECOLOGY AND GOVERNANCE PATH OF “DOUBLE HIGH PLAN” OF VOCATIONAL EDUCATION UNDER COGNITIVE IMPAIRMENT

Zhigao Lu

Office of Academic Affairs, Guangdong Women's Polytechnic College, Guangzhou 511450, China

Background: Professional group is the main driving force for the development of colleges and universities, and in a large number of high-level Higher Vocational Colleges in China, the professional group of colleges is more obvious. At the same time, with the reform measures of national manufacturing education, how to build a professional group ecosystem with Chinese characteristics in higher vocational colleges has become the research object of a large number of educators. The proposal of “double high plan” provides a new direction for vocational education. With the increasing teaching requirements of higher vocational colleges, a large number of professional construction plans have been proposed and implemented, and vocational education has a further development direction. In the “double high plan”, the construction path of high-level professional groups is divided into two directions. The first point is the external leading direction promoted by the external industrial chain, and the second point is to realize the internal leading direction of the systematic growth of professional groups through the self-evolution of professional groups. From the current development trend, the professional group system dominated by external factors is limited by the changes of external industrial chain. At present, with the continuous development of information technology, the emergence of Internet industry and the emergence of new industries, the professional group system is constantly impacted. Therefore, in this environment, how to avoid external interference and realize the ecological maintenance and governance of professional groups from the self-growth of professional group system is a problem to be solved.

In the current vocational education, the specialty group system construction of the “double high plan” is mainly subject to external conditions. Generally speaking, the specialties in the specialty group ecosystem interact with each other, and there will be a chain reaction after a certain impact. Cognitive psychology believes that there will be certain cognitive obstacles in education and teaching. From the ecology of professional groups, it can be seen that due to the influence of ecological structure and external factors, internal majors are bound to have cognitive obstacles, including cognitive obstacles of individual professional groups, cognitive obstacles at the level of professional groups and cognitive obstacles at the level of professional groups. Under the influence of cognitive impairment, there will be evolutionary obstacles among individuals, populations and communities. The cognitive impairment of professional groups seriously affects the ecological balance of professional groups, and also leads to the fact that the ecology of professional groups cannot benefit from the organic coordination between different majors in the system to achieve sustainable and circular development like natural ecology. From the perspective of psychology, cognitive impairment is a risk factor of psychological pain. Psychological pain is an obvious emotional response. The generation of psychological pain will cause a variety of emotional experiences, including behavioral cognition and spiritual cognition. It is easy to lead to individual behavioral reactions such as vulnerability and fear, as well as individual negative psychological reactions such as anxiety and depression. At the same time, some studies have found that there is a significant positive correlation between psychological pain and cognitive impairment, that is, under the influence of cognitive impairment, patients are more likely to have negative emotions such as psychological pain. In the professional group system of

vocational education “double high plan”, individual cognitive impairment and group cognitive impairment will lead to psychological pain in education. How to put forward the corresponding ecosystem governance strategies according to the cognitive barriers has great teaching significance.

Objective: To understand the ecological structure of the professional group of vocational education “double high plan”, analyze the cognitive obstacles, and put forward the governance path of the professional group ecosystem of vocational education “double high plan” from the perspective of improving cognitive obstacles.

Research design: Using the literature method to obtain the high-level professional groups in higher vocational colleges, formulate a questionnaire to conduct a questionnaire survey on the teachers and students in the three higher vocational colleges. The survey content is the main tasks of teachers and students in the professional group ecosystem, put forward the professional group ecosystem governance scheme of the “double high plan” of vocational education, and evaluate the effect of the scheme.

Results: The survey results used five grades of 0-4 to quantify the influence value of specific factors. 0 means irrelevant, 1 means slight impact, 2 means general impact, 3 means obvious impact and 4 means complete impact. In order to reduce the large error caused by personal subjectivity in evaluation, the evaluation value of 100 teachers and students in higher vocational colleges is taken as the average value. The cognitive impairment at three levels of individual, population and community of professional group under cognitive impairment has a significant impact on the proposal of governance plan, as shown in Table 1.

Table 1. Impact of cognitive impairment on ecological governance

Content	Individual cognitive impairment	Population cognitive impairment	Community cognitive impairment
Governance scheme	3	3	3

Conclusions: Cognition is the processing process of the body in receiving external information, including the acceptance, processing and learning of information. Cognitive impairment has defects in the above contents. The cognitive impairment in the ecosystem of the professional group of the vocational education “double high plan” is mainly manifested in the cognitive impairment of the subsystem in the ecosystem. It is unable to accept and learn, which leads to the evolution of the ecosystem. From the perspective of cognitive impairment, the research focuses on the cognitive impairment at all levels in the professional group ecosystem of the “double high plan” of vocational education. It is learned that in order to better manage the system, it is necessary to cultivate professional groups with characteristics from the three aspects of individual, population and community, and resources should be shared among professional groups, develop in the form of collectivization and under the relevant guarantee mechanism.

Acknowledgement: The research is supported by: Fund projects: 2021 Guangdong Province Will Deepen the Pilot Project of Education Evaluation Reform in the New Era: “Recognition and Transformation of Learning Achievements Based on Credit Banks”.

DISCUSSION ON ELECTRICAL ENGINEERING TRAINING AND APPLICATION OF ELECTRICAL AND ELECTRONIC TECHNOLOGY UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Yunqing Li

School of Sino-German Engineering, Shanghai Technical Institute of Electronics and Information, Shanghai 201411, China

Background: With the continuous expansion of industrial production, electrical engineering, as an indispensable part of industrial production, has attracted more and more attention. And in terms of the current international situation, electrical engineering plays a positive role in promoting scientific and technological innovation. Therefore, the development degree of a country’s electronic engineering determines the country’s competitiveness in international scientific and technological innovation. The earliest definition of electrical engineering is the systematic science that combines electronics and electricity. In the process of social and scientific and technological development, electronic and photonic technology also belong to the research content of electrical engineering. The main electrical engineering

talents in China come from colleges and universities. In the training of colleges and universities, electrical engineering has more complicated learning contents, so it is difficult to construct the discipline of electrical engineering in colleges and universities. The main research content of electrical and electronic technology is circuit. In the teaching of electrical and electronic technology in colleges and universities, it is usually based on practice, emphasizing that students master the relevant theoretical knowledge of electrical and electronic technology in practice. In the teaching of colleges and universities in China, electrical engineering and electrical and electronic technology are generally taught as a unified course. In the teaching, because most of the contents tend to practical application, students will have knowledge obstacles in some knowledge learning, which seriously hinders the development of teaching courses.

Cognitive psychology believes that the body will go through the process of receiving, transmitting and processing when receiving information. Cognition is information processing. Cognitive impairment is the result of information processing failure in information processing, resulting in the body unable to receive relevant information and cognitive blind spot. At the same time, cognitive impairment is expressed as mental disorder in psychiatry. In medicine, mental illness is summarized as brain disease, which is the obstacle mental change of human brain after being impacted. Patients with cognitive impairment will be unable to learn in their daily life. In college education, the emergence of cognitive impairment is the learning disability of students in the curriculum. Students' cognitive impairment will seriously hinder the development of students' daily life and learning. From the current situation of college education, college students come from different regions and have certain differences in basic education. Therefore, there will be cognitive differences in the face of the same kind of knowledge, and serious cases will have cognitive impairment. In the cognitive impairment of colleges and universities, the treatment means obtained from psychiatric treatment are generally improved by cognitive restart, mainly by constructing the improvement scheme of cognitive impairment, simplifying and visualizing the knowledge, meeting the receiving conditions of some students and realizing the effective indoctrination of knowledge. Therefore, in the face of students' cognitive obstacles in the teaching of electrical engineering and electrical and electronic technology in colleges and universities, we also need to start with cognitive training to completely improve students' cognitive situation, improve the overall teaching level of the school and promote students' comprehensive development.

Purpose: Starting from psychiatry, improve the teaching of electrical engineering and electrical and electronic technology in colleges and universities through the improvement of cognitive impairment, so as to alleviate the learning pressure of college students, improve students' cognitive level and improve students' comprehensive quality.

Study design: Design a questionnaire to collect students' basic information, including students' gender, age, height, home address and so on, and analyze the impact of students' basic information on students' cognitive level. Understand the professional knowledge of students majoring in electrical engineering and electrical and electronic technology through classroom examination and interview, formulate teaching plans, and divide students into cognitive impairment group and cognitive normal group according to student scores. Analyze the professional performance changes of students in the cognitive impairment group under the innovative teaching mode, and compare the performance changes of the two groups. The students' cognitive level is expressed as 0-10.

Table 1. Comparison of changes in students' cognitive level

Group	Before teaching	After teaching	Variation	<i>P</i>
Cognitive impairment	3.1±1.5	7.6±0.7	4.5±0.8	<0.05
Normal cognition	6.4±1.2	7.8±0.6	1.4±0.6	>0.05
<i>P</i>	<0.05	>0.05	<0.05	-

Results: The age and home address of students will affect the degree of cognitive impairment to a certain extent, but the difference is not statistically significant ($P > 0.05$). Comparing the cognitive level changes of the two groups of students after the teaching of electrical engineering and electrical and electronic technology, it shows that the changes of students in the cognitive impairment group are significantly greater than those in the normal cognitive group, and the difference is statistically significant ($P < 0.05$), as shown in Table 1.

Conclusions: As the main courses in higher education, electrical engineering and electrical and electronic technology have strict requirements on students' cognitive ability. Generally speaking, most students will have more or less cognitive impairment when facing more complex electronic problems. Therefore, it is imperative to improve the cognitive impairment of college students in professional courses. For electrical engineering and electrical and electronic technology, under the background of students' cognitive impairment, this paper puts forward innovative teaching schemes to improve students' cognitive

level and realize the development of students' comprehensive quality, which is conducive to the development of teaching in colleges and universities and can provide theoretical support for the cultivation of industrial construction talents in China.

As the main courses in college teaching, electrical engineering and electrical and electronic technology have strict requirements on students' cognitive ability. Generally speaking, most students will have more or less cognitive impairment when facing more complex electronic problems. When students have this cognitive impairment, it is difficult for some brain regions to obtain complete cognition during learning. Therefore, it is imperative to improve the cognitive impairment of college students in professional courses. For electrical engineering and electrical and electronic technology, under the background of students' cognitive impairment, this paper puts forward innovative teaching schemes to improve students' cognitive level and realize the development of students' comprehensive quality, which is conducive to the development of teaching in colleges and universities and can provide theoretical support for the cultivation of industrial construction talents in China.

CONNOTATIVE DEVELOPMENT OF COLLEGE STUDENTS' INNOVATION AND ENTREPRENEURSHIP EDUCATION UNDER THE OBSTACLE OF THINKING LOGIC

Wulantuya

School of Nursing, Inner Mongolia Minzu University, Tongliao 028000, China

Background: College students' innovation and entrepreneurship education is an important link in the talent training of colleges and universities in China. With the continuous proposal of preferential policies for college students' innovation and entrepreneurship, the innovation and entrepreneurship education model of colleges and universities is also updating day by day. In the innovation and entrepreneurship education in colleges and universities, the connotative development of education has become an important breakthrough in the transformation of college education. Compared with the traditional development mode, connotative development can promote the communication efficiency of college education ideas, and it is also the premise of the adaptive development of colleges and Universities under the background of the times. There are two connotations in the connotative development of college students' innovation and entrepreneurship, namely "innovation" and "entrepreneurship". In terms of "innovation", in the field of economics, it is considered that innovation is a new combination generated by the combination of an unprecedented new element and existing production conditions in the development practice of entrepreneurs. Under this new combination, it can produce a new production system and endow the enterprise with a new form of organization. From the connotation of "entrepreneurship", entrepreneurship is to start an innovative business, and produce a new management mode from the traditional mode to carry out production and operation. Therefore, the connotation of "innovation" and "entrepreneurship" is consistent. Innovation and entrepreneurship education is an education that takes two connotations as the main body for teaching. In education, it is based on cultivating students' innovation and entrepreneurship connotation to promote the development of students' innovation and entrepreneurship ability.

However, in the study of innovation and entrepreneurship, college students will inevitably have thinking logic obstacles, that is, the inherent logical relationship of students in innovation and entrepreneurship is broken, they cannot have normal thinking logic, and then cannot receive relevant educational content. Thinking logic disorder is a common mental disorder. Common thinking logic includes symbolic thinking, new words, logical inversion and sophistry thinking. Under the influence of different thinking logic obstacles, the feelings produced by the body will be very different. When the body has symbolic thinking, there will be behaviors that are difficult for ordinary people to understand, and at the same time, it will show different understanding effects on the received relevant knowledge. New words and logical errors are a kind of logical confusion. Under the influence of these two logical obstacles, students will convey illogical concepts in the teaching process. Under the influence of sophistry thinking, students will doubt the learning content and use invalid debate to prove some wrong views, which will also seriously affect the development of students' quality.

Objective: Through the logical analysis of college students' thinking obstacles, we can determine the logical development path of college students' creative thinking from the perspective of different college students' cognitive education, and determine the logical development path of college students' creative

thinking.

Research design: Investigate the current situation of innovation and entrepreneurship education in five colleges and universities, and interview 50 students from each of the five colleges and universities. Through the interview, determine the proportion of people with thinking logic barriers among the students. Construct the implementation path of the connotative development of college students' innovation and entrepreneurship education, and conduct the second random interview after 6 months. The interview content is the same as that of the first. Compare and analyze the difference in the number of students with thinking logic barriers in the two interviews.

Results: The results of two interviews were compared and analyzed. The results showed that among the five schools, the number of people with thinking and logic disorders before the interview accounted for the highest 42% and the lowest 14%. In the second interview, the number of people with thinking and logic disorders accounted for the highest 26% and the lowest 4%. The difference between before and after was statistically significant ($P < 0.05$), as shown in Table 1.

Table 1. Proportion of people with thinking logic disorder

School number	First interview (%)	Second interview (%)	<i>P</i>
1	22	4	<0.05
2	42	26	<0.05
3	34	14	<0.05
4	28	14	<0.05
5	14	6	<0.05

Conclusions: The connotative development of college education is not only the general trend, but also the basic project of college education reform and transformation. Therefore, the connotative development reform should also be carried out for college students' innovation and entrepreneurship education. The transformation and development from the two connotations of innovation and entrepreneurship will contribute to the cultivation of college students' innovation and entrepreneurship ideas. And in the innovation and entrepreneurship education of college students, we need to always consider students' thinking logic obstacles, and build an education system that can improve students' thinking logic obstacles, which can effectively promote students' comprehensive development.

OPTIMIZATION OF THINKING LOGIC OBSTACLE ANALYSIS IN COMPUTER ALGORITHM SIMULATION EXPERIMENT TEACHING

Min Cao

College of Information Engineering, Zhengzhou University of Technology, Zhengzhou 450044, China

Background: Computer algorithm is a way of logical calculation based on computer. It plays an obvious role in the development of information technology and Internet technology with the change of international environment, colleges and universities pay more and more attention to the course of computer algorithm. From the early written theory education to the current simulation experiment teaching, all show the importance of computer algorithm. In the teaching of computer algorithm simulation experiments in colleges and universities, the excellent environment of the laboratory is used to test and analyze the algorithm performance of the computer. At the same time, teachers can visualize the more abstract theory of computer algorithm with the help of the simulation experiment environment. The teaching mode of the computer algorithm simulation experiment is the key part to reflect the experimental teaching level. At present, in the teaching of computer algorithm simulation experiment in colleges and universities, due to the great difficulty of simulation experiments, students are prone to conceptual confusion, and then there are thinking logic obstacles, which seriously hinder the growth of students.

The thinking logic disorder is a common mental problem. There are many reasons for thinking logic, among which personality, gender, and education level are obvious factors. At the same time, it is also proposed in some studies that the knowledge environment of individuals in learning is also an important factor. In college learning, students' thinking logic is the key part to determine students' final learning

effect, but it is undeniable that there will be more or fewer students' thinking logic obstacles in the teaching of computer algorithm simulation experiment in colleges and universities. Thinking logic disorder refers to the confusion or deviation of students' thinking in the learning process. Thinking logic includes symbolic thinking, new words, logical inversion, and sophistry thinking. The above four thinking logic disorders will affect individual cognition for a long time. Symbolic thinking is a kind of abstract thinking. Under the influence of symbolic thinking, students will have a sense of uncertainty about concrete data. The two thinking logic obstacles of new foreign language words and logical inversion will lead to professional confusion in the learning of knowledge students. General psychology believes that the new words and logical inversion are caused by the concept accepted by the individual that cannot meet the conditions required by the individual. Therefore, the individual will respond accordingly to achieve the purpose of thinking logic. Sophistication thinking refers to the fact that individuals will deal with logic according to their inner needs when facing different concepts, and turn logic into their own subjective consciousness, which usually shows that they use unrealistic logic theory to refute the content of correct logic processing.

Objective: Computer algorithm simulation experiment teaching is one of the important courses in colleges and universities. In order to obtain a more reasonable and scientific teaching mode of computer algorithm simulation experiment in colleges and universities, we need to start with thinking logic and plan the teaching scheme by analyzing students' thinking logic obstacles, so as to achieve the purpose of cultivating computer talents in colleges and universities.

Study design: A questionnaire was designed to investigate 300 computer majors in three universities. The survey content is the current situation of students' thinking logic, including the screening of four kinds of thinking logic obstacles: symbolic thinking, new words, logical inversion, and sophistication thinking. Make use of the teaching plan to carry out long-term teaching for students, and evaluate the improvement of students' thinking logic obstacles during teaching.

Results: After eight months of computer algorithm simulation experiment teaching, all students were interviewed regularly at the same time during this period to determine the changes in their thinking logic. It is concluded that the thinking logic obstacles of middle school students have been significantly improved in eight months, and the maximum improvement has reached 64%, as shown in Table 1.

Table 1. Improvement of thinking logic disorder

School number	Symbolic thinking (%)	New words (%)	Logical inversion (%)	Sophistry thinking (%)
1	22	53	54	58
2	27	44	64	62
3	19	35	21	33

Conclusions: Students' thinking logic obstacles are the main factors affecting students' growth. In education and teaching, we should actively pay attention to students' thinking logic obstacles, and formulate teaching models for students' thinking logic obstacles in different teaching courses, so as to ensure that students can finish relevant learning knowledge in time and accurately in the teaching process. At the same time, as the algorithm basis of scientific and technological innovation, computers should always pay attention to the problem of students' thinking logic obstacles in college education and teaching, formulate a reasonable and scientific computer experimental teaching scheme, ensure that students can grow healthily in teaching, and provide a safe and comfortable teaching environment for the cultivation of high-quality computer talents in our country.

THE EFFECTIVE EFFECT OF CONTINUING EDUCATION ON ALLEVIATING COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Ling Chen^{1*}, Yingjie Lu¹ & Ying Zhao²

¹*School of Continuing Education, Guangdong Industry Polytechnic, Guangzhou 510300, China*

²*School of Management, Guangdong Industry Polytechnic, Guangzhou 510300, China*

Background: Continuing education advocates universal learning and lifelong learning. The object of continuing education theory is gradually expanded from college students to social members, but it can be determined that the key objectives of continuing education is still college students. Since the reform and opening-up, China's economy has experienced substantial growth and maintained a sustained growth trend for a long time. In the process of social and economic development, the demand for highly educated talents in all walks of life is also increasing. Therefore, the continuing education of college students is of great significance. After the 21st century, countries around the world began to speed up the development process of high-tech innovative industries. At this time, China's economy began to realize formal transformation, the people's thoughts began to change, and higher education began to gradually shift from colleges and universities to the public. At the same time, in order to eliminate the ideological contradictions in society, continuing education emphasizes vigorously developing national learning, gradually reducing the cognitive differences between individuals and promoting social and economic growth. In the teaching of colleges and universities, in order to meet the needs of society, it is also committed to strengthening continuing education, advocating college students to receive continuing education, improving their cultural level and comprehensive quality and ability, and providing power for national infrastructure construction and high-tech development.

However, in the education and teaching of colleges and universities, college students are vulnerable to various pressures and psychological anxiety, among which the more obvious is the Employment Anxiety of college students. There are great differences between university environment and social environment. Facing an unknown social environment, most college students will have uneasy psychological emotions, and the long-term accumulation of uneasy emotions will lead to psychological anxiety. Psychological anxiety generally refers to the fear, worry, and tension of individuals in the face of events or objects. There are many factors that lead to individual anxiety. Psychology believes that anxiety is affected by heredity and environment. Genetic factors cannot be avoided. Environmental factors include campus environment and social environment. College students' employment anxiety is affected by the social environment. During their study in colleges and universities, college students have little time to contact the external environment. Therefore, when facing the graduation choice, college students will be confused and confused, which will aggravate their anxiety. At present, in college education, how to effectively alleviate college students' employment anxiety is still the key object that teachers and schools need to breakthrough.

Objective: This paper analyzes the role of continuing education in alleviating college students' employment anxiety, and discusses the mechanism of continuing education in improving college students' ability to adapt to the social environment, so as to provide theoretical support for college students' employment guidance.

Study design: The anxiety rating scale SAS was used to investigate the employment anxiety of college students. The junior and graduate groups of three universities in a city were selected, and 600 volunteers were recruited to participate in the long-term survey. The first anxiety evaluation was conducted on all students, and the second evaluation was conducted on the volunteers entering the graduation season one year later. In the evaluation, they asked whether they received continuing education, grouped the people who accepted and did not accept and compared and analyzed the employment psychological anxiety of the two groups of volunteers.

Results: There were significant differences in anxiety scores between the two groups, and the psychological anxiety scores of the people participating in continuing education were lower, and the difference between the two groups was statistically significant ($P < 0.05$). The intragroup comparison shows that the employment anxiety of postgraduates is significantly lower than that of undergraduates. The difference between groups is statistically significant ($P < 0.05$), as shown in Table 1.

Table 1. The influence of employment anxiety on college students' continuing education

Group	The first time	The second time		P
		Obtain employment	Continuing education	
Undergraduate	55.67±2.37	62.35±1.44	42.39±0.98	< 0.05
Graduate student	47.32±2.06	52.44±1.37	39.±0.37	< 0.05
P	< 0.05	< 0.05	< 0.05	-

Conclusions: The employment pressure of college students is a common phenomenon. The main reason is that college students' cognitive level of the external environment is insufficient. Therefore, it is necessary to effectively alleviate college students' Employment anxiety and help college students adapt to the social environment. The improvement of continuing education can effectively improve college students' employment anxiety, and the improvement of education can also reduce college students' employment anxiety. Therefore, colleges and universities need to encourage college students to carry out continuing

education in routine education, improve their academic and knowledge level at one time, alleviate college students' employment anxiety with the help of continuing learning, help college students understand the current social development situation in advance and quickly grasp the market trend, which is of great significance to China's economic development.

THE SPATIOTEMPORAL DYNAMIC UNBALANCED DEVELOPMENT OF CHINA'S REGIONAL ECONOMY UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Xiaoli Huang^{1,2}

¹*School of Accounting and Finance, The Open University of Shaanxi, Xi'an 710119, China*

²*School of Accounting and Finance, Shaanxi Business College, Xi'an 710119, China*

Background: Since the reform and opening up, great changes have taken place in China's economic construction, and the great achievements have also attracted the attention of all countries in the world. On this basis, China has put forward the goal of building a well-off society in an all-round way, and ensuring the balance of time and space is an important basis for economic development. The diagnosis of spatio-temporal dynamic imbalance of regional economy is the main research content in economic research. There is an obvious correlation between regions. Among them, technology, information and personnel communicate and flow among regions. Therefore, the development between regions is synergistic, so it also has dynamic imbalance. In economic research, the dynamic imbalance of regional economy is not only the dynamic change in time, but also the difference brought by spatial difference leads to the dynamic imbalance in time and space of regional economy. Moreover, the theory of new economic geography holds that in the economic development of a country or region, it tends to control the cost within the minimum range, and ensure that the demand for products in the region is large, which can produce lasting productivity growth in the region. Regional economic development depends on the strategic vision of regional leaders. In the unbalanced development of economic space-time dynamics, the cognitive impairment of leaders will seriously hinder regional economic development. Therefore, only by completely improving the cognitive impairment of leaders can we promote regional development.

Cognitive impairment is a kind of thought disorder. People with cognitive impairment usually show different cognition from ordinary people. In psychology, people's cognitive impairment is the functional abnormality in learning and thinking logic judgment. At present, the main treatment methods for cognitive impairment are divided into protective treatment and surgical treatment. Protective treatment refers to the medication management of people with cognitive impairment and the use of drugs to treat their nerve cell disorders. Surgical treatment refers to the brain repair of people with cognitive impairment through surgery, and the targeted destruction of some parts of the brain by targeted target. The impact of cognitive impairment is significant. People with cognitive impairment will show impatience at work, make mistakes in work arrangement and implementation, and eventually lead to work mistakes. In addition, in medicine, cognitive impairment belongs to mental illness. The emergence of mental illness will cause patients to have ideological disorder. Under the influence of ideological disorder, patients' psychology will also be greatly different from ordinary people. In psychiatry, patients with cognitive impairment are judged as serious mental diseases. After the cerebral cortex is damaged, the brain cognitive function is blocked, resulting in cognitive impairment. When business leaders have confusion in thinking logic, their cognition is impaired and cognitive impairment occurs. In serious cases, it will affect regional development. The reason is that the cognitive impairment of leaders changes their thinking mode in economic development.

Objective: In the context of cognitive impairment, this paper analyzes the spatio-temporal dynamic

unbalanced development of China's regional economy, understands the impact of cognitive impairment on regional economic development, and puts forward precautions for China's regional economic development, so as to promote China's economic development as a whole.

Study design: Taking Southwest China as an example, this paper constructs a spatio-temporal diagnosis model, selects some enterprises for interview survey, mainly investigates the current situation of cognitive impairment of enterprise leaders, evaluates the correlation between the severity of cognitive impairment and enterprise ability, and finally analyzes the correlation between enterprises and the spatio-temporal dynamic unbalanced development of regional economy under the background of cognitive impairment.

Results: The enterprise's ability and cognitive level are evaluated on a 0-5 scale. 0 means very poor and 5 means very good. The comprehensive strength of an enterprise is directly affected by its leaders, and it can be seen that the ability of an enterprise increases with the improvement of leaders' cognitive level, and there is a significant positive correlation between the two, as shown in Figure 1.

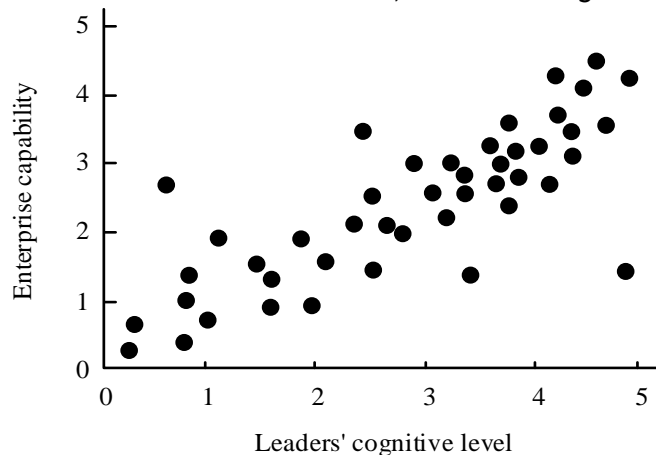

Figure 1. Correlation between leaders' cognitive level and enterprise ability

Conclusions: The uncertainty of economic development is inevitable. Since the reform and opening up, China is committed to building a well-off society in an all-round way. Therefore, how to realize the space-time balance in economic development is the focus of current research. Among them, the cognitive differences of regional enterprise leaders lead to different enterprise comprehensive abilities. Specifically, the higher the cognitive level of enterprise leaders, the stronger the comprehensive ability of enterprises, and the stronger the correlation between enterprises. Therefore, it can be seen that in the time-space dynamic unbalanced development of China's regional economy, the development trend of regional economy can be judged by evaluating the cognitive level of regional enterprise leaders. Finally, in order to ensure the coordinated development of regional economy, it is necessary to eliminate cognitive barriers for enterprise leaders with low cognitive level, ensure that the cognitive level difference between enterprises is small, further promote the relevance between enterprises, promote the efficiency of coordinated development, and promote the development of high and new technologies, so as to drive China's economic development, improve China's comprehensive strength in international competition.

* * * * *

THE INNOVATION OF MARXIST PHILOSOPHY EDUCATION MODEL FOR YOUNG PATIENTS WITH THINKING LOGIC DISORDER

Lingxi Li

School of Marxism, Guangdong University of Technology, Guangzhou 510520, China

Background: Teenagers are the foundation of national development, and their education level can determine their future development. In the growth of teenagers, generally speaking, the thinking and logic ability of young people will be affected by the level of education, but after the growth of young people, the cognitive ability of things and events determines the thinking and logic ability of young people. Therefore, in the growth of young people, the problem of thinking and logic obstacles will appear with the growth of age. The thinking logic barrier of young people refers to that young people are affected by subjective thoughts in learning, and it is difficult to form a more objective and scientific cognitive system. At the same

time, it is difficult to establish excellent thinking quality in the growth of young people, and finally show the confusion of young people's learning and thinking. In daily learning, the main problem of young patients with thinking logic disorder is the abstraction of thinking logic ability. The abstract thinking logic leads to students' deviation in understanding the learning content and unable to understand the concrete related knowledge. A large number of studies have pointed out that it is necessary to cultivate young students' thinking logic ability and improve students' thinking systems in the classroom, but how to effectively cultivate students' thinking ability is an unsolved problem.

Marxist philosophy advocates practical thinking, which is the foundation of Marxist philosophy. Therefore, in the face of the logical obstacles of young people's thinking, the role of Marxist philosophy is becoming increasingly prominent. The practical thinking emphasized in Marxist philosophy includes three aspects: subjectivity, reality and value. In the development of human culture, the use of the three aspects of practical thinking can better investigate the individual way of thinking. In the traditional teaching of Marxist philosophy, the core thinking logic is materialistic dialectics and advocates objective philosophy. Marxist philosophy is not only an educational technology, but also a discipline with professional technology. In education and teaching, Marxist philosophy can effectively help individuals establish a thinking system and improve moral quality cultivation. Facing the thinking logic obstacles of young students, the innovation of Marxist philosophy education model is of great significance. In Marxist philosophy, using the existing thinking logic and philosophical interest can help patients eliminate cognitive obstacles, understand the core thoughts of social development from the philosophical level, and build a perfect and scientific thinking logic.

Objective: At the same time, in order to achieve targeted treatment, combined with the practical thinking in Marxist philosophy, we should innovate the teaching of Marxist philosophy education, so as to eliminate and avoid the thinking logic obstacles of young people, and achieve the purpose of social harmonious development.

Study design: 120 young patients with thinking logic disorder were selected. With the consent of the patients, all patients were divided into three groups: experimental group, control group A and control group B. The experimental group used the innovative teaching method of Marxist philosophy for intervention treatment, the control group a used the traditional Marxist philosophy teaching method for intervention treatment, and the control group B used other philosophical thought teaching methods for intervention treatment. The improvement of ideological logic disorder of the three groups of patients after 5 months was compared.

Results: There was no significant difference in the level of thinking logic disorder among the three groups before the intervention treatment ($P > 0.05$). After the intervention treatment, the improvement of thinking logic disorder in the experimental group was more obvious, and the improvement rate reached 87.5%. The improvement rate among the three groups was statistically significant ($P < 0.05$). Comparing the differences before and after the intervention, there was a significant difference in the number of thinking logic disorders between the control group and the experimental group A ($P < 0.05$), while there was no significant difference in the number of thinking logic disorders between the control group B before and after the intervention ($P > 0.05$).

Table 1. Number of people with thinking logic disorder before and after intervention (n)

Group	Before intervention	After intervention	P
Experience group	40	5	< 0.05
Control group A	40	13	< 0.05
Control group B	40	26	> 0.05
P	> 0.05	< 0.05	-

Conclusions: Young people's thinking logic disorder is the main risk factor affecting their healthy growth. Therefore, it is of great significance to control and eliminate young people's thinking logic disorder. In the study, the treatment of young people's thinking logic disorder is carried out through Marxist philosophy education, and the treatment effect is better after the innovation of education mode. In order to cultivate students' correct values and establish a scientific and reasonable thinking system, colleges and universities should make full use of the practical thinking concept in Marxist philosophy and build an innovative teaching mode in order to ensure the normal and healthy growth of young students. On the one hand, it will help to improve the teaching level of colleges and universities and on the other hand, it will help to build socialist harmony.

THE ROLE AND APPLICATION OF OUTPUT ORIENTED METHOD IN COLLEGE ENGLISH TEACHING UNDER THE BACKGROUND OF THINKING DISORDER

Xueqing Wang

Foreign Studies College, Hunan University of Science and Engineering, Yongzhou 425199, China

Background: In the context of globalization, the cooperation and competition between countries are more significant and fiercer. Therefore, college English teaching has gradually improved its requirements in order to provide English translation talents for national construction. As one of the major courses in college English, teachers generally have strict requirements for students in English teaching, but it is undeniable that English, as another language, students will have a psychological exclusion from English learning in the process of learning, resulting in a negative learning attitude. Under the influence of many factors, students will have confusion in thinking logic in English learning. In serious cases, students will be more affected, and finally have thinking obstacles, which seriously hinders the healthy growth of students. Psychology believes that the emergence of individual thinking disorder is largely affected by the environment, so the treatment of thinking disorder also depends on the environment to a great extent. Among the conventional psychological treatment methods of thinking disorder, education and teaching methods are widely used. Therefore, in the face of students' thinking disorder in college English classroom, adopting innovative English teaching scheme will improve students' thinking disorder to a great extent.

In college English teaching, some studies have put forward the theory of output-oriented method, which is put forward according to the current situation of college English teaching in China, and can effectively improve the quality of college English teaching. The output-oriented method is a new teaching theory, which includes output preparation oriented, output process oriented and output evaluation oriented. Output oriented approach runs through the whole teaching course in English teaching and plays a leading role in English course teaching. It guides teachers to conduct Task evaluation in the process of students' English learning, including evaluating the influencing factors driving English teaching, evaluating the mastery process of students' knowledge points in the process of course teaching, and evaluating students' comprehensive English ability after English learning. The evaluation of output-oriented method includes immediate evaluation and delayed evaluation. The immediate evaluation needs to be carried out in the teaching course to analyze students' language organization ability and expression ability in English learning, and the delayed evaluation is the evaluation of teacher-student cooperative teaching. Therefore, facing the current situation of English teaching, how to apply the output-oriented method to eliminate students' thinking obstacles in English teaching is the focus of teaching research.

Objective: This paper analyzes the current situation of thinking obstacles in college English teaching, discusses the application of output-oriented method in college English teaching innovation and the effect of innovative teaching in alleviating college students' thinking obstacles, so as to provide theoretical support for the cultivation of college English talents in China and improve China's core competitiveness in the international community.

Study design: 200 non-English majors in colleges and universities are selected to investigate the basic information of the selected college students by questionnaire and interview, including the students' basic English achievements and students' ideological barriers. All students were randomly divided into two groups: the experimental group and the control group. The experimental group adopted the English teaching mode under the output-oriented method, and the control group adopted the conventional teaching mode. The improvement of ideological barriers of the two groups was compared and analyzed.

Results: The 0-4 score system is used to evaluate the impact of students' ideological barriers on English teaching. 0 means no impact, 1 means slight impact, 2 means general impact, 3 means obvious impact and 4 means complete impact. The results show that the English teaching mode under the output-oriented method has a complete impact on students' ideological barriers in learning, life and communication.

Table 1. The influence of English teaching model on students' ideological barriers

Content	Learning and ideological barriers	Life thought barrier	Barriers to exchange ideas
English teaching mode	4	4	4

Conclusions: College students' English education is the main content of college education in China. How to cultivate English professionals is a problem that college teachers need to pay close attention to. In the teaching of colleges and universities, students will have negative emotions due to language conflict. Under the influence of negative emotions, students' thoughts will be damaged, and then there will be ideological obstacles. The ideological obstacles of students in English education in colleges and universities are

seriously affected by the educational model. Therefore, it is necessary to formulate targeted plans in teachers' teaching, adopt the output-oriented method to carry out innovative design of English teaching plans, alleviate the ideological obstacles in students' English learning, and finally realize the all-round development of students and promote the development of education and teaching in colleges and universities, provide guarantee for national economic construction.

Acknowledgement: The research is supported by: Research Project of teaching reform in college and universities of Hunan Province: a study of college English curriculum design based on production-oriented approach—a case study of the second edition of Innovation College English Integrated Course 1.

ANALYSIS OF PROBLEMS AND COUNTERMEASURES IN PROJECT MANAGEMENT UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Yang Du

School of Architectural Engineering, Jinling Institute of Technology, Nanjing 211169, China

Background: As China's social development has entered a new stage, scientific research projects in colleges and universities have also ushered in vigorous development. University scientific research projects are scientific and technological innovation R & D projects established with the support of the state. On the premise of industrial upgrading, as a place for high-tech talents to gather, their scientific research projects are of great significance. In addition, colleges and universities are also the key institutions of the state to cultivate high-tech talents. With the social development, the demand for technical talents in all walks of life is increasing. How to carry out vocational education and increase scientific research ability has become an urgent problem to be solved in college education. The necessary condition for the improvement of scientific research ability of colleges and universities in the improvement of scientific research management ability. Scientific research management is the scientific and reasonable arrangement of scientific research projects. Good scientific research project management can greatly improve the efficiency of scientific research. However, it is undeniable that there are still many problems to be solved in the management of scientific research projects in colleges and universities. Among them, the imperfection of project management mode and management regulations are important factors that hinder scientific research innovation. In the management of scientific research projects in colleges and universities, the cognitive level of managers is the premise to determine whether the management mode and management regulations meet the requirements. Poor cognitive level and even cognitive impairment will lead to very big mistakes in the management of scientific research projects, and eventually lead to the end of scientific research projects, which not only wastes human resources, but also wastes a lot of economic resources.

According to psychology, the causes of cognitive impairment of managers are diverse, including education, interpersonal relationship and professional knowledge. Psychologically speaking, the level of education of scientific research project managers will affect their self-confidence or inferiority complex, which will greatly improve their work efficiency. However, for people with cognitive impairment, their self-confidence will gradually deteriorate into arrogance, and their inferiority complex will continue to deteriorate. Interpersonal communication refers to the communication between managers and colleagues. From the perspective of cognitive psychology, people are often only willing to communicate with people within their own cognitive range. The generation of cognitive impairment is the result of their poor interpersonal communication ability. Finally, cognitive psychology believes that people's cognition is the information processing ability shown in learning, while low professional level will lead to poor processing ability, which will lead to cognitive impairment. And cognitive psychology believes that the generation of cognitive impairment is difficult to estimate, and the relatively simple and effective treatment is educational treatment. Therefore, it is of great significance for the mental health of managers and the normal development of scientific research projects to formulate a solution to the existing problems from the perspective of treating the cognitive impairment of project researchers.

Objective: Understand the cognitive impairment of managers in scientific research management projects in colleges and universities, collect the problems existing in the current scientific research project management in colleges and universities through literature method and questionnaire, and formulate the project management scheme, so as to provide reference for the development of scientific research projects in colleges and universities in China.

Study design: Three universities in the university city of a city are selected for questionnaire survey, and the scientific research project managers in each university are randomly interviewed to evaluate their

cognitive level. With the help of the literature method and questionnaire content, the problems existing in scientific research project management are summarized and problem solutions are formulated. Finally, the cognitive level changes of researchers and managers in the process of project management problem solving are analyzed and compared with the results of the first interview.

Results: A total of 500 questionnaires were issued by the three colleges and universities, 497 of which were recovered and 496 of which were effective. Excel was used to count the problems existing in the management of scientific research projects in colleges and universities. 20 scientific research project managers from three universities were randomly selected for interviews. The results of the first and second interviews showed that there were significant differences in the cognitive level of project managers before and after ($P < 0.05$).

Table 1. Changes in the number of researchers with high cognitive level

Index	The first time	The second time	P
School A	2	5	<0.05
School B	2	6	<0.05
School B	4	6	>0.05

Conclusions: Scientific research projects in colleges and universities are the key support projects in China, so we need to pay real-time attention to the development of scientific research projects in colleges and universities, in which the cognitive level of project managers is the focus. The cognitive level of managers is of significant significance to the development and development of scientific research projects. It is effective to alleviate the cognitive impairment of managers by changing the management scheme of scientific research projects in colleges and universities. It can effectively improve the cognitive level of managers and speed up the development of scientific research projects. The improvement of the cognitive level of scientific research project managers in colleges and universities plays a positive role in the development of various disciplines in colleges and universities, and also plays a significant positive role in the development of science and technology in China.

ADJUSTMENT OF TAIJIQUAN TRADITIONAL HEALTH SPORTS TO COLLEGE STUDENTS' MENTAL HEALTH

Yu Li

College of Physical Education, Chengdu University, Chengdu 610106, China

Background: College students are the main student group in China. Although college students are also students in school, there are obvious differences with middle school students and primary school students. When a high school student enters college life after graduation, it shows that the student has gradually mastered the basic knowledge of life and can be responsible for his own life and study. It also means that the student will be separated from the careful care of his parents and study and live alone. Most college students will have strange psychology when they first enter the university. Under the influence of strange environment, a large number of college students will have anxiety and anxiety. The generation of anxiety and anxiety is called negative psychological activities in psychology. Generally speaking, the negative psychological activities of college students are usually influenced by the environment and individuals. The environment includes campus environment and living environment. There are natural environment and learning environment in the campus environment. The learning environment is more likely to make college students have negative emotions. Personally, when facing more complex learning contents, college students will inevitably be restless, produce evasive psychology, and are unwilling to learn new knowledge. With the expansion of achievement differences with their classmates, restless psychological activities will intensify, and finally seriously affect their physical and mental health. In order to alleviate students' mental health problems, colleges and universities have put forward a large number of sports activities, among which Taijiquan, as a relaxed sports item, is deeply loved by students.

Taijiquan's traditional health preservation sports are established to inherit China's excellent martial arts culture. Taijiquan pays attention to the combination of hardness and softness. Unlike other sports, Taijiquan

does not pursue vigorous exercise, but emphasizes that people need to use Qi to transport the body, and the action is natural and powerful. Various studies have found that Taijiquan is not just a simple martial arts project. It has an obvious effect in health preservation and can significantly improve the disease resistance of the body. At present, various colleges and universities have incorporated Taijiquan into physical education. In the teaching course of Taijiquan in colleges and universities, teachers will teach boxing according to the basic situation of students. Different from other projects, teachers will not urge students too much in teaching, but advocate students step by step. Therefore, how to adjust the physical health ability of college students with the help of the health preservation mechanism of Taijiquan, and alleviate the psychological problems of students with the help of the combination of hardness and softness of Taijiquan is the content that needs to be paid attention to in college teaching at present.

Objective: Investigate the current situation of college students' mental health, explore the role of Taijiquan in the regulation of college students' physical and mental health, and evaluate the great significance of Taijiquan as a college sports project, so as to provide a reference for the cultivation of college students' psychological quality in China, and also provide theoretical support for the reform of college education.

Study design: 200 students in a university were selected for questionnaire survey. The questionnaire results of students were counted by Excel, and the students were classified. The students with mental health problems were divided into experimental group and normal psychological students were divided into control group. After six months of study, the second questionnaire survey was conducted to count the number of students with mental health problems, and compared with the results of the first questionnaire.

Results: The first survey showed that among the 200 students, 121 had mental health problems and 79 had no mental problems. A total of 73 students in the experimental group participated in Taijiquan sports teaching, and the remaining 48 students participated in other sports. A total of 41 students in the control group participated in Taijiquan sports, and the remaining 38 students participated in other sports. After sports teaching, the number of students in the experimental group with mental health changed significantly, as shown in Table 1.

Table 1. Changes in the number of college students with mental health

Group		The first time	The second time
Experience group	Taiji boxing	-	68
	Other	-	21
Control group	Taiji boxing	-	41
	Other	-	35

Conclusions: The mental health of college students has always been the main concern of all sectors of society. The mental health of college students directly affects the academic level of college students and its future development space. Using Taijiquan traditional health sports to adjust the mental health problems of college students is the main psychological problem mitigation measures in colleges and universities, and Taijiquan has a significant effect in the mental health conditions of college students. In addition, Taijiquan, as a traditional Wushu project in China, can also ensure the inheritance of Taijiquan Wushu project in the process of regulating the mental health of college students, which is not only conducive to the national talent training and the development of new technology, but also conducive to the protection and inheritance of national traditional culture.

APPLICATION OF COGNITIVE BARRIERS IN THE DESIGN OF CHINESE TRADITIONAL TV CHANNEL

Xuemei Du^{1,2} & Wei Li^{1,2}

¹*School of Art and Design, Hunan Institute of Science and Technology, Yueyang 414006, China*

²*Department of Visual Design, Hoseo University, Asan 336-795, Korea*

Background: Chinese traditional culture was created by the ancestors of the Chinese nation in China. In the thousands of years of continuous development of the Chinese nation, traditional culture has been inherited by the Chinese nation from generation to generation. Chinese traditional culture has distinct national characteristics. The representative elements extracted from traditional culture are traditional

cultural elements. Chinese traditional cultural elements are divided into tangible and intangible. Tangible elements mainly refer to material traditional cultural elements, while intangible elements refer to intangible traditional cultural elements. The tangible cultural elements include a large number of traditional patterns, traditional buildings, traditional products and traditional crafts. The intangible cultural elements include a large number of traditional arts, traditional skills and traditional cultural ideas. With the continuous improvement of our government's attention to the inheritance of traditional culture, the means of inheritance and protection of traditional cultural elements are also being carried out. At present, the most typical protection and inheritance measure is to design the characteristic logo of Chinese traditional cultural elements. In the CCTV channel, in order to meet the innovative and unique identity of CCTV Headquarters, some designers began to talk about the integration of traditional cultural elements into identity recognition, with the purpose of designing visual symbols and representativeness at the same time.

However, based on the complexity and diversity of Chinese traditional culture, the types of traditional cultural elements also have diversity. Therefore, how to meet the public's aesthetic cognition in CCTV identity design is a problem to be solved. Psychology believes that individual cognitive impairment is the inability to receive and learn a certain knowledge, so as to present cognition with a wrong interpretation. At the same time, cognitive psychology emphasizes that when people observe and deal with an object or event, they will input, represent, calculate and deal with it. However, cognitive impairment is unable to carry out the complete cognitive operation, resulting in cognitive errors in events and objects. The cognitive impairment of traditional cultural elements is mainly reflected in the inability to accurately characterize traditional cultural elements, resulting in cognitive differences with the general population. From the perspective of psychology, traditional culture is the inheritance of spirit and thought. The historical thought contained in the psychological elements of traditional culture can affect personal emotion to a great extent. In the cognition of ordinary people, traditional culture is only a unique inheritance culture in China, and the understanding of its unique philosophy is not deep enough. Some psychologists believe that traditional cultural elements can have an impact on individual cognition at some levels. On this basis, some psychologists and psychiatrists have deeply understood the changing trend of individual cognitive impairment in the inheritance of traditional culture from the mechanism of traditional culture affecting cognitive impairment. It can be seen from some studies that the spirit of people with cognitive impairment will be uncertain, the ideas in traditional cultural elements will induce changes in patients' cognition, and the brain-damaged areas of patients will have significant differences in the face of different traditional cultural elements. According to the test of psychologists, the mental and psychological-emotional changes of patients will also be affected by traditional culture. Therefore, in order to improve the application effect of Chinese traditional cultural elements in CCTV identity design, and to alleviate the degree of mental illness of people with cognitive impairment, we need to fully consider the current situation of people with cognitive impairment.

Objective: This paper analyzes the significance of Chinese traditional cultural elements in the channel identification design of China Central Television, discusses the impact of individual subjective cognitive level on the channel identification design of China Central Television, and puts forward more perfect schemes and measures for the inheritance of Chinese traditional culture.

Study design: Using the literature method to collect and sort out the development of Chinese traditional cultural elements, and analyze the internal meaning of Chinese traditional cultural elements. This paper summarizes the principles and methods of the application of Chinese traditional cultural elements in the channel identification design of China Central Television from different angles. Correlation analysis was used to evaluate the correlation between individual cognitive impairment and channel identification design of China Central Television.

Result: In this survey, the influence value of specific factors is quantified into five levels, from 0 to 4. 0 indicates irrelevant, 4 indicates slight impact, 5 indicates general impact, 3 indicates obvious impact, and 4 indicates complete impact. In order to reduce the large error caused by personal subjectivity in the evaluation, the rounding method of the results is determined. The simplicity, uniqueness, novelty, aesthetic sensibility and cognitive level in the channel identification design of China Central Television are analyzed by a correlation system, as shown in Table 1.

Table 1. Correlation analysis between identity design and cognitive impairment

Content	Simplicity	Uniqueness	Novelty	Aesthetic feeling
Cognitive level	3	4	4	3
Traditional cultural elements	3	4	4	4

Conclusions: Chinese traditional cultural elements need to be protected and inherited. The best way to inherit is to spread and use Chinese traditional cultural elements. In the identification design of CCTV

channel, the integration of Chinese traditional cultural elements can make the CCTV logo more unique and maintain the inheritance of traditional culture. At the same time, identity design in the context of cognitive impairment can also achieve a more perfect effect, improve the dissemination of identity design, and promote the national inheritance of traditional cultural elements. And it is worth mentioning that the two-way effect of identity recognition design can also improve individual cognitive impairment and improve their cognitive level.

* * * * *

STUDY ON THE INFLUENCE OF JOGGING ON COLLEGE STUDENTS' MENTAL HEALTH FROM THE PERSPECTIVE OF BEHAVIORAL PSYCHOLOGY

Jiangsong Chen¹ & Yongquan Tang²

¹*Physical Education Institute, Sangmyung University, Seoul 03016, Korea*

²*School of Physical Education, Xinyang Normal University, Xinyang 464000, China*

Background: behavioral psychology is a school of psychology originated in the United States in the early 20th century. Its founder is American psychologist Watson. Behaviorism holds that psychology should not study consciousness, but only behavior. The so-called behavior is the combination of various physical reactions that organisms use to adapt to environmental changes. These reactions are nothing more than muscle contraction and gland secretion. Some of them are expressed outside the body, some are hidden inside the body, and the intensity varies. Behaviorists believe that people's psychological consciousness and spiritual activities are unpredictable and inaccessible. Psychology should study people's behavior. Behavior is a combination of the body's responses to environmental changes, which are nothing more than muscle contraction and gland secretion. Psychological research on behavior is to find out the relationship between stimulus and response, so as to infer the response according to the stimulus, infer the stimulus according to the response, and achieve the purpose of predicting and controlling human behavior. In recent years, there has been an upsurge in physical exercise all over the country. There are all kinds of sports in colleges and universities, including tennis, table tennis, badminton, basketball and other ball games, swimming, aerobics, jogging and other aerobic sports. Aerobic exercise is not limited by venues, equipment and seasons. College students are easy to do. Students who adhere to aerobic exercise for a long time are in a peaceful mood, not anxious or impatient, and jogging in aerobic exercise is more suitable for people of all ages. However, with the rapid development of society and fierce competition, college students are under great pressure and sometimes feel physically and mentally exhausted, which leads to bad psychological problems. For a long time, people generally accept the view that "sports can enhance physique and promote physical health" while ignoring the "heart-strengthening" function of sports.

Objective: At present, the mental health standard of the World Mental Health Association mainly includes four parts: firstly, is the personality with a very coordinated body, emotion, ability, will, words and deeds. Secondly, have a sense of happiness and confidence. Thirdly, in the social environment, treat others with humility and strong adaptability. Fourthly, treat work and occupation and take measures to give full play to their skills and creativity. This study conducted exploratory intervention experiments on jogging from the perspective of behavioral psychology, so as to provide some theoretical reference for solving the problem of college students' improving their mental health.

Research objects and methods: This study mainly selects 400 college students with anxiety in many colleges and universities in a city, and selects 110 college students with medium and low-level anxiety through the self-designed anxiety scale. Understand the basic health status of college students before intervention, and formulate personalized exercise programs. From 5:00 to 6:00 p.m. every Monday to Thursday, college students are arranged to take outdoor jogging exercise in the school playground. Professional coaches are hired to guide college students in outdoor jogging. The psychological relaxation adjustment after exercise is to gradually relax the muscles of the experimenter's whole body by using systematic desensitization method and relaxation technology and understand the changes of their physical functions through the feedback auditory information. Through the consciousness of the brain to regulate their own physiological activities and learn to relax.

Research design: After the experiment, all subjects were evaluated with the SCL-90 scale, which has a total of 90 self-evaluation items. The test factors include somatization, obsessive-compulsive symptoms, depression, anxiety, psychoticism, etc. Through the 5-level scoring method, the higher the score, the lower the level of mental health.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The scores of somatizations, interpersonal sensitivity, anxiety and depression in SCL-90 after treatment were significantly better than those in the control group ($P < 0.05$).

Table 1. Comparison of SCL-90 test results before and after intervention

Factor	Before intervention	After intervention
Somatization	2.19	1.93
Obsessive compulsive symptoms	1.69	1.75
Interpersonal sensitivity	1.75	1.52
Depressed	1.52	1.43
Anxious	2.27	2.21
Hostile	1.47	1.64
Terror	1.51	1.45
Paranoid	1.52	1.44
Psychotic	1.31	1.42

Conclusions: The mental health level of the college students participating in this study is basically consistent with that of the national college students, but some students have certain mental health problems and need further guidance and education. The number of runs per week, the time of running and the number of people running have a certain impact on different mental health factors. College students run 2-3 times a week for more than 1 year and more than 2 people each time, which will improve the eight mental health factors of interpersonal relationship, anxiety, terror, psychosis, hostility, paranoia, terror and others to varying degrees.

* * * * *

EFFECT OF PSYCHOLOGICAL AND BEHAVIORAL INDUCTION IN THE TREATMENT OF CHRONIC PERIAPICAL PERIODONTITIS IN ORAL OUTPATIENTS

Zhixing Jing¹, Changjiang Mi¹, Wanchun Zhu¹ & Fei Teng²

¹*Department of Stomatology, North Sichuan Medical College, Nanchong 637000, China*

²*School of Administration, North Sichuan Medical College, Nanchong 637000, China*

Background: Periapical periodontitis is a kind of infectious disease mainly involving pulp. In the periapical periodontitis infection, the common type of infection is the invasion of bacteria and viruses. If the treatment is not timely, the scope of periapical periodontitis will expand, leading to increased difficulty in treatment, which may eventually lead to systemic diseases. Compared with acute periapical periodontitis, the infection of patients with chronic periapical periodontitis exists for a long time. Under the influence of chronic periapical periodontitis, the periapical tissue of patients presents a chronic inflammatory reaction, the alveolar bone is destroyed, and the inflammatory granulation tissue also begins to form gradually. The study found that patients with chronic periapical periodontitis will have negative psychology such as fear and resistance in long-term repeated treatment. The main reason is that the chronic lesions produced by chronic periapical periodontitis will continue to be interfered by foreign objects in oral treatment, which will breed the patient's sense of resistance and resist treatment. The study found that psychological counseling for patients' tension and other bad emotions can alleviate patients' fear to a certain extent and improve patients' cooperation in treatment.

From previous studies, it can be found that psychological induction in clinical treatment has become the main means to alleviate the psychological burden of patients. The main way of psychological induction is targeted psychological counseling according to the psychological status of patients. Psychological therapy, including psychological induction of anxiety, is used to fundamentally alleviate patients' anxiety. In addition, many studies have shown that the treatment fear of patients is not only reflected in the changes of psychological activities, but also in the behavior of patients, especially the restless behavior of patients during treatment. Patients with serious behavior will also hurt others. Psychology believes that people's negative emotions such as psychological anxiety and fear are caused by environmental changes and human activities. During oral treatment, the sense of depression contained in the hospital environment and the flow of people around will seriously increase the psychological anxiety of patients. In the treatment of oral chronic periapical periodontitis, a large number of studies have proved that the development of targeted

psychological and behavioral induction methods after mastering the psychological characteristics of patients can effectively alleviate the treatment mood of patients and improve the prognosis of patients. Therefore, in order to ensure that the patients with chronic periapical periodontitis in the oral clinic can achieve obvious results after treatment, the research starts with the psychological relief of the patients, and puts forward the targeted scheme of psychological and behavioral induction, in order to reduce the psychological anxiety of the patients while treating the patients with chronic periapical periodontitis.

Objective: Taking patients with chronic periapical periodontitis in oral clinic as the research object, formulate psychological and behavioral induction measures to explore the treatment effect and psychological negative emotion relief effect of patients with chronic periapical periodontitis under psychological and behavioral induction.

Study design: 180 patients with chronic periapical periodontitis in the dental clinic of a hospital were counted. All patients were treated with radical apical periodontitis. During the treatment, 90 of them were treated with psychological and behavioral induction. Finally, the treatment effect of patients with chronic periapical periodontitis and the difference of psychological anxiety before and after treatment were analyzed.

Result: The treatment time difference between patients treated with psychological and behavioral intervention and patients treated with routine treatment is compared, as shown in Table 1. It can be seen from Table 1 that the treatment time required by patients in the study group of psychological and behavioral intervention adjuvant treatment is significantly lower than that in the routine group of routine treatment, and the difference is statistically significant ($P < 0.05$).

Table 1. Comparison of treatment time of patients

Group	Treatment time (min)	<i>t</i>	<i>P</i>
General group	29.63±3.34	11.42	<0.05
Research group	19.52±2.62		

Conclusions: With the development of economy, people's pursuit of daily life is getting higher and higher. Therefore, under the changing background of diet and habits, the incidence rate of oral diseases is also increasing. In the study, aiming at the low efficiency of patients with periapical periodontitis in the treatment of oral diseases, starting with the negative psychological emotions of patients, this paper analyzes the psychological changes of patients, and puts forward psychological and behavioral induction measures. In the treatment of periapical periodontitis, the treatment time of patients receiving psychological and behavioral induction adjuvant therapy has been significantly reduced, and the negative emotions such as psychological depression and anxiety have also been significantly alleviated. The above results show that in the oral clinic, for patients with periapical periodontitis, the introduction of psychological and behavioral induction adjuvant therapy in the treatment process can effectively improve the treatment efficiency. Therefore, in medical treatment, the psychological intervention of patients will help to improve the level of medical service and enhance the sense of experience of patients.

* * * * *

A STUDY ON THE APPLICATION OF FLIPPED CLASSROOM TEACHING MODEL IN COLLEGE ENGLISH TEACHING UNDER COGNITIVE IMPAIRMENT

Yongjuan Niu

International Education College, Henan University, Kaifeng 475001, China

Background: The generation of students' cognitive impairment is the brain cognitive deviation in the face of complex English learning environment. In the basic theory of psychology, it is believed that cognition is to transform external information into internal psychological activities. In psychiatry, cognitive impairment is a mental disorder caused by human brain outside organic diseases. Mental disorders, such as mental retardation and memory impairment, often appear after mental retardation. With the continuous development of medical technology, the treatment methods of patients with cognitive impairment are gradually enriched, in which drug treatment is the main treatment method. According to the research of psychiatrists, when cognitive impairment occurs, the cognitive function is damaged, and the recovery of cognitive function needs continuous targeted training, and drugs need to be taken to alleviate the psychological emotion of patients during the training process. With the continuous development of society,

a large number of methods to alleviate the condition of patients with cognitive impairment have gradually emerged, among which the impact of education and teaching on patients is more obvious.

With the development of society, the communication between countries is becoming more and more frequent. Therefore, colleges and universities are paying more and more attention to English teaching. However, it is undeniable that the current college English education is facing great difficulties. College students have great negative psychology in English learning, and in the face of strange language habits, college students will be afraid of difficulties in English learning. And in terms of the current situation of English teaching, the current situation of students' English performance and the passing rate of CET-4 and CET-6 are not ideal, so it is urgent to reform English teaching. As an international language, English is very important for college students to understand the world and expand their horizons. However, the low level of English will lead to students' inability to fully express their ideas in both literature reading and oral communication. In recent years, the proposal of flipped classroom has brought hope to the reform of English classroom teaching. Flipped classroom represents the reversal of knowledge transfer and knowledge internalization. Culture teaching in English teaching has always been a difficulty in the classroom. For incomprehensible language classroom, teachers' lectures cannot arouse students' interest. Therefore, it is necessary to use flipped classroom to reasonably and effectively improve English teaching mode. In the formulation of flipped classroom teaching model, it is easy to find that students' cognitive impairment will have an impact on the formulation of flipped classroom teaching model. In college education, the education model reform for patients with cognitive impairment has also become one of the methods for higher education to improve teaching quality. Therefore, exploring the model reform of cognitive impairment on college English flipped classroom will not only help to improve college teaching level, but also alleviate college students' cognitive impairment and promote students' healthy development.

Objective: Starting with cognitive impairment, this paper explores the construction scheme of flipped classroom model in college English teaching, and analyzes the impact of flipped classroom model on students' cognitive impairment.

Study design: Using the method of stratified sampling, 350 students in a university were investigated in class, and the students' learning experience in flipped classroom teaching was judged from the students' classroom performance. Select students with cognitive impairment, count the changes of students' cognitive impairment before and after flipped classroom teaching, and evaluate the mitigation effect of students' cognitive impairment.

Results: A total of 47 of the 350 students suffer from cognitive impairment to varying degrees. The changes of cognitive impairment of 47 students are shown in Table 1. Table 1 shows that among the 47 students, the number of students with mild cognitive impairment increased to 32 after teaching, the number of students with severe cognitive impairment decreased to 0, and 8 students with cognitive impairment were effectively treated. The difference in the number of cognitive impairments before and after teaching is statistically significant.

Table 1. Changes of students' cognitive impairment before and after teaching (n)

Degree of cognitive impairment	Before teaching	After teaching	P
Light	26	32	<0.05
Moderate	14	7	<0.05
Severe	7	0	<0.05

Conclusions: Cognitive impairment is the mental problem of students in college teaching. Considering students' cognitive impairment in college teaching and formulating teaching plans can not only alleviate students' condition, but also improve the quality of college teaching. From the perspective of cognitive impairment and the reform of flipped classroom teaching model in college English teaching, the research formulates innovative teaching plans. The results show that under the new teaching mode, the number of students with cognitive impairment has decreased significantly, and in this process, teachers' teaching level and students' professional performance have been significantly improved. Therefore, in the reform of teaching mode in colleges and universities, considering students' cognitive barriers will help to alleviate students' negative emotions in teaching, promote students' healthy growth and ensure the talent training needs of national development.

PSYCHOLOGICAL RELIEF METHODS OF HIGHER VOCATIONAL STUDENTS' ENGLISH LEARNING ANXIETY BASED ON SELF-EFFICACY

Ling Li & Tianyi Sun

Aviation Security Management College, Sichuan Southwest Vocational College of Civil Aviation, Chengdu 610499, China

Background: Foreign language learning in higher vocational colleges is the focus of professional teaching in higher vocational teaching. From the current situation of higher vocational English teaching, we can know that most students will have English learning anxiety in the face of a complex English environment. English learning anxiety is a kind of fear generated by students when learning English. In English learning, students are faced with more difficult foreign language learning content, which leads to exclusion from English teaching. It also leads to students' English performance being unable to meet the needs of teachers, and finally makes students have English anxiety. Anxiety not only has a serious impact on students' learning efficiency but also has a more serious impact on students' learning efficiency. At the same time, some studies suggest that after students have English learning anxiety, the overall development of comprehensive quality is limited, and students' behavior values will also be affected, resulting in a large number of psychological anxiety students who cannot achieve a satisfactory state in their future development. A large number of studies have proved that students' English learning anxiety in higher vocational colleges mainly comes from students' self-efficacy, so it is of great educational value to analyze the impact of self-efficacy on students' anxiety psychology and put forward coping strategies.

Self-efficacy is the perception of behavior control those individuals show when facing challenges in the environment, that is, when people face different events, their own instinctive judgment can adjust their own behavior. Self-efficacy does not directly affect human behavior, but it can affect people's motivation, cognition and emotion, and play a role in personal psychological self-control in the process of its influence. Students' self-efficacy in English learning has three dimensions. The first is the students' self-confidence reflected in their learning level. The difference in students' self-confidence leads to students' ability to challenge English in English learning. The second is universality. Students' universal self-efficacy in English learning can help students extend their learning attitude to the whole learning field. The difference of universal self-efficacy is the embodiment of students' flexibility in quoting learning methods. The last is the sense of intensity self-efficacy. In English learning, students' learning anxiety will affect students' learning emotion, so different students' sense of intensity self-efficacy also has significant differences. In the psychotherapy of English learning anxiety of higher vocational students, starting with the analysis of students' self-efficacy, we can effectively formulate a plan to alleviate students' anxiety, which is of great significance to the growth of students.

Objective: By analyzing the influence of self-efficacy on students' English learning anxiety, we can alleviate students' learning anxiety by improving students' self-efficacy, providing theoretical reference for English teaching in higher vocational colleges, and bringing guarantee for students' comprehensive development.

Study design: This paper uses multiple linear regression to evaluate the correlation between English learning self-efficacy and students' learning anxiety, constructs a path model, and uses the mediation effect test to determine the relationship between learning self-efficacy and students' learning anxiety, and constructs a psychological mitigation scheme for students' English learning anxiety. 100 students in higher vocational colleges were selected for experimental analysis, and all students were given an anxiety scale and self-efficacy questionnaire to collect students' anxiety scores and self-efficacy scores before the experiment. All students were given a teaching program based on self-efficacy to alleviate psychological anxiety. After 6 months, the students were evaluated on anxiety and self-efficacy for the second time, and the differences were compared.

Table 1. Factor correlation matrix

	Self-efficacy	Learning anxiety	Teacher influence	Teacher closeness
Self-efficacy	1.00	-0.50	0.27	-0.21
Learning anxiety	-0.50	1.00	-0.19	0.14
Teacher influence	0.27	-0.19	1.00	0.10
Teacher closeness	-0.21	0.14	0.10	1.00

Result: There is a significant correlation between students' English learning psychological anxiety and students' self-efficacy, and it can be seen that there is a negative correlation between self-efficacy and

learning anxiety, that is, the improvement of self-efficacy can reduce students' learning anxiety. In addition, the influence of teachers on students also affects students' anxiety to a certain extent. The greater the influence of teachers, the more students' psychological anxiety can be alleviated, that is, there is a negative correlation between the two. The correlation matrix between each factor is shown in Table 1.

Conclusions: Therefore, it is helpful to reduce students' psychological anxiety in English teaching in higher vocational colleges. Starting from self-efficacy, the study first analyzes the correlation between self-efficacy and students' English learning anxiety and then formulates teaching plans to alleviate students' anxiety by improving students' self-efficacy. The results show that improving students' self-efficacy can significantly alleviate students' psychological anxiety, improve the quality of English Teaching in higher vocational colleges, promote the healthy growth of higher vocational college students and cultivate students' healthy values.

INTERACTION BETWEEN ANXIOUS PEOPLE AND EDUCATIONAL ROBOT PRODUCTS BASED ON USER EXPERIENCE

Yue Yuan¹ & Huanghao Feng²

¹*School of Textile Garment and Design, Changshu Institute of Technology, Suzhou 215500, China*

²*School of Computer Science and Engineering, Changshu Institute of Technology, Suzhou 215500, China*

Background: Anxiety is a kind of negative psychological emotion. In psychology, it is considered that anxiety is an irritable emotion generated after excessive worry about their own safety and fate. Generally speaking, people with anxiety disorder often have emotions such as sadness, tension, panic, and uneasiness, and when the patient's anxiety increases, the patient will have varying degrees of mental disorders. Psychology believes that people's anxiety is caused by facing a repressive environment and their inability to take effective defense mechanisms. At the same time, it is difficult to solve problems. Being trapped in worry for a long time will also lead to anxiety. In the treatment of anxious people, psychologists believe that it is necessary to improve their communicative competence to gradually alleviate their psychological pressure. Communicative competence can change the cognition and understanding of anxious people to the environment. Some studies have found that when people with different degrees of anxiety communicate in a team according to a certain combination, a large number of patients with anxiety have alleviated their negative emotions, and with the growth of time, the improvement of patients' negative emotions is more obvious. However, some studies have found that the cognitive differences between different individuals will also aggravate the anxiety of patients to a certain extent. Therefore, how to find an effective way to alleviate the anxiety of anxious people is of great significance.

With the advent of the intelligent era, a variety of intelligent products are emerging, among which robots, as the representative of intelligent products, have attracted more and more public attention. So far, robots are mainly used in the fields of education and social services. In the field of education, educational robots can help students consolidate their daily knowledge points. At the same time, some studies have shown that the educational robot designed on the basis of user experience can also help students alleviate negative psychological emotions to a certain extent. Through in-depth discussion, it is found that the mechanism of educational robots in alleviating negative emotions is to bring human-computer interaction experience to students and improve the frequency of students' daily social communication. Moreover, the educational robot based on user experience can change its interactive content according to the psychological feelings of interactive individuals. In the face of anxious people, the educational robot can change the educational content in real-time according to the psychological needs of anxious people, so as to achieve the purpose of alleviating anxiety in the remission period. Therefore, exploring the emotional changes of anxious people under the influence of educational robots can effectively provide a reference for higher education, and alleviate students' negative emotions by increasing the interaction between anxious people and educational robots, in order to provide direction for the development of higher education and science and technology in China.

Objective: This paper discusses the degree of interaction between educational robots and anxious people in college education, and analyzes the changes in middle school students' anxiety during the interaction between educational robots and anxious people.

Study design: 100 anxious students in a university were selected for experimental tests and analysis. The psychological anxiety of 100 students was measured by an anxiety evaluation scale. Educational robot interactive teaching was adopted to assist teachers' curriculum teaching during students' teaching. The

course lasted for 5 months. Students' anxiety was measured at 1, 2, 3, 4, and 5 months after teaching, and the changes in students' psychological anxiety scores were counted. SPSS24.0 has been used for all data for statistical analysis to evaluate the changes in students' anxiety scores before and after teaching.

Results: Among the 100 students, there were 57 girls and 43 boys. Before the experiment, the anxiety score of 100 students was more than 65. After five months of education and teaching, the anxiety score of all students decreased to less than 40. The difference between the scores before and after comparison was statistically significant ($P < 0.05$).

Table 1. Changes in anxiety scores of students

Group		Before treatment	After treatment	<i>P</i>
Gender	Male	65.33±2.31	37.45±1.37	<0.05
	Female	67.39±2.17	39.18±1.33	<0.05
<i>P</i>		>0.05	>0.05	-

Conclusions: With the continuous development of society, life has gradually changed, and more and more people begin to have anxiety. The generation of anxiety has seriously affected the normal development of people's life. In the research, the interaction between the anxiety crowd and the educational robot is analyzed, and the effect of educational robots in anxiety relief is discussed. The results show that after receiving the interactive intervention teaching of the educational robot, the school performance of anxious students in colleges and universities has been significantly improved, and the anxiety score of students has also been significantly reduced. After a long time of teaching, most students' anxiety has been completely relieved. In college education or social activities, for anxious people, it is necessary to reduce the negative emotions of anxious patients through communication and interaction. The use of intelligent robots can better realize targeted communication and interaction, and can also alleviate patients' emotions more quickly and effectively, which can significantly promote social development.

ANALYSIS OF PSYCHOLOGICAL CRISIS OF ADULT EDUCATION TEACHERS UNDER COMMUNICATION ADAPTATION BARRIERS

Wenlong Xu

Dongguan Open University, Dongguan 523000, China

Background: Communication adaptation barrier is a kind of communication barrier in social communication. From psychological research, communication is the psychological and psychological distance between people, which is composed of cognition, emotion and behavior. In social communication, people with communication barriers mainly lack harmonious interpersonal relationship and scientific and reasonable cognitive ability. The so-called communication adaptation is the understanding and grasp of the relationship between individuals. In psychology, communication adaptation can effectively help individuals establish a good relationship network in communication and help people make correct decisions. Better communication adaptability, lower anxiety level under work pressure, stronger self-confidence at work and better adaptability to the working environment. In the research of psychology, many empirical studies have confirmed that the emergence of communication adaptation disorder will bring serious negative emotions to adults, because communication adaptation disorder will bring serious psychological obstacles to adults. In addition, some psychological studies believe that adults with communication adaptation disorder will have less contact times of employees' external communication due to the existence of psychological obstacles at work, which will lead to employees' inability to show their professional ability at work, which will easily lead to employees' mistakes at work, leading to more serious psychological obstacles.

Adult education is an educational measure to face adults in society. The purpose of adult education is to make social members voluntarily accept education, help adults increase their ability and enrich their knowledge, and cultivate adults' social communication ability in learning. From the public cognition, we can know that adults are a group with independent cognition. From the perspective of psychology, the main gap between adult students and child students is adults' independent thinking ability. And from the life experience of adults, when adults receive continuing education, their rich experience can bring more convenient resources for their education stage. In adult education, the challenges faced by adults are also more obvious. First, the thoughts of adults are fully affected by the social environment. In education, due

to ideological reasons, the educational results are not obvious. At the same time, teachers will have more obvious psychological crisis due to the ideological differences between teachers and adults in education. The main psychological crisis is the obstacle of communication and adaptation. In the communication between teachers and adults, the communication between them cannot be carried out normally due to the difference of ideas. Therefore, how to deal with the psychological crisis of teachers' communication adaptation obstacles in adult education is the key to effectively solve the continuous teaching. Therefore, from the perspective of communication adaptation obstacles in the research, this paper analyzes the generation mechanism of teachers' psychological crisis in adult education, in order to provide reasonable suggestions for adult education in our country.

Objective: This paper discusses the current situation of teachers' communication and adaptation barriers in adult education, analyzes the causes of teachers' communication and adaptation barriers' psychological crisis in adult education, and puts forward corresponding solutions to provide theoretical support for adult education and continuing education in China.

Study design: Through literature search and teacher follow-up survey to determine the current situation of psychological crisis under the obstacle of teachers' communication adaptation, use association rules to determine the psychological crisis that has a great impact on teachers, then use principal component analysis to determine the weight of each psychological crisis, and finally put forward the strategies to solve teachers' psychological crisis.

Result: The use of association rules is recognized. The psychological crisis of teachers in education is mainly cognitive psychological crisis, role psychological crisis, adaptation psychological crisis and value identity crisis. Principal component analysis shows that the weight of teachers' adaptation to psychological crisis under communication adaptation disorder is the largest and the weight of role psychological crisis is the smallest. Finally, the correlation between psychological crises is shown in Table 1.

Table 1 Correlation analysis of psychological crisis

Types of psychological crisis	Cognitive psychology	Role psychology	Adaptive psychology	Value identification
Cognitive psychology	1.00	0.41	0.37	0.66
Role psychology	0.41	1.00	0.51	0.42
Adaptive psychology	0.37	0.51	1.00	0.33
Value identification	0.66	0.42	0.33	1.00

Conclusions: Communication adaptation disorder is one of the normal psychological obstacles for adults in social activities. In adult education, communication adaptation disorder will cause teachers' teaching psychological crisis, hinder teachers' teaching progress and the normal progress of adult education. Therefore, it is urgent to explore teachers' psychological crisis mechanism and put forward relevant solutions. In the research, the categories of teachers' psychological crisis in adult education are obtained by using association rules and principal component analysis, and the correlation test shows that there is a significant correlation between each psychological crisis. Therefore, in the construction of solutions, it is necessary to deal with the four kinds of psychological crisis in a unified way, and alleviate the teachers' psychological crisis by cultivating the values between teachers and adult students. In adult education and continuing education, teachers' psychological state is the main factor affecting the development of teaching. Therefore, in social institutions and college teaching, it is necessary to prevent and intervene teachers' psychological crisis, ensure the normal development of teaching and improve China's comprehensive cultural level.

MUSIC EDUCATION AS A STRATEGY TO RELIEVE STRESS AND ANXIETY AMONG UNIVERSITY STUDENTS— FROM THE PERSPECTIVE OF COMMUNICATION STUDIES

Hong Zheng

College of Art, Hainan Tropical Ocean University, Sanya 572022, China

Background: Communication psychology includes strong communication and weak communication. In the weak communication theory, the generation and storage of information is the total amount of human information, and then expand the value of information through communication, and the value of

information can be realized only after information is concerned. The generation of attention also indicates the emergence of public opinion. Through the above process, the basic logic of weak communication theory is simply formed. In the strong communication theory, the emphasis is to induce information with a high identity and achieve the purpose of communication through the appeal and influence. Generally speaking, communication psychology is that communicators use communication media to induce the psychological changes of receivers. Within the research scope of communication psychology, it includes the psychological demands of communicators, the psychological conditions of receivers and the psychological role of communication channels. With the development of network technology, the communication media of communication psychology has gradually shifted from offline ways such as newspapers to online media. However, it is undeniable that both online and offline, in the research of communication psychology, communicators will directly or indirectly affect the psychological changes of recipients through different communication channels according to their own psychological demands. Using the unique psychological induction method of communication psychology, various fields have gradually begun to take communication psychology as a tool to alleviate personal psychological negative emotions. The main mechanism is to use the disseminator's psychological emotion to affect the receiver's psychological emotion through the communication channel, and then change the receiver's negative emotion.

In college education, students' anxiety is the main factor affecting students' academic progress. Colleges and universities are also looking for teaching programs that can solve students' anxiety. In the teaching of piano course in colleges and universities, the anxiety faced by students is also more serious. Piano, as one of the courses favored by art students, is more difficult. It is difficult for students to achieve ideal learning results in the process of learning, and then appear the anxiety of self-confidence. In the current education, in order to alleviate students' anxiety, some studies have proposed the use of hybrid teaching to carry out piano teaching, so as to improve students' comprehensive ability, enhance students' self-confidence and alleviate students' anxiety. Piano mixed teaching includes two parts: online and offline. In teachers' teaching, offline is used for basic knowledge teaching and online is used for knowledge consolidation. In this teaching mode, students' enthusiasm for piano learning can be gradually improved. At the same time, in the mixed teaching mode, teachers can transfer the teaching psychological emotion to students through the Internet through the online mode, affect students' psychological anxiety through psychological induction, and realize the multi-way relief of students' psychological anxiety. In order to understand the specific mechanism and effect of college piano teachers using communication psychology to alleviate college students' anxiety under the Internet mode, from the perspective of communication psychology, this paper analyzes the impact of piano mixed teaching on students' anxiety, so as to provide ideas for the teaching reform of colleges and universities.

Objective: This paper analyzes the current situation of the application of communication psychology in college teaching, discusses the current situation of college piano teachers using communication psychology for psychological induction in mixed teaching, and analyzes the influence of piano students in mixed teaching and teachers on students' anxiety.

Study design: According to the statistics of the anxiety of freshmen to seniors in a university in piano teaching, all students were randomly divided into experimental group and control group. Both groups of students used piano mixed teaching. The teachers in the experimental group used communication psychology for psychological guidance and intervention on the Internet, and the teachers in the control group only used mixed teaching. The changes of students' anxiety before and after teaching were counted by SPSS22.0 the anxiety scores of students were statistically analyzed.

Table 1. Comparison of students' anxiety before and after teaching

Group	Before teaching	After teaching	<i>P</i>
Experience group	66.57±2.31	35.45±1.26	<0.05
Control group	66.39±2.17	39.07±1.29	<0.05
<i>P</i>	>0.05	<0.05	-

Result: There was significant difference in anxiety scores between the two groups before and after the experiment, and the anxiety of students after the experiment was significantly lower than that before the experiment ($P < 0.05$). The scores of the two groups of students after the experiment were compared, and the data had significant difference ($P < 0.05$).

Conclusions: The anxiety of college students is the key factor hindering the growth of students. Effective anxiety relief can improve the teaching quality of colleges and universities to a great extent. From the perspective of communication psychology, this paper discusses the impact of piano mixed teaching on students' anxiety. The results show that piano mixed teaching can significantly reduce students' anxiety score and alleviate students' anxiety. At the same time, teachers can further reduce students' anxiety by

using communication psychology. Therefore, in college teaching, using the advantages of the Internet to carry out teaching can not only improve the teaching quality, but also solve the psychological problems for students. The use of communication psychology can further reduce the negative psychological emotions of students, which is of great positive significance to the development of students.

RESEARCH ON THE EMOTIONAL ANXIETY OF CONSTRUCTION WORKERS BY INTELLIGENT CONSTRUCTION TECHNOLOGY FOR ENGINEERING CONSTRUCTION MANAGEMENT

Xin Hu¹, Huimin Li², Shan Hua³ & Sunmeng Wang⁴

¹*Engineering Construction Headquarters, Xi'an University of Architecture and Technology, Xi'an 710055, China*

²*School of Civil Engineering, Xi'an University of Architecture and Technology, Xi'an 710055, China*

³*Xi'an University of Architecture and Technology Huaqing College, Xi'an 710043, China*

⁴*School of Management, Xi'an University of Architecture and Technology, Xi'an 710055, China*

Background: Emotional anxiety is a kind of psychological negative emotion. In psychology, emotional anxiety is defined as psychological anxiety. When individuals have emotional anxiety, they will show obvious emotional and behavioral changes. Emotional anxiety has always been one of the important mental health problems concerned by all sectors of society. In psychology, the treatment of emotional anxiety is usually hypnosis or verbal stimulation. In the process of hypnosis, psychologists will urge patients to enter deep sleep by means of hypnosis, so as to alleviate patients' psychological anxiety from the subconscious. In verbal motivation, psychologists will appropriately reduce the trading pressure of patients by communicating with patients, obtain the changes of patients' psychological activities from communication, and take this as a breakthrough to build a conversation system to gradually alleviate patients' anxiety. Generally speaking, the problem of emotional anxiety often appears in the management construction. In the construction process, due to the demand of work progress, the construction personnel will face great pressure. Under the influence of pressure, the problem of psychological emotional anxiety gradually appears. A number of studies have shown that in the construction process, the emotional anxiety of construction workers is mainly manifested in the lack of sense of security, inattention and lack of self-confidence. Under the influence of anxiety, the lack of sense of security of construction personnel leads to the inability of construction personnel to concentrate on their work. The consequence of inattention is the detailed loopholes in the construction process, which reduces the project quality. The lack of self-confidence will lead to the inability of construction personnel to carry out construction work normally and reduce the efficiency of project construction.

In dealing with the anxiety of construction workers, different enterprises take different measures, but from the current development status, most enterprises take intelligent technology to alleviate the work pressure of construction workers, so as to reduce the anxiety of construction workers. In engineering construction, intelligent technology adopts intelligent construction technology. Intelligent construction technology is a technology that uses intelligent equipment and information technology to realize the intellectualization of engineering construction. From the perspective of construction workers' anxiety, intelligent construction technology can optimize the planning and layout through visualization technology. For construction workers, a more reasonable planning and layout can effectively reduce their psychological anxiety. In addition, the intelligent construction technology supported by the Internet of things technology can effectively control the construction quality. At the same time, based on the automation technology, the construction personnel in the engineering construction can reduce their workload through automatic operation, which also plays a certain role in alleviating psychological anxiety. Therefore, the research starts with the existing literature, analyzes the application of intelligent construction technology in engineering construction management, and specifically analyzes the impact of intelligent construction technology on the anxiety of construction workers, so as to alleviate the work pressure of construction workers and provide theoretical guarantee for the harmonious development of society.

Objective: Explore the application status of intelligent construction technology in engineering construction management, count the anxiety status of construction workers in engineering construction, and analyze the changes of anxiety of construction workers under the intervention of intelligent

construction technology.

Study design: Taking three engineering construction projects introducing intelligent construction technology in a city as the research object, 150 construction workers and 50 construction sites were selected. Before the experiment, evaluate the anxiety status of construction personnel through the Self-rating Anxiety Scale, use intelligent construction technology for construction management during the construction process, regularly and simultaneously evaluate the anxiety of all construction personnel within one year after the construction, count the anxiety scores of all construction personnel by Excel, and use SPSS24.0 for statistical analysis.

Results: The anxiety scores of 150 constructors before the start of construction were more than 60 points. After one year of construction, the psychological anxiety scores of constructors decreased to less than 40 points. The difference between the scores at the end of the experiment and before the start of the experiment was statistically significant ($P < 0.05$).

Table 1. Changes of anxiety of construction personnel

Project	0 month	4 months	8 months	12 months	<i>P</i>
1	65.33±2.31	59.11±2.28	44.36±1.87	37.45±1.37	<0.05
2	67.39±2.17	57.34±2.21	44.82±1.83	39.18±1.33	<0.05
3	64.82±2.39	58.10±2.44	42.32±1.77	38.45±1.43	<0.05

Conclusions: In engineering construction, the anxiety of construction personnel is the main factor affecting the normal development of construction. Therefore, effectively alleviating the anxiety of construction personnel has important practical significance for engineering development and management. In the research, the purpose of alleviating the anxiety of construction workers is to use intelligent construction technology to reduce the work pressure of construction workers, improve the sense of work safety and self-confidence of construction workers, and reduce their psychological anxiety. The results show that intelligent construction technology has a significant inhibitory effect on the anxiety of construction workers. Therefore, in engineering construction, enterprise managers should fully consider the psychological anxiety of construction personnel, and make full use of intelligent technology and information technology to alleviate the working pressure of personnel, so as to reduce their anxiety.

PATH OF IDEOLOGICAL AND POLITICAL TEACHING REFORM IN HIGHER VOCATIONAL COLLEGES UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Fei He

Chongqing Technology and Business Institute, Chongqing 400052, China

Background: Educational psychology is a type of psychology proposed according to the current situation of education. The purpose of educational psychology is to solve the problems of traditional teaching schemes in innovative design. Educational psychology believes that in the educational situation, human learning behavior is affected by psychology, and in the design of teaching methods, it advocates paying attention to students' learning habits and development space. In psychology, educational psychology can be divided into pedagogy and psychology. It is considered that the combination of the two forms educational psychology, that is, combining the teaching practice in pedagogy theory and the characteristics of teachers' and students' learning psychological activities in psychology theory. In educational psychology, pedagogy and psychology integrate and influence each other, that is, teachers can take psychology as the theoretical basis to formulate the teaching curriculum plan, and can also give psychological support in teaching practice to gradually improve the teaching plan. With the needs of social development, the research objects of educational psychology also began to increase. From previous studies, we can know that early educational psychology focused on the research of students' psychology and learning rate, and focused on the cultivation of students' professional knowledge by using students' psychology. With the transformation of the concept of social education, college education is not only the cultivation of students' basic professional knowledge, but also the cultivation of students' moral behavior and aesthetic emotion, which

shows that so far, educational psychology has gradually been used in students' ideological and political cultivation, in order to cultivate students' correct values and promote students' mental health.

In the ideological and political training of college students, with the change of social situation, the ideological and political teaching curriculum in higher vocational colleges also needs to be innovated and reformed. The reform of ideological and political teaching in higher vocational colleges is to help students establish correct values after admission. In higher vocational colleges, students need to cultivate strong self-management ability. For higher vocational college students, the lack of self-management knowledge will lead to serious cognitive bias, and then lead to serious psychological problems in their learning. Higher vocational colleges gradually began to apply educational psychology to ideological and political teaching courses, aiming to use students' learning psychology to formulate a teaching model suitable for students' learning, hoping to use ideological and political education to guide students to establish a crisis intervention mechanism, so as to improve students' psychological quality and promote students' healthy growth. Therefore, the research deeply discusses the current situation of ideological and political education in higher vocational colleges from the perspective of educational psychology, and puts forward a reasonable and appropriate teaching reform plan, so as to make a preliminary practical exploration for the reform of ideological and political education in higher vocational colleges.

Objective: This paper discusses the current situation of ideological and political education teaching curriculum in higher vocational colleges, and discusses the role of educational psychology in the teaching reform of ideological and political education curriculum in higher vocational colleges, in order to put forward the reform direction of ideological and political education curriculum in higher vocational colleges and provide theoretical support for the teaching development of higher vocational colleges.

Study design: The research takes the freshmen, sophomores and juniors of a higher vocational college as the research object, selects 100 students in each grade as the main research object, counts the students' psychological demands and psychological changes in the ideological and political course, and constructs the innovative scheme of ideological and political teaching with students' psychological activities. The innovative scheme was used for ideological and political teaching to evaluate the psychological changes and ideological and political performance changes of middle school students in different grades in the teaching process. The experimental time was set as 6 months.

Results: The psychological changes and ideological and political achievements of middle school students in the teaching process are shown in Table 1. Taking students' learning psychological demands as the main index to evaluate students' psychological changes, they represent no demands and high demands according to the 0-4 score system. Table 1 shows that the scores of students majoring in ideology and politics show an increasing trend, and the change of freshmen is the most obvious. From the changes of students' psychological demands, it can be seen that the psychological demands of students in all grades are gradually increasing, which shows that students' interest in ideological and political teaching is increasing.

Table 1. Changes of students in ideological and political teaching

Survey object		0 month	2 months	4 months	6 months
Professional achievement (points)	Freshman	47.2	57.9	72.4	80.4
	Sophomore	51.4	60.1	70.5	79.3
	Junior	50.6	61.3	68.9	77.2
Psychological appeal	Freshman	1	2	4	4
	Sophomore	1	1	3	4
	Junior	1	2	3	4

Conclusions: The ideological and political teaching of students in higher vocational colleges is very important, which can build a complete and perfect correct ideological value for students. Therefore, from the perspective of educational psychology, the research puts forward the reform plan of ideological and political teaching in higher vocational colleges based on educational psychology, which aims to improve the moral and cultural level of higher vocational college students and improve the comprehensive teaching ability of higher vocational colleges. The results show that under the guidance of educational psychology, the innovative model of ideological and political education in higher vocational colleges can significantly improve students' ideological and political professional achievements, improve students' learning psychological demands, stimulate students' learning interest and help students establish a good learning concept. Therefore, in higher vocational education, teachers need to pay attention to students' psychological demands, provide appropriate teaching programs, stimulate students' learning enthusiasm, and achieve the purpose of cultivating students' correct values and correct learning concepts.

THE OVERSEAS DISSEMINATION OF ANCIENT CHINESE LITERARY CLASSICS FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY – TAKING METAPHOR AS AN EXAMPLE

Chunyu Niu

School of Education, Chuzhou City Vocation College, Chuzhou 239000, China

Background: For a long time, the traditional metaphor thought that “metaphor is just a rhetorical method, a way of expression of meaning transfer, metaphor translation has been regarded as the transformation between languages on the rhetorical level”. From the perspective of modern cognitive psychology, the traditional theory of metaphor translation has obvious defects. Contemporary translation theory also holds that translation is not only a formal transformation between two different language systems, but also an active cognitive process of the translator. Since both of them belong to thinking activities, translation and metaphor are intrinsically related in literal meaning, relevant categories, mapping and working mechanism. Since cognition is the basis of metaphor, which is a universal phenomenon in human language, it is unscientific to avoid the translation of cognition. Poetic metaphor is used to express humor, evoke resonance, explain abstraction, explain science, express one’s mind and understand idioms. Considering the characteristics of poetic metaphor, the real-time comprehension of poetic metaphor needs the help of relevant psychological mechanism and cognitive procedure. With the development of cognitive linguistics, the translation of metaphor not only stays in the category of rhetoric and functional grammar, but also the cognitive theory is introduced into the translation of metaphor. Cognitive psychology is the psychology that obtains information from the world and takes information processing as the core. The process of cognitive processing is perception, memory, understanding and processing. The translation is the psychological process of obtaining information from the source text and processing it. Therefore, cognitive psychology provides a theoretical basis for translation studies.

Objective: Poetic metaphor is a kind of unconventional metaphor, which is characterized by originality, interdependence and trans-regularity. After the introduction of conceptual integration theory into metaphor construction, a series of unconventional metaphors such as poetic metaphors are interpreted and their meaning construction process is analyzed. Because poetic metaphor covers a wide range and is flexible, it is difficult to select materials comprehensively. Therefore, we can analyze the overseas spreading effect of ancient Chinese literary classics through cognitive psychology.

Subjects and methods: Based on the existing literature, archaeological relics, poetry and other materials, this paper analyzes and compares the overseas dissemination effects of ancient Chinese literary classics.

Study design: Based on the cognitive psychology theory of metaphor translation, this paper discusses the cognitive processing mechanism and processing model of metaphor translation by means of multiple textual research, historical comparison and induction.

Methods: Using Excel statistical cognitive psychology perspective of the overseas dissemination of classical Chinese literature.

Results: Based on the subjective cognitive experience, the translator will have a general understanding of the central idea of the conjecture, the intention and the style of the text, and the author’s context. Through processing the effective information, extracting the important linguistic features and effectively transforming them, we can find the surface meaning and related expressions of the target language. Compare the acquired information with the mental lexicon, process the words flexibly according to the logic of the original text and the literary accomplishment and knowledge accumulation, and clearly show the cultural connotation of metaphor. In order to make readers more receptive to the foreign culture, the translator will adjust the grammar, syntactic structure and culture of the target language so that the metaphorical meaning of the original can be expressed accurately.

The results of this survey use 0-4 levels to quantify the influence values of specific factors, 0 indicating irrelevance, 1 indicating slight influence, 2 indicating general influence, 3 indicating obvious influence, 4 indicating full influence, and the obtained statistical table is shown in Table 1.

Table 1. Effects of overseas dissemination of ancient Chinese literary classics from the perspective of cognitive psychology

Mode	Subjective cognitive experience	Processing information	Contrastive mental lexicon	Do as the Romans do
Classical literature	4	4	4	4

Conclusions: There is no doubt that translators are familiar with rhetoric, linguistics, translatology, cognitive linguistics, cognitive psychology and other related theories, which can better translate metaphor. In the process of translating metaphor, the translator needs to bring his subjective ability into full play, and at the same time, to follow the grammatical structure. Therefore, translators need to improve their own cultural accomplishment and cognitive ability through cognitive psychology. No metaphor can be understood without the experience of the subject. However, the accumulated experience between people cannot be completely unified, and often vary from person to person, each person has his own different life accumulation. Furthermore, the interpretation of metaphor by the metaphorist is essentially a kind of appreciative activity. Finally, it is hoped that the translator can combine the traditional and modern theories of metaphor translation to effectively resolve the contradictions in cross-cultural communication and transfer the cognitive mode of the source language culture to the readers so as to achieve the goal of cultural communication.

CULTURAL CONFLICT AND STUDENTS' THINKING EXPRESSION OBSTACLES IN COLLEGE ENGLISH TEACHING UNDER THE BACKGROUND OF MULTICULTURALISM

Lili Yang

School of Teacher and Education, Yinchuan University of Science and Technology, Yinchuan 750001, China

Background: In the process of China's social and economic development, economic and cultural exchanges between China and other countries are becoming more and more frequent. In this context, China's culture and the culture of other countries continue to collide and integrate, and on this basis, it has been innovated and developed, and the renewal and development of culture are also faster and faster. The cultures of various countries, nationalities, industries and regions are facing different bases and challenges. Emerging cultures are also emerging and developing, which has also created cultural diversity. In the context of multiculturalism, the importance of international talents who can master and skillfully use English is becoming more and more prominent. Therefore, in recent years, college English teaching has become more and more important in the college education system, and has been paid attention by local governments, parents and people from all walks of life. The university gathers students from all over the world. These students have different cultural backgrounds, living habits, eating habits and language use habits. Therefore, in the process of college English teaching, it is easy to produce cultural conflicts, which will damage students' self-esteem and self-confidence, affect students' physical and mental health, and then lead to some students' thinking and expression barriers.

Patients with thinking expression disorder cannot normally express their emotions, tendencies, feelings and judgments, which seriously affects students' daily life and learning. If the thinking and expression disorder of students cannot be solved and alleviated for a long time, it will also lead to the increasingly withdrawn character of students, the degradation of students' social function, and even make students have psychology such as weariness and depression. Therefore, finding a suitable method to improve and innovate the college English teaching mode, so as to alleviate the obstacles of students' thinking and expression, is of great significance to students' physical and mental health and future development. In view of the above contents, the research combines school psychology to improve and innovate the college English teaching model. School psychology is a kind of applied psychology and the application of psychology in school education practice. The main research content of school psychology is to scientifically and reasonably evaluate the students' mental health level and the school's psychological education level, improve the teaching mode according to the evaluation results, and carry out psychological intervention on students. School psychology plays a good role in correcting and alleviating students' emotional disorders, personality disorders, and other mental diseases. Based on school psychology, this study puts forward strategies for the innovation and improvement of college English teaching mode, discusses the impact of improving college English teaching mode on students' thinking and expression barriers, and designs experiments to verify the teaching effect of improving college English teaching mode. The research provides a new way to improve the mental health level of college students, and is also of great significance to the long-term development of college students.

Objective: The university gathers students from all over the world. These students have different cultural backgrounds, living habits, eating habits and language use habits. Therefore, in the process of college English teaching, it is easy to produce cultural conflicts, which will damage students' self-esteem and self-confidence, affect students' physical and mental health, and then lead to some students' thinking and expression disorders. Based on school psychology, this study puts forward strategies for the innovation and improvement of college English teaching mode, discusses the impact of improving college English teaching mode on students' thinking and expression disorder, and hopes to find an appropriate way to treat students' thinking and expression disorder.

Research objects and methods: Using stratified cluster sampling method, 120 students with thinking expression disorder due to cultural conflict were selected from 8 colleges and universities, including 67 boys and 53 girls. 120 students from different majors, aged 18-25. Using the self-made thinking expression ability evaluation scale to evaluate students' thinking expression ability. The scale includes four elements: fluency of expression, clarity of speech, clarity of thinking logic and expression intention. The score of each element is 1-25, and the full score of the scale is 100. The higher the score, the stronger the students' thinking and expression ability. Using students' English performance evaluation to improve the teaching effect of English teaching model.

Research design: 120 students were randomly divided into research group and control group by random number table method, with 60 people in each group. Among them, the students in the research group adopted the improved college English teaching model based on school psychology. The control group adopts the traditional college English teaching mode. After four months of teaching, the thinking expression ability and English performance of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS22.0.

Results: After teaching, the English scores of the students in the study group were significantly improved compared with those before teaching ($P < 0.05$). The English scores of the students in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. English scores of the two groups

Timing	English achievement		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	67.1±10.2	66.4±11.1	0.246	0.752
After teaching	85.3±8.4	75.9±12.4	8.572	0.001
<i>t</i>	8.720	0.453	-	-
<i>P</i>	0.001	0.654	-	-

Conclusions: Under the multicultural background, the importance of international talents who can master and skillfully use English is becoming more and more prominent. Therefore, in recent years, college English teaching has become more and more important in the college education system, and has been paid attention by local governments, parents and people from all walks of life. In the process of college English teaching, it is easy to produce cultural conflict, which leads to the damage of students' self-esteem and self-confidence, affects students' physical and mental health, and then leads to some students' thinking and expression barriers. Patients with thinking expression disorder cannot normally express their emotions, tendencies, feelings and judgments, which seriously affects students' daily life and learning. School psychology plays a good role in correcting and alleviating students' emotional disorders, personality disorders and other mental diseases. Therefore, combined with school psychology, the research improves and innovates the college English teaching model, effectively alleviates the degree of students' thinking and expression obstacles, and improves students' English performance.

THE CURRENT SITUATION AND COUNTERMEASURES OF RURAL FINANCIAL TARGETED POVERTY ALLEVIATION UNDER THE RURAL REVITALIZATION STRATEGY UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Xiaoyan Duan

School of Economics and Management, Xi'an University, Xi'an 710065, China

Background: Poverty has always been a difficult problem that the whole world attaches importance to. With the progress of the times and the improvement of national strength, China's economic level is growing rapidly, but some remote rural areas are still in poverty due to the problems of education, resources and regional environment, and the annual income of farmers is very low. In recent years, in order to complete the poverty alleviation work and eliminate poverty in China, China has put forward the rural revitalization strategy and launched the targeted poverty alleviation policy of rural finance. In the process of rural financial targeted poverty alleviation, there are still some problems. Some rural financial targeted poverty alleviation work is not carried out smoothly, resulting in some poverty alleviation workers having negative emotions such as anxiety and depression. With the long-term lack of progress in poverty alleviation, negative emotions have accumulated for a long time, resulting in some staff suffering from cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. The process of cognition will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking, and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment.

Patients with cognitive impairment will have obstacles in learning, communication, and memory, which will not only affect the daily life of poverty alleviation workers, but also affect the progress of poverty alleviation, and then affect the development of a harmonious society in China. Social psychology is a branch of psychology that began to rise in the early 20th century. It mainly studies the occurrence and change laws of psychology and behavior of individuals and groups in social interaction and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms, and so on. Based on social psychology, the research analyzes the behavior and psychological laws of financial targeted poverty alleviation objects, and then puts forward improvement countermeasures according to the current situation of financial targeted poverty alleviation, so as to alleviate the cognitive obstacles of poverty alleviation workers, so as to speed up the progress of rural financial targeted poverty alleviation and realize rural revitalization.

Objective: Based on the concept of targeted poverty alleviation, some researchers put forward the concept of financial targeted poverty alleviation. In the process of rural financial targeted poverty alleviation, there are still many problems, resulting in the long-term lack of progress in poverty alleviation. In this context, some poverty alleviation workers have a long-term backlog of negative emotions and suffer from cognitive impairment. Patients with cognitive impairment will have obstacles in learning, communication and memory, which will not only affect the daily life of poverty alleviation workers, but also affect the progress of poverty alleviation, and then affect the development of a harmonious society in China. Therefore, based on social psychology, the research analyzes the behavior and psychological laws of financial targeted poverty alleviation objects, and then puts forward improvement countermeasures according to the current situation of financial targeted poverty alleviation, so as to alleviate the cognitive obstacles of poverty alleviation workers, so as to accelerate the progress of rural financial targeted poverty alleviation and realize rural revitalization.

Research objects and methods: From four poor rural areas, 100 staff engaged in rural financial targeted poverty alleviation and suffering from varying degrees of cognitive impairment were selected as the research objects. The mental health part of the Mini-mental State Examination (MMSE) and quality of 36-Item Short Form Health Survey questionnaire (SF-36) were used to evaluate the degree of cognitive impairment.

Study design: 100 staff were randomly divided into study group and control group by the random number table method, with 50 people in each group. Among them, the staff of the research group adopted the improved rural financial targeted poverty alleviation model based on social psychology to carry out poverty alleviation work. The control group used the traditional rural financial targeted poverty alleviation model to carry out poverty alleviation. After 4 months of poverty alleviation, the cognitive impairment of the two groups of students was compared.

Methods: The relevant data were processed and analyzed by SPSS22.0.

Table 1. Changes in the degree of cognitive impairment between the two groups

Timing	MME Score		t	P
	Research group	Control group		
Before work	11.4±5.5	11.3±5.2	0.254	0.671
After work	26.4±2.4	12.2±4.0	6.673	0.035
t	7.643	0.361	-	-
P	0.001	0.412	-	-

Results: After 4 months of poverty alleviation, the degree of cognitive impairment of the staff in the study group decreased significantly ($P < 0.05$). There was no significant change in the control group ($P > 0.05$), and it was significantly lower than that in the study group ($P < 0.05$), as shown in Table 1.

Conclusions: Poverty has always been a difficult problem valued by the whole world. With the progress of the times and the improvement of national strength, China's economic level is growing rapidly, but some remote rural areas are still in poverty due to the problems of education, resources, and regional environment, and the annual income of farmers is very low. Therefore, China has put forward the rural revitalization strategy and launched the targeted poverty alleviation policy of rural finance. In the process of rural financial targeted poverty alleviation, there are still many problems, resulting in the long-term lack of progress in poverty alleviation. In this context, some poverty alleviation workers have a long-term backlog of negative emotions and suffer from cognitive impairment. Based on social psychology, the research analyzes the behavior and psychological law of the target of financial targeted poverty alleviation and then puts forward improvement countermeasures according to the current situation of financial targeted poverty alleviation. The results showed that after 4 months of poverty alleviation, the degree of cognitive impairment of the staff in the study group decreased significantly ($P < 0.05$). There was no significant change in the control group ($P > 0.05$), and it was significantly lower than that in the study group ($P < 0.05$). Therefore, based on social psychology, putting forward improvement countermeasures for the current situation of financial targeted poverty alleviation can alleviate the cognitive impairment of poverty alleviation workers, so as to speed up the progress of rural financial targeted poverty alleviation and realize rural revitalization.

* * * * *

ANALYSIS ON THE FACTORS AFFECTING THE PSYCHOLOGICAL STABILITY OF TENNIS PLAYERS

Hongjian Yin

College of Physical Education, Chengdu University, Chengdu 610106, China

Background: The motivation of tennis players can be divided into intrinsic motivation and extrinsic motivation. Intrinsic motivation includes competent motivation, achievement motivation and motivation to accept challenge. Extrinsic motivation includes sports motivation caused by the pressure of external environment such as material benefits, coaches, family and society. Intrinsic motivation can promote people's pursuit of sports goals. Athletes in the game, to be able to organically combine the internal and external motives, in order to effectively mobilize the enthusiasm. Psychological quality is an important factor that can help athletes to win in competitive events, and it is also an important factor to help athletes win. Tennis is one of the most important sports, which has a high requirement for the psychological quality of the athletes. Generally speaking, in tennis competition process, if both sides athlete's physical strength and the technical level are equal, then the psychological quality has become the core factor which obtains the competition victory. In tennis competition, if the skill level and physical quality level of the two sides are not too different, then the level of athletes will have a direct impact on the psychological changes of athletes, especially on the key ball. If the athletes play well in the competition, it will greatly enhance their self-confidence and help them to win the competition. If the athletes play poorly in the competition, it will increase the tension and anxiety of the athletes, and even reduce their self-confidence, which will affect the competition results.

Objective: With the rapid development of modern competitive sports, coaches all over the world use all means to maximize the potential of athletes, through scientific and systematic training. In the modern sports competition practice, the investigation discovered that athlete's competition psychology has played the decisive role in the entire competition victory or defeat, especially in the high-level contestant's confrontation.

Subjects and methods: Randomly selected 20 tennis players, regardless of sex. Before the experiment, the 20 athletes were interviewed. The main content of the interview was to analyze the factors influencing the psychological stability in the competition. The results show that there are two aspects: one is the impact of objective factors, such as the stadium environment, coaches and referees. Second, the impact of subjective factors, such as athletes' goal setting, tactical achievements and play level, will quality, physical aspects and self-motivation and so on. In the weekly training to open a psychological course, a period of 3 months. During the experiment, in addition to normal training, the coach should focus on the following points of training and enlightening athletes. First, to establish the self-confidence of athletes. Second, the

tension, anxiety and effective psychological control and dredging. Third, ensure that the target is reasonable. Fourth, strengthen attention training. After the end of the experiment, the 20 players were investigated by questionnaires, using Excel statistics in the above four aspects to improve the quality of tennis players on the impact of competition.

Results: Every excellent athlete has a glorious history and an unforgettable lesson. It is a good teaching material for us to educate the athletes. This kind of material can inspire the athletes to love the collective, maintain the honor, not forget the humiliation, the courage to fight, positive and enterprising spirit. Even if the skills and movements of the athletes are not satisfactory, as long as the coaches give more encouragement and encouragement to the athletes, it will give them a kind of self-confidence, a kind of affirmation, and will have a profound impact on cultivating their interests and other psychological qualities.

The results of this survey use 1-5 grades to quantify the influence values of specific factors, 1 to indicate irrelevant, 2 to indicate slight influence, 3 to indicate ordinary influence, 4 to indicate obvious influence, and 5 to indicate full influence. In order to reduce the relatively large error caused by individual subjectivity in the evaluation, the evaluation values of 20 tennis players are adopted and the average values are obtained by rounding off the results. The specific statistical table is shown in Table 1.

Table 1. The influence of improving the quality of tennis players on competition

Factor	Enhance self-confidence	Control one's nervousness	Ensure the reasonableness of objectives	Intensified attention
Grades	5	5	4	5

Conclusions: In the tennis match, the athlete's psychological quality is the direct factor which affects the match result. Therefore, to improve the psychological quality of athletes can not only ensure the normal or extraordinary level of athletes, but also help athletes win the game. However, there are many factors that affect athletes' psychology, so we should pay attention to the application of various effective measures in order to reduce the impact of various factors on athletes' psychology, so that they can achieve the best results in the process of competition and thus win the competition.

* * * * *

ANALYSIS ON THE EFFECT OF THE INNOVATION AND REFORM OF PHYSICAL EDUCATION TEACHING MODE IN COLLEGES AND UNIVERSITIES ON STUDENTS WITH COMMUNICATION AND ADAPTATION BARRIERS

Yefei Zhang

College of Physical Education, Shanghai University of Electric Power, Shanghai 200090, China

Background: Physical education is an important part of higher education and an important means to promote the all-round development of students' morality, intelligence and physique. The essential function of physical education is to improve people's health, enhance people's physique and promote people's socialization process. College physical education is one of the important courses to cultivate modern qualified and innovative talents. It plays an important role in shaping college students' strong physique, complete personality, tenacious perseverance, stable emotion, good adaptability and smart adaptability. At present, due to the imbalance of college students' physical and mental development, many college students often face psychological confusion and psychological conflict, and some develop into serious psychological obstacles such as weariness, loneliness and inferiority, and even lead to psychological diseases. According to statistics, the number of college students with communication and adaptation barriers is increasing year by year.

The reform of physical education curriculum in colleges and universities should aim at strengthening students' physique, developing psychological quality and cultivating noble moral quality and personality characteristics. On the premise of health education and emphasizing the importance of college students' physical and mental health, we should carry out physical education curriculum teaching to comprehensively improve college students' physical culture literacy. Make full use of various resources, set up a variety of sports to meet the learning needs of students, show students the colorful and pleasant charm of sports, and form the educational characteristics of traditional sports culture in colleges and universities.

Objective: Colleges and universities should actively expand the function of physical education, optimize the physical education teaching mode, integrate physical education teaching resources, give full play to

their subjective initiative according to students' interests and hobbies, make physical education develop in a multi-functional and diversified direction, and achieve remarkable results in cultivating students' technical skills. It effectively cultivates the will and quality of students to adapt to the environment, dare to face difficulties, overcome themselves, overcome difficulties, bear hardships and stand hard work, unite and cooperate, so as to achieve the purpose of physical and mental education in colleges and universities, and adjust and treat the psychological confusion and psychological obstacles of college students.

Subjects and methods: 400 students with communication adaptation disorder were randomly selected, including 180 girls and 220 boys, with an average age of 20.51±1.35. The subjects were divided into experimental group and control group, with 200 students in each group.

Research design: Give the experimental group an innovative model of college physical education teaching. The control group was given routine physical education teaching mode. After teaching, the cognitive impairment of the two groups of college students before and after teaching was compared, and Alzheimer's Disease Assessment Scale cognitive subscale (ADAS-cog) was used to evaluate before and after intervention. The scale has 11 questions with a full score of 70. The evaluation content involves the use of language, concept, structure, orientation and word recognition, and the score is directly proportional to the degree of damage. In order to judge the situation of communication and adaptation obstacles of college students before and after the innovative mode of physical education in colleges and universities.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: Before teaching, there was no significant difference in ADAS-cog between the two groups ($P > 0.05$). After teaching, there was significant difference in ADAS-cog scores between the two groups ($P < 0.05$). As shown in Table 1.

Table 1. The ADAS cog scores of the two groups in different periods were compared

	Group	Experience group	Control group	P
ADAS-cog	Before teaching	20.02±2.61	20.12±2.58	0.379
	After teaching	13.55±1.87*	17.59±2.31*	0.018

Note: Compared with the baseline ADAS-cog score of this group, * indicates $P < 0.05$.

Conclusions: Deepening the reform of college physical education curriculum, expanding the function of physical education, and promoting the physical and mental health of college students are the inevitable trend of the development strategy of modern physical education. It is one of the effective methods and means to test college students' psychological disorders to conduct a follow-up survey of college students' mental health and establish and improve college students' psychological archives. The positive influence of physical education on college students' psychological obstacles is all-round. There is a positive correlation between the purpose of physical education and college students' mental health. According to the actual situation of colleges and universities, reasonably optimize the physical education curriculum, implement the integrated teaching mode inside and outside the class, expand the physical education platform, and lead the treatment of college students' psychological obstacles to the process of physical education. The reform of physical education curriculum in colleges and universities must achieve the goal of physical and mental education of students. According to the learning characteristics, learning tasks, interests and hobbies of college students, the reform system of physical education curriculum in colleges and universities should be implemented. All these are in line with the requirements of the state on the all-round development of quality education and the development direction of contemporary education.

* * * * *

THE IMPACT OF SOCIAL POLICY CHANGES ON COMMUNICATION ADAPTABILITY DISORDER OF MIGRANT ELDERLY

Yuandong Liu

Law School, Zhongyuan University of Technology, Zhengzhou 450007, China

Background: The background of China's urbanization is accelerating, including a large number of rural populations moving into cities. These young and middle-aged rural people settled in cities and towns by going to school and working. These young and middle-aged parents for various reasons, such as taking care of their children's daily life, self-pension, filial piety and so on, these old people either voluntarily or forced to leave their rural hometown and move to cities and towns to settle down. For this special group of elderly

immigrants, some scholars define it as the accompanying elderly. Most of the accompanying elderly are used to rural life. After moving to the city, they will have maladjustment, including social adaptation, cultural adaptation and psychological adaptation. Social adaptation includes interpersonal communication, recreational activities and community participation. Cultural adaptation includes language communication, living habits and values. Psychological adaptation includes life satisfaction, psychological distance, identity and future plans. In addition, changes in urban social policies, such as the pension system and medical expense reimbursement system, are different from those in rural areas, resulting in the extremely maladjustment and confusion of the accompanying elderly. Therefore, based on the above contents, the quality of life of the accompanying elderly can be improved to a certain extent, but the mental health status is not optimistic. Under various maladjustments, many accompanying elderly people have psychological diseases such as anxiety and depression, which lead to the damage of cerebral cortex, the decline of cognitive function, and finally suffer from communication adaptability disorder.

Communication adaptability disorder is that in the process of communication, patients have language cognitive impairment due to defects in one or more cognitive functions such as working memory, self-management or executive function, which leads to the decline of patients' language communication ability, unable to accurately express their thoughts and normal communication with people. Therefore, the negative emotions of the accompanying elderly with communication and adaptation barriers will be more serious and cannot be effectively alleviated, which will greatly damage the mental health of the accompanying elderly and reduce the quality of life of the accompanying elderly. Social psychology is a branch of psychology that began to rise in the early 20th century. It mainly studies the occurrence and change laws of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. Therefore, based on social psychology, the study analyzes the social adaptability of the migrant elderly, and puts forward strategies to enable the migrant elderly to adapt to urban life faster, alleviate the negative emotions of the elderly, and then treat the communication adaptability obstacles of the elderly, so as to promote the construction and development of a harmonious society.

Objective: Most of the elderly who move with them are used to rural life. After moving to the city, due to the changes of living habits, social policies and other factors, they will not adapt to the situation, and then have psychological diseases such as anxiety and depression, resulting in the damage of cerebral cortex, the decline of cognitive function, and finally suffer from communication adaptability disorder. Communication adaptability disorder will reduce the quality of life of the elderly and increase the family burden. Therefore, the research analyzes the social adaptability of the elderly based on social psychology, and puts forward strategies to enable the elderly to adapt to urban life faster, alleviate the negative feelings of the elderly, and then treat the communication adaptability disorder of the elderly and promote the construction and development of a harmonious society.

Subjects and methods: 80 elderly people with communication adaptability disorder were randomly selected by stratified cluster sampling. The Chinese Rehabilitation Research Center Standard Aphasia Examination (CRRCAE) was used to evaluate the degree of communication adaptation disorder.

Study design: 80 accompanying elderly people were randomly divided into study group and control group, with 40 people in each group. The patients in the study group used the intervention method proposed by the study to intervene in the elderly. The patients in the control group did not take measures. After 3 months, the degree of communication adaptability disorder of the two groups was compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: Before the intervention, there was no significant difference in CRRCAE scores between the two groups ($P > 0.05$). After the intervention, the CRRCAE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Figure 1.

Conclusions: With the continuous development of China's economic level and the accelerating process of urbanization, a large number of young and middle-aged people in rural areas began to move into cities, so there were a large number of accompanying elderly groups. Some elderly people who move with them are used to rural life. After moving to the city, they will have maladjustment, and then have psychological diseases such as anxiety and depression, resulting in damage to the cerebral cortex, decline in cognitive function, and finally suffer from communication adaptability disorder. The research is based on social psychology and puts forward intervention methods. The results showed that there was no significant difference in CRRCAE score between the two groups before the intervention ($P > 0.05$). After the intervention, the CRRCAE score of the study group was significantly higher than that of the control group ($P < 0.05$). The above shows that the intervention method proposed in the study can effectively treat the communication adaptability disorder of the elderly and promote the construction and development of a harmonious society.

Figure 1. The degree of communication adaptability disorder between the two groups

THE STATUS QUO OF INTERNET PLUS EMBEDDED COMMUNITY PENSION IN JIANGSU FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Guoping Xie, Shuang Zhao, Jianbing Yin & Yinan Dai

School of Finance and Economics, Wuxi Institute of Technology, Wuxi 214121, China

Background: Population aging has become a worldwide problem. According to previous reports, the population aging of Jiangsu Province ranks third in China. The proportion of people over 60 years old exceeds 22.5% of the total population of Jiangsu Province. The problem of population aging is very serious. At present, the main pension modes in China are home-based pension and institutional pension. However, in the above pension model, due to insufficient economic support, lack of emotional comfort and other reasons, the elderly are easy to feel lonely and lonely, resulting in mental health problems and mental diseases, such as anxiety, depression, cognitive impairment and so on. Many studies show that most of the elderly have a strong sense of loneliness and their mental health is very unsatisfactory, which not only greatly affects the quality of life of the elderly, but also may lead to the decline of cognitive function of the elderly, which will increase the prevalence of cognitive impairment, increase the burden on families and affect the construction of a harmonious society. In this context, some scholars put forward a community-embedded elderly care model that combines the advantages of home-based elderly care and institutional elderly care, and quickly extended it to major cities for pilot. Community embedded pension model can reintegrate the elderly into the social relationship structure and relieve the loneliness and anxiety of the elderly. It is of great significance to improve the mental health level and quality of life of the elderly.

In recent years, Internet technology has developed rapidly, and has been integrated into all walks of life. It also plays an important role. The concept of Internet plus has emerged. Some scholars apply Internet plus to the field of providing for the aged, and realize "intelligent endowment". However, many elderly people have low awareness of the Internet, which is difficult to understand, and the intelligent elderly care industry is immature and fails to form a mature industrial chain. Therefore, the effect of Internet plus embedded pension mode needs further study. Social psychology is a branch of psychology, which mainly studies the occurrence and change law of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. In social psychology, it is generally divided into three fields: individual process, interpersonal process and group process. Among them, individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. The interpersonal process is to explore the interpersonal relationship between individuals and the impact of interpersonal relationship on individual psychology. Group process studies individual psychology and behavior law from the perspective of macro environment, including the psychological impact of group and organization on individual and the

psychological impact of the surrounding environment on the individual. The Internet plus Internet plus embedded mode is closely related to the mental health of the elderly in the three fields, namely, individual process, interpersonal process and group process. Therefore, based on social psychology, the social integration, psychological changes and behavior rules of the elderly on the Internet + embedded pension mode are analyzed, and the effect of Internet plus embedded pension mode is analyzed. The research has a certain reference for the construction of China's elderly care service system, and is also of great significance to promote the development of China's elderly care.

Objective: Population aging has become a worldwide problem, among which China's population aging problem is the most serious. Among them, the proportion of people over 60 years old in Jiangsu Province exceeds 22.5% of the total population of Jiangsu Province, far exceeding the national aging social standard. In recent years, Jiangsu has launched an Internet plus embedded pension mode and has been piloted in various places. Based on social psychology, this paper analyzes the social integration, psychological changes and behavior rules of the elderly on the Internet plus embedded pension mode, analyzes the effect of the Internet plus embedded pension mode, and promotes the development of our pension industry.

Research objects and methods: Using a stratified sampling method, 100 elderly people were selected as the research objects. The subjects ranged in age from 62 to 78, including 43 males and 57 females. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the mental health status of the elderly, and the Elderly Life Satisfaction Scale (ELSC) was used to evaluate the quality of life of the elderly.

Study design: 100 elderly people were randomly divided into study group and control group, with 50 people in each group. The elderly in the study group were given Internet plus embedded pension mode, while the elderly in the control group were provided by the community embedded pension mode. Three months later, the changes in mental health and quality of life of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After three months of different pension modes, the anxiety level of the elderly in the study group was significantly lower than that in the control group ($P < 0.05$), as shown in Figure 1.

Figure 1. SAS scores of the elderly in the two groups

Conclusions: The traditional community home-based elderly care has the problems of unsatisfactory governance efficiency and low professional level. Institutional pension is limited to the problems of lack of resources and high cost, so it is difficult to promote it on a large scale. In this context, some scholars have proposed a community-embedded pension model that combines the advantages of home-based pension and institutional pension. In recent years, Jiangsu has launched an Internet plus embedded pension mode and has been piloted in various places. Based on social psychology, the paper analyzes the effect of the Internet plus embedded pension mode. The results showed that the anxiety level of the elderly in the study group was significantly lower than that in the control group ($P < 0.05$). The above results show that the Internet plus embedded pension mode can effectively alleviate the loneliness and anxiety of the elderly.

Acknowledgement: The research is supported by: Jiangsu University Philosophy and Social Sciences the Path Exploration on Jiangsu Community New Type of Pension According to "Internet + Embedded" (No. 2019SJA0825).

THE COOPERATIVE EDUCATION MECHANISM BETWEEN IDEOLOGICAL AND POLITICAL EDUCATORS AND PROFESSIONAL COURSE TEACHERS IN COLLEGES AND UNIVERSITIES BASED ON COGNITIVE PSYCHOLOGY

Xue Gong

Hubei University of Automotive Technology, Shiyan 442002, China

Background: In the process of the continuous development and progress of China's economy and society, the government and people from all walks of life pay more and more attention to moral education in colleges and universities. In recent years, the Party Central Committee has established moral education as the primary task of higher education. Ideological and political education is an important way to strengthen the ideological construction of students, and it is also the main method to guide college students to cultivate a correct outlook on life and values. It plays an important role in establishing students' self-confidence, cultivating good moral concepts and strengthening college students' ideals and beliefs. It has an important impact on the level of college students' moral quality mental health construction and future development are of great significance. In colleges and universities, professional course teaching and ideological and political education are the two main ways to cultivate high-quality talents. Among them, professional course teaching mainly cultivates college students' professional knowledge and learning ability, so that students have a solid theoretical foundation. Ideological and political education in colleges and universities is to cultivate students' ideological and moral cultivation and professional quality. Nowadays, the education industry is gradually developing in a diversified direction, requiring students to develop in all aspects of morality, intelligence, physique, beauty, labor and so on. Therefore, as a professional course of intellectual education and ideological and political education as moral education, it has a very high position in the curriculum system of colleges and universities and is an important way to achieve the goal of cultivating talents in colleges and universities. The integration of professional courses and ideological and political education in colleges and universities can cultivate professional talents with high ideological and political quality and contribute to the development of society, which requires the mutual cooperation and collaborative education of ideological and political educators and professional course teachers.

At present, the collaborative education between ideological and political educators and professional course teachers in colleges and universities cannot be carried out effectively, and there are many problems, such as teachers' insufficient cognition of collaborative education. There are few talents in collaborative education and the team is incomplete. The practice of collaborative education mode is less and lack of experience. Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition. Therefore, based on cognitive psychology, this study analyzes the cognition of professional course teachers and ideological and political educators in the collaborative education model and then puts forward corresponding strategies to improve the collaborative education model of ideological and political educators and professional course teachers. Including clarifying the working objectives of collaborative education and improving the ideological cognition of collaborative education. Cultivate talents of collaborative education, innovate the ways of collaborative education and build a collaborative education system. The research improves the collaborative education model of ideological and political educators and professional teachers based on cognitive psychology, which can improve the ideological and moral level of students, transport professionals with excellent ideological and political literacy for the society, and then promote the development of society and economy.

Objective: In the process of the continuous development and progress of China's economy and society, the government and people from all walks of life pay more and more attention to moral education in colleges and universities. The integration of professional courses and ideological and political education in colleges and universities can cultivate professional talents with high ideological and political quality and contribute to the development of society, which requires the mutual cooperation and collaborative education of ideological and political educators and professional courses teachers. At present, there are many problems in the collaborative education of ideological and political educators and professional course teachers in colleges and universities. Therefore, the research improves the collaborative education model of ideological and political educators and professional course teachers based on cognitive psychology, hoping to improve the ideological and moral level of students and transport professional talents with excellent ideological and political quality for the society, so as to promote social and economic

development.

Research objects and methods: 100 students in a university were selected as the research object, and the examination results of ideological and political education and professional courses were used to evaluate the students' understanding and learning level of the theoretical knowledge of ideological and political education.

Study design: The students were randomly divided into study group and control group by random number table method, with 50 people in each group. The students in the research group used the improved collaborative education model based on cognitive psychology to teach. The students in the control group were taught with the traditional collaborative education model. Three months later, the examination results of ideological and political education courses and professional courses of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: After 3 months, the scores of students in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. Professional course scores of the two groups of students

Timing (months)	English achievement		<i>t</i>	<i>P</i>
	Research group	Control group		
0	67.1±10.2	66.4±11.1	0.246	0.752
1	71.5±9.2*	67.9±9.4	1.537	0.053
2	78.6±10.1*	71.3±8.6*	5.413	0.034
3	85.3±8.4*	75.9±12.4*	8.572	0.001

* $P < 0.05$ compared with that before teaching

Conclusions: Ideological and political education is not only an important way to strengthen students' ideological construction, but also the main method to guide college students to cultivate a correct outlook on life and values. As a professional course of intellectual education and as moral education, ideological and political education has a very high position in the curriculum system of colleges and universities. It is an important way to achieve the goal of cultivating talents in colleges and universities. Based on cognitive psychology, the research improves the collaborative education model of ideological and political educators and professional teachers, hoping to improve the ideological and moral level of students, transport professionals with excellent ideological and political literacy for the society, and then promote the development of society and economy. The results showed that after 3 months, the scores of students in the study group were significantly higher than those in the control group ($P < 0.05$). Therefore, based on cognitive psychology, we can accurately analyze the cognitive psychology of teachers and students in the process of collaborative education, and then effectively improve the collaborative education model.

THE INNOVATION OF CHINESE TRADITIONAL ELEMENTS IN MODERN ART DESIGN AND ITS THERAPEUTIC EFFECT ON COGNITIVE IMPAIRMENT

Kuo Hu & Fan Yang*

School of Art and Design, Dalian Polytechnic University, Dalian 116034, China

Background: In the process of social and economic development, people's pace of life is faster and faster, and the pressure of competition is greater and greater. Many people have serious psychological problems, such as anxiety, depression and so on. When these psychological problems are not solved for a long time, it will lead to psychological diseases, damage the patient's body function, and even damage the patient's cerebral cortex, resulting in cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. The process of cognition will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients, increases the family economic burden of patients, and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to the patients themselves, their

families and the harmonious development of society.

Works of art can give the audience a sense of beauty, so that the audience can get emotional resonance with the art creator. Art designers can realize the emotional interaction with the audience, so as to awaken the audience's past or current cognition and memory, stimulate emotional feedback, meet the audience's emotional needs and create more value. Therefore, the modern art design is often used in the adjuvant treatment of cognitive impairment. However, the form of the modern art design is relatively single, the audience is prone to aesthetic fatigue, and most modern art design is westernized, and the audience cannot fully understand the meaning and emotion of the works, resulting in the unsatisfactory adjuvant treatment effect of modern artworks. Studying the role of the audience's psychology in art appreciation will help the audience find a correct aesthetic and understanding angle under objective conditions, and improve the emotional resonance between the audience and artworks. Visual psychology is a branch of psychology, which mainly studies the relationship between external images and human psychological mechanisms. Visual psychology involves a wide range of disciplines, including psychology, physical optics, anatomy, visual physiology, visual art, visual learning and so on. Therefore, visual psychology has important applications in cognitive science, architectural design, ophthalmology and art design. The research applies visual psychology to modern art design and analyzes the psychology of the audience. In order to get close to the aesthetics of the audience, let the audience fully appreciate the emotion and connotation contained in modern artworks, and then treat cognitive obstacles, research on integrating Chinese traditional elements into modern art design. Based on visual psychology, modern art design integrated with Chinese traditional elements can arouse the emotional resonance of the audience, affect the psychological and physical functions of the audience, and then treat the cognitive impairment of the audience, reduce the economic burden of the patient's family and promote the harmonious development of society.

Objective: In modern society, many people have serious psychological problems, such as anxiety, depression and so on. When these psychological problems are not solved for a long time, it will damage the patient's cerebral cortex and lead to cognitive impairment. The modern art design is often used in the adjuvant treatment of cognitive impairment. However, the form of the modern art design is relatively single, the audience is prone to aesthetic fatigue, and most modern art design is westernized, and the audience cannot fully understand the meaning and emotion of the works, resulting in the unsatisfactory adjuvant treatment effect of modern artworks. Based on visual psychology, the research integrates Chinese traditional elements into modern art design, hoping to arouse the emotional resonance of the audience, then treat the cognitive impairment of the audience, reduce the economic burden of the patient's family and promote the harmonious development of society.

Subjects and methods: 83 patients with different degrees of cognitive impairment were selected as the subjects from the department of neurology of a tertiary hospital in City. The Cognitive Impairment Assessment Scale (CIAS) was developed in combination with the mental health part of the concise mental state examination scale and the 36-Item Short Form Health Survey questionnaire (SF-36) to assess the degree of cognitive impairment.

Study design: During the normal drug treatment of patients, different modern art and design works are displayed to patients for adjuvant treatment. When presenting works to patients, patients are required to express their feelings about modern art and design works and the emotions contained in the works. Part of the patients (82 people) was treated with modern art and design works integrated with Chinese traditional elements, which were recorded as a research group. Another part of patients (81 people) was treated with western modern art and design works, which were recorded as the control group. The CIAS scores of the two groups were compared 3 months later.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: Before the intervention, there was no significant difference in CIAS scores between the two groups ($P > 0.05$). After the intervention, the CIAS scores of members in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. CIAS scores of two groups of researchers

Timing	CIAS Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before intervention	56.4±8.5	56.5±9.2	0.254	0.671
After intervention	86.4±6.4	77.2±7.0	6.673	0.025
<i>t</i>	7.643	5.361	-	-
<i>P</i>	0.001	0.032	-	-

Conclusions: The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients, increases the family economic burden of patients, and is not

conducive to the harmonious development of society. Works of art can give the audience a sense of beauty so that the audience can get emotional resonance with the art creator. Therefore, the modern art design is often used in the adjuvant treatment of cognitive impairment. However, the modern art design is mostly westernized, and the audience cannot fully understand the meaning and emotion of the works, resulting in the unsatisfactory adjuvant treatment effect of modern artworks. Based on visual psychology, the research integrates Chinese traditional elements into modern art design. The results showed that there was no significant difference in CIAS scores between the two groups before intervention ($P > 0.05$). After the intervention, the CIAS score of the study group was significantly higher than that of the control group ($P < 0.05$). Therefore, integrating Chinese traditional elements into modern art design based on visual psychology can effectively alleviate the cognitive impairment of the audience, reduce the economic burden of the patient's family and promote the harmonious development of society.

ON THE DESIGN OF CULTURAL AND CREATIVE PRODUCTS FROM THE PERSPECTIVE OF ART DESIGN PSYCHOLOGY

Lin Li

College of Art and Design, Wuhan Textile University, Wuhan 430073, China

Background: In the process of social and economic development, people's pace of life is faster and faster, and the pressure of competition is greater and greater. Therefore, many people suffer from mental anxiety symptoms. Generally speaking, anxiety refers to people's emotional reaction to specific things in reality or the value characteristics of things that may happen in the future. Some scholars also put forward another definition of anxiety, that is, anxiety refers to negative emotions such as tension, uneasiness and anxiety in the face of upcoming or possible things with a certain probability of danger and threat. In previous studies, it has been confirmed that mild anxiety can help people better concentrate and energy, so as to improve work or learning efficiency. This is because the objective purpose of anxiety is to guide people on how to quickly take various measures and urgently mobilize various value resources, so as to effectively prevent the serious deterioration of the value characteristics of real or future things and make them develop in a favorable direction. However, excessive anxiety will cause patients to have emotional or physiological diseases, which will seriously affect the physical and mental health of patients, and then affect the normal work and life of patients. Therefore, we need to find a method that can effectively alleviate the anxiety level of people with mental anxiety, so as to promote the harmonious development of society.

Cultural and creative products, namely cultural and creative products, are high value-added products that rely on the wisdom, skills and talents of designers, recreate and improve the existing cultural resources and cultural goods, and finally produce after the full development and application of intellectual property rights. Cultural and creative works can reach the effect of emotional resonance with consumers through visual effects, cultural heritage and artistic expression, so as to improve the anxiety psychology of consumers. At present, in order to cater to consumers, most cultural and creative products ignore the cultural heritage and practical functions, resulting in the lower added value of cultural and creative products, the lower effect of treating mental anxiety, and the significant decline of consumers' consumption desire. Therefore, we need to find a way to improve the current design of cultural and creative products. Design psychology can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Design psychology contains many contents, including visual design, color psychology, consumer psychology, product design, environmental design, personality tendency, hierarchical demand, etc., it also involves perceptual texture and psychological effect. Among them, product design is based on visual design, color psychology and consumer psychology. Designers need to consider consumers' aesthetic, spiritual needs and economic strength, so as to design products with deep cultural connotation and meet consumers' psychological needs. Therefore, based on design psychology, the research puts forward suggestions on the design of cultural and creative products to improve them, so as to improve the cultural connotation of cultural and creative products and stimulate consumption, which also plays a positive role in the dissemination and promotion of China's traditional culture.

Objective: A good cultural and creative product needs to have three characteristics: aesthetics, function

and connotation. At present, in order to cater to consumers, most cultural and creative products ignore cultural heritage and practical functions, blindly pursue beauty and novelty, resulting in the lower added value of cultural and creative products and a significant decline in consumers' consumption desire. Therefore, based on design psychology, the research puts forward suggestions on the design of cultural and creative products in order to improve them, hoping to improve the cultural connotation of cultural and creative products, stimulate consumption, and also play a positive role in the dissemination and promotion of China's traditional culture.

Research objects and methods: 20 students majoring in art design in a university were selected to design cultural and creative products. Collect consumer satisfaction and purchase intention of cultural and creative products in a cultural and creative product trading website.

Study design: 20 students were randomly divided into two groups with 10 students in each group. One group carries out cultural and creative product design based on design psychology, which is recorded as the research group. The other group was created freely and was recorded as the control group. Each group of students designed 20 cultural and creative products for consumer evaluation. The satisfaction of consumers is quantified as 1-5. The greater the satisfaction value, the higher the consumer's recognition of the cultural and creative product.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: Consumers' satisfaction with the design of cultural and creative products based on design psychology was higher than that of freely created cultural and creative products in terms of aesthetics, function, and connotation, as shown in Table 1.

Table 1. Consumer satisfaction with cultural and creative products

Index	Group		t	P
	Research group	Control group		
Taste	3.42±0.45	3.03±0.57	5.324	0.037
Function	4.03±0.48	3.14±0.41	6.711	0.009
Connotation	4.57±0.33	2.76±0.64	8.725	0.001

Conclusions: Creative products are cultural and creative products, which are high value-added products. Good cultural and creative products need to have three characteristics, namely aesthetics, function and connotation. At present, in order to cater to consumers, most cultural and creative products ignore the cultural heritage and practical functions, resulting in the lower added value of cultural and creative products and a significant decline in consumers' consumption desire. Therefore, we need to find a way to improve the current design of cultural and creative products. Based on design psychology, the research puts forward suggestions on the design of cultural and creative products in order to improve them. The results show that consumers' satisfaction with the design of cultural and creative products based on design psychology is higher than that of freely created cultural and creative products in three aspects: aesthetics, function and connotation. Therefore, the design of cultural and creative products based on design psychology can improve the cultural connotation, stimulate consumption, and also play a positive role in the dissemination and promotion of China's traditional culture.

PSYCHOLOGICAL RESEARCH BASED ON THE INTERNET PLUS INTERACTION DESIGN

Jinghao He

School of Art & Design, Zhengzhou University of Aeronautics, Zhengzhou 450046, China

Background: In recent years, with the accelerating process of economic globalization, people's pace of life is getting faster and faster, and the competition in society, work and study is becoming more and more fierce. Therefore, many people suffer from a mental anxiety disorder. Excessive anxiety will form emotional or physiological diseases, which seriously damage the physical and mental health of patients. Therefore, we need to find an appropriate way to alleviate the anxiety of patients. Under the background of Internet plus, the rapid development of intelligent technology and the increasing demand of users' experience has made great changes in the content and form of interaction design. The fundamental principle of interactive design is people-oriented, based on user needs, focusing on the usability and user experience of interactive system design. Therefore, the use of interaction design can alleviate the anxiety of patients.

At present, there are still some defects in the interaction design under the background of “Internet plus”, such as immature voice interaction technology, weak emotion recognition and weak expression ability. Therefore, interaction design also needs to be improved and innovated. Design psychology can analyze people’s psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Therefore, based on design psychology, the research analyzes the aesthetic and experience needs of users, and then puts forward an interactive design system based on the Internet and artificial intelligence, which designs the interactive forms of touch, voice, and physiological signals, improves the usability of interactive design, improves user experience, and forecasts the development trend of interactive design in the future, promote the development of interaction design industry to a certain extent.

Objective: Under the background of Internet plus, the rapid development of intelligent technology and the increasing demands of users on experience have made great changes in the content and form of interaction design. At present, there are still some defects in the interaction design under the background of “Internet plus”, such as immature voice interaction technology, weak emotion recognition, and weak expression ability. Therefore, based on design psychology, the research analyzes the aesthetic and experience needs of users, and then puts forward an interactive design system based on the Internet and artificial intelligence, hoping to improve the user experience, predict the development trend of interactive design in the future, and promote the development of interactive design industry to a certain extent.

Research objects and methods: 200 users were invited to experience the interactive design system and evaluate the interactive system. The evaluation value is 1-5. The higher the score, the higher the user experience.

Research design: An interactive design system based on design psychology and a traditional interactive design system is installed in a large shopping mall respectively. Users are invited to experience the two interactive design systems and evaluate the interactive system. After the experience, the interactive design system will have a pop-up window to investigate users’ satisfaction with the interactive design system. After all, users experience and check the scores, the evaluation values of 200 users will be counted.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: The user’s evaluation value of the interactive design system improved based on design psychology was significantly higher than that of the traditional interactive design system ($P < 0.05$), as shown in Figure 1.

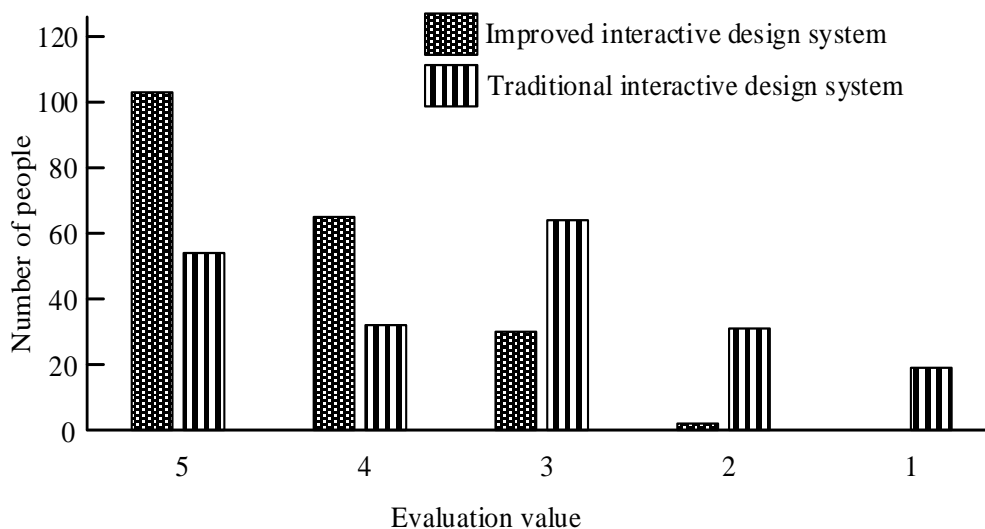

Figure 1. User evaluation value of interactive design system

Conclusions: The fundamental principle of interaction design is people-oriented, based on user needs, focusing on the usability and user experience of interaction system design. Among them, usability is the most basic and important index of interactivity, which is the evaluation of the overall practicability of interactive system design. At present, there are still some defects in the interaction design under the background of “Internet plus”, such as immature voice interaction technology, weak emotion recognition and weak expression ability, which leads to the lack of user experience. Based on design psychology, this

paper analyzes the aesthetic and experience needs of users, and then puts forward an interactive design system based on the Internet and artificial intelligence. The results of user experience show that the users' evaluation value of the interactive design system based on the improvement of design psychology is significantly higher than that of the traditional interactive design system. Therefore, the improvement of interactive design systems based on design psychology can improve the user experience and promote the development of the interactive design industry to a certain extent.

ANALYSIS OF SCENE DESIGN IN 3D ANIMATION FROM THE PERSPECTIVE OF DIGITAL MEDIA ART DESIGN PSYCHOLOGY

Gitao Yu¹ & Chun Ma²

¹*Department of Art and Cultural Tourism, Chongqing Vocational Institute of Tourism, Chongqing 409000, China*

²*Qianjiang District Cultural Relics Management Office, Chongqing 409000, China*

Background: With the continuous development of computer technology and Internet technology, digital media art also came into being and developed rapidly. Digital media art is a kind of skill and method of artistic processing, processing and creation of various works mainly through information technology. With the wide application of digital media art, more and more industries are involved. Now digital media art plays an important role in various modern designs, such as three-dimensional animation. 3D animation, also known as 3D animation, has the characteristics of comprehensive display, vivid, interesting, convenient modification, convenient use and low cost. It can jump out of the limitations of time and space, conditions and objects, and express complex and abstract things or concepts in vivid, simplified and vivid forms through various forms. Therefore, 3D animation is widely used in military, medical, education, entertainment and other fields. In today's highly developed information technology, the scene design in 3D animation also needs innovation and improvement to bring the audience a better viewing experience. However, the traditional scene design of 3D animation generally adopts the form of hand drawing. In the process of conversion and modification, it has low efficiency and high error rate, which greatly affects the creation of the whole 3D animation. In addition, the original processing technology of 3D animation is relatively single, and the animation and sound cannot be effectively integrated in the scene design, resulting in the low authenticity of 3D animation and reducing the viewing experience of the audience. Therefore, we should find a way to optimize and improve the scene design in 3D animation.

Design psychology can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. The research is based on design psychology to analyze the audience's demand experience for 3D animation, and integrate digital media art into the scene design of 3D animation, so as to improve innovation and provide technical support for the development of subsequent 3D animation. The application of digital media art can improve the performance effect of 3D animation, highlight the connotation of animation, increase artistic appeal and visual impact, and provide a driving force for the development of 3D animation in China.

Purpose: 3D animation, also known as 3D animation, has the characteristics of comprehensive display, vivid, interesting, convenient modification, convenient use and low cost. It can jump out of the limitations of time and space, conditions and objects, and express complex and abstract things or concepts in vivid, simplified and vivid forms through various forms. Therefore, it is widely popular. However, there are many defects in the traditional three-dimensional animation scene design, which reduces the viewing experience of the audience. Therefore, based on design psychology, the research analyzes the audience's demand experience for 3D animation, integrates digital media art into the scene design of 3D animation, hoping to improve the performance effect of 3D animation, highlight the connotation of animation, increase artistic appeal and visual impact, and provide a driving force for the development of 3D animation in China.

Research objects and methods: Invite 3D animation creators to design the scene of 3D animation. For the scene design of the same three-dimensional animation, the traditional design method is adopted, and the design method based on design psychology and digital media art is adopted. 100 3D animation enthusiasts were selected as the research object to evaluate the scene design of two 3D animation. The

evaluation value is 1-5. The higher the score, the better the effect of 3D animation scene design.

Research and Design: Publish three-dimensional animation scene design based on traditional design methods and three-dimensional animation scene design based on design psychology and digital media art on a three-dimensional animation website. Invite 100 3D animation lovers to evaluate the two scene designs.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: The evaluation value of 100 3D animation lovers on 3D animation scene design based on design psychology and integrated into digital media art was significantly higher than that of traditional design methods ($P < 0.05$), as shown in Figure 1.

Figure1. Evaluation value of 3D animation lovers

Conclusions: In today's highly developed information technology, the scene design in 3D animation also needs innovation and improvement to bring the audience a better viewing experience. However, the traditional scene design of 3D animation generally adopts the form of hand drawing. In the process of conversion and modification, it has low efficiency and high error rate, which greatly affects the creation of the whole 3D animation and reduces the viewing experience of the audience. Therefore, based on design psychology, the research analyzes the audience's demand experience for 3D animation, integrates digital media art into the scene design of 3D animation, improves the performance effect of 3D animation, highlights the connotation of animation, increases artistic appeal and visual impact, and provides a driving force for the development of 3D animation in China.

STANDARDIZATION OF LEGAL PROCEDURE IN THE TREATMENT OF DEPRESSIVE PSYCHOSIS

Jun Hu^{1,2}

¹The Industry-education and Innocation-entrepreneurship Center, Hezhou University, Hezhou 542899, China

²Department of International Law Affairs, Graduate School, DONG-A University, Busan 49236, Korea

Background: Psychosis, in order to reduce social discrimination, is more easily accepted by the society, so it is also called psychological disorder. Psychosis refers to the abnormal behavior of individuals in psychological process, thinking logic and personality characteristics due to physiological defects, psychological diseases or various social reasons. Patients with mental disorders lack sufficient ability to carry out appropriate social activities. Therefore, the consequences of the behavior of patients with mental disorders may pose a certain threat to themselves and society, and have a certain negative impact on the construction of a harmonious society. According to the clinical manifestations of patients, psychological disorders are divided into several types, such as psychosomatic disorders, anxiety, depression, hysteria, schizophrenia, manic, hallucinogenic and so on. Depressive psychosis, i.e., depression, is a more serious disease among psychological disorders. It is a psychological disease in which patients have a deviation in their cognition of social things under the influence of negative emotions such as depression and pessimism. The cognitive bias of patients with depressive psychosis is more serious. In order to end pain and confusion, they often have the idea of suicide. Therefore, the suicide rate of patients with depressive psychosis is 20

times higher than that of normal people, which is a vulnerable group.

In China, the protection of human rights of patients with depressive psychosis has always been a research hotspot, which has been widely discussed by people. People also pay great attention to the standards and procedures of standardizing diagnosis and treatment behavior by mental health legal system. At present, there are still some problems in the standardization of legal procedures in the treatment of depressive psychosis in China, such as the lack of strict standards and procedures for involuntary treatment, the unclear object of diagnosis and treatment notification, the opacity of diagnosis and treatment, the lack of supervision and so on. Personality psychology is a branch of psychology, which mainly studies the unique behavior patterns of individuals, including beliefs, self-concept, personality and so on. Personality psychology holds that each individual has unique characteristics, that is, the specificity of behavior characteristics and personality composition characteristics. This uniqueness leads individuals to choose different coping styles when facing the same problem. Based on personality psychology, this study analyzes the emotion, attitude and personality of patients with depressive psychosis in diagnosis and treatment, and then puts forward some suggestions to improve the legal procedure norms in the treatment of depressive psychosis, so as to avoid the occurrence of "being mentally ill" on the one hand, and help the hospital to be targeted on the other hand. Implement scientific rehabilitation treatment for patients differently, save medical resources and promote the construction of a harmonious society.

Objective: At present, there are still some problems in the standardization of legal procedures in the treatment of depressive psychosis in China, such as the lack of strict standards and procedures for involuntary treatment, the unclear object of diagnosis and treatment notification, the opacity of diagnosis and treatment, the lack of supervision and so on. Based on personality psychology, this study analyzes the personality of patients with depressive psychosis in diagnosis and treatment, so as to put forward suggestions, improve the legal procedure norms in the treatment of depressive psychosis, and promote the construction of a harmonious society.

Research objects and methods: 90 law students and 10 professors were selected as the research objects. Invite professors and students to evaluate the suggestions put forward by the research. The evaluation value is 1-5. The higher the score, the more effective the research object thinks the suggestions are.

Research design: Using Analytic Hierarchy Process (AHP) combined with fuzzy comprehensive evaluation to construct the evaluation system of legal procedure standardization in the treatment of depressive psychosis. The comprehensive analytic hierarchy process and fuzzy comprehensive evaluation method are used to analyze the suggestions put forward in the study.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: All 100 subjects gave high evaluation to the suggestions put forward in the study, as shown in Figure 1.

Figure 1. Evaluation value of research object

Conclusions: Depressive psychosis, i.e., depression, is a more serious disease among psychological disorders. It is a psychological disease that patients have a deviation in their cognition of social things under the influence of depression, pessimism and other negative emotions. The cognitive bias of patients with depressive psychosis is more serious. In order to end pain and confusion, they often have the idea of suicide. In China, the protection of human rights of patients with depressive psychosis has always been a research hotspot, which has been widely discussed by people. People also pay great attention to the standards and

procedures of standardizing diagnosis and treatment behavior by mental health legal system. Based on personality psychology, this study analyzes the emotion, attitude and personality of patients with depressive psychosis in diagnosis and treatment, and then puts forward some suggestions. The results show that 100 subjects have a high evaluation of the suggestions put forward by the study. Therefore, the suggestions put forward in the study can improve the legal procedure norms in the treatment of depressive psychosis and promote the construction of a harmonious society.

LEGAL RESEARCH ON THE GUIDING EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION ON ANTISOCIAL PERSONALITY

Xiufu Ye^{1,2}

¹*School of Marxism, Hezhou University, Hezhou 542899, China*

²*Department of International Law Affairs, Graduate School, DONG-A University, Busan 49236, Korea*

Background: Antisocial personality is antisocial personality disorder, also known as ruthless personality disorder and social morbid disease. It is a disease that seriously affects social security and social harmony. The causes of antisocial personality disorder are closely related to the family environment, including parents' education mode, parents' educational level, family economic income, family marital status and so on. Studies have shown that a good family environment can greatly reduce the incidence rate of antisocial personality disorder. Antisocial personality disorder mainly has the following four characteristics: high aggression, no sense of shame, unplanned behavior and poor social adaptation. The personality characteristics of patients with antisocial personality disorder deviate significantly from those of normal people. There are obvious abnormal behavior patterns in personal life and interpersonal relationships, and there will be conduct problems in adolescence, such as truancy, weariness, alcoholism, sexual debauchery, lying, violating discipline, attacking people and so on, which will continue to develop for a long time until the patient reaches adulthood or lifelong. Generally speaking, patients with antisocial personality disorder rarely take the initiative to seek the help of doctors. Instead, they will be imprisoned or put into reeducation through labor for violating laws and disciplines. Therefore, in the process of imprisonment or reeducation through labor, it is of great significance to guide the personality of patients with antisocial personality disorder, reduce the antisocial degree of patients, and avoid patients from violating the law and discipline again, which is of great significance to social harmony and stability and the long-term development of patients.

Personality psychology is a branch of psychology, which mainly studies the unique behavior patterns of individuals, including beliefs, self-concept, personality and so on. Personality psychology holds that each individual has unique characteristics, that is, the specificity of behavior characteristics and personality composition characteristics. This uniqueness leads individuals to choose different coping styles when facing the same problem. Based on the theory of personality psychology, in order to guide the patients with antisocial personality disorder to change in a good direction, we first need to change their personality traits such as thoughts, ideas and emotions. Ideological and political education is not only an important way to strengthen the ideological construction of educational objects, but also the main method to guide educational objects to cultivate correct outlook on life and values. It plays an important role in establishing the self-confidence of educational objects, cultivating good moral concepts and strengthening the ideals and beliefs of educational objects, and has an important impact on the moral quality level of educational objects. Mental health construction and future development are of great significance. Based on personality psychology, this study uses ideological and political education to educate and treat imprisoned patients with antisocial personality disorder, so as to reduce the aggression and antisociality of patients, improve social security and promote the construction of a harmonious society.

Objective: Patients with antisocial personality disorder are often imprisoned or put into reeducation through labor for violating laws and disciplines. Therefore, in the process of imprisonment or reeducation through labor, it is of great significance to guide the personality of patients with antisocial personality disorder, reduce the antisocial degree of patients, and avoid patients from violating the law and discipline again, which is of great significance to social harmony and stability and the long-term development of patients. Based on personality psychology, this study uses ideological and political education to educate and treat imprisoned patients with antisocial personality disorder, so as to reduce the aggression and antisociality of patients, improve social security and promote the construction of a harmonious society.

Participants and methods: 100 patients with antisocial personality disorder were selected as the

research object in a juvenile detention center, and the treatment effect of patients was evaluated by explicit aggressive behavior scale.

Study design: 100 patients with antisocial personality disorder were randomly divided into study group and control group, with 50 people in each group. The study group was treated with ideological and political education based on personality psychology, while the control group was treated with blank treatment. One month later, the scores of explicit aggressive behavior scale were compared between the two groups.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and excel.

Results: After one month of intervention treatment, the score of explicit aggressive behavior scale in the study group was significantly lower than that in the control group ($P < 0.05$), as shown in Table 1.

Table 1. Explicit aggressive behavior scale scores of the two groups

Timing	Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before intervention	8.7±3.8	8.6±2.9	0.246	0.752
After intervention	2.1±1.3	7.4±3.8	6.537	0.013
<i>t</i>	8.462	1.453	-	-
<i>P</i>	0.000	0.132	-	-

Conclusions: Antisocial personality is antisocial personality disorder, also known as ruthless personality disorder and social morbid disease. It is a disease that seriously affects social security and social harmony. Patients with antisocial personality disorder are often imprisoned or put into reeducation through labor for violating the law and discipline. Therefore, in the process of imprisonment or reeducation through labor, it is of great significance to guide the personality of patients with antisocial personality disorder, reduce the antisocial degree of patients, and avoid patients from violating the law and discipline again, which is of great significance to social harmony and stability and the long-term development of patients. Based on personality psychology, ideological and political education is used to educate and treat imprisoned patients with antisocial personality disorder. The results showed that after one month of intervention treatment, the score of explicit aggressive behavior scale in the study group was significantly lower than that in the control group ($P < 0.05$). Therefore, the ideological and political education based on personality psychology can effectively reduce the aggression and antisociality of patients, improve social security and promote the construction of a harmonious society.

AN EMPIRICAL STUDY ON GENDER DIFFERENCES IN COMPLIMENT RESPONSE STRATEGIES OF CHINESE COLLEGE STUDENTS IN THE CONTEXT OF COGNITIVE IMPAIRMENT

Li Yang

School of Foreign Studies, Nanjing University of Posts and Telecommunications, Nanjing 210023, China

Background: In the process of economic and social development, the competition is becoming more and more fierce. Therefore, many college students have too much psychological pressure and suffer from social anxiety, which leads to cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. In the process of cognition, it will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. Cognitive impairment is a pathological process involving brain function. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment and aphasia, which seriously affect their daily life and reduce their quality of life. Therefore, we need to find an appropriate way to alleviate social anxiety and treat cognitive impairment. Compliment is a kind of positive speech act, which can praise someone's quality, possessions and talents explicitly or implicitly. The reasonable use of compliments can express their greetings or encouragement, which also plays an important role in alleviating the contradiction between the two sides and improving their relationship. The use of compliments can effectively alleviate social anxiety, and then play a role in the treatment of cognitive impairment.

Language is one of the most direct and convenient ways of communication between human individuals,

individuals and groups, groups and groups. Language is also a cultural and social phenomenon. Different countries and races also have different languages. Some studies have shown that there are obvious differences between men and women in the use of language, and this difference is mainly reflected in the users' vocabulary, language and communication strategies. There are also significant differences between men and women in the response strategies of compliments. Personality psychology is a branch of psychology, which mainly studies the unique behavior patterns of individuals, including beliefs, self-concept, personality and so on. Personality psychology holds that each individual has unique characteristics, that is, the specificity of behavior characteristics and personality composition characteristics. This uniqueness leads individuals to choose different coping styles when facing the same problem. Based on personality psychology, this study analyzes the gender differences of compliment response strategies of Chinese college students, and then analyzes the personality characteristics of students with cognitive impairment of different genders, so as to treat the patients, improve the treatment effect and reduce the family burden of students.

Objective: Patients with cognitive impairment are often accompanied by learning impairment, memory impairment and aphasia, which seriously affect their daily life and reduce their quality of life. Therefore, we need to find an appropriate way to alleviate social anxiety and treat cognitive impairment. Based on personality psychology, this study analyzes the gender differences of compliment response strategies of Chinese college students, and then analyzes the personality characteristics of students with cognitive impairment of different genders, so as to treat the patients, improve the treatment effect and reduce the family burden of students.

Subjects and methods: 80 students with cognitive impairment were selected from three universities, including 43 boys and 37 girls. The concise Mini-mental State Examination (MMSE) was used to evaluate the degree of cognitive impairment of students.

Research design: By interviewing teachers, classmates and students with cognitive impairment, we get the basic information and compliment response strategies of students, and compare the degree of cognitive impairment of students with different gender and compliment response strategies, so as to analyze the relationship between different personality characteristics and the degree of cognitive impairment.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: There were significant differences in the choice of compliment response strategies between different genders, as shown in Table 1.

Table 1. The choice of compliment response strategies in different genders

Strategy	Male		Female	
	Number	Percentage (%)	Number	Percentage (%)
Explicit compliment	19	44.2	32	86.5
Implied compliment	4	9.3	4	10.1
Mention but not compliment	5	11.6	1	27.0
Not mentioned	15	34.9	0	0.0
Total	43	100	37	100

Conclusions: In the process of economic and social development, the competition is becoming more and more fierce. Therefore, many college students have too much psychological pressure and suffer from social anxiety, which leads to cognitive impairment. The reasonable use of compliments can express their greetings or encouragement, which also plays an important role in alleviating the contradiction between the two sides and improving their relationship. The use of compliments can effectively alleviate social anxiety, and then play a role in the treatment of cognitive impairment. Based on personality psychology, this study analyzes the gender differences of compliment response strategies of Chinese college students, and then analyzes the personality characteristics of students with cognitive impairment of different genders, so as to treat the patients, improve the treatment effect and reduce the family burden of students.

ANALYSIS OF INNOVATIVE TEACHING REFORM OF FINANCIAL ACCOUNTING SPECIALTY EDUCATION IN COLLEGES AND UNIVERSITIES FROM A PSYCHOLOGICAL PERSPECTIVE

Xuemei Dong

Faculty of Education, Sichuan Vocational and Technical College, Suining 629000, China

Background: In an enterprise, financial accounting is an indispensable post. The working ability of relevant staff is related to the profit limit of the enterprise. Therefore, the teaching of financial accounting is very important. Financial accounting teaching is a compulsory course for finance majors, which plays an important role in finance-related majors such as accounting and financial management. The traditional teaching mode of the financial accounting course in colleges and universities is relatively backward and has many defects, which leads to students' inability to understand and remember some abstract and complex concepts, which is not conducive to students' learning. In the long run, students will have anxiety, and then have the psychology of weariness. Generally speaking, anxiety refers to people's emotional reaction to specific things in reality or the value characteristics of things that may happen in the future. Mild anxiety can help people better concentrate and energy, so as to improve work or learning efficiency. Long-term and excessive anxiety will lead to the impairment of students' physical function, the decline of mental health level, affect students' daily life and study, and have a negative impact on students' long-term development and the improvement of China's market economy. Based on the above contents, it is necessary to innovate and reform the traditional teaching mode of financial accounting courses in colleges and universities, so as to improve the teaching effect and alleviate students' anxiety.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Based on educational psychology, this study analyzes the psychology of students majoring in financial accounting, and then puts forward strategies to innovate and reform the traditional teaching mode of financial accounting. The first is to construct the intelligent teaching mode of the financial accounting course in colleges and universities by combining multimedia technology and Internet technology. In the intelligent teaching mode, we should strengthen practical teaching, innovative teaching methods, actively promote school-enterprise cooperation and improve students' practical ability, optimize teaching resources, strengthen the cultivation of teachers' professional level. The innovation and reform of the traditional teaching mode of financial accounting course based on educational psychology and the construction of intelligent teaching mode combined with Internet technology can improve students' learning interest and enthusiasm and improve students' financial accounting scores, so as to output more high-quality accounting talents for the society and the market and make a contribution to the development of China's social economy.

Objective: The traditional teaching mode of the financial accounting course in colleges and universities is relatively backward, and there are many defects, such as relatively backward teaching resources, weak teachers and so on. Based on educational psychology, the research analyzes the psychology of students majoring in financial accounting, and constructs the intelligent teaching mode of the financial accounting course in colleges and universities in combination with multimedia technology and Internet technology, so as to improve students' learning interest and enthusiasm, improve students' financial accounting scores, and output more high-quality accounting talents for the society and the market.

Research objects and methods: Two classes of financial accounting specialty in a university were selected as the research objects, and the teaching effects of the two classes were evaluated by using the examination results of the two classes of financial accounting specialty courses.

Research design: One class (68 people) was used as the research group and the other class was used as the control group (70 people). Among them, the class of the research group adopts the intelligent teaching mode constructed by combining Internet technology for teaching, the control class adopts the traditional college financial accounting teaching mode. Three months later, compare the examination results of college financial accounting courses in the two classes.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After teaching, the results of the college financial accounting examination of the students in the research group were significantly improved ($P < 0.05$). And it was significantly higher than that of the control group ($P < 0.05$). The results of the college financial accounting examination of the two groups of students are shown in Table 1.

Table 1. College financial accounting examination results of two groups of students

Timing	Examination results		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	63.4±10.9	62.5±11.3	0.304	0.653
After Teaching	86.7±11.7	73.1±10.9	6.420	0.013
<i>t</i>	6.371	4.421	-	-
<i>P</i>	0.006	0.029	-	-

Conclusions: In the enterprise, financial accounting is an indispensable post, and the working ability of relevant staff is related to the profit limit of the enterprise. Therefore, the teaching of financial accounting is very important. The traditional teaching mode of the financial accounting course in colleges and universities is relatively backward, there are many defects, and the teaching quality is not ideal. Based on educational psychology, the research analyzes the psychology of students majoring in financial accounting, then puts forward strategies, innovates and reforms the traditional teaching mode of financial accounting course, and constructs the intelligent teaching mode of the financial accounting course in colleges and universities in combination with multimedia technology and Internet technology. The results show that after teaching, the scores of colleges financial accounting examination of the students in the research group have been significantly improved ($P < 0.05$). And it was significantly higher than that of the control group ($P < 0.05$). Therefore, the innovation and reform of the teaching mode of financial accounting based on educational psychology can improve students' learning interest and enthusiasm, and improve students' financial accounting scores, so as to output more high-quality accounting talents for the society and the market and make a contribution to the development of China's social economy.

EFFECT OF NATIONAL SPORTS ON ALLEVIATING PATIENTS WITH BEHAVIORAL DISORDERS

Xudong Fan

School of Sports and Health, Guangdong Polytechnic of Science and Technology, Zhuhai 519090, China

Background: In society, there is a special vulnerable group, namely patients with behavioral disorders. Behavior disorder is a kind of disease that occurs in a variety of psychological process disorders and leads to obvious abnormal behavior of individuals. According to the behavior of patients, the researchers divided behavioral disorders into two types: psychomotor inhibition and psychomotor excitement. Among them, psychomotor excitement is also known as behavioral excitement. The main feature of this type of behavior disorder is that the amount of behavior and movement of patients increase significantly. Psychomotor excitement can also be divided into two situations, one of which is coordinated excitement, that is, the patient's behavior and action and thoughts and feelings are coordinated and matched with each other. This type of psychomotor excitement is common in emotional excitement, mild mania, etc. The other is uncoordinated excitement, which is manifested in the uncoordinated behavior and action of patients with psychology and thought, which is common in schizophrenia. The main characteristic of behavioral disorder of psychomotor inhibition is that the patient's movement and behavior are greatly reduced, which affects the normal life, study and work. Therefore, finding an appropriate method to alleviate behavior disorders is of great significance to improve the quality of life of patients and the construction of a harmonious society.

Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness, human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Therefore, based on behavioral psychology, this study analyzes the behavior, will and mental activity law of patients with behavioral disorders, and puts forward the use of national sports to alleviate the degree of behavioral disorders. National health is not only one of the important indicators of a country's comprehensive strength, but also an important symbol of the development and progress of social and economic level. National sports are an important way and means to achieve national health. It can enhance the physique of the whole country and improve people's happiness. Through national sports, it can alleviate the negative emotions such as anxiety and depression of patients with behavior disorders, improve the physical quality of patients, and then alleviate the degree of behavior disorders. It is of great significance to improve the quality of life of patients and the construction of a

harmonious society.

Objective: Behavioral disorders have a significant impact on patients' life, study and work, reduce patients' quality of life and affect the harmonious development of society. Therefore, based on behavioral psychology, the study proposes to use national sports to alleviate the behavior disorder of patients, hoping to alleviate the degree of behavior disorder of patients, improve the quality of life of patients and promote the construction of a harmonious society.

Research objects and methods: 80 patients with behavioral disorders admitted from July 2020 to June 2021 were selected as the research objects in the psychiatric department of a third-class hospital. SF-36 scale was used to evaluate the quality of life of patients. Nosie-30 scale was used to evaluate the degree of behavior disorder. The Ability of Daily Living (ADL) was evaluated by the Ability of Daily Living scale (ADL).

Study design: The patients were randomly divided into study group and control group with 40 people in each group. The patients in the control group were treated with routine behavior disorder treatment. On the basis of the control group, the patients in the study group were intervened in combination with national sports. After 3 months, SF-36, nosie-30 and ADL scores of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After 3 months of treatment, the nosie-30 score of patients in the study group was significantly higher than that in the control group ($P < 0.05$), as shown in Table 1.

Table 1. Nosie-30 score of two groups

Timing	Nosie-30 scores		<i>t</i>	<i>P</i>
	Research group	Control group		
Before treatment	157.9±17.9	157.7±18.5	0.604	0.554
After treatment	199.3±15.2	180.6±10.8	6.420	0.023
<i>t</i>	6.371	3.421	-	-
<i>P</i>	0.000	0.039	-	-

Conclusions: In society, there is a special vulnerable group, namely patients with behavior disorders. Behavioral disorders have a significant impact on patients' life, study and work, reduce patients' quality of life and affect the harmonious development of society. Therefore, finding an appropriate method to alleviate behavior disorders is of great significance to improve the quality of life of patients and the construction of a harmonious society. Based on behavioral psychology, this study proposes to use national sports to alleviate patients' behavioral disorders. The results showed that the nosie-30 score of the study group was significantly higher than that of the control group after 3 months of treatment ($P < 0.05$). Therefore, through national sports, it can effectively alleviate the degree of behavioral barriers of patients, improve the quality of life of patients, and promote the construction of a harmonious society.

JUDGMENT METHOD OF MENTAL ILLNESS OF ENTERPRISE LEADERS IN UNFAIR COMPETITION FROM THE PERSPECTIVE OF LAW

Zeli Jiang^{1,2}

¹*School of Political Science and Law, Yichun University, Yichun 336000, China*

²*Beijing Jingsh Law Firm Shenzhen Office, Shenzhen 518026, China*

Background: Since the reform and opening up, China's market economy has developed continuously, and the number of listed companies is increasing day by day. At the same time, the market competition is becoming more and more fierce. In the increasingly fierce market competition, some companies violate the principle of good faith in industrial and commercial activities, disrupt the order of market competition and damage the legitimate rights and interests of other companies or consumers, such as counterfeiting the above statement, commercial bribery, false publicity, illegal acquisition of trade secrets of other enterprises, improper reward and sale Defamation of goodwill and unfair competition on the Internet. In order to prevent these acts, China has formulated the anti-unfair competition law to punish enterprises and enterprise leaders who violate the anti-unfair competition law. In order to avoid criminal responsibility, some leaders of unfair competition enterprises will falsely claim that they have mental disorders. When unfair competition enterprise leaders use this excuse to successfully evade criminal responsibility, it will cause other unfair competition enterprise leaders to follow suit, reduce the credibility of China's law, and

have a negative impact on the construction of China's legal society. Therefore, from the perspective of law, finding an appropriate psychiatric judgment method for the leaders of unfair competition enterprises is of great significance to the development of China's market economy and the construction of a legal and harmonious society.

Psychoanalysis is an important branch of psychology, which focuses on the analysis and evaluation of individual mental state, and then analyzes individual psychological characteristics and personality characteristics. Psychoanalytic theory holds that individual psychology is mainly composed of psychological activities that can be observed, human instinctive impulse and desire suppressed by secular morality and law, namely consciousness and unconsciousness. Based on the theory of psychoanalysis, the research analyzes the spiritual structure, mental state, consciousness and unconsciousness of the leaders of unfair competition enterprises, constructs the evaluation index system of mental disorders, and then accurately judges the mental disorders of the leaders of unfair competition enterprises. The experimental results show that the mental disorder evaluation index system is a more effective psychiatric judgment method, which can promote the development of China's market economy and the construction of a legal and harmonious society.

Objective: In order to avoid criminal responsibility, some leaders of unfair competition enterprises will falsely claim that they have mental disorders. This phenomenon will cause other unfair competition enterprise leaders to follow suit, reduce the credibility of China's law, and have a negative impact on the construction of China's legal society. Therefore, based on the theory of psychoanalysis, the research analyzes the spiritual structure, mental state, consciousness and unconsciousness of the leaders of unfair competition enterprises, constructs the evaluation index system of mental disorders, and then accurately judges the mental disorders of the leaders of unfair competition enterprises, so as to promote the development of China's market economy and the construction of a legal and harmonious society.

Research objects and methods: Based on psychoanalysis theory, select psychiatric judgment indicators and construct mental disorder evaluation index system. Select 20 legal experts to evaluate these indicators, calculate the weight of each indicator by analytic hierarchy process, and test the consistency. AHP software is used for analytic hierarchy process calculation.

Research design: Based on the existing theory and psychoanalysis theory, construct the mental disorder evaluation index system, use the expert survey method to recover the data, and use the analytic hierarchy process to calculate the weight of each index. Finally, the evaluation values of 20 experts on the whole mental disorder evaluation index system are counted. The evaluation values are divided into 1-5 levels. The higher the evaluation value, the higher the recognition of the system.

Methods: The corresponding data were processed and calculated by using the software AHP and SPSS22.0.

Results: 20 experts recognized the mental disorder evaluation index system constructed in the study, as shown in Figure 1.

Figure 1. Experts' recognition of mental disorder evaluation index system

Conclusions: Since the reform and opening up, China's market economy has developed continuously, and the number of listed companies is increasing day by day. At the same time, the market competition is becoming more and more fierce. In the increasingly fierce market competition, some companies violate the principle of good faith in industrial and commercial activities, disrupt the order of market competition,

damage the legitimate rights and interests of other companies, enterprises or consumers, and violate the anti-unfair competition law in order to increase their profits or attack their competitors. In order to avoid criminal responsibility, some leaders of unfair competition enterprises will falsely claim that they have mental disorders. In order to promote the development of China's market economy and the construction of a legal and harmonious society, based on psychoanalysis theory, this paper analyzes the spiritual structure, mental state, consciousness and unconsciousness of unfair competition enterprise leaders, and constructs a mental disorder evaluation index system. 20 experts were invited to evaluate the index. 20 experts recognized the mental disorder evaluation index system, which confirmed the effectiveness of the evaluation index system.

TEACHING OF CHINESE AND FOREIGN LITERARY WORKS IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Yunlan Wen

General Education Teaching Department, Chongqing Vocational Institute of Safety & Technology, Chongqing 404121, China

Background: College students with cognitive impairment often encounter more complex and diversified difficulties than conventional students in the process of learning Chinese and foreign literary works. These cognitive disorders are often composed of six main types: cognitive difficulties in the theme and content of the article, cognitive difficulties in foreign languages, cognitive difficulties in literary background, lack of understanding of works, lack of reference materials, and cognitive difficulties in foreign cultures. From the six main types of cognitive impairment, it can be seen that in the process of college students' learning foreign literary works, the most likely cognitive impairment is the obstacle caused by the difference of cultural system. This kind of cognitive impairment is not only affected by metacognitive impairment at the level of cognitive psychology, but also closely rooted in the differences of culture and values between different nationalities and cultural systems. When learning foreign literature, college students cannot make a clear distinction between these foreign cultures and values, which is easy to produce confusion psychology and even psychological cognitive obstacles in the learning process. This is also the result of the lack of detailed cultural guidance and psychological cognitive guidance in the Chinese teaching of foreign literature in contemporary colleges and universities. Therefore, we should intervene in the metacognitive and cross-cultural cognitive impairment of students with cognitive impairment respectively in the teaching process. The intervention of metacognitive impairment depends more on the cognitive impairment auxiliary procedures in the teaching process, while the intervention of cross-cultural cognitive impairment depends on the knowledge teaching of foreign cultural background and foreign language habits in the teaching. On the basis of these knowledge, we can introduce the main content of Chinese teaching, or select the more flexible model in the foreign literature library as the understanding sample to help students substitute for understanding, and help students establish an effective cognitive path through more specific localized teaching methods, so as to lay a foundation for helping students eliminate cognitive obstacles.

Objective: In the process of college Chinese and foreign literature, contemporary college students often form certain cognitive obstacles due to factors such as cultural background and language use habits, which will have a serious impact on daily Chinese learning. This study analyzes the characteristics of cognitive impairment in the process of Chinese and foreign literature teaching in colleges and universities, and formulates teaching strategies for cognitive impairment, so as to help students understand foreign literature more comprehensively and thoroughly and break the cognitive impairment.

Subjects and methods: This study takes the types of cognitive impairment produced by students in the teaching of Chinese and foreign literature works in colleges and universities as the research starting point, excavates and analyzes the root causes of cognitive impairment, formulates the teaching strategies of Chinese and foreign literature in colleges and universities, and analyzes its benign impact on students.

Study design: This study is mainly conducted in the way of multiple groups of comparative experiments. The research objects mainly select the students participating in the course of foreign literary works appreciation in a university. In the course, the students are divided into mild impairment, moderate impairment, severe impairment and control group according to the degree of cognitive impairment. The teaching method of intervening cognitive impairment is adopted in the intervention groups of three kinds of impairment. The control group used traditional teaching methods. Finally, the psychological experience and learning results of students in the four groups were statistically and compared.

Methods: This study mainly uses Excel as an analysis tool for statistics and analysis of comparative experimental results, and uses it to analyze the impact and degree of foreign literature teaching methods that interfere with cognitive impairment.

Results: The composition of students with cognitive impairment of different types of foreign literary works in this study is shown in Table 1.

Table 1. Cognitive impairment factor table

Cognitive difficulties	Number of people	Proportion (%)
Difficulty in recognizing the theme and content of the article	4	11.43
Language cognitive impairment	8	22.86
Cognitive difficulties in literary background	6	17.14
Lack of understanding of the work	3	8.57
Missing references	5	14.29
Cognitive impairment of foreign culture	8	22.86
All the above elements exist	1	2.86

The most frequent types of cognitive impairment in foreign literature in Table 1 are language cognitive impairment and foreign cultural cognitive impairment, both of which are 8, accounting for 22.86% of the total number, while cognitive difficulties in literary background are the second, accounting for 6, accounting for 17.14% of the total number.

Conclusions: Due to the different cultural backgrounds and language habits among different nationalities, college students often have different types of cognitive barriers when learning foreign literature and Chinese. In view of the cognitive obstacles of college students in Chinese learning, we should start with its causes, and help students break through the cognitive obstacles and achieve better learning results by changing teachers' teaching ideas, increasing teachers' and students' cross-cultural awareness, increasing the reserve of foreign cultural knowledge and cultivating students' interest in learning in the cross-cultural context.

THE INFLUENCE OF CURRICULUM IDEOLOGICAL AND POLITICAL TEACHING REFORM ON ALLEVIATING THE PSYCHOLOGICAL ANXIETY OF ART COLLEGE STUDENTS

Tianxi Jiang¹ & Ruixia Zhang²

¹*College of Humanities, Guangxi Arts University, Nanning 530007, China*

²*College of Industrial Design, Guangxi Vocational & Technical Institute of Industry, Nanning 530001, China*

Background: Some art college students are affected by some bad ideas, with distorted value orientation, lack of social responsibility and vague ideals and beliefs, resulting in poor mental health. When facing various pressures, such as academic pressure, employment pressure and interpersonal pressure, they are also more prone to anxiety. Long-term and excessive anxiety will affect students' normal study and life, and then have a negative impact on students' physical and mental health and long-term development, which is not conducive to the construction of a harmonious society. Therefore, we need to find a way to alleviate students' negative emotions, alleviate students' anxiety and improve students' mental health level. In colleges and universities, ideological and political education is the main way to improve students' mental health and alleviate students' anxiety and depression. However, the current teaching mode of ideological and political education in colleges and universities is relatively single and traditional, and the students' learning enthusiasm and interest are not high, which cannot play its role in helping students shape positive, healthy and upward ideals and beliefs, establish correct outlook on life and values, and improve the level of mental health.

Curriculum ideological and political education is an educational concept that takes "Building Morality and Cultivating People" as its own task, constructs an all-round education pattern, and then complements and cooperates with other courses and ideological and political courses, so as to form a synergistic effect. The transformation from ideological and political course to curriculum ideological and political education is a necessary condition for building a collaborative ideological and political education system of all staff and

all courses. The syllabus, tasks and teaching modes of other courses are consistent with the laws and logic of ideological and political education courses in colleges and universities, highlighting the hidden educational value of courses. In the teaching of students' knowledge and skills, we should also integrate relevant ideological and political education content into the teaching, guide students' ideological value, carry out moral education for students, and then form efficient complementarity and interaction with the ideological and political education curriculum in colleges and universities. School psychology is a kind of applied psychology and the application of psychology in school education practice. The main research content of school psychology is to scientifically and reasonably evaluate the students' mental health level and the school's psychological education level, improve the education mode according to the evaluation results, and carry out psychological intervention on students. Based on school psychology, the research analyzes the current college curriculum ideological and political system and the behavioral and psychological laws of teachers and students in teaching practice, and then reforms the curriculum ideological and political teaching mode, so as to improve the mental health level of art college students, alleviate the anxiety degree of students, and transport higher-level art talents for the society.

Objective: Based on school psychology, this paper analyzes the current college curriculum ideological and political system and the behavioral and psychological laws of teachers and students in teaching practice, and then reforms the curriculum ideological and political teaching mode, so as to improve the mental health level of art college students, alleviate the anxiety level of students, and transport higher-level art talents for the society.

Research objects and methods: 100 art majors were selected as the research objects from an art university. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Symptom Checklist-90 (SCL-90) were used to evaluate students' mental health.

Research design: Students were randomly divided into research group and control group, with 50 students in each group. The students in the research group used the improved course ideological and political teaching mode to teach. The students in the control group were taught with the traditional ideological and political teaching mode. After 3 months, compare the mental health level of the two groups of students.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the SAS score, SDS score and SCL-90 score of the students in the study group were significantly higher than those in the control group ($P < 0.05$). The SAS scores of the two groups are shown in Table 1.

Table 1. SAS scores of two groups of students

Timing	SAS score		<i>t</i>	<i>P</i>
	Research group	Control group		
Number of students	50	50	-	-
Before teaching	71.9±12.3	72.1±13.1	0.403	0.762
After teaching	52.6±6.2	65.3±10.1	4.354	0.042
<i>t</i>	8.019	2.431	-	-
<i>P</i>	0.001	0.037	-	-

Conclusions: With the development of economy and the progress of the times, the national and social demand for art talents is increasing. Therefore, art education in colleges and universities has attracted the attention of people from all walks of life. In the face of various pressures, such as academic pressure, employment pressure, interpersonal pressure and so on, art college students are prone to anxiety. Long-term and excessive anxiety will affect students' normal study and life, and then have a negative impact on students' physical and mental health and long-term development, which is not conducive to the construction of a harmonious society. Therefore, based on school psychology, the research analyzes the current college curriculum ideological and political system and the behavioral and psychological laws of teachers and students in teaching practice, and then reforms the curriculum ideological and political teaching mode. The results showed that after teaching, the SAS score, SDS score and SCL-90 score of the students in the research group were significantly higher than those in the control group ($P < 0.05$). Therefore, the improved curriculum ideological and political teaching mode based on school psychology can improve the mental health level of art college students, alleviate students' anxiety, and transport higher-level art talents for society.

THE INNOVATION OF CHINA'S CROSS-BORDER E-COMMERCE DEVELOPMENT MODEL FROM THE PERSPECTIVE OF CONSUMER PSYCHOLOGY

Shiying Liang

School of Business Management, Shanghai Vocational College of Science & Technology, Shanghai 201800, China

Background: With the continuous development of Internet technology and the continuous improvement of national income, online shopping is gradually rising. In the context of economic globalization, the regional restrictions on consumption have also been broken, and cross-border e-commerce retail imports are increasingly favored by consumers and investors. In recent years, China has vigorously built infrastructure and developed computer technology, which has laid a solid foundation for the rise and rapid development of cross-border e-commerce. Cross-border e-commerce is a new e-commerce trade situation and plays an important role in China's import and export trade. The rise of cross-border e-commerce has greatly promoted the cross-border trade of products and given consumers more consumption choices. In recent years, with the strong support of national policies, China's cross-border e-commerce has developed rapidly, and the cross-border e-commerce industry has become an important part of China's market economy. In order to make the cross-border e-commerce industry develop in the long term and contribute to China's national economic growth, the innovation of the cross-border e-commerce development model is essential.

Consumer psychology is a branch of psychology that mainly studies the consumer behavior and psychological change law of consumers in consumer activities, including the process of consumers' psychological activities, consumers' personality psychological characteristics, and so on. In the theory of consumer psychology, it is believed that consumers have a series of complex psychology in the process of making purchase decisions, such as seeking truth, beauty, convenience, comparison, preference, conformity, pride, possession, preservation, nostalgia, love to take advantage, fear of regret and so on. By studying the psychological phenomena and psychological laws of consumers in purchasing behavior, we can improve the service quality and innovate the development model of e-commerce. Based on consumer psychology, the research analyzes the consumer psychology of cross-border e-commerce consumers and constructs a cross-border e-commerce profit model evaluation system to innovate the existing cross-border e-commerce development model, so as to promote the development of the cross-border e-commerce industry and improve China's national economy.

Objective: In recent years, with the strong support of national policies, China's cross-border e-commerce has developed rapidly, and the cross-border e-commerce industry has become an important part of China's market economy. Based on consumer psychology, the research analyzes the consumer psychology of cross-border e-commerce consumers and constructs a cross-border e-commerce profit model evaluation system to innovate the existing cross-border e-commerce development model, hoping to promote the development of the cross-border e-commerce industry and improve China's national economy.

Research objects and methods: A questionnaire was developed and distributed to consumers with at least one year of cross-border e-commerce shopping experience to build a profit model evaluation system. The multi-level fuzzy evaluation method is used to calculate the weight of each index.

Research design: Select indicators based on Porter's five forces model, build an evaluation system of cross-border e-commerce profit model, obtain the corresponding data by issuing questionnaires to 800 cross-border e-commerce consumers, calculate the index weight, and evaluate it by using multi-level fuzzy evaluation method.

Methods: The corresponding data were processed and calculated by using the software AHP and SPSS22.0.

Results: The weight of each index is as shown in Figure 1.

Conclusions: With the continuous development of Internet technology and the continuous improvement of national income, online shopping is gradually rising. In the context of economic globalization, the regional restrictions on consumption have also been broken, and cross-border e-commerce retail imports are increasingly favored by consumers and investors. In order to make the cross-border e-commerce industry develop in the long term and contribute to China's national economic growth, the innovation of the cross-border e-commerce development model is essential. Based on consumer psychology, the research analyzes the consumer psychology of cross-border e-commerce consumers and constructs a cross-border e-commerce profit model evaluation system to innovate the existing cross-border e-commerce development

model, so as to promote the development of the cross-border e-commerce industry and improve China's national economy.

THE INFLUENCING FACTORS OF ANXIETY OF CHINESE OPERA ACTORS IN OVERSEAS PERFORMANCE

Tao Xian

College of Art, Guangdong University of Foreign Studies, Guangzhou 510006, China

Background: Opera is a comprehensive art integrating music, drama, literature, dance and stage art. In recent years, the artistic level of opera in China has been rapidly improved and famous at home and abroad. Therefore, Chinese opera actors are often invited to perform opera abroad. Stage anxiety is a common phenomenon of Chinese opera actors performing overseas, which has a great impact on the live performance of opera actors. Stage anxiety is stage tension, also known as performance anxiety. When performing in a strange environment and on a strange stage, each opera actor will have varying degrees of anxiety. If the anxiety level is moderate and the actors can make good use of their anxiety psychology, stage anxiety will become the driving force to promote the actors to perform better. However, if the anxiety is too serious and the actors cannot control their anxiety well, it will affect the performance effect of the actors on the stage and become an obstacle to the progress of the actors. Therefore, exploring and analyzing the influencing factors of Chinese opera actors' anxiety in overseas performance is of positive significance to the long-term development of actors and the promotion of Chinese opera.

Behavioral psychology originated in the United States in the early 20th century. It is a branch of psychology. Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Based on behavioral psychology, this study analyzes the psychological activities of Chinese opera actors when performing on overseas stages, and explores the actors' stage anxiety. Based on the theory of behavioral psychology, the stage anxiety of actors

is divided into physiological anxiety, emotional anxiety, cognitive anxiety, and behavioral anxiety. Using questionnaire survey and multiple regression equation to obtain the psychological influencing factors of overseas performance anxiety of Chinese opera actors, so as to help actors overcome stage anxiety and better show themselves on the stage, which also makes a certain contribution to China's cultural communication.

Objective: Based on behavioral psychology, this paper analyzes the psychological activities of Chinese opera actors when performing on overseas stages, and explores the stage anxiety of actors. Using a questionnaire survey and multiple regression equation, we can obtain the psychological influencing factors of Chinese opera actors' overseas performance anxiety, so as to help them overcome stage anxiety and better show themselves on the stage.

Research objects and methods: In an art college, 180 students with overseas performance experience were selected as the research objects. The subjects were investigated by the Stage Anxiety questionnaire, Life Events Scale (LES), Symptom Checklist-90 (SCL-90), and Cattell's 16 Personality Factor questionnaire.

Research design: Pearson correlation analysis and multiple regression analysis were used to analyze the obtained data in order to obtain the psychological influencing factors of anxiety of Chinese opera actors performing overseas. Use SPSS22.0 software to process the data.

Results: There was no difference in stage anxiety between actors of different genders ($P > 0.05$), as shown in Table 1.

Table 1. Stage anxiety of actors of different genders

Project	n	Stage anxiety				Total anxiety
		Physiological anxiety	Emotional anxiety	Cognitive anxiety	Behavioral anxiety	
Male	86	1.16±1.21	2.85±1.32	3.00±1.61	1.41±1.24	10.57±5.03
Female	94	1.09±1.14	2.83±1.65	3.31±1.72	1.31±1.29	9.38±5.03
Total	180	1.12±1.17	2.85±1.53	3.17±1.71	1.37±1.25	9.95±4.96

Conclusions: In recent years, the artistic level of opera in China has been rapidly improved and famous at home and abroad. Therefore, Chinese opera actors are often invited to perform opera abroad. Stage anxiety is a common phenomenon of Chinese opera actors performing overseas, which has a great impact on the live performance of opera actors. Every opera actor has different levels of anxiety. If the anxiety level is moderate and the actors can make good use of their anxiety psychology, stage anxiety will become the driving force to promote the actors to perform better. However, if the anxiety is too serious and the actors cannot control their anxiety well, it will affect the performance effect of the actors on the stage and become an obstacle to the progress of the actors. Therefore, exploring and analyzing the influencing factors of Chinese opera actors' anxiety in overseas performance is of positive significance to the long-term development of actors and the promotion of Chinese opera. Based on behavioral psychology, the research uses a questionnaire survey and multiple regression equation to obtain the psychological influencing factors of Chinese opera actors' overseas performance anxiety, so as to help actors overcome stage anxiety and better show themselves on the stage, which also makes a certain contribution to China's cultural communication.

EMPLOYEES' ANXIETY PSYCHOLOGY UNDER THE ENVIRONMENT OF INTELLIGENT ACCOUNTING TRANSFORMATION

Dan Zheng

School of Economics and Management, Zhengzhou Normal University, Zhengzhou 450044, China

Background: With the development of computer technology, Artificial Intelligence (AI) technology has been proposed in recent years and has made great progress. Artificial Intelligence is a branch of computer science, which can simulate human thinking mode and consciousness. Nowadays, Artificial Intelligence technology has penetrated into all walks of life, guided all industries to realize automation and intelligence, and the accounting industry has also been greatly affected. The application of Artificial Intelligence in the field of accounting simplifies the process of accounting, improves the efficiency of accounting work, and

reduces labor cost. It is deeply favored by major companies. But at the same time, the rapid development and integration of Artificial Intelligence technology in the accounting industry have also brought great impact and challenges to accounting practitioners. First of all, the basic posts of accounting have been sharply reduced and replaced by Artificial Intelligence, while there will be a shortage of talents in senior posts. Secondly, major enterprises have higher and higher requirements for the quality and ability of accounting practitioners, which requires accounting practitioners to have good coordination ability, communication ability, social ability, and comprehensive ability. Finally, the application of Artificial Intelligence in the accounting industry requires accounting practitioners not only to have professional accounting knowledge but also to have corresponding computer knowledge, network information knowledge, and so on. Therefore, accounting practitioners urgently need transformation.

Under the background of Artificial Intelligence, the huge transformation challenge and the pressure of unemployment make some accountants suffer from anxiety. Moderate and self-control anxiety can help accounting practitioners set goals, pay close attention to learning and enrich themselves, so as to realize transformation. However, if the degree of anxiety is too heavy and lasts too long, it will affect the normal life and work of accounting practitioners, thus affecting the transformation of accounting practitioners. Personality psychology is a highly comprehensive branch of psychology. Its research content includes education, personality traits, individual personality, social effects and so on. Personality psychology belongs to applied psychology. It mainly studies people's learning, the law of individual psychological changes in the process of learning, and the changes of emotion and motivation when individuals adapt to the environment. Personality psychology includes psychoanalysis, social cognition, humanism and biological school. Among them, social cognitive theory holds that individual behavior and psychology will be controlled not only by themselves, but also by the environment and social factors. Humanism believes that people are born with different levels of needs. When the needs are not met, negative emotions will occur. Based on the social cognitive theory and humanistic theory in personality psychology, this paper analyzes the psychological changes of accounting practitioners in the process of transformation under the background of Artificial Intelligence, and puts forward transformation strategies for the psychology of accounting practitioners to help accounting practitioners complete the transformation, so as to alleviate their anxiety and improve their quality of life, Provide more high-quality accounting talents for China's market.

Objective: The rapid development and integration of Artificial Intelligence technology in the accounting industry has also brought great impact and challenges to accounting practitioners. The huge transformation challenge and the pressure of unemployment make some accountants suffer from anxiety. Based on personality psychology, this study analyzes the psychological changes of accounting practitioners in the process of transformation under the background of Artificial Intelligence and puts forward strategies for the psychology of accounting practitioners to help accounting practitioners complete the transformation, so as to alleviate anxiety, improve the quality of life and provide more high-quality accounting talents for China's market.

Research objects and methods: 100 accounting practitioners were selected as the research object in a city. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS), and Symptom Checklist-90 (SCL-90) were used to evaluate the mental health status of accounting practitioners.

Research design: 100 accounting practitioners were randomly divided into research group and control group with 50 people in each group. The accounting practitioners in the research group adopted the transformation strategy based on personality psychology. The control group adopted the traditional transformation strategy. After 4 months, compare the mental health level of the two groups of accounting practitioners.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Table 1. Changes in SAS scores of accounting practitioners in the two groups

Timing (months)	SAS score		<i>t</i>	<i>P</i>
	Research group	Control group		
0	76.4±10.8	78.2±11.5	0.321	0.651
1	71.9±12.3	72.1±13.1	0.403	0.762
2	65.6±8.9	73.3±10.1	1.354	0.022
3	55.6±7.3	75.7±12.4	0.215	0.013
4	52.6±6.2	73.9±11.7	0.146	0.000

Results: After 4 months, the SAS score, SDS score and SCL-90 score of accounting practitioners in the study group were significantly higher than those in the control group ($P < 0.05$). The SAS scores of the two groups of accounting practitioners are shown in Table 1.

Conclusions: Under the background of Artificial Intelligence, the huge transformation challenge and the pressure of unemployment make some accountants suffer from anxiety. Based on the social cognitive theory and humanistic theory in personality psychology, this paper analyzes the psychological changes of accounting practitioners in the process of transformation under the background of Artificial Intelligence, and puts forward transformation strategies for the psychology of accounting practitioners to help accounting practitioners complete the transformation, so as to alleviate their anxiety and improve their quality of life, provide more high-quality accounting talents for China's market. The results showed that after 4 months, the SAS score, SDS score, and SCL-90 score of accounting practitioners in the study group were significantly higher than those in the control group ($P < 0.05$).

THE EFFECT OF PHYSICAL EXERCISE ON ALLEVIATING THE ANXIETY OF MINORITY COLLEGE STUDENTS FUNCTION RESEARCH

Shaojun Zhang

College of Physical Education, Honghe University, Mengzi 661199, China

Background: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very prone to mental diseases, such as anxiety, depression, and so on. Ethnic minority college students are more likely to have anxiety than Han students because of differences in living habits, religious beliefs and cultural background. Anxiety refers to tension, anxiety, fear, and other negative emotions caused by the threat of imminent threat of an individual to something. Generally speaking, when an individual is nervous about something, such as learning, work, social networking, etc., the individual will be attracted most of the attention by the event, and make a lot of efforts and imagination assumptions to solve or complete the event. When individuals pay more attention to the event because of repeated failures, until they break through the critical point, individuals will feel anxious. Many studies have shown that maintaining moderate anxiety can help students concentrate so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Therefore, we need to find an appropriate method to help ethnic minority students alleviate anxiety.

Social psychology is a branch of psychology, which mainly studies the occurrence and change law of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. In social psychology, it is generally divided into three fields: individual process, interpersonal process and group process. Among them, the individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. The interpersonal process is to explore the interpersonal relationship between individuals and the impact of interpersonal relationships on individual psychology. Group process studies individual psychology and behavior law from the perspective of macro environment, including the psychological impact of group and organization on individual and the psychological impact of the surrounding environment on the individual. Based on the above theory, this study analyzes the factors that lead to the anxiety of ethnic minority college students, mainly including social environment factors, campus environment factors, interpersonal relationship factors, academic achievement factors, employment and career factors and love psychological factors. In view of the above factors, this paper analyzes the psychology of ethnic minority college students and summarizes that the main causes of students' anxiety psychology are lack of self-confidence, unclear goal, insufficient psychological adaptation and so on. Physical exercise is a kind of physical activity aimed at developing the body, improving health, enhancing physique, regulating spirit, enriching cultural life and dominating leisure time. From the perspective of social psychology, appropriate physical exercise can improve students' physical quality, improve students' self-confidence and alleviate students' anxiety. Therefore, based on social psychology, the research uses physical exercise to treat the anxiety of minority college students, alleviate the degree of anxiety and improve the learning efficiency of students.

Objective: Ethnic minority college students are more likely to have anxiety than Han students because of differences in living habits, religious beliefs and cultural background. Based on social psychology, this study uses physical exercise to treat the anxiety of minority college students and alleviate the degree of

anxiety of students.

Research objects and methods: 80 ethnic minority students with anxiety psychology were selected from three colleges and universities as the research objects. The anxiety degree of students was evaluated by the Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90), and the learning efficiency of students was evaluated by the scores of students' professional courses.

Study design: The students were randomly divided into study group and control group by the random number table method, with 40 people in each group. The students in the research group used physical exercise based on social psychology to intervene. The students in the control group were treated with blank intervention. After 3 months, the anxiety and learning efficiency of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After 3 months of intervention, the scores of students in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Figure 1.

Note: * means $P < 0.05$ compared with that before intervention; # indicates that compared with the control group, $P < 0.05$.

Figure 1. Professional course scores of the two groups of students

Conclusions: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very easy to suffer from mental diseases, such as anxiety, depression, and so on. Ethnic minority college students are more likely to have anxiety than Han students because of differences in living habits, religious beliefs, and cultural backgrounds. Based on social psychology, this study analyzes the factors that lead to the anxiety of ethnic minority college students and applies physical exercise to the treatment of anxiety. The experimental results showed that after 3 months of intervention, the scores of students in the study group were significantly higher than those in the control group ($P < 0.05$).

THE INFLUENCE OF COLLEGE IDEOLOGICAL AND POLITICAL EDUCATION INNOVATION ON COLLEGE STUDENTS' MENTAL ANXIETY UNDER THE NEW MEDIA ENVIRONMENT

Shenshen Wang¹ & Yue Liu²

¹Dean's Office, Southwest Petroleum University, Chengdu 610500, China

²School of Marxism, Jilin Animation Institute, Changchun 130013, China

Background: With the continuous progress of the times, the requirements for college students are becoming higher and higher. Nowadays, how to strengthen the moral, intellectual, physical, aesthetic and

labor development of college students has become a concern of the whole society. University is an important turning stage for students. During the university period, students began to initially contact the society, accept all kinds of ideological impact in the society, and their mentality began to change rapidly. Some students are affected by some bad ideas, distorted value orientation, lack of sense of social responsibility and vague ideals and beliefs, resulting in poor mental health. When facing various pressures, such as academic pressure, employment pressure and interpersonal pressure, they are also more likely to have negative emotions such as anxiety and depression. When these negative emotions are overstocked for a long time and cannot be alleviated and released, it will lead to psychological diseases, reduce students' psychological cognitive ability, and affect students' normal study and life. Ideological and political education is the main way to improve students' mental health and alleviate students' anxiety and depression. However, the current teaching mode of ideological and political education in colleges and universities is relatively single and traditional. Students' learning enthusiasm and interest are not high, which cannot play its role in helping students shape positive, healthy and upward ideals and beliefs, establish correct outlook on life and values, and improve the level of mental health. Therefore, it needs to be improved and innovated.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Based on educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. Therefore, the study analyzes the learning psychology and learning behavior of students in ideological and political education in colleges and universities in order to improve the teaching mode of ideological and political education in colleges and universities. In order to improve students' learning initiative and initiative, this paper studies the application of new media technology to ideological and political education, and puts forward corresponding strategies. Innovating and improving the teaching mode of ideological and political education in colleges and universities based on educational psychology can improve students' learning enthusiasm, help students shape positive, healthy and upward ideals and beliefs, alleviate negative emotions, and then improve their psychological cognitive ability, which is of positive significance to students' long-term development and the construction of a harmonious society.

Objective: Based on educational psychology, apply new media technology to ideological and political education, and put forward corresponding strategies to improve the teaching mode of ideological and political education, improve students' learning enthusiasm, help students shape positive, healthy and upward ideals and beliefs, alleviate negative emotions, and then improve students' psychological cognitive ability.

Research objects and methods: 100 students from a university were selected as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Symptom Checklist-90 (SCL-90) were used to evaluate students' mental health. Using the examination results of ideological and political education courses to evaluate students' learning effects.

Research design: Students were randomly divided into research group and control group, with 50 students in each group. The students in the research group were taught by the improved ideological and political teaching model based on educational psychology. The students in the control group were taught by the traditional ideological and political teaching mode. Three months later, the mental health level and test scores of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Table 1. SAS scores of two groups of students

Timing	SAS score		t	P
	Research Group	Control group		
Before teaching	71.9±11.3	72.1±12.8	0.542	0.659
After teaching	51.9±5.8	63.3±12.5	3.125	0.032
t	8.132	2.431	-	-
P	0.000	0.037	-	-

Results: After teaching, the SAS score, SDS score and SCL-90 score of the students in the study group were significantly higher than those in the control group ($P < 0.05$). The SAS scores of the two groups are

shown in Table 1.

Conclusions: Since the 20th century, China's economic level and science and technology have been improving rapidly, and the era of new media has also come. New media refers to the communication form based on digital technology, taking the network as the channel and taking high-tech products such as mobile phones, televisions and computers as the terminal to provide users with information or services. The rise of new media has promoted the optimization, upgrading and transformation of a large number of industries, and brought new opportunities and impetus to the development of various industries in China. Based on educational psychology, the research applies new media technology to ideological and political education and puts forward corresponding strategies to improve the teaching mode of ideological and political education. The experimental results show that after teaching, the SAS score, SDS score and SCL-90 score of the students in the research group are higher than those in the control group, and the difference is significant ($P < 0.05$).

INTEGRATION AND PRACTICE OF RED CULTURE AND IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Xian Xia¹ & Yang Nie²

¹*Propaganda Department of Party Committee, Changzhou Institute of Technology, Changzhou 213032, China*

²*Electromechanical College, Changzhou Vocational Institute of Textile and Garment, Changzhou 213164, China*

Background: College students need to face academic pressure and employment pressure at the same time, so they are very prone to mental diseases, such as anxiety, depression and so on. Anxiety refers to the tension, anxiety, fear and other negative emotions caused by the threat or imminent threat of an individual to something. Generally speaking, when an individual is nervous about something, such as learning, work, social networking, etc., the individual will be attracted most of the attention by the event, and make a lot of efforts and imagination assumptions to solve or complete the event. When individuals pay more attention to the event because of repeated failures, until they break through the critical point, individuals will feel anxious. Many studies have shown that maintaining moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Therefore, it is necessary to find an appropriate method to help students alleviate anxiety.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Through educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. In the education system of colleges and universities, ideological and political education plays an important role in helping students alleviate anxiety. Based on educational psychology, the research integrates red culture into ideological and political education in colleges and universities to realize the deep integration of red culture and ideological and political education in colleges and universities. Based on educational psychology, the integration of red culture into ideological and political education in colleges and universities can effectively alleviate students' anxiety, and then transport high-level and high-quality talents for the country.

Objective: Based on educational psychology, to integrate red culture into ideological and political education in colleges and universities, effectively alleviate students' anxiety, and then transport high-level and high-quality talents for the country.

Research objects and methods: 80 students were randomly selected from a university as the research object. Using the examination results of ideological and political education courses in colleges and universities to evaluate students' learning effects.

Research design: By sampling the random number table method, the students were randomly divided into research group and control group, with 40 people in each group. The students in the research group used the ideological and political education courses in colleges and universities based on educational psychology and integrated them into the red culture. The students in the control group used the traditional ideological and political teaching mode. After three months of teaching, the teaching effects of ideological and political education of the two groups of students were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the test scores of the students in the research group were significantly higher than those in the control group ($P < 0.05$), as shown in Figure 1.

Note: * $P < 0.05$ compared with that before teaching; # It means that compared with the control group at the same time, $P < 0.05$.

Figure 1. The examination results of the two groups of students in the course of ideological and political education in colleges and universities

Conclusions: University is an important turning stage for students. During the university period, students began to initially contact society, accept all kinds of ideological impact in the society, and their mentality began to change rapidly. Some students are influenced by some bad ideas, their value orientation is distorted, their sense of social responsibility is missing, and their ideals and beliefs are vague, so they cannot bear the great responsibility of socialist successors. Based on educational psychology, the research puts forward strategies to integrate red culture into ideological and political education in colleges and universities. The comparative experiment shows that after teaching, the test scores of the students in the research group are significantly higher than those in the control group ($P < 0.05$). Therefore, we can convey the high-quality ideological and political talents to the students of colleges and universities, and then integrate them into the high-quality ideological and political education.

ANALYSIS OF INTERVENTION MEASURES FOR ANXIETY DISORDER OF COLLEGE STUDENTS IN THE PROCESS OF INNOVATION AND ENTREPRENEURSHIP

Zhigang Bian

School of Innovation and Entrepreneurship Education, Jilin University of Finance and Economics, Changchun 130117, China

Background: In recent years, with the advancement of the national economic and social process, the scale of colleges and universities in China has been expanding, and the number of college graduates has also shown an upward trend year by year. The employment competition pressure of college graduates is increasing, and the employment situation is becoming more and more severe. The difficulty of graduates' employment has become a social problem. In the face of the current international development situation

and the difficulty of employment, the state has put forward the national development strategy of “entrepreneurship by all and innovation by all”, encouraged the people to actively carry out innovation and entrepreneurship activities, and provided a new development possibility for the employment of college students. College students have responded to the call of national policies and actively joined the wave of innovation and entrepreneurship. However, due to the lack of social experience and other reasons, college students will inevitably encounter setbacks and obstacles in the process of entrepreneurship. Some college students have too high expectations of entrepreneurial achievements and expect to achieve certain achievements in a short time, reflecting their own value and ability.

This contradiction between ideal and reality makes college students’ entrepreneurial groups easy to fall into negative emotions and be troubled by psychological problems such as anxiety and depression. From the perspective of psychology, anxiety comes from people’s fear of threat situations, showing tension and anxiety about the current situation and what will happen in the future. Appropriate anxiety can help college students maintain a positive state in the process of innovation and entrepreneurship and promote the development of entrepreneurial college students. However, if college students are in high anxiety for a long time, it will have a serious negative impact on their physical and mental health. Therefore, it is necessary to investigate and analyze the anxiety symptoms of college students in the process of innovation and entrepreneurship, understand the causes of college students’ anxiety, and put forward corresponding intervention measures to alleviate college students’ anxiety.

Objective: To investigate and analyze the performance of anxiety disorder of college students in the process of innovation and entrepreneurship, analyze the causes of anxiety emotion of college students, take this as the guide, put forward the intervention measures for anxiety disorder of college students in the process of innovation and entrepreneurship, and further analyze the application effect of anxiety intervention. Through the analysis of college students’ anxiety intervention means, this paper provides suggestions and references for alleviating college students’ anxiety in the process of innovation and entrepreneurship, helps college students improve their mental health level, and promotes the process of innovation and entrepreneurship.

Research objects and methods: Taking 200 college students’ entrepreneurs as the research object, through the form of questionnaire survey to understand the psychological anxiety performance of college students’ entrepreneurs in the process of innovation and entrepreneurship, combined with the interview method to deeply understand the causes of psychological anxiety of college students’ entrepreneurs. Aiming at the problems of entrepreneurship projects and expected planning of college students’ entrepreneurs, restore the innovation and entrepreneurship journey of college students’ entrepreneurs, so as to obtain the performance and causes of anxiety disorder of college students’ entrepreneurs, put forward anxiety intervention methods, and analyze the practical application effect of intervention means in anxiety relief of college students’ entrepreneurs.

Research design: Combined with the self rating anxiety scale, to understand the psychological and physical performance characteristics of college students’ entrepreneurs’ psychological anxiety, and to explore the performance and inducement of college students’ entrepreneurs’ anxiety in the process of innovation and entrepreneurship. A total of 200 questionnaires were distributed, and the respondents were required to fill in the questionnaire on site. The filling time of the questionnaire was about 15-25 minutes.

Results: The investigation results of the causes of psychological anxiety of college students’ entrepreneurs are shown in Table 1. College students’ entrepreneurs with different entrepreneurial hours have different performance in entrepreneurial policies, family support and other anxiety factors.

Table 1. Investigation on the causes of psychological anxiety of college students’ entrepreneurs

Duration of entrepreneurship	<1 year	1 year	2 years
Innovation and entrepreneurship policy	3	3	2
Entrepreneurship education in colleges and universities	4	3	2
Family support	4	3	4
Personal ability	3	3	4
Expected drop	4	3	2
Group comparison pressure	4	4	4

Conclusions: Whether the promotion of college students’ innovation and entrepreneurship process has important practical significance at the level of national social development and college students’ personal development. Alleviating the psychological anxiety of college students’ entrepreneurs in the process of innovation and entrepreneurship can effectively promote the success of college students’ entrepreneurship. On the one hand, it provides a new solution to the employment difficulties of college graduates. On the

other hand, it can speed up China's development towards an innovative country and promote the improvement of national innovation strength. In order to ensure the promotion of innovation and entrepreneurship, college students should adjust their psychological state in time to avoid psychological anxiety and other problems hindering the realization of entrepreneurship success.

* * * * *

ANALYSIS ON THE LEVEL OF PSYCHOLOGICAL STRESS AND INDIVIDUAL DIFFERENCES OF ADMINISTRATIVE PERSONNEL IN COLLEGES AND UNIVERSITIES

Jianbin Chen & Tanyuan Xing

School of Public Administration, Xiangtan University, Xiangtan 411105, China

Background: The progress of national social economy puts forward higher requirements for the education of high-quality talents, and colleges and universities, as the training base of high-quality professional and skilled talents, have played an unparalleled role in the development of national economy and science and technology. The administrative personnel in colleges and universities are an important factor in the development of colleges and universities. The level of administrative management in colleges and universities is directly related to the smooth development of administrative management and teaching arrangements in colleges and universities. In recent years, due to the needs of social development and the change of policy direction, colleges and universities continue to expand enrollment, the number of college students continues to increase, and the workload of college administrators has increased significantly, which increases the work pressure of college administrators. Under the high requirements and high volume of university administration, university administrators have high psychological pressure and are prone to psychological imbalance, which has a negative impact on the smooth implementation of university administration.

Workplace environment is one of the main life scenes of people. About one-third of people's time and energy are invested in workplace work every day. Therefore, the working environment and state are directly related to people's daily psychological quality and affect people's psychological and physiological level. The university administrators need to invest a lot of emotion in the work process, and the continuity of university management is strong. Under the long-time and high-intensity work tasks, some university administrators may have lost or bored emotions. The administrative work of colleges and universities also has the characteristics of detail and tediousness. The work content is relatively monotonous. Some college administrators have a low sense of self-identity in their work and think it is difficult to give full play to their self-worth in their work, so they fall into negative emotions, resulting in a sharp rise in the psychological pressure of college administrators. Under the accelerating social rhythm, college administrators are affected by the dual effects of life pressure and work pressure, which may lead to physiological and psychological fatigue and tension, so as to reduce the mental health level and quality of life of college administrators.

Objective: To study and analyze the psychological stress level of university administrators, hoping to truly and objectively reflect the psychological status of university administrators through data extraction, mining and analysis, and explore the individual differences of psychological quality of university administrators. Through the analysis of the level and difference of psychological pressure of university administrators, this paper deeply excavates the reasons behind the psychological pressure of university administrators, and puts forward corresponding countermeasures on this basis, so as to provide help for improving the mental health level of university administrators.

Research design: The research extracted and sorted out the psychological state-related information of university administrators from the physical examination database of university employees, collected the basic information of career development, family environment, personal characteristics and other aspects of university administrators, and deeply analyzed the psychological state level of university administrators. To provide reference for exploring the influencing factors of psychological stress and burnout of university administrators. The research uses the analytic hierarchy process to analyze the influencing factors of the psychological state of university administrators, combined with the information of university administrators, constructs the psychological impact index system of university administrators, and uses the analytic hierarchy process to solve the characteristic vector and priority weight of the impact index, so as to lay the foundation for putting forward the coping strategies of psychological pressure of university administrators.

Results: The statistical results of psychological stress and burnout of college administrators are shown in Table 1. College administrators of different ages have the phenomenon of job burnout. They have great

psychological pressure in their daily work, among which the level of psychological stress and job burnout of college administrators aged 35-45 is the highest.

Table 1. Statistical results of psychological stress and burnout of administrative personnel in colleges and universities

Age of respondents	25-35	35-45	45-55
Depersonalization	3	4	4
Emotional exhaustion	3	4	3
Low sense of achievement	2	1	1

Conclusions: In recent years, with the development of social economy, the requirements for the working ability of university administrators are higher and higher. University administrators are prone to psychological imbalance and have low awareness of their roles in work, which makes university administrators under psychological pressure for a long time, it is not conducive to the development and efficient long-term development of administrative affairs in colleges and universities. This paper analyzes the psychological pressure of university administrators. There are individual differences in age and gender. Compared with male administrators, female university administrators have greater psychological pressure and higher degree of job burnout than men. With the growth of age, the degree of the psychological pressure of college administrators is also gradually increasing, and the work enthusiasm of young administrators is higher.

ON THE STRATEGIES OF IMPROVING COLLEGE TEACHERS' TEACHING ABILITY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Qian Xu

School of Humanities, Wuhan University of Engineering Science, Wuhan 430200, China

Background: Educational psychology takes teaching activities as the research object and analyzes and studies the learning and intervention psychology in the process of education from the perspective of psychology, which has the characteristics of paying equal attention to theory and practice. As an auxiliary means for teachers to carry out teaching activities, educational psychology explains, describes and predicts the psychological factors in the process of education. Educational psychology can effectively provide systematic guidance for teachers' actual teaching activities from a scientific perspective, help teachers intervene in students' psychological status in teaching activities, and has important guiding significance for improving the quality and level of education. Educational psychology focuses on the main body of teachers and students in teaching activities, and analyzes the changes of psychological characteristics in teaching activities from the perspective of educational content, educational environment and educational media.

With the gradual change of the concept of higher education in China, the focus of higher education is no longer the traditional teaching of simple knowledge, but pays more attention to the cultivation of students' comprehensive quality and ability. Under the new higher education concept with quality education and professional skill training as the core, the education quality of colleges and universities has become the focus of all sectors of society, and college teachers, as the key factor, have also improved their teaching ability standards. The transformation of higher education concept has brought greater challenges to the teaching ability of college teachers, which requires college teachers to actively improve their professional teaching ability and cultivate more high-quality talents with innovative ability and professional quality under the guidance of educational psychology.

Objective: Under the new situation of college enrollment expansion, the decline of college education quality has aroused doubts from all walks of life, requiring college teachers to improve their teaching ability and level and promote the development of higher education. Based on the theory of educational psychology, the research provides strategic reference for the improvement of college teachers' teaching ability, organically integrates educational activities with psychology, examines the education and teaching process from the unique perspective of psychology, and expects to put forward practical suggestions for the improvement of college teaching quality and the promotion of teaching reform.

Research design: Based on the public information of teaching quality evaluation of three colleges and universities in a city in 2021, the research extracts the data of teachers' teaching quality evaluation results

for college students from the teaching quality evaluation report of colleges and universities. Using statistical software SPSS22.0 sort out and analyze the evaluation data of college students, obtain the current situation of college teachers' teaching quality from the perspective of college students, and provide reference for analyzing the direction of improving college teachers' teaching ability. Using the method of correlation analysis, this paper analyzes the correlation between different teaching factors and teaching effectiveness of college teachers, and discusses the impact of college teachers' teaching design, teaching research and teaching implementation on their teaching quality from the improvement of teachers' and students' psychological changes in the teaching process. Based on the data results of correlation analysis, this paper puts forward the corresponding strategies to improve the teaching ability of college teachers, so as to provide help to improve the teaching quality of college teachers.

Results: The statistical results of teachers' teaching quality evaluation data for college students are shown in Table 1. College students of different grades generally have low evaluation scores on the teaching ability of college teachers in three aspects, and college students' overall recognition of the teaching ability of college teachers is not high, which requires college teachers to actively improve themselves and professional teaching ability.

Table 1. Statistical results of teachers' teaching quality evaluation for college students

Scoring items	Freshman	Sophomore	Junior	Senior
Instructional design	3	2	2	2
Teaching research	2	2	2	3
Teaching implementation	2	3	2	3

Conclusions: In the new era, the importance of higher education to national development and social progress is becoming increasingly prominent. Colleges and universities are required to improve their own education quality level, improve the professional teaching ability of college teachers, and provide higher quality classroom teaching for college students. College teachers should first clarify their self goal orientation, take teaching as the focus and goal of their work, diagnose and analyze their self teaching ability in time, understand the learning demand orientation of college students, and dynamically adjust the teaching plan and implementation mode. Moreover, colleges and universities should strengthen the training of teachers' teaching ability, organically integrate teacher training with teaching reform, establish a dynamic coordination mechanism for the cultivation of teachers' teaching ability, mobilize the comprehensive ability of functional departments and departments of colleges and universities, and provide college teachers with a good teaching environment and self-improvement atmosphere. Moreover, colleges and universities should actively improve the evaluation and assessment system of teachers' professional ethics, and pay attention to the comprehensive improvement of teachers' professional teaching ability and teaching professional ethics.

* * * * *

INFLUENCE OF ATHLETES' PHYSICAL HEALTH AND PRE-COMPETITION ANXIETY IN THE PROCESS OF PHYSICAL TRAINING

Hongbing Tang

College of Physical Education, Hunan International Economics University, Changsha 410205, China

Background: In modern sports competition, athletes' training level, their own physical quality and competitive mentality all have an important impact on athletes' competition results. Before the sports competition, athletes have undergone long-term and professional skill training. Therefore, in the close competition, the psychological state of athletes before and during the competition has become the key to defeating their opponents. As a fierce competition, there is a strong confrontation relationship in sports competition. Athletes restrict and compete with each other. Athletes bear a high-intensity psychological and physiological load in the process of competition. With the increase of the intensity of modern sports competition, coaches and athletes pay more attention to psychological quality training. It is expected that through scientific and systematic training, athletes' on-the-spot competitive psychological state will maintain a good level and avoid the influence of psychological factors on athletes' competition results.

Anxiety refers to a threatening state that individuals feel because it is difficult to achieve their goals. When they encounter insurmountable obstacles, individuals may feel a strong sense of frustration. The

difficulties they face lead to the frustration of their self-esteem and self-confidence, which makes individuals in nervous anxiety. Anxiety is activated by the individual's autonomic nervous system, which makes the individual show a variety of emotional characteristics, such as tension, worry and so on. Often, the degree of this anxiety state can only be directly described by myself. Therefore, researchers usually judge the anxiety degree of the object through indirect physiological characteristics, or understand the anxiety characteristics of the object by means of investigation and interview.

Objective: This paper analyzes the causes of sports athletes' pre-competition anxiety, and explores the relationship between athletes' physical health and pre-competition anxiety in the process of sports training. The research deeply excavates the influence of the technical level and psychological quality of sports athletes on the competition results in the competition state, hoping to provide reference for alleviating the competition anxiety of sports athletes before the competition, carry out targeted psychological training and counseling for athletes, and improve the psychological quality of athletes.

Research objects and methods: The research takes 80 basketball athletes as the research object, through the form of questionnaire survey to understand the mental health status of sports athletes before competition, and analyze the causes of athletes' pre-competition anxiety. Starting from the influencing factors of athletes' pre-competition anxiety, this paper explores the relationship between athletes' physical health and pre-competition anxiety in the process of sports training, and puts forward the corresponding adjustment strategies of athletes' pre-competition anxiety.

Study design: The study passed the Pre-competition Emotion Scale Trait (PEST). To investigate the pre-competition anxiety state of sports athletes, and understand the emotional state of athletes from four aspects: athletes' trait self-confidence, personal failure anxiety, social expectation anxiety and physical trait anxiety. The pre-competition emotion scale is divided into 4 subscales by 4 measurement factors. Each subscale includes 8 test items, with a total of 32 test items.

Results: The pre-competition anxiety scores of 80 basketball athletes are shown in Table 1. The pre-competition anxiety status of basketball athletes is different under different competition duration. The longer they participate in the competition, the lower their pre-competition anxiety, and their psychological quality is improved with the increase of time.

Table 1. Score results of pre-competition anxiety of 80 basketball players

Competition duration	<6 month	6 month-1 year	1 year-2 years	>2 years
Trait confidence	3	4	4	3
Personal failure anxiety	4	4	3	2
Social expectation anxiety	4	3	3	3
Somatic trait anxiety	3	3	3	4

Conclusions: The anxiety state of sports athletes before competition is affected by many factors, such as their self-confidence, the importance of personal failure, the importance of social expectation and physical quality. The self-confidence of sports athletes is based on their physical quality and economic strength. Sports athletes should make a correct self-assessment of their sports strength. Maintain high self-confidence and calm attitude during the competition. And sports athletes cannot pay too much attention to personal success or failure. Some athletes are too worried about losing the game before the game, which makes it difficult for them to give full play to their full strength in the competition process, thus affecting the competition results. On the other hand, social expectation will also cause the competition psychological pressure of sports athletes and make sports athletes in anxiety. The physical quality of sports athletes is directly related to their competitive state and competitive strength. The physical health level of sports athletes affects their pre-competition anxiety. Some sports athletes decline their physical health level due to sports injury and other reasons. They are worried that physical factors will affect their competition results, which makes athletes fall into pre-competition anxiety.

* * * * *

ROLE OF MORAL EDUCATION IN ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY

Shuang Zhang

School of Civil Engineering and Architecture, Guangzhou City Construction College, Guangzhou 510925,

China

Background: Under the increasingly severe social competition situation, contemporary college students bear multiple pressures from family, school, society and other aspects, and have been under psychological anxiety for a long time. Academic and interpersonal communication are the main sources of pressure for college students. Different from the previous learning mode of junior high school and senior high school, the learning and life of the university requires college students to have higher autonomous ability, require students to have higher learning initiative and initiative, and be able to realize self-active learning and positive exploration. Some college students are difficult to adapt to the differences in learning habits between college and high school, have learning disabilities, and have serious anxiety and anxiety about learning and examination. On the other hand, university campus is the epitome of society. College students need to face a variety of interpersonal scene requirements on campus. College students have strong interpersonal and communication skills. However, some college students are shy and introverted, and it is difficult to adapt to the high social college life for a while. When communicating with others, they are prone to tension and anxiety.

Moral education refers to the purposeful and planned ideological and political education and moral quality education for the educated, so as to improve their ideological and moral consciousness and character through the moral education for the educated. Mental health education is an important part of moral education. It has important educational significance for the moral quality and mental health level of the educated, and can effectively promote the personality development and spiritual sublimation of the educated. Therefore, moral education is based on the formation law of students' ideology and morality, counseling and intervention on students' mental health, and interpreting students' psychological contradictions from the perspective of psychology, which is of great value in alleviating college students' psychological anxiety.

Objective: The research explores the effect of moral education in colleges and universities, analyzes the effect of moral education in colleges and universities on alleviating college students' psychological anxiety, and hopes to provide reference and help for improving college students' mental health level. Starting from the content and methods of moral education, this study explores the role and status of moral education in college students' teaching system, excavates the effect of moral education on college students' psychological intervention, hopes to alleviate college students' psychological anxiety through moral education, and puts forward college students' psychological intervention strategies.

Research objects and methods: The research takes 500 college students as the research object, through the combination of questionnaire survey and experimental comparison to understand the psychological anxiety of contemporary college students, and analyze the causes of college students' psychological anxiety. By means of comparative experiment, this paper explores the effect of moral education in alleviating college students' psychological anxiety, and explores the impact of moral education on improving the quality of college students' mental health.

Study design: The study used the form of questionnaire to understand the mental health status of college students, and combined with the self rating anxiety scale to analyze the characteristics and degree of college students' psychological anxiety. The research adopts the method of stratified cluster random sampling to select 50 college students for comparative experiment, and the research objects are divided into experimental group and control group. The students in the experimental group received moral education for three months, once a week, each time for 1.5 hours, while the students in the control group did not participate in any type of moral education related activities.

Results: The anxiety scores of the experimental group and the control group before and after the experiment are shown in Table 1. The psychological anxiety scores of the students in the experimental group decreased significantly, and the psychological anxiety level changed from moderate anxiety to no anxiety, while the psychological anxiety scores of the students in the control group changed slightly, and the difference before and after the experiment has no statistical significance.

Table 1. Anxiety scores of the experimental group and the control group before and after the experiment

Survey object	Before experiment	After the experiment
Experience group	65.57	46.32
Control group	65.11	62.43

Conclusions: College moral education intervenes the psychological state of college students through planned moral education guidance, helps college students enhance their sense of subjective well-being and self-efficacy, and maintains their mental health. In the new era, college students pay attention to the realization of self-worth, but sometimes their own efforts will conflict with the results, resulting in a sense of frustration and loss, which makes college students fall into psychological anxiety and depression.

Through the intervention of college students' mental health, college moral education can improve college students' self-emotional experience and enhance their sense of self-worth, which can effectively alleviate college students' psychological anxiety and improve their mental health level and quality of daily life.

Acknowledgement: The research is supported by: The First Batch of High-Level Professional Group Projects of Provincial Higher Vocational Colleges of Guangdong Provincial Department of Education: Construction Engineering Technology Professional Group (No. gspzyq2020015).

VALUE OF CULTIVATING COLLEGE STUDENTS' SPORTS PSYCHOLOGICAL QUALITY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Fuyang He

School of Physical Education, Xichang University, Xichang 615000, China

Background: Social psychology organically combines the contents of sociology and psychology, analyzes the behavior and psychological activities of individuals and groups in the social environment, studies the interaction between social groups and individuals, and discusses the law of their psychological changes. In recent years, interdisciplinary has gradually sprung up. Many researchers have found that the integration of discipline theories in different fields can further give play to the strengths and advantages of their respective fields and effectively deepen discipline research. Therefore, the research extends the theory of social psychology to the field of education, analyzes and studies the obedience, persuasion and cognitive imbalance in the process of students, and interprets the interaction between educational subjects in the teaching process by using the theoretical methods of social psychology.

College students are the future main force of China's social and economic construction. The level of college students' comprehensive quality and ability is directly related to the future development speed of the country and society. Therefore, we should pay attention to the balanced development of college students' quality and ability in all aspects and promote the improvement of contemporary college students' comprehensive quality. Sports psychological quality education is an important part of college students' quality education in China. The cultivation of sports psychological quality is of great value to improve the mental health level of contemporary college students. Maintaining good physical quality and sports psychological quality can effectively help college students realize the all-round development of physical function, reduce the possibility of mental health problems, and realize the common development of college students' body and mind. Therefore, it is necessary to analyze the actual value of cultivating college Students' sports psychological quality, excavate the training strategies of college students' sports psychological quality, and promote the overall improvement of contemporary college students' comprehensive quality based on the theory of social psychology.

Objective: The research integrates the content of psychological theory with higher education, applies the knowledge of social psychology to the curriculum reform of higher education, and explores the practical value of cultivating college students' sports psychological quality from the perspective of social psychology, hoping to provide suggestions and references for the curriculum reform of colleges and universities.

Research design: The research obtains the relevant information of college sports psychological quality education from the comprehensive evaluation report of college teaching in a city in 2021, and collects the evaluation result data of college sports education and college students' psychological education in the evaluation report. And use SPSS23.0 makes statistical analysis on the evaluation data, analyzes the current situation of college students' sports psychological quality education from the college teaching evaluation data, and understands the problems existing in college students' sports psychological quality education from the perspective of college students. The logistic regression model is used to analyze the impact of the improvement of college students' sports psychological quality on the comprehensive quality and development of college students. From the perspective of social psychology, this paper discusses the impact of cultivating college students' sports psychological quality on college students' physical quality, learning ability, pressure resistance ability and interpersonal communication ability. This paper analyzes the practical value and significance of cultivating college students' sports psychological quality. Combined with the results of regression analysis, this paper deeply excavates the causes of the problems existing in contemporary college students' sports psychological quality education, and puts forward corresponding improvement measures on this basis, so as to provide suggestions and references for the realization of college curriculum reform in sports.

Results: The evaluation and statistical results of college students on the teaching quality of college

sports psychological quality education are shown in Table 1. At present, colleges and universities pay less attention to students' physical education courses and sports psychological health quality education courses, the setting of relevant physical education courses is unreasonable, and there are few relevant courses. And in the process of physical education teaching, teachers pay more attention to technical guidance and ignore the cultivation of students' physical mental health quality. On the other hand, the allocation of resources related to physical education curriculum and mental health quality education curriculum is not in place, and there is a lack of arrangement of venues and basic materials.

Table 1. Statistical results of college students' evaluation of college sports psychological quality education

Survey object	Freshman	Sophomore	Junior	Senior
Attention	2	2	1	2
Curriculum	2	1	2	1
Teacher qualification	1	2	1	1
Resource allocation	2	1	1	2

Conclusions: Contemporary college students are the main force in building a well-off society in an all-round way. Their comprehensive quality and ability are directly related to the development level of social economy. The government and colleges and universities are required to pay attention to the development of college students' comprehensive quality and ability in skills and psychology, so as to make college students' various ability levels in a balanced development state. Sports psychological quality education can effectively improve students' mental health problems and enhance students' pressure resistance in the face of difficulties. It is of great significance to improve the psychological quality of contemporary college students. Sports psychological quality education can also cultivate students to establish correct concepts of self-evaluation and self-consciousness, and cultivate students' spirit of mutual assistance and struggle through cooperative and competitive sports collective activities.

INTERVENTION EFFECT OF ENGLISH TRANSLATION TEACHING REFORM BASED ON THE CONCEPT OF CHINESE AND WESTERN CULTURAL COMMUNICATION ON COLLEGE STUDENTS' ANXIETY PROCESS

Feng Shi

School of Foreign Studies, University of Science and Technology Liaoning, Anshan 114051, China

Background: With the advancement of social process, the speed of social development is accelerating day by day, and the social competition is fierce. As the main force of social construction, college students are under strong psychological pressure. Among them, learning is one of the important sources of college students' psychological pressure. Many college students are difficult to adapt to different learning modes, have poor learning autonomy and enthusiasm, and have low adaptability to the university campus learning environment, which makes some college students bear strong learning competitive pressure. English learning is an important part of learning and life. College students' English skill level will also affect their subsequent employment development. Therefore, many college students pay more attention to English learning, pay more attention to English learning achievement, and always maintain an anxious emotional state for their own English learning.

In the process of English learning, college students may have anxiety and fear about classroom language learning, have low self-confidence in self perception, belief and behavior in the process of English learning, and worry too much about the effectiveness of English learning, which leads to college students' learning anxiety and affects their daily learning life. Learning anxiety mainly refers to students' fear of classroom, examination, communication and negative evaluation in the process of English learning. Students have low self-confidence in their English communication ability, fear of being asked by teachers in English classroom, and have strong fear of English test scores. This state of English learning anxiety will also affect the English learning effect of college students, thus forming a vicious circle, leading to the continuous decline of students' English learning performance. English translation teaching is an important factor in English learning. English translation requires students to master strong basic English knowledge and application ability, and higher requirements for students' bilingual language application ability. Therefore, some college students have a strong fear of English translation. When facing English translation and practice, they often

have anxiety and fear.

Objective: Under the guidance of the concept of Chinese and Western cultural communication, this study studies the English learning anxiety of college students, explores the new model of English translation teaching, the intervention effect on college students' English learning anxiety, and helps teachers clarify students' English learning anxiety in the process of English translation teaching. Starting from the research on the causes of college students' English learning anxiety and the spread of English learning culture, we hope to provide help for college students to improve their English learning anxiety.

Research design: Using the evaluation method of artificial neural network, this paper analyzes the effect of English translation teaching reform under the concept of Chinese and Western cultural communication on alleviating college students' English learning anxiety, constructs an English translation teaching model combined with BP neural network, and uses the deep learning performance of BP neural network. To solve the intervention effect of students' English learning anxiety under different English translation teaching modes, and explore the intervention effect of students' learning anxiety under different English translation teaching modes. BP network is used to analyze the teaching quality and anxiety intervention effect of the new English translation teaching mode under the concept of Chinese and Western cultural communication and the traditional English translation teaching mode. The students' English translation learning index and learning anxiety index vector under the two modes are used as the input data of BP neural network to obtain the students' learning effect and anxiety change of different teaching modes. Combined with the output results, understand the differences between the new English translation teaching model and the traditional teaching model under the concept of Chinese and Western cultural communication, and analyze the intervention effect of the new English teaching model on alleviating college students' English learning anxiety. Based on the evaluation results of neural network, this paper discusses the development and reform direction and strategies of the new English translation teaching model, so as to provide help for alleviating college students' English learning anxiety.

Results: The input vector of college students' English learning anxiety is shown in Table 1. College students' English learning anxiety level is high, and college students generally have English learning anxiety.

Table 1. Input vector of college students' English learning anxiety

Survey object	Freshman	Sophomore	Junior	Senior
Classroom	3	3	4	3
Examinations	4	4	4	4
Communication	4	3	4	3
Negative evaluation	3	3	3	4

Conclusions: The existence of English learning anxiety will affect students' learning effect. Teachers should actively adjust the English translation teaching mode, take the new Chinese and Western cultural communication concept as the guidance, innovate and optimize the teaching concept and teaching mode, and alleviate students' English learning anxiety.

THE ROLE OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES IN ALLEVIATING COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Weijing Duan

The Communist Youth League, Wuhan Textile University, Wuhan 430200, China

Background: Anxiety refers to the tension, anxiety and other emotions caused by an individual's excessive worry about safety, future and destiny. Individual anxiety includes anxiety, tension, panic and other psychological states. Many factors such as society, family and environment may lead to individual anxiety, make individuals fall into a restless psychological state, and reduce the quality of individual mental health. In recent years, with the accelerating speed of social and economic development and the changing social situation, the problem of college students' employment has gradually appeared. In recent years, the proposal of college enrollment expansion policy has also increased the number of college graduates and further increased the employment difficulty of college students. Under this social situation, many college

students bear strong employment anxiety, and feel nervous and uneasy about the future employment prospects at the stage of college study. On the other hand, the university stage is an important stage for the formation of college students' outlook on life, values and world outlook. Many college students' ideas are not mature and their grasp of the employment situation and their own ability is not accurate enough, which makes some college students fall into employment anxiety, worry too much about their future development direction and fear of employment choice, affect the daily life of college students.

Since the reform and opening up, the reform of ideological and political education in colleges and universities has been continuously promoted. After continuous adjustment and standardization, the ideological and political education system in colleges and universities has been continuously developed. It has been adjusted in time with the needs of the development of the times. Although the mode of ideological and political education in colleges and universities continues to improve, colleges and universities always put the correct guidance of ideological and political education to students' consciousness in an important position, adhere to the principle of moral education first, and correctly guide students' moral personality and ideological consciousness through ideological and political education. In the face of the general situation of college students' employment anxiety, colleges and universities should give full play to the intervention role of ideological and political education in students' mental health, help college students' employment anxiety through ideological and political education, dredge their mental health problems, and alleviate their employment anxiety.

Objective: To analyze the employment anxiety of college students, understand the degree of anxiety of college students about their employment prospects, master the mental health level of contemporary college students, and explore the causes of employment anxiety of college students. The research analyzes the role of college ideological and political education in college students' psychological intervention, excavates the application effect of college ideological and political education in alleviating college students' employment anxiety, and hopes to put forward a new solution to alleviate college students' employment anxiety.

Research design: Combined with Delphi method and experimental method, this study analyzes the impact of college ideological and political education on students' employment anxiety, uses Delphi method to carry out three rounds of expert consultation and empowerment, and understands the correlation between college political education and college students' employment anxiety. The selected experts are required to have been engaged in scientific research or practical work in the fields related to ideological and political education for more than 5 years, with high professional quality, and are required to ensure the whole process participation during the research consultation, and all experts are willing to participate in the consultation and research. The study used the comparative experimental method to understand the alleviating effect of college ideological and political education on college students' employment anxiety. 50 college students were randomly selected as the experimental objects for three months of ideological and political education. The ideological and political education was taught once a week for 1.5 hours each time. Compare the scores of employment anxiety of the subjects before and after the experiment, and analyze the application effect of ideological and political education in colleges and universities in alleviating college students' employment anxiety.

Results: The statistical results of the anxiety of the subjects before the experiment are shown in Table 1. The employment anxiety of the subjects showed certain differences in grades. With the approaching of the employment period, the employment anxiety of college students gradually increased.

Table 1. Statistical results of subjects' anxiety before the experiment

Survey object	Experience group	Control group
Choice of employment direction	3.47±0.21	3.46±0.25
Choice of employment mode	3.10±0.34	3.13±0.33

Conclusions: At present, there are still many problems in the ideological and political education in colleges and universities in China, which requires the teachers of ideological and political education in colleges and universities to constantly optimize the curriculum reform, improve and innovate the educational evaluation standards and educational contents, and keep the ideological and political education in colleges and universities in line with the development pace of the times. The employment of college students is the key issue of people's livelihood. In order to alleviate the employment anxiety of college students, the ideological and political education in colleges and universities should strengthen the psychological endurance and pressure resistance of college students through ideological intervention, help college students establish a diversified concept of employment and alleviate the employment anxiety of college students.

THE NECESSITY OF MENTAL HEALTH EDUCATION IN HIGHER EDUCATION

Jiayi Ren

Collaborative Innovation Center for Children Aged 6-12, Chongqing University of Education, Chongqing 400065, China

Background: With the advancement of social process and the acceleration of social development, the social competition situation is becoming increasingly severe. The fierce social competition makes college students face pressure from family, society, environment and other aspects. The number of college students with mental health problems is increasing year by year. The mental health level of college students is not optimistic. A considerable number of college students suspend or drop out due to mental diseases. In serious cases, a few college students cause bad social events due to mental health problems. In their daily life and study, college students are faced with pressures from academic achievements, interpersonal communication, social practice, employment competition and other aspects. Some college students have anxiety and fear when facing difficulties or obstacles that are difficult to solve, resulting in college students falling into a state of psychological anxiety or depression, which has seriously affected the normal life of college students, it reduces the quality of life of college students.

The government and society always pay attention to the education quality level of higher education, including professional knowledge and skill education and mental health education for college students, and require college students to achieve comprehensive development in professional, psychological and physical quality. As a key link, college students' mental health education is directly related to the overall promotion of higher quality education. Strengthening college students' mental health education can effectively help college students establish a good psychological mechanism and promote college students to establish a correct and mature outlook on life, values and world outlook. College students' mental health education is also a key part of college moral education and a necessary factor for the development of college moral education under the new situation. Colleges and universities are required to strengthen college students' mental health education according to the growth characteristics and psychological characteristics of college students under the new situation, so as to cultivate college students' adaptability and pressure resistance to social life.

Objective: To analyze the importance of college students' mental health education in higher education, and to explore the necessity and value of college students' mental health education in higher education system. The research deeply analyzes the significance of college students' mental health education to the healthy growth of college students, and puts forward the ways and paths of college students' mental health work in higher education, hoping to provide help for improving college students' mental health level and mental endurance.

Research design: Through the analysis of the relationship between the mental health education of middle school students in higher education and the mental health level of students, this study understands the impact of college ideological and political education on the psychological quality level of students, and explores the necessity of college ideological and political education in promoting the all-round development of higher education in China. Based on the comprehensive evaluation of teaching quality in colleges and universities carried out by a city in 2021, the research obtains the relevant evaluation information data of ideological and political education in colleges and universities from the evaluation report of colleges and universities, and analyzes the problems existing in the existing ideological and political education in colleges and universities from the perspectives of educational concept, publicity and popularization, intervention mechanism and resource allocation, on this basis, it explores the key role of ideological and political education in colleges and universities. The research uses Pearson correlation coefficient to analyze the correlation between ideological and political education in colleges and universities and the development of college students' mental health, deeply excavates the internal relationship between ideological and political education in colleges and universities and students' mental health, and discusses the necessity of ideological and political education in higher education.

Results: The statistical analysis results of the problems existing in the current mental health education in colleges and universities in the evaluation report are shown in Table 1.

Table 1. The statistical analysis results of the existing problems of mental health education in colleges and universities in the evaluation report

Survey object	Freshman	Sophomore	Junior	Senior
Educational philosophy	1	2	1	2
Publicity and popularization	1	1	1	1
Intervention mechanism	2	1	2	1
Resource allocation	1	1	1	2

Conclusions: Strengthening the development of college students' mental health in higher education can effectively enhance college students' psychological tolerance and pressure resistance, improve college students' mental health level, alleviate college students' psychological anxiety and depression, and reduce the probability of mental health problems in college students. And the development of mental health education has a direct impact on the improvement of college students' comprehensive quality and ability. College students' mental health education lays a solid psychological foundation for college students' professional knowledge and skill learning through the cultivation of college students' psychological quality and character and morality, which is conducive to the all-round and healthy development of college students.

COPING STRATEGIES OF COMMUNITY ELDERLY CARE SERVICE SYSTEM FOR THE ELDERLY WITH MILD COGNITIVE IMPAIRMENT

Chidan Ni

Shenzhen Elderly and Healthcare College, Shenzhen Polytechnic, Shenzhen 518055, China

Background: With the aggravation of China's aging population, the domestic elderly population shows a stable growth trend. According to the statistical data released by the Ministry of civil affairs, by 2016, the number of elderly people over the age of 60 has exceeded 230 million, and the number of people over the age of 65 has exceeded 150 million. With the aging of population, the number of patients with some age-related diseases is also increasing, among which the problem of cognitive impairment is particularly prominent. Cognitive impairment is a kind of mental disease in which the brain cognitive level is in the transition state between normal aging and dementia. Patients often have symptoms such as the decline of advanced brain functions such as memory, emotion and logical analysis ability. Although this decline is not serious enough to affect their normal life in most cases, it will make some elderly people depressed confusion, depression and other bad emotions. Moreover, relevant studies show that the elderly living in community elderly care institutions have a higher degree of life pattern due to the lack of communication with their relatives, and the cognitive impairment of this group is more serious. At present, the mainstream solution to the problem of cognitive impairment of the elderly at home and abroad is drug intervention. However, the treatment cycle of drugs is generally longer, and the side effects and adverse reactions brought by drug treatment are significantly higher than those in the placebo group in relevant experiments. Therefore, in recent years, the research on the choice of non-drug treatment for cognitive impairment of the elderly in community elderly care institutions has gradually increased, but the specific combination of non-drug intervention can achieve more significant treatment effect has not been determined.

Objective: Aiming at the cognitive impairment of the elderly in community elderly care service institutions, this study collects, analyzes and arranges the information on the life and cognition of the elderly in many elderly care institutions, tries to find out the main factors leading to the cognitive impairment of the elderly, and puts forward non drug intervention methods with significant effect and feasibility, then the experimental method is used to verify the effectiveness and feasibility of the intervention, in order to provide some reference opinions and exploration routes for alleviating the cognitive impairment of China's elderly population and improving the means of living of the elderly in elderly care institutions.

Objects and methods: Seven professional pension institutions with different scales and management modes were randomly selected from multiple provinces and cities in China. After reaching research cooperation with the selected elderly care institutions, collect complete basic information, life state information and cognitive state information of the elderly from the institutions. Some of the features are

processed by feature extraction, feature digitization and normalization. The information style of the processed data set is shown in Table 1.

Table 1. Partial data display of elderly cognitive impairment data set in elderly care institutions after data cleaning and feature processing

Number	Feature name	Characteristic interpretation	Feature type
01	Age	In pension institutions, the age of the elderly is accurate to two decimal places	Continuous decimal
02	Gender	-	Integer of type 0 and 1
03	Life hobby	When there are multiple hobbies that the subjects most often develop and like, only the favorite one is selected	Continuous positive integer
04	Weekly exercise duration	It is calculated according to the situation of the latest quarter, and the unit is minutes	Continuous decimal
05	Average sleep time at night	The unit is hour	Continuous decimal

Then build a multiple regression model based on ridge regression algorithm, input the processed data set into the regression model (the label of the data set is the cognitive impairment level of the sample), and output the importance coefficient of each feature after manually adjusting the super parameters of the model to make the classification accuracy of the cognitive impairment level of the sample reach more than 80%. According to the value of each coefficient and the correlation between them, targeted non drug intervention measures were designed. 84 elderly people with mild cognitive impairment were selected from nursing institutions and asked to implement non drug intervention measures. After 3 months, they were interviewed to understand the treatment of cognitive impairment.

Results: The probability of cognitive impairment was 2.4% and 7.9% respectively between the elderly who needed to use a lot of brain function hobbies such as manual production, chess sports, video games and reading, who had the habit of going to bed early and getting up early and regular exercise, and who had frequent contact with their relatives and the elderly who did not have any of the above behaviors, and 69.9% lower than the latter. After the intervention, the number of elderly people with cognitive impairment decreased by 38.

Conclusions: Based on the results and data obtained from the research, the research team puts forward the following suggestions. It is suggested that the elderly should reasonably adjust their work and rest habits, appropriately increase their exercise time and contact frequency with their relatives. When conditions permit, pension institutions should also cooperate with the elderly to cultivate and carry out various interests and hobbies that help to promote brain activities, and take measures such as regular power failure organize regular social activities to support the elderly to develop more beneficial habits.

RESEARCH ON ENTERPRISE INNOVATION MANAGEMENT MODE SELECTION AND INNOVATION PERFORMANCE FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Weixuan Hu¹, Yulan Bu¹ & Zhenming Yue²

¹*School of Management, Tianjin University of Commerce, Tianjin 300134, China*

²*School of Management, Jilin University, Changchun 130022, China*

Background: Cognitive psychology is a branch of psychology rising in the middle of last century. The research objects of cognitive psychology in a broad sense are human perception, creativity, language, logical thinking, memory and other advanced psychological processes. Cognitive psychology emphasizes the influence of environment on human cognition and behavior, that is to say, without environmental

stimulation, human beings will not subconsciously connect themselves with the environment and think about various affairs and phenomena. At present, most Chinese enterprises are affected by the epidemic and the Sino US trade war, and the external business environment has deteriorated. Therefore, if enterprises want to maintain their own industry competitiveness and maintain or improve their business profits, they need to further innovate the long-term management and performance management model to stimulate employees to optimize their work processes and work quality, which requires managers to have a sufficient understanding of employees' cognition and psychological situation. For example, the cognitive model of some employees is very different from that of managers. They don't care much about the development and profitability of the company, but about the balance between work and life. Giving them higher overtime subsidies has little incentive effect, and rewarding their extra holidays can get twice the result with half the effort. It can be seen that the knowledge theory of cognitive psychology has certain reference and reference significance for enterprise innovation management and performance model. Therefore, this study focuses on exploring the use of cognitive psychology to innovate the enterprise management model and performance calculation model, in order to provide some useful suggestions for improving the business efficiency and anti-risk ability of Chinese enterprises.

Objective: To analyze the operation status and management mode of enterprises by using cognitive psychology, so as to put forward innovative and improvement suggestions on enterprise management mode and performance rules, and design and carry out examples to verify the effectiveness of these suggestions, so as to provide some useful ideas for the sustainable development of small and medium-sized enterprises in China under the complex economic environment.

Participants and methods: 16 enterprises that are willing to participate in the study and have little difference in scale of operation, industry distribution and number of employees were randomly selected from China. Then 224 employees willing to participate in the study were selected from these enterprises, and the employees were grouped according to their companies, including 110 in the psychological innovation group and 114 in the normal innovation group. First, make statistics on the work information of the two groups of employees to ensure that the data obtained from subsequent experiments are sufficiently comparable. If one or more items of work information are significantly different, the employees in the group should be adjusted or innovatively grouped until there is no significant difference between the two groups. Then, the management of the psychological innovation group is required to carry out the innovation of management mode and performance rules combined with cognitive psychology. The normal innovation group is required to innovate in the same field, but there are no requirements for its specific innovation direction and mode. The innovation and reform time is 6 months, and then the income of employees participating in the research before and after the reform is collected from the human resources department or senior executives of the companies of the two groups Work error rate, satisfaction with the company and other core indicators related to work.

Results: After the six-month innovation and reform experiment, the statistical data of various work-related indicators of the two groups of employees are shown in Table 1.

Table 1. Comparison of multiple work indicators of the two groups of employees before and after the test

Statistical time	Statistical indicators	Psychological innovation group	Normal innovation group	<i>t</i>	<i>P</i>
Before test	Job satisfaction	3.72±1.38	3.74±1.17	0.649	0.812
	Average monthly income	6442±3168	6529±3024	0.784	0.846
	Average work error rate (%)	3.57±1.30	3.55±1.28	0.116	0.908
After test	Job satisfaction	4.17±1.29	3.72±1.25	2.121	0.035
	Average monthly income	7406±1543	6820±2195	2.304	0.022
	Average work error rate (%)	2.70±0.96	3.24±0.84	4.485	0.000

Note that the job satisfaction in Table 1 is quantitatively evaluated according to the 5-point system, and the average monthly income and average job error rate are calculated according to the situation in the last two months. It can be seen from table 1 that before the reform test, the *p* value of *t*-test on the three indicators of the two groups of employees was much greater than the significance level, and the data difference was not statistically significant, that is, the data were comparable. After the experiment, the average job satisfaction, average monthly income and average job error rate of the psychological innovation group were 4.17, 7406 and 2.70 respectively, which were 12.10%, 8.59% and 16.67% higher than those of the normal innovation group. And the difference was statistically significant.

Conclusions: In order to explore the effect of the application of cognitive psychology in enterprise management mode and performance innovation, this study cooperates with many domestic enterprises to

carry out the reform experiment of management and performance mode combined with cognitive psychology. The test results show that there is no significant difference in the three work indicators before the test between the employees of the two groups with different reform methods. After the experiment, the job satisfaction and average monthly income of the employees in the psychological reform group have increased by 12.10% and 8.59% compared with the normal reform group, and the average job error rate has decreased by 16.67% compared with the latter. The test results show that when carrying out the innovation and reform of enterprise management mode and performance rules, the local fine-tuning of reform measures considering employees' cognitive psychology will help to improve the effectiveness of the reform, especially the work quality and income of employees.

* * * * *

ANALYSIS ON THE EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION ON COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Wei Wang

Department of Recruitment and Employment, Nanjing University of Posts and Telecommunications, Nanjing 210023, China

Background: Positive psychology is a discipline that tends to analyze the laws of human psychology and emotion from a positive perspective. It uses qualitative analysis and scientific quantitative methods to study the conditions for human beings to obtain and maintain happiness, which is of great significance to promote the quality of human life and improve social stability.

Since the reform and opening up, the demand of Chinese enterprises for talents has increased significantly, and the requirements for talent quality are also improving simultaneously, which is equivalent to putting forward higher employment requirements for Chinese college students. Therefore, in recent years, the employment anxiety of college students in China has become more and more serious. On the other hand, a large number of relevant research documents show that the ideological and political education received by college students during their studies can also alleviate employment anxiety to a certain extent. From a higher perspective, in fact, college ideological and political education can be regarded as a part of college students' employment guidance, which can help college students establish a more scientific and stronger outlook on life during their study and job search values, dispel the depression, disappointment, anxiety, depression and other negative emotions caused by poor employment and poor job search, and even inspire students to design more reasonable and effective job search and interview methods. However, at present, the content of Ideological and political education in colleges and universities in China focuses too much on improving students' political literacy and guiding students to cultivate healthy living habits. There are too few adjustment contents related to employment guidance and bad psychology in employment, and insufficient consideration is given to students' own bad psychological conditions, so it is unable to provide more valuable job-hunting strategies and psychological counseling services for each student. Therefore, the current ideological and political curriculum of higher education in China should integrate the theoretical methods of positive psychology to assist schools to solve many employment problems including employment anxiety.

Objective: By analyzing the current employment situation of college students in China, this study summarizes the reasons for college students' employment anxiety, and puts forward a number of feasible treatment measures. Then a comparative experiment is constructed to verify the application effect of the proposed strategy, so as to provide some new ideas for solving the employment problem of college students and improving the employment quality of college students in China.

Participants and methods: Five colleges and universities with similar teaching and scientific research levels were selected from China to cooperate with them. First, 236 fourth graders with various degrees of employment anxiety were selected from the full-time college students who will receive ideological and political education in these schools, and they were evenly divided into experimental group and control group, and then they were given ideological and political education, In the ideological and political education of the experimental group, teachers should be required to take targeted teaching according to students' psychological status and employment anxiety, and appropriately increase the positive psychological content in their teaching content, especially the methods used to adjust their own bad psychological emotions. The control group only received the traditional ideological and political education. Three months after graduation, the return visit data of the school on the employment situation of these students participating in the experiment were collected from the graduating university, and analyzed and

counted. Explore the role of Ideological and political education curriculum combined with positive psychology in regulating students' employment anxiety. In addition, the significance level of difference significance test in the study is 0.05.

Results: Digitize the degree of employment anxiety of students. 1, 2, 3, 4 and 5 represent no anxiety, slight anxiety, medium anxiety, obvious anxiety and serious anxiety respectively. Then count and analyze the employment data of students participating in the experiment after graduation, and get Table 1.

Table 1. Comparison of employment data of students after completing ideological and political education

Comparison items	Experimental group (n=118)	Control group (n=118)	Mean change rate (based on the control group) (%)	P
The value of employment anxiety before graduation after the experiment	2.68±0.52	3.74±0.49	-28.34	0.008
Employment anxiety after graduation	2.88±0.43	4.05±0.44	-28.89	0.007
Employment anxiety after work	1.32±0.51	2.63±0.47	-49.81	0.001

As shown in Table 1, in the comparison of previous employment anxiety data after the completion of ideological and political teaching experiment, the quantitative mean value of anxiety level of the experimental group is lower than that of the control group. Specifically, the quantitative mean value of employment anxiety of the experimental group before graduation, after graduation and after employment are 2.68, 2.88 and 1.32 respectively, which are 28.34%, 28.89% and 49.81% lower than that of the control respectively, And the *p* value of anxiety score *t* test at each time was less than the significance level of 0.05.

Conclusions: In order to verify the effect of integrating positive psychology into Ideological and political education in colleges and universities to carry out targeted ideological and political education for students, such as teaching students how to use the methods of positive psychology to eliminate the negative emotions caused by employment anxiety, changing job search ideas, coping with common problems in interview, expanding job search channels, etc., on regulating students' employment anxiety, a comparative teaching experiment is designed in the experiment. The experimental results show that the average score of employment anxiety severity of the students in the experimental group who combine positive psychology teaching with ideological and political teaching is significantly lower than that of the control group before graduation, after graduation and after work. The experimental results show that integrating positive psychology into Ideological and political education in colleges and universities and carrying out a variety of personalized employment guidance work will help to improve students' employment anxiety.

* * * * *

IMPACT OF CONSUMER COGNITIVE IMPAIRMENT ON THE DEVELOPMENT OF RURAL TOURISM

Lina Fu^{1,2} & Yan Wang^{2*}

¹College of History and Culture, Tianjin Normal University, Tianjin 300387, China

²Department of Management, Ordos Institute of Technology, Ordos 017000, China

Background: Cognitive impairment is a pathological process in which higher brain functions such as language, thinking, logic and memory are abnormal. Cognition is the main function of human cortical structure, so all the factors that can cause the abnormality of cortical function and structure may lead to cognitive impairment. In the business field, the consumption habits of consumers with cognitive impairment will also be different from those of normal consumers. If such groups are large, it will have a significant impact on the suppliers of goods or services.

In recent years, with the promotion of China's rural revitalization strategy, the rural tourism industry has shown a vigorous development trend, which not only reduces the development gap between urban and rural areas to a great extent, but also provides favorable conditions for dealing with the problems of "agriculture, rural areas and farmers". However, in the development of rural tourism, there are also some thorny problems, among which the damage and excessive consumption of local tourism resources and environment caused by consumers with cognitive impairment are some of the problems of high concern. Consumers with cognitive impairment may have a wrong understanding of the boundary between individual and collective rights and obligations, or even lack of relevant knowledge, resulting in various conflicts with local residents,

merchants and other tourists in the process of playing in rural tourist attractions, and are more likely to make behaviors that will damage the scenic spot environment. Therefore, it is necessary to explore the impact of consumers with cognitive impairment on the development of rural tourism in order to formulate effective prevention and response measures.

Objective: Consumers with cognitive impairment will bring higher public security costs and management costs to rural tourism due to their cognitive problems. In order to explore a more suitable rural tourism management model to deal with consumers with cognitive impairment, this study puts forward constructive countermeasures based on the analysis of the current behavior status of consumers with cognitive impairment in rural tourism, and select the appropriate research object to carry out experiments to verify the application value of the strategy, so as to provide some references for the formulation of follow-up policies and regulations in our country.

Objects and methods: Firstly, by searching the academic literature on tourism management and cognitive impairment, and asking relevant experts, this paper summarizes the rural tourism management countermeasures for consumers with cognitive impairment. Then randomly select a representative rural tourism destination in terms of residents' income level, residents' education level, transportation convenience and tourism value level from China, cooperate with the local government department in charge of tourism and development management, and carry out cognitive impairment discipline theory the training of communication skills of patients with cognitive impairment and the handling of emergencies caused by patients with cognitive impairment lasts for one month. After another three months, the statistics of the public security cost, environmental governance cost, number of illegal cases and residents' satisfaction of the tourist destination in this March and the same period last year are made.

Results: After the social experiment, the required data obtained from the experiment were collected from the local government, sorted and entered into the computer, and Amos 23.0 software, and Table 1 is obtained.

Table 1. Statistical results of management data of selected rural tourism destinations before and after the experiment

Statistical time	Total cost of public security (ten thousand yuan)	Total cost of environmental management (ten thousand yuan)	Total number of illegal cases	Resident satisfaction
Within three months after the experiment	69.2	95.4	7	3.68
Same period before experiment	82.6	113.7	12	3.04

Note that the residents' satisfaction in Table 1 is quantified by a five-level scoring system of 1-5, in which 1 represents dissatisfaction, 2 represents relative dissatisfaction, 3 represents neutral, 4 represents relative satisfaction and 5 represents satisfaction. According to Table 1, after the training, the total cost of public security, the total cost of environmental management, the number of illegal cases and residents' satisfaction in the tourist area were 692000, 954000, 7 and 3.68 respectively, which were -16.2%, -16.1%, -41.67% and 21.1% higher than those before the experiment.

Conclusions: With the implementation of China's rural revitalization strategy, there are more and more rural tourism scenic spots in China, but consumers with cognitive impairment have brought obstacles to the development of rural tourism. Therefore, on the basis of collecting relevant information and summarizing countermeasures, this study designs an experiment to verify the effect of these strategies. The experimental results show that after the targeted training for the residents and merchants in the selected experimental area, the total cost of public security, the total cost of environmental management and the total number of illegal cases in the area have decreased by -16.2%, -16.1%, -41.67%, and the residents' satisfaction has increased by 21.1%. This is because after the training, local residents can better understand the psychological situation of people with cognitive impairment, and can take a more effective and gentle way to deal with the events and riots caused by people with cognitive impairment. The results show that targeted training for local residents can help reduce the additional burden of consumer cognitive impairment on rural tourism.

Acknowledgement: The research is supported by: 2021 philosophy and social sciences research project: Research on the effective application of tourism management digital teaching resources under the background of new liberal arts—focusing on the construction of virtual simulation experiment teaching center (NO. zszx21146). 2020 Municipal Industrial Innovation Team: Research on the technology and mechanism of coordinated development of ecological restoration and global tourism in Ordos mining area.

THEORETICAL ANALYSIS AND SKILL EXPLORATION OF COLLEGE ENGLISH TRANSLATION TEACHING UNDER COGNITIVE IMPAIRMENT

Yueming Tang

School of Foreign Languages, Changzhou Institute of Technology, Changzhou 213032, China

Background: The main reason for cognitive impairment is that patients with cognitive impairment in some aspects, such as cognitive impairment and logical impairment of brain function, are often accompanied by cognitive impairment in other aspects. Because cognitive impairment will have a great impact on patients' ability to understand the world and surrounding environment, it does great harm in the field of education. Among the people who accept college English translation teaching in China, some students suffer from varying degrees of cognitive impairment due to family inheritance, childhood experience, family education and other factors. Teaching them qualified English translation knowledge is a great challenge for college English translation teachers in China. It is difficult to solve the problem of college English translation teaching for college students with cognitive impairment only by the efforts of teachers. It needs the cooperation of the government, society, colleges and universities, teachers and students. This study is set up to solve the English translation learning problems of college students with cognitive impairment.

Objective: The purpose of this study is to explore the performance and knowledge absorption of college students with cognitive impairment in college English translation teaching, so as to put forward some feasible coping strategies according to the learning status of this group, and verify the real effect of these strategies in the actual teaching process, so as to improve the English translation ability of Chinese college students, Provide some methods and references to alleviate the negative effects of cognitive impairment.

Objects and methods: Firstly, find the books and documents in the fields of pedagogy, college English teaching and cognitive impairment, and sort out the countermeasures that may help to improve the negative impact of college students' cognitive impairment on English translation learning. Then, an English translation teaching experiment based on semi-structured interview and indirect data collection method is designed to verify whether the strategy is helpful to improve college students' English translation ability. A representative foreign studies university was selected from China, and 200 students with varying degrees of cognitive impairment who agreed to participate in the experiment were randomly selected from the group of full-time English majors. The research objects are randomly divided into experimental groups and control groups, with 100 students in each group. The basic information related to the experiment is counted for the two groups of students, and the statistical results are verified for the significance of the difference. If the verification is passed, the follow-up experiment is carried out, otherwise, it needs to be regrouped. If the data differences between the groups after multiple regrouping cannot meet the requirements, you need to reselect the research object. Then start the college English translation teaching experiment. Both groups of students receive the same college English translation teaching at the same time. For the purpose of controlling irrelevant variables and increasing the comparability of experimental data, the teachers of the two groups of students need to ensure that they are the same person. At the same time, in the teaching process of the experimental group, teachers are required to combine the specific manifestations of cognitive impairment of each student, provide them with targeted pre-class guidance and post-class Q&A. A service, avoid criticizing students as much as possible and encourage their progress. The teaching experiment lasted for one semester. After the experiment, the teachers collected the data of each student's English translation ability before and after the experiment (which can be obtained from the test scores) and conducted semi-structured interviews with the students in the experimental group to understand their views on the experimental intervention.

Results: After completing the teaching experiment, collect the experimental data and get Table 1.

Table 1. Average scores of English translation ability of the two groups of college students before and after the experiment

Inspection time	Group	Translation speed	Translation accuracy	Text fluency
Before experiment	Experience group	-1.25	0.17	0.03
	Control group	-1.24	0.18	0.03
After the experiment	Experience group	0.84	1.30	0.62
	Control group	0.23	0.51	0.25

It should be explained that all English translation abilities listed in Table 1 are evaluated according to the five scores, -2 represents “poor”, 1 represents “relatively poor”, 0 represents “normal”, 1 represents “relatively good” and 2 represents “good”. According to Table 1, before the experiment, the scores of English translation ability of the two groups were poor, and the data difference between the two groups was small. After the experiment, the average scores of translation speed, translation accuracy and text fluency of the experimental group and the control group were 0.84, 1.30, 0.62 and 0.23, 0.51 and 0.25 respectively. The former was significantly higher than the latter.

Conclusions: Aiming at the problem that cognitive impairment will hinder college students’ English translation learning, this paper studies and analyzes the current situation and main symptoms of cognitive impairment of English majors, puts forward a number of coping strategies, and then designs a set of teaching experimental plan. The experimental results show that, the average scores of students in the experimental group in terms of translation speed, translation accuracy and text fluency after the experiment were significantly higher than those in the control group. The main reason for this result is that the teachers in the experimental group took into account the specific performance and severity of students’ cognitive impairment in the teaching process, repeated and increasingly difficult teaching is carried out for the parts where students’ knowledge is weak, which significantly improves the efficiency of students’ knowledge absorption. This study shows that teachers’ consideration of students’ cognitive impairment in college English translation teaching is helpful to improve the learning effect of such students.

REFORM AND PRACTICE OF PHYSICAL EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Lianju Lu & Haiying Zhang

Ministry of Sports, Liaoning University of International Business and Economics, Dalian 116052, China

Background: Educational psychology is an interdisciplinary subject that applies psychological theories and methods to the field of human education. Its research focus is to improve courses and teaching methods, stimulate students’ learning enthusiasm and help students face various challenges and difficulties in the process of growth. At present, there are some universal problems in college physical education in China. For example, the teaching prevention in physical education classroom is mainly based on teachers’ demonstration and explanation, and students passively accept the teaching content. The syllabus and teaching plan of physical education is inconsistent with the law of students’ physical and mental development. Some teaching contents are too difficult for students to learn, which will attack students’ learning enthusiasm. Most colleges and universities have fewer physical education teachers than the course teaching content. Some physical education teachers need one person to teach multiple sports. The reason is related to the limited investment resources and insufficient attention of colleges and universities, but the most important reason is that the teaching concept of school leaders and physical education teachers needs to be changed, and more educational psychology methods need to be integrated into the teaching process, so as to fully mobilize students’ learning enthusiasm and let students know the purpose and significance of learning these sports. However, there are few research projects that put forward reform suggestions on college physical education from the perspective of educational psychology, so the research focuses on this, hoping to provide some new ideas for improving the quality of physical education in China’s higher education system.

The purpose of applying the theories and methods of physical education to the study of physical education in colleges and universities in China is to improve the enthusiasm and initiative of physical education.

Objects and methods: Firstly, through communicating with physical education experts at home and abroad and consulting the classic works of physical education and educational psychology in colleges and universities, this paper puts forward some constructive suggestions to improve the current situation of physical education in colleges and universities and improve the overall physical quality and physical ability of college students in China. Then, the Delphi method is used to select 20 front-line high-quality teachers and experts in the field of college physical education from China, send the suggestions to them, let them evaluate these methods, and then adjust the suggestions according to the evaluation results, so as to obtain the opinions of college physical education reform with considerable trial value recognized by industry experts and scholars.

Results: The college physical education reform suggestions adjusted considering the results of the first

expert feedback were sent to the expert group and the physical education teacher group again, and they were asked to evaluate the impact of various opinions on students in all aspects which is shown in Table 1.

Table 1. Comments of experts and scholars on the adjusted opinions

Opinion	Enthusiasm	Learning speed	Learning difficulty	Physical quality	Habit cultivation
Teachers should actively guide and encourage students	4.53	4.27	3.01	2.86	3.67
Dynamic adjustment of physical education syllabus according to students' ability	2.30	3.48	4.85	1.33	3.51
Adjust the teaching staff according to the teaching content	2.43	3.24	2.86	4.04	1.39
Diversification of physical education curriculum content	3.95	3.40	2.72	1.93	3.25
The interesting physical education teaching process	4.28	4.69	3.74	2.68	4.17

It should be explained that the impact level is numerically calculated according to the rule that 1 is no impact, 2 is slight impact, 3 is medium impact, 4 is significant impact and 5 is full impact. It can be seen from Table 1 that the interviewed experts and PE teachers believe that the adjusted reform suggestions have different effects on students. Specifically, they believe that the three opinions of “teachers should actively guide and encourage students”, “diversification of physical education curriculum content” and “interesting teaching process” have a more consistent impact on students, which will have a higher than significant impact on students' enthusiasm and learning speed, followed by the impact on habit cultivation. The opinion of “adjusting the teaching staff according to the teaching content” has the greatest impact on students' physical quality. “Dynamic adjustment of physical education syllabus according to students' ability” has the greatest impact on students' learning difficulty.

Conclusions: In order to deal with various problems existing in physical education in colleges and universities in China, this study attempts to apply the principles and methods of teaching psychology to physical education in colleges and universities. Firstly, based on the analysis of a large number of relevant documents, the original suggestions are obtained, and then a group of domestic experts and front-line teachers in the field of physical education are selected by Delphi method, ask them to give feedback on these opinions and seek feedback again after adjustment. Finally, according to the statistics, experts and teachers believe that “teachers should actively guide and encourage students”, “dynamically adjust the physical education syllabus according to students' ability”, “adjust the teaching staff according to the teaching content”, “diversify the physical education curriculum content” and “make the physical education teaching process interesting” are the opinions that have the greatest comprehensive impact on the college students. Specifically, these opinions are put forward from the perspective of schools, teachers, or students, taking into account the educational psychology and objective educational conditions of students. Delphi survey results show that experts believe that integrating the methods and principles of educational psychology into college physical education can improve the quality of college physical education and improve students' physical education level.

THE INFLUENCE OF FARMERS WITH COGNITIVE IMPAIRMENT ON E-COMMERCE SUPPORTING AGRICULTURE AND ITS COUNTERMEASURES

Haijing Hu

Agricultural and Commercial Management College, Jiangsu Agri-animal Husbandry Vocational College, Taizhou 225300, China

Background: Cognitive impairment is a mental and psychological disease caused by abnormal function of human cerebral cortex. Its clinical manifestations are mainly perceptual impairment, memory impairment and thinking impairment. There are many causes of abnormal cerebral cortex function, such as depression, Alzheimer's disease, manic disorder and so on. In some rural areas of China with low overall education and poor health habits, the factors that may lead to cognitive impairment appear more frequently, so there are more patients with cognitive impairment in rural areas of China, which brings additional difficulties to the

development of various rural revitalization and rural poverty alleviation. Especially for the e-commerce poverty alleviation and agricultural support work that requires the operator to have a high cognitive level, if the operator suffers from a certain degree of cognitive impairment, it will greatly affect the processing, storage, packaging, transportation of sales products and online communication with consumers. Therefore, in order to promote the rapid development of rural e-commerce, promote the structural reform of rural agricultural supply side, increase the family disposable income of poor farmers, and solve the cognitive impairment of some farmers, it is quite necessary and urgent.

Objective: To find the countermeasures to solve or alleviate the cognitive barriers of some farmers in China, so as to help their rural e-commerce business further develop, so as to promote the income generation and poverty alleviation of local residents, and provide more positive ideas for improving the working methods of e-commerce industry in the countryside.

Objects and methods: Collect the historical data and cognitive impairment academic research materials of e-commerce supporting agriculture in China, sort them out and analyze them, and theoretically summarize the effective methods to help farmers with cognitive impairment develop e-commerce business. Then, an empirical analysis experiment was conceived, in which 20 unrelated independent farmers with different degrees of cognitive impairment symptoms were selected as the research object. These farmers were randomly divided into experimental group and control group, with 10 farmers in each group. Firstly, the basic information statistics of the two groups of farmers including the severity level of cognitive impairment, gender, age and other characteristics were carried out. After confirming that there is no significant difference in the basic information, the farmers in the experimental group will receive special training on cognitive impairment and knowledge and skills related to the e-commerce business. The main contents of the training are as follows. The first point is to introduce the definition, etiology, treatment methods and precautions in the daily life of cognitive impairment. Secondly, teach the impact, harm and effective coping methods of cognitive impairment on various key matters in poverty alleviation e-commerce work (such as the workflow of agricultural product planting, transportation, storage, processing, packaging and so on). The control group received only ordinary e-commerce agricultural skills training. The training time of the experimental group and the control group is 3 months, and the poverty alleviation department of the local government is requested to provide the data of the average online sales of the last month, the average online monthly sales profit and life satisfaction of the research object within half a year before participating in the experiment and half a year after the completion of the training.

Results: After the experiment, the relevant data of the research object provided by the poverty alleviation department of the local government were sorted into a standard form that is easy to calculate, and SPSS21.0 was used and Python 2.0 programming language for statistical analysis. In terms of result presentation, the measurement data needs to be expressed in the form of mean combined with standard deviation, and t-test needs to be carried out. In addition, the difference significance level index is set to 0.05. The e-commerce performance and other data of the two groups of farmers before and after the training are counted, as shown in Table 1.

Table 1. Statistical results of e-commerce performance and life satisfaction of two groups of farmers before and after training

Statistical time	Statistical indicators	Experience group	Control group	<i>t</i>	<i>P</i>
Before training	Average monthly sales of online stores	27562±5120	27611±5489	0.069	0.945
	Average monthly sales profit of online store	3562±533	3541±469	0.313	0.75
	Life satisfaction	2.69±0.16	2.70±0.12	0.530	0.596
After training	Average monthly sales of online stores	32915±4226	29644±3792	6.102	0.000
	Average monthly sales profit of online store	4685±617	3920±423	10.856	0.000
	Life satisfaction	3.92±0.18	3.15±0.21	29.417	0.000

The indicators of life satisfaction in Table 1 are quantified according to the five-level scoring system. The specific rules are: 1 represents dissatisfaction, 2 represents relative dissatisfaction, 3 represents neutrality, 4 represents relative satisfaction and 5 represents satisfaction. It can be seen from Table 1 that the *P* value of the *t*-test of each comparative data of the two groups before training is greater than the significance level of 0.05, and it is considered that the data difference is not significant. After the training, the data of each statistical index in the experimental group were better than that in the control group, and the difference was statistically significant.

Conclusions: In view of the problem that farmers with cognitive impairment cannot adapt to the business model of the e-commerce industry in the process of supporting the development of agricultural e-commerce in some areas of China, this study randomly selects some farmers with cognitive impairment from a rural e-commerce industry in China for a group experiment. The experimental results show that the average monthly sales and online monthly sales profit of the experimental group receiving the coping strategies training for cognitive impairment diseases increased by 11.03% and 19.52% respectively compared with the control group, and the satisfaction of the former is also significantly higher than that of the control group. The experimental results show that training farmers with cognitive impairment on the coping methods of diseases in the process of e-commerce operation are helpful to improve farmers' e-commerce income and life satisfaction.

Acknowledgement: The research is supported by: The Project of Jiangsu Agri-animal Husbandry Vocational College in 2019: Research on the Integrated Development of Primary, Secondary and Tertiary Industries in Rural Taizhou under Rural Revitalization (Project No. NSFR201902).

STRATEGY OF COLLABORATIVE EDUCATION IN COLLEGE PHYSICAL EDUCATION AND ITS INFLUENCE ON COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY

Rongbin Yang

Sport Department, Zhejiang University of Science and Technology, Hangzhou 310023, China

Background: As China's higher education system pays more and more attention to quality education, it is gradually of value and necessity to flexibly integrate the content of mental health education in college physical education. Because at present, most colleges and universities in China have not specially set up mental health education courses. Integrating these contents into physical education teaching will not occupy too much existing teaching time. Moreover, allowing students to learn mental health knowledge in the process of sports can promote students' physical and psychological development towards a healthier direction at the same time, and can also alleviate to a certain extent, even completely solve the anxiety of some students due to their poor study, employment and life. The research results of some scholars show that integrating mental health education into college physical education can protect students' mental health, promote students to form good quality and living habits, and improve students' self-confidence and comprehensive ability. At present, there are three specific ways to combine college physical education with mental health education: improving the mental health education ability of physical education teachers, requiring schools and teaching teachers to improve their attention and material investment to students' mental health, and reforming the teaching methods of college physical education. This study will specifically analyze the effects of these strategies on students' psychological anxiety.

Objective: To design a machine learning model and analyze the impact of various mental health education methods on students' psychological anxiety after they are integrated into college physical education. So as to provide some ideas and examples for other scholars to conceive the collaborative education strategy of college physical education and mental health education in the future.

Objects and methods: A machine learning model based on GBDT (Gradient Boosting Decision Tree) algorithm was constructed to predict the psychological anxiety of students under the combination of physical education and mental health education in different colleges and universities. The data of the experiment comes from a third-party data dealer. The content of the data set is the learning psychological anxiety scores obtained from the combination of various psychological safety education measures to the college physical education teaching of students with no significant difference in psychological anxiety groups. Here, the psychological anxiety score after taking measures is the label of the data set. Before model training and prediction, single-factor analysis is carried out for each strategy. After the model is optimized 15 times, the historical optimal prediction results are obtained, and the importance coefficients (i.e., regression coefficients) of each input feature of the model (i.e., the collaborative education strategy adopted) are counted, so as to find a better psychological health collaborative education strategy integrated into college physical education. In addition, the anxiety score data were measured by the Self-rating Anxiety Scale (SAS).

Results: The statistical results of the corresponding input feature importance of the model with the best prediction effect in the limited parameter adjustment scheme are obtained, as shown in Table 1.

Table 1. Statistical results of input characteristic importance coefficient

Number	Input strategy	Whether to adopt	Regression coefficient <i>B</i>	Standard deviation <i>SD</i>	<i>P</i>	OR	95%CI
1	Improve the mental health education ability of physical education teachers	Yes	-1.864	0.462	0.014	0.524	0.095-1.205
		No	-	-	0.009	-	-
2	Schools and teachers are required to pay more attention and material investment	Yes	-1.387	0.692	0.007	0.715	0.124-2.461
		No	-	-	0.018	-	-
3	Reform the teaching methods of physical education in colleges and universities	Yes	-0.527	0.614	0.024	0.152	0.028-1.529
		No	-	-	0.013	-	-

In the machine learning regression model with reasonable processing of original data, the regression coefficient can also be understood as the importance coefficient of each feature to improve the accuracy of model prediction results. It can be seen from Table 1 that strategies 1, 2 and 3 are protective factors to regulate college students' psychological anxiety, and the absolute value of the importance coefficient of strategy 1 is the largest, followed by strategy 2, which shows that the two methods of improving physical education teachers' mental health education ability and requiring schools and teachers to increase attention and material investment have the best effect on Improving college students' psychological anxiety.

Conclusions: Due to the increasing pressure of employment competition and academic difficulty, the psychological anxiety of college students in large countries has become more and more serious in recent years. In college physical education, the teaching mode of integrating mental health education and collaborative education can alleviate college students' psychological anxiety without significantly changing college education planning. In order to verify the role of various sports and mental health collaborative education strategies proposed in this study, a machine learning regression model based on the GBDT algorithm is constructed, and the relevant data purchased from third-party data trading institutions are input for training. The model training results show that the three methods of "improving the mental health education ability of physical education teachers", "requiring schools and teachers to improve their attention and material investment" and "reforming the teaching methods of college physical education" all help to improve college students' psychological anxiety, and the effect of the first strategy is the best.

* * * * *

MATHEMATICS TEACHERS' VIEWS ON MATHEMATICS AND MATHEMATICS EDUCATION FROM THE PERSPECTIVE OF PSYCHOLOGY

Luyu Sun

Department of Basic Education, Henan Vocational College of Water Conservancy and Environment, Zhengzhou 450011, China

Background: Educational psychology is a compound discipline that applies traditional psychological theories and methods to human education. Its research focus is to optimize courses and teaching methods to stimulate students' learning enthusiasm and help students face various challenges and difficulties in the process of growth. However, educational psychology does not only use traditional psychological methods and theories to explain the psychological phenomena in education, nor does it study the psychological activities of the educated party and the professor in the process of education as general psychological activities, but to explore the exchange process of students' internal and external information and the law of psychological changes caused by it in the teaching environment.

The view of mathematics can be simply regarded as the sum of mathematics teachers' attitudes, views and views on the mathematics subjects taught. The view of mathematics education can be understood as the views and opinions of teachers in mathematics teaching activities. The connotation of mathematics view and mathematics education view overlap, but they are not the same. The former has a larger scope, and the latter is only limited to mathematics education. Mathematics teachers' views on mathematics and

mathematics education will directly affect teachers' teaching behavior. For most students, mathematics is a subject with great difficulty in learning. Therefore, mathematics teachers should master a certain degree of educational psychology knowledge, so that they can be more acutely aware of students' psychological state and learning status in the teaching process, so as to adjust teaching contents and teaching methods, and eliminate students' anxiety, depression and anxiety caused by difficult understanding in time negative emotions such as fear.

Objective: After studying the mathematics education literature and educational psychology data in universities and middle schools at home and abroad in recent 5 years, a comparative teaching experiment was designed and implemented to verify whether adjusting teachers' views on mathematics and mathematics education from the perspective of students' psychology can help improve students' mathematics learning ability and learning effect. Therefore, it provides some suggestions supported by empirical materials to promote the reform of mathematics teaching in compulsory education and higher education in China.

Objects and methods: A representative university was selected from China, and then 82 non mathematics majors were randomly selected as the research objects. Before the experiment, the research objects were evenly divided into experimental group and control group, with 41 students in each group. The basic information statistics related to the experiment were carried out for the students after the grouping. Note that the measurement data in the study are displayed in the form of mean \pm standard deviation, and *t*-test is performed. The counting data is described in the form of number of cases or percentage, and chi square test is used. The significance level of difference is 0.05. After the beginning of the experiment, mathematics teaching with the same knowledge content was carried out for both groups of students, and the teaching methods, teaching environment and teaching time were adjusted to the same degree. Before teaching the experimental group, teachers need to carry out special training on psychological knowledge, and then require teachers to use educational psychology methods to think and analyze students' psychological situation as much as possible when teaching the students of the experimental group, and adjust the teaching content and teaching methods in real time according to their psychological situation. Students are required to take a math test before and after the experiment, and collect a variety of math ability data of each student from teachers (judged by teachers according to students' test results).

Results: The scores of multiple mathematical abilities of students in the two groups before and after the teaching experiment are counted, as shown in Table 1.

Table 1. Scores of various mathematical abilities of the subjects before and after the experiment

Test time	Group	Logical thinking ability	Computing power
Before experiment	Experience group	3.42 \pm 0.32	3.72 \pm 0.24
	Control group	3.41 \pm 0.28	3.72 \pm 0.22
	<i>P</i> value	0.804	1.001
After the experiment	Experience group	3.86 \pm 0.18*	3.74 \pm 0.13
	Control group	3.42 \pm 0.31	3.73 \pm 0.25
	<i>P</i> value	0.000	0.709

Note: * in Table 1 represents the data difference of corresponding statistical items before and after a group of experiments, which is statistically significant.

Each mathematical ability is quantified by five points, i.e., integer 1, 2, 5. They represent poor, relatively poor, normal, relatively good and good respectively. It can be seen from Table 1 that before the experiment, there was no significant difference in each mathematical ability between the two groups, but after the experiment, the logical thinking ability of the experimental group was significantly different from that of the control group, but the calculation ability of the experimental group was not significantly different from that of the control group and the experimental group before the experiment.

Conclusions: In order to improve the efficiency and quality of mathematics education in China's education system, this study attempts to explore the application of psychological theories and methods to mathematics classroom teaching, and designs a comparative teaching experiment. The experimental results show that teachers are required to analyze their own psychological state and learning state from the perspective of students as much as possible in the process of teaching the experimental group, so as to adjust the teaching methods and contents. The average score of logical thinking ability of students in the experimental group after the experiment is significantly higher than that of the control group and the experimental group before the experiment. The experimental results show that the conjecture put forward in the study "from the psychological point of view of students' education, adjusting the mathematics view and mathematics education view of mathematics teachers will help to improve students' mathematics

learning ability and mathematics knowledge learning effect”, which is generally correct.

* * * * *

MITIGATION STRATEGIES OF EMPLOYMENT ANXIETY OF LOGISTICS PROFESSIONALS UNDER THE BACKGROUND OF DOUBLE HIGH CONSTRUCTION

Jianquan Li

Business School, Kunming Metallurgy College, Kunming 650033, China

Background: Anxiety disorder, also known as anxiety neurosis, is a common disease in neurosis. It can be generally divided into two types: chronic anxiety (also known as generalized anxiety) and acute anxiety (also known as panic attack). The main clinical manifestations of chronic anxiety disorder are emotional symptoms, autonomic nerve symptoms and motor anxiety. The main clinical manifestations of acute anxiety are feeling of dying, feeling out of control, chest tightness, palpitation, shaking of the whole body and so on. There are two mainstream treatment methods for anxiety disorder: drug treatment and non-drug treatment. The former generally uses diazepam drugs and antidepressants, which have quick effect but short duration, and do not cure the symptoms. The latter refers to the use of professional psychotherapy to change patients' cognitive habits and thinking habits, so as to achieve a radical effect, which is also a more commonly used treatment method.

In recent years, with the substantial increase of competitive pressure in China's logistics industry, the profit space of small and medium-sized enterprises in the industry has been reduced, resulting in the employment pressure of talents in the logistics industry. In this context, students majoring in logistics in higher vocational colleges will inevitably worry about their “unemployment upon graduation”, resulting in employment anxiety and even anxiety disorder. At the same time, after the State Council issued the implementation plan of national vocational education reform in 2019, the “double high construction” requiring higher vocational colleges to build high-level professional courses has gradually become the key goal to lead the construction and development of higher vocational colleges. If higher vocational colleges reasonably integrate industrial development and industrial talent demand in the process of building high-quality logistics specialty, it will significantly improve the employment competitiveness of logistics professionals and their attraction to recruitment units, so as to alleviate the employment anxiety of logistics professionals.

Objective: To put forward the methods of optimizing the training of talents in logistics majors combined with the actual employment needs of logistics professionals and the connotation of “double high plan”, and design experiments to verify whether these methods can effectively improve the employment situation of logistics professionals and alleviate students' employment anxiety.

Objects and methods: A representative higher vocational college is selected from China. 206 students majoring in logistics who are about to graduate from the school are randomly selected as the research objects. The research objects are evenly divided into reform group and normal group. First, the baseline information statistics of the two groups of students are carried out, and then the significance of the difference of basic information between the two groups of students is tested. Then conduct a comparative teaching experiment. The teaching courses are the same professional courses in the current syllabus, but the teaching materials of the reform group are jointly prepared by backbone teachers and experts in the industry. The teaching teachers belong to the type with rich enterprise work experience. Before teaching, teachers should analyze the current situation of the industry and the recruitment psychology of enterprise personnel in detail. And the skills and knowledge skills that will help students find jobs are interspersed into the teaching process. In the process of teaching, teachers should pay attention to students' psychological status and answer the problems that will cause students' employment anxiety in time. In addition, before and after the experiment, a questionnaire survey should be conducted for all students. The survey content is the test questions designed by the research team about the employment anxiety of logistics students.

Results: After the experiment, the collected data were screened, and then the effective data were entered into the computer, and SPSS22.0 statistical data, the measurement data is displayed in the form of mean \pm standard deviation, and *t*-test is carried out. The counting data is displayed in the form of number or proportion of number, and chi square test is carried out. The difference significance level index is determined as 0.05, and Table 1 is obtained.

Table 1. Comparison of employment anxiety levels between the two groups of students before and after the experiment

Investigation time	Group	Very anxious (%)	Relative anxiety (%)	Neutral (%)	Relatively no anxiety (%)	No anxiety (%)
Before teaching	Reform group	27.6	42.5	21.0	6.3	2.6
	Normal group	26.8	38.6	23.6	7.1	3.9
After teaching	Reform group**	3.5	16.2	29.3	35.4	15.6
	Normal group*	21.0	34.2	24.5	14.1	6.2

Note: ** means that the *P* value of the significance test of the difference between this group of data and the data of other groups and other times at the same time is less than the significance level, * means that the *P* value of the *t* test of this group of data and the data of the same group at other times is less than the significance level.

By analyzing the data in Table 1, it can be seen that the data distribution of students' anxiety level in the reform group after teaching is significantly better than that in the normal group and the reform group before teaching, and the data difference is statistically significant.

Conclusions: In view of the employment anxiety of domestic logistics professionals, this study puts forward a series of strategies to improve the professional ability and employment competitiveness of logistics professionals under the background of higher vocational colleges responding to the national "double high construction", and designs a teaching experiment to verify the real application effect of these strategies. The experimental results show that in the teaching mode and teaching environment adjusted according to these strategies, the employment anxiety level of the reform group receiving professional course teaching has been significantly improved, whether compared with the normal group after the experiment or the reform group before the experiment. The experimental results show that adjusting and optimizing the training scheme of logistics professionals according to the idea and standard of "double high construction" can effectively alleviate the employment anxiety of logistics professionals.

THE INFLUENCE OF COLLEGE EDUCATION AND TEACHING REFORM ON COLLEGE STUDENTS' IDEOLOGY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xin Zhou

Broadcasting and Hosting College, Sichuan Film and Television University, Chengdu 610000, China

Background: Educational psychology is a branch of social psychology, and it is closely related to general psychology and pedagogy. Its main research object is the learning and educational psychology of students and the teaching psychology of educators in the environment of receiving education. By studying the psychology of students and educators, the application of educational psychology can achieve many purposes, such as improving teaching methods, stimulating students' learning motivation, assisting students to face difficulties in the learning process and so on. Because educational psychology helps to improve teaching methods, teachers and scholars often apply it to the teaching of subjects with high teaching or learning difficulties. The object of this research, that is, college students' ideological education, belongs to this type. Ideology refers to the social consciousness of an individual or organization that reflects a certain social class relationship and economic relationship. Ideology is mainly composed of morality, art, religion, philosophy and so on. Ideology can be classified into nonmainstream ideology and mainstream ideology. The ideology recognized by the vast majority of individuals in an economy is the mainstream ideology. The mainstream ideology can be guided by media, public opinion, culture and institutional means. For college students, because their mental intelligence is not yet mature, they are more vulnerable to the influence of bad social atmosphere and foreign media. Therefore, under the background of the current education reform in colleges and universities, it is necessary to use the powerful tool of educational psychology to optimize the ideological education methods of college students.

Objective: After collecting and analyzing the books and papers in the field of college students' ideology and educational psychology, summarize the strategies of using educational psychology to improve college students' ideological education, and then select a group of representative experts and scholars in the field of college students' ideological teaching, using Delphi method, obtain their evaluation of the impact of various strategies on college students' ideological education, so as to provide some useful references for promoting college students' Ideological education and improving the ideological health level of college students in our country in the future.

Objects and methods: After consulting the relevant literature and summarizing the strategies that may help to improve the ideological education of college students in China, 20 experts or scholars with sufficient authority and representativeness in the field of ideological education and educational psychology in colleges and universities were selected from China to form an expert group. Share the countermeasures with the expert group, ask the members of the expert group to evaluate the impact of the strategy on the ideological education of college students, then summarize the evaluation results of the expert group, adjust and summarize the strategies according to the evaluation results, and then send them to the expert group for evaluation again. The inquiry cycle will not stop until the evaluation opinions of the expert group become consistent. In addition, the impact degree is quantified according to the five-point system, that is, the number 1 represents the level of no impact, 2 represents the level of slight impact, 3 represents the level of general impact, 4 represents the level of obvious impact and 5 represents the level of full impact.

Results: After several rounds of expert inquiry and strategy adjustment, the expert comments reached an agreement. The statistical expert group's views on the impact of strategies on college students' ideological education are shown in Table 1.

Table 1. Statistics of final comments of the expert group

Strategy	No effect	Slight impact	General impact	Obvious influence	Full impact
Training to improve teachers' Ideological and political level	1	3	6	7	3
Adjust the teaching contents and methods of Ideological and Political Education	1	4	9	5	0
Improve campus culture and ideological atmosphere	2	4	5	8	1
Application of network new media tools for information dissemination	2	6	9	2	1

The numbers in columns 2 to 6 in Table 1 represent the number of people who the expert group believes that a strategy will have a corresponding impact on college students' ideological education. Secondly, the "Ideological and cultural adjustment" and "political observation" are the two most significant tools for college students to improve the ideological and cultural level of education, and the "Ideological and cultural adjustment" and "political observation" are the two most significant tools for teachers to improve the ideological and cultural level of campus education. The number of people whose influence the level of the above strategies is not lower than "obvious influence" is 10, 9, 5 and 3 respectively.

Conclusions: In view of the current insufficient ideological education of domestic college students and the relatively scattered ideology of college students as a whole, this study puts forward a number of countermeasures to optimize college students' ideological education based on the analysis of literature and the theory of educational psychology, and uses the Delphi method to consult the selected expert group. The results of the expert group's opinion statistics show that the expert group believes that the two strategies of "training to improve teachers' Ideological and political level" and "improving campus culture and ideological atmosphere" have the most significant impact on college students' ideological education, followed by "adjusting the teaching contents and methods of Ideological and political education", and the least impact is "using network new media tools for information dissemination", the number of people whose influence level of the above strategies is not lower than "obvious influence" is 10, 9, 5 and 3 respectively. The evaluation results of the expert group show that using the strategies proposed by educational psychology, such as considering the students' educational psychology, adjusting the content and methods of Ideological and political education in colleges and universities, adopting new media tools that more cater to the psychology of the new generation of college students, and so on, are indeed helpful to improve the quality of Ideological education in colleges and universities in China.

Acknowledgement: The research is supported by: Source: Education Department of Sichuan Province; Project name: Research and Practice on the Course Construction of TV Integrated Production Based on Cross Fusion; Project Number: JG2021-1488.

THE POSITIVE INFLUENCE OF INTERNET PLUS COLLEGE ENGLISH TEACHING ON MENTAL DISORDERS OF COLLEGE STUDENTS

Chengwei Wang

School of International Education, Yellow River Conservancy Technical Institute, Kaifeng 475004, China

Background: Mental disorder refers to the disorder of individual mental activities such as cognition, emotion and will due to the abnormal operation of human brain function. The common causes of the mental disorder include growth environment, physique, congenital heredity and so on. Most patients with mental disorders have self-talk, abnormal behavior, weak will, emotional judgment and expression disorders, delusions, hallucinations and other behavioral manifestations, and lack of correct self-awareness. Generally, they are unable to accurately judge that they have mental disorders. Since the reform and opening, China has become more and more closely connected with the world, and enterprises and government agencies have higher and higher requirements for students' English ability, which directly increases the employment psychological pressure of college English majors. Some students begin to show symptoms of mental disorders such as self-talk and weak will because they can't bear the environmental pressure. However, in the context of the sinking of Internet applications, it is possible to use Internet technology tools in college English teaching. These technologies can bring English majors a broader learning perspective and more diverse employment channels and values, and there is the possibility of improving students' mental disorders. Therefore, this study focuses on exploring the impact of the application of Internet technology tools in college English teaching on students' mental disorders.

Objective: After understanding the current application of Internet technology in teaching, college English teaching and the current situation of college students' mental disorders, this paper puts forward the countermeasures of using Internet technology and tools to improve English majors' mental disorders, and verifies the effectiveness of the strategies in teaching experiments, to provide some positive ideas for improving the comprehensive quality of college English majors in China.

Participants and methods: A general undergraduate school was selected from cities with a medium level of domestic economic development. 164 full-time college students of English-related majors who were willing to participate in the experiment and suffered from different degrees of mental disorders were randomly selected as the research objects. Then let them accept English teaching lasting for one semester. During the teaching experiment, with the consent of the school management and teachers, teachers are required to upload the video version of the teaching content to the school intranet after teaching a course, and add some tips for auxiliary learning considering the students' mental impairment for students to review the course. At the same time, teachers are required to provide students with more forms of learning materials as a supplement to the main courses on the premise of considering the symptoms of students' mental disorders. At the beginning and end of the teaching experiment, teachers are required to investigate the severity of mental disorders of all students participating in the experiment. The investigation method is not limited and is at the discretion of teachers, but the methods used in the previous and subsequent investigations need to be completely consistent to avoid introducing additional irrelevant variables into the experiment.

Results: The data of teachers' investigation results on the severity of students' mental disorders were collected. It was found that they used the SCL-90 scale to investigate and judge the level of students' mental disorders. Therefore, the study stipulated to display the score data in the form of mean combined with standard deviation and conduct a *t*-test. The significance level of the difference was 0.05. See Table 1 for the data after statistical investigation.

Table 1. Comparison of statistical results of students' SCL-90 scale before and after teaching experiment

Project	Before teaching	After teaching	<i>t</i>	<i>P</i>
Somatization	1.58±0.53	1.57±0.63	1.143	0.942
Obsession	1.96±0.62	1.42±0.43	1.251	0.001
Susceptibility	2.14±0.54	1.53±0.58	0.341	0.001
Depressed	2.26±0.80	1.66±0.51	0.554	0.002
Anxious	2.37±0.53	1.70±0.43	0.786	0.004
Hostile	1.50±0.44	1.41±0.62	0.163	0.035
Terror	1.42±0.57	1.43±0.40	1.910	0.769
Paranoid	1.47±0.57	1.30±0.71	0.415	0.028
Psychotic	1.33±0.41	1.33±0.52	1.326	1.150

It can be seen from Table 1 that before and after the teaching experiment, the *P* value of the average quantitative score difference of students on somatization, phobia, and psychosis factors is greater than the

significance level, and it is considered that the data difference is not significant. The scores of students on obsessive-compulsive disorder, sensitivity, depression, anxiety, hostility, and paranoia after the experiment were statistically significant compared with the data before the experiment.

Conclusions: Aiming at the mental disorder of English majors in colleges and universities in China, based on the investigation and collection of relevant literature, this study puts forward some improvement methods combined with Internet technology and tools, and designs and implements a teaching experiment to verify the effectiveness of these strategies. The experimental results show that after teaching, students have an obvious recovery effect on the symptoms closely related to mental disorders. This experiment shows that paying more attention to students' mental disorders in the process of English teaching and adopting targeted internet means to adjust teaching methods and progress can help alleviate the severity of mental disorders of English majors.

THE VIEW OF WOMEN IN RUSSIAN LITERATURE FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Guoying Du

School of Foreign Language, Harbin Institute of Technology, Harbin 150001, China

Background: Social psychology is a subject that studies the psychological and behavioral conditions of individuals and organizations in the social environment, and summarizes the laws used to solve the corresponding social problems. Social psychology is an interdisciplinary subject of sociology and psychology. Compared with traditional psychology, it focuses on language, friends, family, living environment. While the learning environment has an impact on itself, it also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. Because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to prevent irrelevant variables affecting the results from being introduced into case study.

From modern times to modern times, the concept of women in Russian literature shows an obvious law of change. In the literary works of the Russian Soviet era, because at that time, under the background of communism, equality between men and women and materialistic historical concept were the mainstream ideas in society, the female roles were always positive, willing to contribute, intelligent and high social status. In these literary works, many women are morally noble, despise material interests, and are willing to struggle for their beliefs and ideals without complaint and regret all their life, with a sense of beauty similar to religious asceticism. The writers of literary works in these times praise and publicize the Russian women as the mainstream force that can save the country and change history. However, after the disintegration of the Soviet Union, the Russian literary thought, which has long been restricted by the literary censorship system and guided by the government, began to become diversified, the proportion of positive female roles in literary works decreased significantly, and the female roles at the grass-roots and bottom levels in society appeared more and more frequently. This study is expected to use social psychology methods and tools to find the reasons for the change of women's views in Russian literary works.

Objective: To analyze the specific content and change trend of women's view in Russian literature in different periods of modern times, and to find the social-psychological reasons for the drastic changes of women's view in Russian literature. It provides some valuable references for China's construction of high-quality socialist spiritual civilization.

Objects and methods: Collect the literary works with high influence and popularity in modern and contemporary Russia, carefully study these literary works, and summarize the female view and the changes of female view in Russian literary works in different periods of modern and contemporary times. Combined with the era and social background at that time and the characteristics of the material and spiritual needs of the Russian people, this paper analyzes the social-psychological reasons for the formation and transformation of women's view in literary works in various periods. Then, 25 Russian writers, historians and sociologists were found to form an expert group. Using the Delphi method, based on the proposed social-psychological reasons, they were asked to return their comments on the social-psychological reasons for the formation and transformation of women's views in Russian literary works in various periods. The

expert group is required to judge the influence degree of various reasons on the view of women in literary works. The influence degree is divided into no influence, slight influence, medium influence, obvious influence and full influence. The feedback results are sorted out and sent to the expert group for evaluation again. Until the expert group reaches an agreement on the evaluation.

Results: After the expert group reached an agreement, the evaluation results of the statistical expert group are shown in Table 1.

Table 1. Social psychological reasons for the change of women’s view in Russian literary works investigated by the Delphi method

Reason	No effect	Slight impact	Medium impact	Obvious influence	Full impact
The author and the masses are emancipated	0	1	3	12	9
The masses need more diverse literary works	1	2	6	10	6
Release the repressed desire to express	3	5	9	7	1
Foreign public opinion and guidance of literary works	1	4	12	7	1

The figures in Table 1 represent the number of people who the expert group believes that the corresponding reasons have an impact on the transformation of women’s view in Russian literary works at all levels. It can be seen from Table 1 that the expert group believes that there are four main social-psychological reasons for the transformation of women’s view in Russian literary works, among which “the minds of authors and the masses are liberated” and “the masses need more diverse literary works” have the most significant impact, followed by “foreign public opinion and guidance of literary works”.

Conclusions: In order to explore the reasons for the changes in women’s view in modern Russian literary works, this study selects research tools and methods from the more suitable research discipline social psychology to analyze the reasons. And share these reasons with the expert group for cross-validation to increase the reliability of the conclusion. After sorting out the opinions of the expert group, it is found that the expert group believes that the social-psychological reasons for the transformation of women’s view in Russian literary works mainly include “the emancipation of the thoughts of authors and the masses”, “the masses need more diverse literary works”, “the release of repressed desire for the expression” and “the guidance of foreign public opinion and literary works”, of which the first two have the most significant impact. The research results enlighten us that in the process of building socialist spiritual civilization, we should pay attention to maintaining the appropriate right of freedom of expression in the literary circles, to meet the growing diversified needs of the masses for literary and artistic works.

TRAINING OF APPLIED TALENTS BASED ON ENGINEERING EDUCATION CERTIFICATION AND EVALUATION SYSTEM UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Junjie Zhang, Lei Chen, Yawei Gu & Feng Ma

School of Environmental Science and Engineering, Qilu University of Technology (Shandong Academy of Sciences), Jinan 250353, China

Background: Educational psychology is an interdisciplinary subject composed of general psychology and pedagogy, which studies the psychological situation of human beings in the context of education, the teaching psychology of teachers and the overall consciousness and behavior of teaching related institutions. The research focus of educational psychology is to find the research results that help to improve the teaching effect and teaching quality in psychology, and apply them to improve the teaching mode in a reasonable way.

After China put forward the strategic goal of building a powerful manufacturing country, the

requirements of the state and society for the application ability of science and engineering students in colleges and universities have been greatly improved. Therefore, the training mode of applied talents in science and engineering based on engineering education and evaluation system is more and more adopted in colleges and universities. However, there are some problems in the construction and practice of the teaching mode of engineering education certification and evaluation system in some colleges and universities, such as unreasonable certification system, too strict cognitive standards, low response of students and so on. Therefore, educational psychology, which is specially used to improve teaching quality and promote the reform of teaching methods, is particularly suitable for improving the training mode of applied talents based on engineering education certification and evaluation system. Teachers and relevant school managers can investigate and understand students' real thoughts and psychological feelings about the teaching method of engineering education certification, and analyze the contents that can be improved in the teaching mode and do not conform to students' learning psychology, such as excessive and partial repetition of evaluation indicators, resulting in students' learning weariness, etc. So as to adjust and optimize this new teaching mode of science and engineering.

Objective: This paper analyzes whether the application of teaching psychology tools and principles in the process of using engineering education certification and evaluation system to cultivate higher applied engineering talents will help to improve the employment competitiveness and their own knowledge and skills.

Objects and methods: Collect the research literature on the talent training mode of science and engineering majors in China, and understand the current situation of the talent training mode of science and engineering. Then purchase the data of science and engineering talent training and employment in China in recent 10 years from a professional data supplier. The data set is sorted and cleaned, and the teaching modes are divided into three types: traditional mode without engineering education certification, engineering education certification mode and engineering certification mode with educational psychological intervention. Then compare the basic information of the three groups of students when they are exposed to engineering certification education. If there is no significant difference in the basic information of the three groups of students, carry out subsequent analysis. The monthly income data of the three groups of students after their first employment, one year after employment, three years after employment and five years after employment are statistically compared, and the statistical results are used as the basis to judge whether teaching psychology can optimize the talent training mode based on engineering education certification and evaluation system. In addition, the measurement data in the study are expressed by *t*-test and the combination of mean and standard deviation. The counting data are expressed in the form of number or proportion of number by Chi-square test, and the significance level of difference is set to 0.05.

Results: The employment data of three types of students are shown in Table 1.

Table 1. Comparison of employment income data of three types of students

Teaching mode grouping	First employment	One year after employment	After 3 years of employment	After five years of employment
No engineering education certification	4058±465	4825±846	6265±946	7521±840
Engineering Education Certification	4134±526	5362±753	7041±984	9044±922
Engineering education certification with educational psychological intervention	4122±653	5797±815	8319±813	11630±1154

The unit of income data in Table 1 is RMB, and the data are converted into the income data of 2021 under the condition of considering price factors. It can be seen from Table 1 that there is little difference in the income data of students with different education modes in their first employment after graduation. After one, three and five years of employment, the difference gradually expands. After five years of employment, the average monthly income of students who receive traditional education mode, engineering education certification mode and engineering education certification mode with educational psychological intervention is 7521, 9044 and 11630 respectively. The latter increased by 54.63% and 28.59% respectively compared with the former two.

Conclusions: At present, more and more universities in China have integrated the teaching mode of engineering education certification and evaluation system into the teaching of science and engineering, but there are many problems affecting the teaching quality in the application process. Therefore, this study proposes to apply the method of educational psychology to this teaching mode, and collect the education mode and employment data of science and engineering college students in recent 10 years to verify the

effect of this teaching mode adjustment. The analysis results show that after five years of employment, the average monthly income of students who accept the traditional education mode, engineering education certification mode and engineering education certification mode with educational psychological intervention is 7521, 9044 and 11630 respectively, and the latter is 54.63% and 28.59% higher than the former two respectively, indicating that the method of educational psychology should be integrated into the engineering certification education mode of science and engineering students for adjustment. It can improve students' employment competitiveness. This is because teachers will pay more attention to the teaching methods and progress in the teaching process to meet the students' educational psychological status, and schools will also configure auxiliary teaching tools such as practical operation animation to reduce students' fear and anxiety in the process of learning new skills.

DESIGN AND RESEARCH OF RESIDENTIAL SPACE ENVIRONMENT FROM THE PERSPECTIVE OF HUMANISTIC PSYCHOLOGY

Shengyang Mo¹ & Yihua Hu²

¹*Department of Architectural Engineering and Art Design, Liuzhou City Vocational College, Liuzhou 545036, China*

²*Art College, Liuzhou Vocational & Technical College, Liuzhou 545005, China*

Background: Humanistic psychology, the full name of humanistic psychology, is a discipline developed in the academic confrontation between the two major psychological schools of behaviorism psychology and psychoanalysis. Humanistic psychology opposes the study of human individuals in isolation without considering human psychological phenomena, and also opposes the understanding of individuals solely from the functions of various elements of human existence, or the interpretation of human words and deeds from the perspective of chemistry and neurology. Humanistic psychology attempts to build a comprehensive human analysis model, and take this as the basis to comprehensively analyze individual psychological laws and psychological conditions. With the development of economy, people's requirements for living environment are not limited to material aspects. More and more residents put forward aesthetic requirements for living space environment. Therefore, in interior design and environmental design, it is necessary to use humanistic psychology as a tool to analyze and study the living psychology and aesthetic needs of residents with different occupations and habits, so as to design a more satisfactory living space environment for residents. However, the common research methods of humanistic psychology lack reliable data support, and the research results will be significantly affected by the subjective consciousness of researchers, which is also the main reason why humanistic psychology is criticized by rigorous experimental psychological researchers. Delphi method will be introduced in this study to enhance the reliability and scientificity of the research results, try to avoid the above shortcomings of humanistic psychology.

Objective: To analyze the residents' living experience of new residential buildings in China in recent years, understand the current situation and main problems of residential space environment design, and then analyze the residents' living psychology and needs from the perspective of humanistic psychology according to these problems, give some suggestions and carry out an experiment based on Delphi method, Consulting with experts is helpful to improve the design quality of national residential space and residents' satisfaction.

Participants and methods: Through investigation and interview, we understand the opinions and evaluation of 100 newly-built community residents on the living space environment in five representative regional administrative centers in China, which are representative in economy, employment, infrastructure, climate and geography, and then analyze the residents' living psychology and actual needs from the perspective of humanistic psychology based on this feedback. Analyze and put forward suggestions that help to improve the living conditions of residents. Invite 24 domestic experts with certain authority and professional level in interior design and environmental design to send their opinions to them for feedback. After taking back the opinions, sort out and adjust the opinions and continue to send them to the expert group for feedback again until the opinions of the expert group are unified. The content of the survey is to consider the humanistic psychological needs of residents, what measures can be taken to improve the current residential space environment design, and the impact of various treatment measures on optimizing

the residential space environment. The impact degree is refined according to the five-level classification method, including no impact, slight impact, general impact, obvious impact and full impact.

Results: After the opinions of the expert group were unified, the opinions of the statistical expert group are shown in Table 1.

Table 1. Statistical results of the expert group's opinions on improving the environmental design of residents' living space

Proposal	No effect	Slight impact	General impact	Obvious influence	Full impact
Pay attention to the social and emotional needs of residents	0	2	5	11	6
Rational design of road network	2	8	7	5	2
Scientific layout of residential green environment	1	5	10	6	2
Improve the visual beauty of the environment	1	4	11	5	3

The values in each cell in Table 1 represent the number of people who believe that the impact of a proposal on the living space environment of residents is the corresponding level. The consultation results show that the expert group believes that the countermeasures of "paying attention to the social and emotional needs of residents" have the greatest impact on improving the environmental quality of residents' living space, followed by "scientifically arranging the living green environment" and "improving the visual beauty of the environment". The number of people who believe that the impact of these suggestions is above the "general impact" is 17, 8 and 8 respectively.

Conclusion: With the improvement of national living standards, people's demand for living space environment is higher and higher. In order to meet the higher aesthetic needs of residents for the space environment, this study uses humanistic psychology tools to analyze the inner desires of residents in the living environment and put forward reasonable suggestions. After adjusting these suggestions, the expert group found that the countermeasures of "paying attention to the social and emotional needs of residents" have the greatest impact on improving the environmental quality of residents' living space, followed by "scientifically arranging the living green environment" and "improving the visual beauty of the environment". The number of people who believe that the impact level of these suggestions is above the "general impact" is 17, 8 and 8 respectively. The expert consultation results show that analyzing the psychological status of residents in the living space environment from the perspective of humanistic psychology is helpful to put forward the countermeasures to optimize the living environment.

RESEARCH ON THE IMPACT OF REGIONAL ECOTOURISM DEVELOPMENT ON CONSUMERS' COGNITIVE IMPAIRMENT FROM THE PERSPECTIVE OF BEHAVIORAL ECONOMICS

Hua Feng

School of Economics and Management, Hulunbuir University, Hulunbuir 021008, China

Background: The main manifestation of cognitive impairment is that the high-level functions of human brain such as memory, logic and thinking cannot operate normally, and the cognitive impairment of patients in one aspect is likely to cause cognitive impairment in other aspects. The causes of cognitive impairment diseases are mostly abnormal activities of human cerebral cortex. The common clinical symptoms of cognitive impairment include perceptual impairment (such as sensory retardation, sensory deterioration, hallucinations, pathological illusions, etc.), memory impairment (such as strong memory, memory defect, memory error, etc.), and thinking impairment (delusion, abstract generalization disorder, association process disorder, etc.). Cognitive impairment will have a great impact on patients' ability to understand the world and the surrounding environment, so it has a certain potential threat to ecotourism scenic spots with

strict environmental protection requirements. Therefore, managers and businesses of ecotourism scenic spots may take some measures against consumers with cognitive impairment to reduce their losses to the scenic spots, for example, explain the reasons and significance of protecting the environment of scenic spots, and demonstrate the correct waste treatment methods. These intentional or unintentional interventions and educational measures may help consumers recover from cognitive impairment. Therefore, this study verifies this hypothesis in order to provide some possible new ideas for the treatment of cognitive impairment.

Objective: To explore whether ecotourism has the effect of treating consumer cognitive impairment, and how strong this effect is, so as to provide a potential new method for the field of non-drug treatment of cognitive impairment in the future.

Objects and methods: 20 scenic spots with different levels of ecotourism development were selected from China and divided into five categories according to the maturity of ecotourism development (mainly determined by referring to the environmental protection, public security management, business norms and prosperity of scenic spots). Within 2 days after the start of the study, the consumers of these ecotourism scenic spots conducted MMSE (full name: Mini-mental State Examination) questionnaire survey. 55 consumers who were willing to cooperate with the study were randomly selected from the consumers with a total score of less than 27 (i.e., they were considered to have cognitive impairment). Then, after the tour, MMSE questionnaire survey will be conducted every 10 days, and the last questionnaire survey will be conducted on the 90th day after the tour. Through the statistics of these questionnaire data, we can understand the impact of ecotourism on consumers with cognitive impairment.

Results: After the experiment, the data of the first and last questionnaire survey of 55 subjects were counted, as shown in Table 1.

Table 1. Statistics of the first and last MMSE questionnaire survey results of the subjects

Statistical items	For the first time	Last hole	<i>t</i>	<i>P</i>	Rate of change (%)
Total score	18.52±3.65	23.17±4.50	0.548	0.004	20.07
Overall cognitive impairment level	Medium level	Slight level	-	-	-

Note: All measurement data involved in the experiment are expressed in the form of mean ± standard deviation, and *t*-test is carried out.

The counting data are displayed in the form of number or standard deviation, Chi Square difference significance test is used, and the significance level is taken as 0.05. In addition, the subjects with MMSE total scores of 27-30, 21-26, 10-20 and 0-9 were classified into normal cognition, mild cognitive impairment, moderate cognitive impairment and severe cognitive impairment respectively. According to the data in Table 1, the average total score of the subjects in the last MMSE questionnaire was 23.17, and the subjects were in the state of mild cognitive impairment, while the average total score of MMSE in the first questionnaire was 18.52, and the subjects were in the state of moderate cognitive impairment, an increase of 20.07% compared with the latter. The *P* value of *t*-test of the difference significance of the score data of the two MMSE surveys is 0.004, which is less than the significance level of 0.05. It is considered that the score data of the two surveys are significantly different.

Conclusions: With the development of tourism economy, more and more scenic spots that rely on ecological resources to carry out ecotourism appear in China, and the management and development level of some scenic spots have reached a fairly perfect level. However, after the increase of tourist flow, it is inevitable to receive some consumers with mental diseases such as cognitive impairment, these consumers will bring greater challenges and pressure to scenic spot management. At the same time, scenic spots will also provide them with more intimate and detailed services. Some studies have shown that this service can alleviate the symptoms of mental diseases. This study designed a questionnaire to verify the effectiveness of this conclusion. The experimental results show that the average total score of the subjects in the last MMSE questionnaire is 23.17, and the subjects are in a state of mild cognitive impairment as a whole, the mean value of MMSE total score in the first questionnaire survey was 18.52. The subjects were in a state of moderate cognitive impairment, and the difference between the two MMSE survey scores was significant. The results of the questionnaire show that consumers with cognitive impairment can alleviate their cognitive impairment symptoms to a certain extent through ecotourism.

RELIGIOUS BELIEF EMOTION AND THE DEFINITION OF “CREATIVE SUBJECT” IN THE CONCEPT OF “BUDDHIST LITERATURE”

Jingjing Guo

School of Literature, Hainan Normal University, Haikou 571158, China

Background: Social psychology is an interdisciplinary subject of sociology and psychology. It studies the psychological and behavioral conditions of individuals and organizations in the social environment, and summarizes the laws used to solve the corresponding social problems. Compared with traditional psychology, it focuses on language, friends, family, living environment while the learning environment has an impact on itself, it also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. In addition, because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to prevent the introduction of irrelevant variables affecting the results in case study. Religious activities are also a special form of social activities, so social psychology can also be applied to analyze the psychological activities of religious people in religious activities. In recent years, more and more religious forces in China have adopted more popular forms of religious literature to influence the psychology of believers and expand the influence of religions they believe in. Religious literature specifically refers to the types of media that share and disseminate religious content with literature as the carrier, accurately judge and classify the feelings of religious belief and the creative subjects in Buddhist literature, which is helpful to supervise the healthy development of religion in China and avoid the occurrence of extreme religious events.

Objective: On the basis of understanding the current missionary methods of Buddhist forces and the main contents of Buddhist literature in China, to explore a more rapid and accurate method to judge the belief and emotion of Buddhist believers and the way to identify the main body of Buddhist literature creation, so as to provide support and supervision methods for the long-term and healthy development of religious undertakings in China.

Participants and methods: Collect the main Buddhist literary works at home and abroad and study them to a certain extent, then find 30 Buddhist people and 20 non-Buddhist people who are willing to participate in the research from home as the research objects, divide 20 non-Buddhist people into experimental group and control group, and conduct special training on social psychology knowledge for the personnel in the experimental group. In particular, teach them the skills to judge their emotions through the words and deeds of the observation objects, do not train the control group, and then ask the personnel of the two groups to interview 30 Buddhist people, and then tell the researchers what they think of the current religious belief emotion type of the interview objects, and then ask the Buddhist people to feed back their true religious belief emotion. Then ask the two groups to study the Buddhist literature of five different Buddhist masters, and then ask them to read the other 10 Buddhist literature written by the five masters, and judge the information of the creative subject (i.e., the author) of each Buddhist literature. Finally, the accuracy rate is used to measure the judgment correctness of the two groups.

Results: After all the experimental steps were completed, the judgment results of the two groups were counted, as shown in Table 1. In addition, all the measurement data in the study are displayed in the form of mean \pm standard deviation, and the *t*-test is conducted. The significance level of the difference is selected as 0.05.

Table 1. Statistics of judgment results of two groups of personnel

Statistical items	Experience group (%)	Control group (%)	Difference	<i>P</i>
Accuracy of belief and emotion judgment	78.2 \pm 4.3	61.9 \pm 5.1	16.3	0.003
Accuracy of judgment of Buddhist literary creation subject	86.5 \pm 4.8	63.7 \pm 4.2	22.8	0.001

The last column in Table 1 is the *P* value of the *t* difference significance test output of the two groups of data, “difference” represents the difference value of the mean value of the corresponding statistical indicators of the two groups of objects. The experimental results show that the average accuracy of the experimental group and the control group in judging the belief and emotion of Buddhist believers and the main body of Buddhist literature creation are 78.2%, 86.5%, 61.9% and 63.7% respectively. The average of the experimental group in these two data is 16.3 and 22.8 percentage points higher than that of the control group, and the data difference is significant.

Conclusions: In order to consolidate the healthy and stable development of religion in China, this study

analyzes the religious belief emotion and psychology of Buddhist believers from the perspective of social psychology, and designs a comparative experiment to teach these methods to the personnel of the experimental group. The experimental results show that the average accuracy rate of judging believers' belief emotion in the experimental group is 78.2%, an increase of 16.3 percentage points compared with the control group. The average accuracy rate of judging the subject of Buddhist literature creation is 86.5%, which is 22.8 percentage points higher than that of the control group, and the output *P* values of *t*-difference significance test of the two groups are 0.003 and 0.001 respectively, which are far less than the significance level of 0.05. The experimental results show that using the theoretical knowledge of social psychology can better judge the religious belief emotion of Buddhist believers and the creative subject of Buddhist literary works. The research results can be applied to the supervision and inquiry of religious people's religious belief emotion and the search for the creators of negative religious literary works, which will help to improve the governance level of religious affairs in China.

INFLUENCE OF LEISURE SPORTS TRAINING ON IMPROVING COLLEGE STUDENTS' PHYSICAL HEALTH AND MENTAL HEALTH

Lei He

Physical Education Teaching Department, Henan Vocational College of Agriculture, Zhengzhou 451450, China

Background: On the one hand, with the rapid development of China's economy, science and technology, social organizations and the state put forward higher employment requirements for higher education talents. On the other hand, college students are in a critical period of growth, development, mental health quality and personality formation, and their physical function gradually tends to mature, but the development of individual psychology lags behind. After switching from middle school life to college life, due to the drastic changes in learning environment, learning mode and social relations, a considerable number of college students cannot quickly adapt to college life. Thus, anxiety, fear, negativity, depression and even pessimism are produced in the heart. These negative psychological factors will often affect the learning efficiency and social process of college students, make their social and learning results more unsatisfactory, form a negative psychological self-prediction effect, lead to more serious negative psychological factors and vicious behavior cycle. At the same time, a large number of studies show that physical training helps to improve the mental health level and physical fitness of athletes. Because when exercising, the athlete's mental attention will be firmly attracted by the exercise matters and cannot continuously allocate energy to think about other things, so that the brain has the opportunity to temporarily get rid of self-internal friction. At the same time, physiologically, during human exercise, the organs of the body's endocrine system will secrete hormones that will make people feel lasting happiness, including oxytocin, this will also help greatly alleviate the negative impact of bad psychology. However, after all, sports need some self-control and active consciousness to start. For the objects whose body and mind are in a negative atmosphere, it is more difficult to persuade themselves to carry out traditional sports. Therefore, this study adopts the leisure sports training method with much lower implementation threshold to verify whether it can also improve the level of mental health and physique.

Objective: To understand the current situation of college students' mental health and the main causes of mental health problems in China, think about leisure sports training programs suitable for college students, and design multiple groups of comparative experiments to verify the impact of these different intensities of leisure sports training on students' mental health and physique. So as to provide some research data support for exploring non drug treatment of college students' negative mental diseases.

Objects and methods: A representative university in China was selected from which 100 students with different levels of mental health problems were selected as the research objects. These students were divided into five groups, each group containing 20 people. Each group was required to choose one of their favorite sports as the sports activity in the experiment. The intensity, time and frequency of sports are determined by the students themselves, but the sports activity level of each student in the group needs to be consistent, which needs to be carried out under the guidance of physical education teachers. The sports activity level is determined according to the sports activity level scale revised by Mr. Liang Deqing, scores in (0, 9), (9, 19), (19, 42), (42, 60) (60, 100) students in the interval are marked as minimal exercise, small exercise, medium exercise, large exercise and maximum exercise, that is, one exercise interval corresponds to one group. The exercise experiment lasts for 3 months. Before and after the experiment, SCL-90 scale is

used to investigate the mental health level of students respectively. The average score of SCL-90 represents the mental health level of students, and 1 is used 000-meter running, vital capacity, standing long jump and grip strength test students' physique. All physique test items are scored by physical education teachers according to the 100-point system, and the average value represents the physical quality of individual students. In addition, in order to control irrelevant variables, the proportion of men and women in each group should be consistent.

Results: The measurement data in the experiment were displayed in the form of mean \pm standard deviation for *t*-test, and the counting data were displayed in the form of number or proportion of number for Chi-square test. The value of difference significance level was 0.05 The mental health and physical condition data of students in each group after the experiment are shown in Table 1.

Table 1. Statistical data of mental health and physical fitness of students in each group after the experiment

Statistical items	Micro exercise	Small amount of exercise	Moderate exercise	Large amount of exercise	Maximum exercise
SCL-90 single average score	2.73 \pm 0.12	2.51 \pm 0.14	2.14 \pm 0.11	1.70 \pm 0.16	1.68 \pm 0.25
Average score of individual physical fitness test	64.5 \pm 6.4	68.1 \pm 5.3	75.2 \pm 5.0	84.3 \pm 5.7	87.0 \pm 9.6

It can be seen from Table 1 that with the increase of exercise volume, the average single score of SCL-90 and the average single score of physical fitness test of students in each group show a trend of gradual decrease and gradual increase respectively. However, after the exercise volume reaches the level of "large exercise volume", the impact of increasing exercise volume on improving mental health and physical fitness becomes small.

Conclusions: In order to explore the role of leisure sports training in improving college students' physical and mental health, this study designed an experiment based on sports training. 100 college students were divided into five groups on average, and each group was required to carry out leisure sports to varying degrees. The experimental results show that with the increase of the amount of exercise, the average single score of SCL-90 and the average single score of physical fitness test of students in each group show a gradually decreasing and increasing trend respectively. The experimental results show that developing leisure sports can indeed improve students' physical and mental health.

APPLICATION OF SOCIAL PSYCHOLOGY IN ENTERPRISE HUMAN RESOURCES DEVELOPMENT AND TRAINING

Wenli Jiang

Department of Economics and Management, Guangdong Vocational College of Post and Telecom, Guangzhou 510630, China

Background: In the face of the gradual informatization and diversification of the external market, the traditional enterprise management method is no longer applicable, and the importance of human resource management is gradually revealed. The competition between enterprises in diversified markets is no longer a simple competition of material resources and technology. The competition of human resources has become one of the main competitive links of enterprise management. As a psychological science that studies the interaction and change law between social groups and social individuals at the psychological level, social psychology not only helps people improve their comprehensive psychological quality and quality of life, but also provides an effective way for the scientific talent management of enterprises. As the first step of enterprise talent management system, the development and training of enterprise human resources combined with social psychology is mainly divided into two parts: shallow development and deep development. Shallow development takes the number, professional level and resource allocation of talents as the main content, that is, develop a sufficient number of talents, carry out professional training, and finally allocate them to their matching positions according to the characteristics of each employee. Deep development takes the follow-up training of employees as the main form of expression, and mainly takes the psychological evaluation, psychological incentive, psychological contract and emotional intelligence development of employees as the main content. Through the management of employees' psychology and the external performance behavior of employees' psychology, it can achieve the organizational goal and

ensure the positive development of employees at the same time. Psychological evaluation is generally used when employees first enter the organization to grasp the psychological state and working state of employees. Psychological motivation is mainly to establish positive organizational values by inducing employees' work motivation and rewarding work achievements, so as to make employees have a stronger desire to serve the organization. Psychological contract is used to ensure the effective transmission of organizational information to each employee in talent management and maintain the consistency of the organization from top to bottom. Emotional intelligence development is to provide training for employees' self-psychological state management, so that the influence of organization members on each other remains positive.

Objective: The purpose of this study is to provide a path for human resources development and training of enterprises through scientific and reasonable social psychology means, help enterprises show talent advantages from the management level, promote each other with employees, and jointly form a competitive group.

Subjects and methods: Based on the theory of social psychology, this study effectively connects the means of social psychology with the needs of human resource management by determining the human resource management needs of enterprises in diversified markets. On this basis, it compares the organization using social psychology for human resource management with the organization using traditional methods for human resource management, test the superiority of social psychology management methods.

Study design: This study adopts the comparative research method. In the research process, two organizations with little difference in scale and business direction are selected as the research samples. The researchers will act as consultants and be responsible for constructing the human resource development and training methods based on social psychology in the psychological group, while the non psychological group adopts the traditional human resource development and training methods, The two groups were compared and analyzed.

Methods: This study obtained the psychological state data of employees in different types of organizations through employee interviews, and summarized them into quantitative data for analysis.

Results: The comparison of economic and psychological benefits between psychological group and non-psychological group is shown in Figure 1.

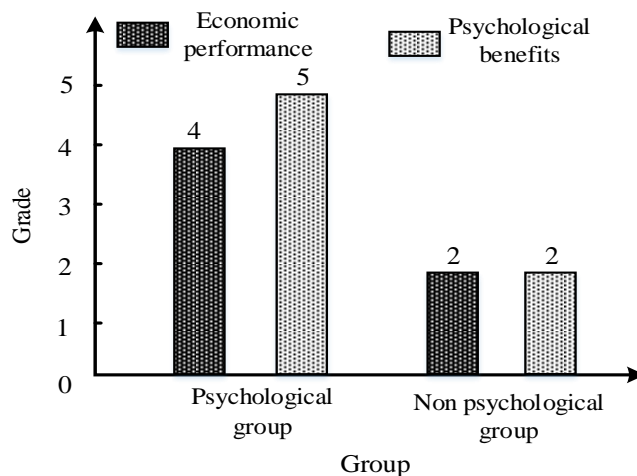

Figure 1. Inter group comparison

In Figure 1, the economic benefit of the psychological group reaches level 4 and the psychological benefit reaches level 5, while the economic benefit and psychological benefit of the non-psychological group are both level 2. It can be seen that the organization using social psychology can achieve greater benefits.

Conclusions: As an important way of modern enterprise management, human resource management needs a theory with strong consistency as management guidance, and social psychology is a discipline with strong consistency with human resource management. The mutual development of employees' psychological and psychological benefits can be realized by making full use of the relationship between employees' psychological and psychological benefits, and the mutual development of individual and psychological benefits can be realized from multiple aspects, such as human and psychological benefits. At the same time, it provides solid organizational support for enterprises to deal with various challenges in the external diversified market.

COMPUTER SIMULATION OF SOCIAL PSYCHOLOGICAL PHENOMENA AND ITS METHODOLOGICAL SIGNIFICANCE

Yun Qian

The Electronic Engineering, Yangzhou Institute of Technology, Yangzhou 225009, China

Background: With the improvement of social material living standards, the public's demand for psychological counseling is also increasing year by year. The research of modern psychology is divorced from the traditional experimental research method, because the psychological phenomena and psychological laws of social people in the complex social environment often have clustering and particularity, which is difficult to restore through simple experiments. Computer simulation provides sufficient methods for the study of this part of social psychological phenomena. This part of the social-psychological phenomena that need computer simulation is mainly divided into two categories: one is the abnormal individual psychological phenomenon caused by the psychological influence of social environment or social group under the special social environment, and the other is the cluster psychological phenomenon caused by external or internal factors of the social group itself. In social psychology, individual psychological phenomena and group psychological phenomena are often described as the relationship of interaction and mutual influence, and this psychological relationship and psychological law are the functional relationships within small and medium-sized groups, such as the group psychological relationship in the company, which often has a certain degree of group rules, which are both material and psychological, through the external forms of obedience relationship, incentive relationship and assistance relationship. In other words, the psychological relationship in such groups is based on rules, so the peripheral conditions are sufficient in the process of speculation and experiment. However, the research on large-scale social psychological phenomena cannot adopt this method, because the speed of contemporary information transmission has accelerated rapidly, the communication frequency between social individuals has accelerated, and the psychological influence between each other has been improved. Even if there is no physical aggregation between individuals, it is still possible to produce large-scale cluster psychological phenomena. For the description of this part of psychological phenomena, computer simulation is an effective means. Computer simulation can fully simulate the functional relationship between different individual psychological elements through powerful computing power, and then simulate and predict large-scale cluster social psychological phenomena.

Objective: Starting from the social-psychological characteristics of large-scale clusters, this study takes computer simulation as research means to reveal and analyze the psychological phenomena and psychological change laws of modern people. This research can lay a foundation for individual psychological counseling of intelligent urban residents and the simulation of group psychological phenomena in crisis situations at the same time.

Subjects and methods: This study takes computer statistical simulation as the main research method. The information of individual social and psychological factors is collected in the form of a network questionnaire, and the collected data is used as the social and psychological sample of the public. Finally, the relationship between social and psychological variables is simulated and predicted by establishing a simulation model of social and psychological phenomena.

Study design: In this study, a Complex Adaptive System (CAS) and swarm platform were used to establish the simulation model of computer social psychological phenomena. The complex adaptive system is most in line with the phenomenon operation principle of social psychology phenomenon, that is, the complex social system in which the aggregation of micro individual factors affects the macro-overall factors. The swarm platform mainly provides tools for model building.

Methods: Establish different types of computer social psychological phenomenon simulation models through swarm platforms, and make quantitative statistics on the data according to different psychological elements.

Results: Under the sudden pressure environment, the curve of people's psychological stress score changing with time is shown in Figure 1.

Figure 1. Pressure score change curve

In Figure 1, the psychological pressure of the masses gradually decreased from a peak state in the middle and early stage, and was in the state of self-processing the crisis information and continuously releasing their sense of pressure with the deepening of Du Yu's understanding of the crisis. However, with the deepening of the understanding of the crisis information, the pressure will further rise and will fluctuate with the emergence of new news in the later stage.

Conclusions: With the increase of the speed of social-psychological simulation, it is difficult to transfer a large amount of information between individuals and groups through the traditional psychological simulation. Through computer simulation, we can simulate the relationship between individual psychological state and interaction in the specific social environment, so as to achieve the effect of prediction. Using the computer system to simulate the social psychological phenomenon of the masses can lay the foundation for the individualized psychological consultation system of an intelligent city. At the same time, in the social crisis environment, the computer psychological simulation system can also make a macro prediction for the crisis psychology of the masses, so as to make a plan before the crisis and effectively control the crisis psychology of the masses in the process of crisis.

STRATEGIES OF IDEOLOGICAL AND POLITICAL EDUCATION FOR COLLEGE STUDENTS IN THE FIELD OF PSYCHOLOGY

Dongdong Dong^{1,2}, Mi Li³ & Yong Yuan¹

¹*School of International Education, Hainan Medical University, Hainan 571199, China*

²*School of Education, Taylor's University, Selangor 47500, Malaysia*

³*Department of Student Affairs, Hainan Medical University, Hainan 571199, China*

Background: At the moment of drastic changes in the employment environment and social concepts, college students, as a group whose psychology is not yet mature and whose world outlook is not fully formed, their lack of social practice experience and correct understanding of external concepts will have a strong impact on their psychological balance. If they are not handled in time, they are likely to evolve into symptoms such as depression anxiety symptoms and other serious psychological problems. The efficient ideological and political education of students based on psychology can provide a way to alleviate the learning pressure, living environment pressure, emotional pressure and external employment situation pressure of college students through psychological counseling and concept guidance, so as to reduce the source and breeding environment of depressive symptoms and anxiety symptoms. College students are in an important period when they are about to enter the society, and in a highly information-based social environment with anxiety in the overall social mood, there is an urgent psychological demand for ideological, political and mental health guidance, while the traditional ideological, political and mental health education methods cannot effectively connect ideological and political education with the actual psychological state and living state of college students. There is a sharp contradiction between its urgent psychological needs and the backward and efficient psychological intervention means. Therefore, it is necessary to formulate an efficient ideological and political education method based on psychology and

accurately fit the actual psychological state and living state of college students. Psychological ideological and political education can help contemporary college students establish a correct outlook on life, values and world outlook through ideological guidance, concept establishment and psychological counseling, and provide methodological guidance for students' daily study and life. At the same time, psychological ideological and political education can also help sort out students' psychological state and provide students with understanding of their own psychological state. Understand the ways of self-psychological needs, and then provide students with a better self-psychological defense mechanism when they feel depressed or anxious. This study will analyze students' acceptance and psychological state in Ideological and political teaching in the process of summarizing data, and form a relatively clear psychological ideological and political education strategy according to the data direction, so as to provide guidance for the reform of Ideological and political education in the future.

Objective: Through the research on the ideological and political education strategies of college students in the field of psychology, this study helps contemporary college students get rid of the psychological pressure brought by the external environment and information, and establish a correct world outlook, outlook on life and methodology in their daily study and life.

Subjects and methods: This study investigates the psychological state and psychological acceptance of contemporary college students in Ideological and political education by means of interview and on-site investigation, establishes relevant index system, and analyzes the benign impact of psychological ideological and political education on college students by means of index comparison.

Study design: Provide a platform for college students to participate in psychological ideological and political education by setting up psychological ideological and political elective courses and conducting trial teaching. The course is maintained for one semester, and students' psychological changes are recorded through interviews during the semester.

Methods: SPSS18.0 was used in this study. Structural Equation Model with Amos21.0 and other social statistical software for data statistical analysis.

Results: The impact of the ideological and political course based on psychology on the content cognition and emotional cognition of college students in the trial elective course is analyzed, as shown in Table 1.

Table 1. Content cognition and affective cognition analysis

Gender	Scoring type	Content cognition	Emotional cognition
Male	M	26.407	19.485
	SD	5.379	3.795
Female	M	26.842	19.617
	SD	4.882	3.542
Whole	<i>t</i>	-2.143*	-0.128

Note: * indicates $P < 0.05$, ** indicates $P < 0.01$, *** indicates $P < 0.001$.

It can be seen from Table 1 that the ideological and political teaching based on psychology has a significant impact on college students participating in elective courses in terms of content cognition, $P < 0.05$.

Conclusions: College students are in a special period in their life. During this period, students are full of longing for the external social environment and eager to receive external social information. At the same time, they are also extremely vulnerable to the influence of external information and bad values, resulting in bad psychological state and even bad behavior, which seriously affects their study and life with others. This study analyzes the positive impact of Ideological and political education on students from the aspects of students' content identity and emotional identity in the process of psychological ideological education, and based on the ideological and political education based on psychology, helps students establish a correct outlook on life and values and dredge psychological pressure through psychological counseling, ideological guidance and methodological guidance.

COORDINATED DEVELOPMENT OF COLLEGE STUDENTS' IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yuxia Cao

School of Mathematics and Statistics, Shandong University of Technology, Zibo 255000, China

Background: Educational psychology is limited to the scope of teaching situation. It takes the psychological phenomena and laws of the interaction between teachers and students in the teaching process as the main research object, and reveals the close relationship between teachers and students in teaching behavior. The application of educational psychology in ideological and political education in colleges and universities helps to provide more paths for teaching. The traditional ideological and political education tends to provide students with the correct value orientation and ideas that should be observed. In the teaching relationship, middle school students have always been on the side of passive acceptance rather than active learning, which has a certain degree of resistance at the psychological level. In the causal relationship of educational psychology, the psychological factors between teachers and students are interrelated and interactive. At the teacher level, teachers' personal charm, teachers' teaching prestige, teachers' teaching efficiency and other factors will have a great impact on students' learning psychological guidance and learning psychological pressure. Students' self-awareness and personality preferences are also psychological factors that have a great impact on the learning effect. Ideological and political education based on educational psychology pays more attention to the growth personality and psychological needs of college students, takes the initiative in the psychological interaction between teachers and students, guides students by mastering students' psychological characteristics, and reduces students' psychological pressure in the process of learning. This process is a process of two-way psychological communication between teachers and students, rather than the traditional teaching style one-way street, so the ideological and political education using educational psychology is easier to be accepted by students and more suitable for students' psychological needs. On the one hand, the ideological and political education of collaborative educational psychology takes the role of teachers as educational guides. Teachers need to pay attention to students' psychological effects and psychological counseling. On the other hand, it promotes students to give full play to their subjective initiative and give full play to students' ability of self-study, self-reliance and positive communication. At the same time, a psychological environment of harmonious communication should be formed between teachers and students, provide a healthy atmosphere of leisure and pleasure for ideological and political learning.

Objective: By applying educational psychology to ideological and political education in colleges and universities, this study provides teachers and students with a new teaching method different from the traditional way of ideological education, which makes the ideological and political education more humanized, more effective and more targeted.

Subjects and methods: This study takes the teaching method of educational psychology as the methodology to guide the ideological and political education of college students, and uses the fuzzy evaluation method to transform the qualitative indicators of ideological and political courses into calculable quantitative elements in the statistical process. Through the realization of the method of educational psychology in the teaching process, this paper analyzes its positive impact from two aspects of students and teachers.

Study design: This study randomly selected the students of ideological and political compulsory courses in the second academic year of a university as the research object, conducted experimental research by adding educational psychology and educational methods to the ideological and political compulsory courses in colleges and universities, and interviewed and collected the students' psychological state data before and after the semester. Combined with the elements of ideological and political education quantified by fuzzy evaluation method, it is used for statistics and impact analysis.

Methods: When sorting out the survey results, this study uses Excel as an analysis tool to analyze the impact and degree of educational psychology and educational methods.

Results: The students' achievements in the ideological and political elective course of educational psychology are shown in the Table 1.

The data in Table 1 shows that the most influential part of psychological ideological and political elective courses for students is to improve moral cultivation and knowledge reserve, reaching 132 and 104 respectively, with the proportion of 28.95% and 22.81% respectively, followed by the part of establishing correct outlook on life and values, with the number reaching 81, with the proportion of 17.76%.

Table1. Student harvest statistics

Option	Frequency	Proportion (%)
Establish a correct outlook on life and values	81	17.76
Improve the ideological and theoretical level	67	14.69
Improve moral cultivation	132	28.95
Increase knowledge reserve	104	22.81
Little gain	72	15.79
Total	456	100.00

Conclusions: College students are in a special period vulnerable to external influence. The traditional way of ideological and political education is difficult to integrate with students' daily learning, life and psychological state. The ideological and political teaching based on educational psychology provides an effective way for college students' ideological and political education in the new era. Ideological and political education based on educational psychology should start with the concept of emotional teaching, respect and actively respond to students' thoughts and feelings, and stimulate students' interest in learning. In addition, we should also conduct teaching in the way of psychological counseling, relieve students' psychological pressure through infectious and dialogue psychological counseling, solve students' psychological confusion and cultivate students' positive mentality.

ANALYSIS ON THE INFLUENCE OF “ANXIETY” EMOTION ON CONSUMER BEHAVIOR IN E-COMMERCE ENVIRONMENT

Shiying Liang

School of Business Management, Shanghai Vocational College of Science & Technology, Shanghai 201800, China

Background: In recent years, China has made great efforts to build infrastructure and develop computer technology, which has laid a solid foundation for the rise and rapid development of e-commerce. With the continuous development of Internet technology and the continuous improvement of national income, online shopping is gradually rising. With the rapid development of e-commerce and information technology in China, e-commerce has gradually become one of the mainstream development modes of consumers. E-commerce refers to a comprehensive business operation mode based on the Internet, which can carry out business activities without meeting between buyers and sellers. Through e-commerce, consumers can realize various business, transaction and financial activities such as online shopping, online transactions between merchants, and online electronic payment. Nowadays, the annual transaction scale of e-commerce market exceeds 10 trillion, which is an important part of China's market economy.

Consumers are prone to anxiety due to social and personal factors. For example, competitive anxiety caused by work pressure and learning pressure. Consumers' selective anxiety in the face of many choices, and social anxiety in the face of strange environments. Consumer psychology is a branch of psychology that mainly studies the consumer behavior and psychological change law of consumers in consumer activities, including the process of consumers' psychological activities, consumers' personality psychological characteristics and so on. In the theory of consumer psychology, consumers' anxiety will have an uncertain impact on consumers' purchase decision. That is, different characteristics of anxiety will have different effects on consumers' purchase decisions. Generally speaking, anxiety will make consumers tend to make decisions to reduce losses and avoid risks. Therefore, anxiety is not conducive to the development of e-commerce market. Therefore, based on consumer psychology, the research analyzes the impact of consumer anxiety on consumer behavior, and puts forward strategies to improve the original e-commerce model, so as to alleviate consumers' anxiety and increase consumers' consumption desire, so as to promote the development of e-commerce industry and China's market economy.

Objective: Consumers' anxiety will have an uncertain impact on consumers' purchase decisions and affect the transaction volume of e-commerce. Based on consumer psychology, this study analyzes the impact of consumer anxiety on consumer behavior, and puts forward strategies to improve the original e-commerce model, hoping to alleviate consumers' anxiety and promote the development of e-commerce industry and China's market economy.

Research objects and methods: 100 e-commerce consumers were selected as the research objects, and

the anxiety degree of consumers was evaluated by Self-rating Anxiety Scale (SAS) and Hospital Anxiety and Depression Scale (HADS).

Study design: 100 consumers were randomly divided into study group and control group by random number table method, with 50 people in each group. Among them, consumers in the research group used the improved e-commerce model based on consumer psychology to shop and consume. The consumers in the control group used the traditional e-commerce model for shopping and consumption. One month later, the anxiety levels of the two groups of consumers were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After one month of consumption, the SAS score of consumers in the study group was significantly lower than that of consumers in the control group ($P < 0.05$), as shown in Figure 1.

Note: * means $P < 0.05$ compared with that before the test, # means that compared with the control group at the same time, $P < 0.05$.

Figure 1. The degree of anxiety of the two groups of consumers

Conclusions: Consumers are prone to anxiety due to social and personal factors. For example, competitive anxiety caused by work pressure and learning pressure, consumers' selective anxiety in the face of many choices, and social anxiety in the face of strange environments. Consumers' anxiety will have an uncertain impact on consumers' purchase decisions and affect the transaction volume of e-commerce. Therefore, based on consumer psychology, this study analyzes the impact of consumer anxiety on consumer behavior, and puts forward strategies to improve the original e-commerce model. The experimental results showed that after one month of consumption, the SAS score of consumers in the study group was significantly lower than that of consumers in the control group ($P < 0.05$).

INHERITANCE OF TRADITIONAL CULTURE EDUCATION BASED ON SOCIAL PSYCHOLOGY IN COLLEGE CHINESE TEACHING

Yunlan Wen

General Education Teaching Department, Chongqing Vocational Institute of Safety & Technology, Chongqing 404121, China

Background: Social psychology takes the attitude of social individuals as the basic concept and the interaction law and phenomenon between social individuals and groups as the research object. In the contemporary complex information environment, the formation process of social psychology and the interaction process between individuals are relatively complex. Therefore, in this process, different factors affect each other, and the psychological impact on contemporary college students is also complex. College students are exposed to external social information, and the imperceptible influence of information of different values on students' psychological state will eventually act on students' behavior. Traditional culture education in college Chinese teaching can exert a subtle influence on college students, which can be called "the influence of spiritual environment" in social psychology. Social psychology believes that the

material world that human senses can directly feel will form a reflection of social environment in human spiritual world, which is called spiritual environment. The spiritual environment seriously affects people's social behavior, but the interaction between people and the spiritual environment is not actual experience, but psychological experience. Based on the theory of spiritual environment, college Chinese teaching, as the main humanities subject backed by Chinese culture, is very suitable for the integrated teaching of traditional culture education. In the Chinese subject integrating traditional culture and education, the traditional teaching method is divorced from the daily life and psychological state of contemporary students to a certain extent, and the teaching method based on social psychology can make up for this shortcoming. Through the use of traditional culture for psychological hint and intervention, the traditional cultural values are rooted in the students' psychological environment, and then provide methodology for students' daily social behavior, so as to improve students' cultural literacy and overall quality. Due to the close connection between college Chinese and Chinese traditional culture, the positive role of this traditional culture education is easier to be reflected. The integration of the two is an effective way to improve students' overall quality. From the perspective of students' psychology, students have psychological recognition of Chinese traditional culture to a certain extent. Through the effective use of this psychological recognition. It can help psychology traditional culture education achieve better results.

Objective: This study uses the theory of spiritual environment in social psychology to integrate the education of Chinese excellent traditional culture into college students' Chinese teaching, so that students are affected by traditional culture in their daily learning and life, so as to help students improve their cultural literacy.

Subjects and methods: This study uses interdisciplinary research method and random forest algorithm to apply the theory of social psychology into the pedagogy discipline. On this basis, it analyzes the impact of the teaching methods of social psychology on college students through the classification results.

Study design: This study takes Chinese department students as the main research object, carries out Chinese course teaching by using new teaching methods after teacher training, transforms the course content into quantitative, focuses on a questionnaire survey of students' learning results, delimits the quantitative dividing line of learning results according to different achievement levels, and finally classifies students' learning results by using random forest algorithm. Analyze the impact of different teaching methods on students' academic performance.

Methods: The main statistical and analytical tool used in this study is Excel. Through the classification and integration of data, this paper analyzes the impact of the new Chinese teaching method combined with social psychology and traditional culture education on students.

Results: In Chinese teaching, the benefits of traditional culture education to students are shown in Figure 1.

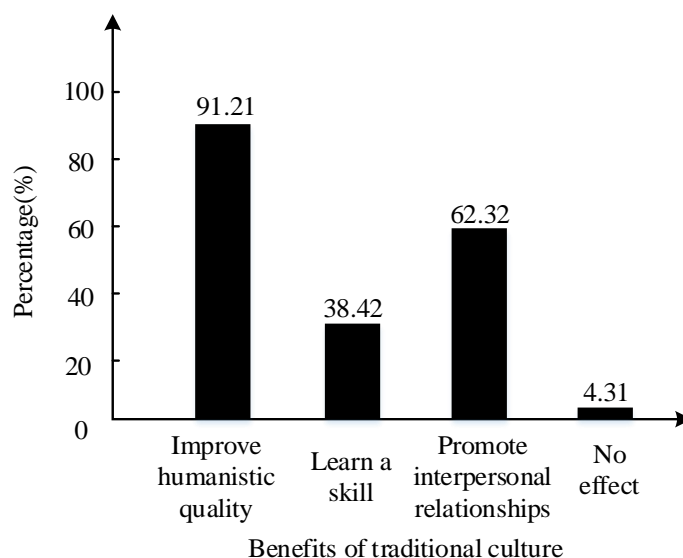

Figure 1. The benefits of traditional culture in Chinese teaching

Figure 1 the benefits of traditional culture education in Chinese teaching are mainly reflected in the improvement of humanistic quality, accounting for 91.21% of the total number, followed by the harmony of interpersonal relations, accounting for 62.32% of the total number, and the number of people who acquire skills accounts for 38.42% of the total number.

Conclusions: The application of psychology in college education can better grasp the violations of

traditional education methods against psychological science, correct them, and form a more effective teaching method. Based on the theory of social psychology, this study combines traditional culture education with college Chinese education, and exerts the influence of excellent traditional culture on students' most habitual learning behavior, so as to achieve better learning effect. In the new Chinese teaching methods, teachers should give full play to their leading role, pay attention to psychological effects, innovate Chinese teaching methods according to the actual situation in the teaching process, help students remove psychological obstacles in the learning process, create a more harmonious psychological environment, and promote students to improve their overall cultural literacy, Become a strategic learner with both morality and ability.

THE INFLUENCE OF COLLEGE STUDENTS' RURAL EMPLOYMENT ON ALLEVIATING COLLEGE STUDENTS' EMPLOYMENT ANXIETY UNDER THE BACKGROUND OF THE NATIONAL STRATEGY OF RURAL REVITALIZATION

Jun Yang

College of Packaging and Printing Engineering, Henan University of Animal Husbandry and Economy, Zhengzhou 450046, China

Background: At present, the social employment environment is grim, and the overall social atmosphere has a strong sense of anxiety. In the process of job hunting, college students will inevitably face problems such as the inconsistency between psychological expectations and actual job conditions, difficult employment environment and highly competitive pressure. In this environment, college students often have concerns about the future. Then, with the spread of bad emotions such as employment difficulties, they fall into employment anxiety. Anxiety psychology is mainly divided into three types: objective anxiety, nervous anxiety and moral anxiety. Neurotic anxiety refers to an uncomfortable state that human beings show when fighting their own impulses. Moral anxiety refers to a certain contradiction between human behavior and secular morality, which leads to the choice anxiety of actors themselves. Objective anxiety, also known as realistic anxiety, is an anxiety symptom caused by the actual situation. Employment anxiety is based on the current situation of employment difficulties, which is typical objective anxiety. For objective anxiety, the most effective solution is to solve the objective facts causing anxiety symptoms at the objective level, that is, the current situation of employment difficulties. Rural revitalization provides a way to solve the objective facts causing anxiety symptoms at the objective level. Agriculture is one of China's basic industries, so the rural revitalization strategy is an essential key development strategy. The rural revitalization strategy includes both the revitalization of construction and the revitalization of talents. Only by cultivating skilled and professional talents that can be retained in rural areas can we ensure that rural areas have stable technical support in the process of development. Rural revitalization, as a macro strategy to relieve the pressure of urban employment and drive the development of rural technology and economy, provides college students with new employment ways and career prospects to a certain extent. It not only solves the bottleneck of the domestic employment environment but also brings a solution to the psychological anxiety caused by college students' employment difficulties.

Objective: Starting from the rural revitalization and rural employment policy of college students, this study explores the current situation of college students' employment anxiety and the impact of rural employment on this situation in the current employment environment with highly competitive pressure and bad industry situation.

Subjects and methods: This study combines the investigation and research method with the measurement model method, through the investigation data and substituting the measurement index dimension as a variable into the measurement model for cross-a impact analysis.

Study design: In this study, senior undergraduates in a university were randomly selected and investigated. In the process of investigation, in addition to the indicators related to anxiety self-assessment, they also measured from the scale of rural employment identity, which is mainly divided into two important parts: Employment optimism and professional identity. On this basis, a structural equation model is established to transform the dependent variable college students' employment anxiety and its independent variable into a binary variable.

Methods: In this study, Excel is used to make statistics and summary of the data from the survey, and computer algorithms are used to analyze the employment anxiety of college students and their recognition of rural employment.

Results: The rural employment identity of the surveyed students are shown in Table 1.

Table 1. Identity score

Identity description	Average score	Quantity
Do you like to develop professional knowledge in rural areas	3.96	300
Are you satisfied with the prospect of rural career development	3.91	300
Are you willing to engage in rural related occupations in the future	3.27	300
Overall average score	3.71	-

The scores of the sense of identity in Table 1 range from 1 to 5, indicating that the views are very positive, relatively positive, general, relatively negative and very negative respectively. It can be seen that the overall score of the sense of identity in rural employment is between general and relatively positive, with an average of 3.71 points. Among them, whether they like the professional knowledge of rural development and whether they are satisfied with the prospect of rural career development have reached more than 3.9 points, close to the relatively positive score.

Conclusions: In the harsh employment environment in the city, college students close to graduation are prone to serious anxiety, and the rural employment policy of college students under the rural revitalization strategy solves the source of students' anxiety from an objective point of view by solving the problem of college students' employment. After the analysis of professional identity, professional optimism and anxiety psychology in Jinguo, the results show that students maintain a relatively positive attitude towards rural employment, indicating that rural employment is one of the effective ways to solve college students' employment anxiety symptoms from the perspective of rural technology demand and college students' willingness.

REFORM AND DEVELOPMENT OF EDUCATIONAL MANAGEMENT SYSTEM FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Guifang Xiong^{1*}, Runping Guo² & Yanwu Yu³

¹*Institute of Urban Construction, Xi'an Siyuan University, Xi'an 710038, China*

²*Business School, Xi'an Siyuan University, Xi'an 710038, China*

³*Entrepreneurship and Employment Guidance and Service Center, Xi'an Siyuan University, Xi'an 710038, China*

Background: Cognitive psychology is a theory that focuses on the cognitive process in the process of individual growth. Cognitive psychology emphasizes that learning is the process of forming the knowledge structure. This process not only includes the absorption of knowledge, but also includes the internal processing and cognition of individual forces to a certain extent through the stimulation of the external environment. In this process, biased cognition may affect the growth path of individuals, and then have a serious impact on individual behavior. The student period is an important period for the sound development of individual personality. In the student stage, the individual's cognition of the world is not perfect and is easy to be misled by the external environment. With the growth, all kinds of psychological obstacles and psychological troubles gradually increase. If they are not dealt with, it is easy to lead to a certain degree of deviation in students' life cognition and world cognition, and finally lead to individual behavior deviation, Affect the lives of individuals and others. The traditional education management system is lack of attention to the cognitive psychology in the process of individual growth in the process of education, such as the backward educational organization structure in the field of psychology. The professional level of staff to solve students' psychological problems needs to be improved. The curriculum system lacks relevant courses to guide students' cognitive psychology and correct values. The overall education system lacks the characteristics of keeping pace with the times. The regulatory system is not sound enough and other characteristics need to be reformed and improved. In dealing with students' psychological growth, we

should not neglect management, but should adopt professional and targeted management. In this way, we should establish a relatively perfect mental health education system, teach students' professional knowledge and maintain students' personal psychological state and cognitive direction, through curriculum allocation, staffing, systematic supervision structure and system reform to cultivate students' good comprehensive physical and mental quality and promote the unified development of students' body and mind.

Objective: This study examines the modern education management system from the perspective of cognitive psychology, and on this basis, reforms the education management system without psychological education, so as to provide the correct development direction for students' psychological growth and improve students' comprehensive physical and mental quality.

Subjects and methods: This study mainly uses the methods of interview and factor analysis to collect data on students' psychological status and teachers' and students' views on the current education management system, and on the basis, establish the foundation for the reform of education management system under cognitive psychology.

Study design: This study selects freshmen from a university as the survey object. The age of the survey object is basically between 16 and 23 years old. The relevant data collection begins in the 8th week after freshmen enters the school.

Methods: SPSS17 was used in data analysis to make statistics and analysis of students' personality characteristics and psychological state.

Results: The psychological scores in the education management system are shown in Table 1.

Table 1. Teacher score statistics

Project	Mean score	Standard deviation of score
Mental health publicity	11.48	1.12
Importance of mental health	6.94	1.53
Importance of psychological counseling	6.35	0.86
Implementation degree of psychological counseling	3.99	1.13
Teachers' self-mental health assessment	7.93	1.46
Management system of mental health education	4.38	1.38

In Table 1, the average score of mental health publicity is the highest, reaching 11.48 points. It can be seen that in the view of teachers, the construction of mental health publicity is the most insufficient, followed by the attention to mental health, which is 6.94 points. Among them, the average score of the implementation degree of psychological counseling is the lowest, which shows that the implementation of this aspect is relatively in place.

Conclusions: After decades of gradual development and improvement, the domestic education system has formed a relatively complete system and norms, but new problems are still emerging one after another. Students in the new era have more obvious characteristics, so relevant reforms of the domestic education system are also needed to adapt to this characteristic. This study examines and reforms the domestic education management system from the perspective of cognitive psychology, so as to create an operation mode that pays more attention to students' mental health and cognitive tendency from the three levels of schools, teachers and students, so as to lay a foundation for building an education system that is more suitable for students' actual learning life and psychological state, and improve students' comprehensive physical and mental quality, provide psychological plans and solutions for the problems that students may encounter in the process of growth, and help students grow more healthily.

APPLICATION OF HUMANIZED NURSING INTERVENTION IN THE NURSING OF SENILE EPILEPSY

Qi Mu & Shuhong Li

Mongolian Dementia Institute, Inner Mongolia Minzu University, Tongliao 028000, China

Background: Epilepsy is a neurological disease that seriously endangers the health and quality of life of modern residents. Head trauma, brain tumors and nervous system diseases are the common causes of epilepsy. There are about 50 million cases of epilepsy in the world, of which the number of domestic cases has reached 9 million, accounting for nearly one fifth of the total number of cases. Among them, the elderly, as a multiple period of epilepsy, accounts for a great part of the group of epilepsy. Epilepsy is often accompanied by characteristics such as transient and repetitive in the course of disease, so patients often suffer great pain, and about 30% of them are still ineffective after several years of drug treatment and need to be intervened through surgery. Due to the characteristics of the above diseases, patients with epilepsy are often accompanied by common symptoms such as depression and anxiety. Therefore, humanized and personalized nursing of patients' psychological and physiological states in nursing work is an important topic of related medical nursing. Positive psychology believes that patients are individuals with self-awareness and self-care ability, and the universal law that can produce positive tendencies can often play a positive effect in brain diseases, neurological diseases and other chronic diseases. The improvement of patients' psychological resilience in terms of self-efficacy, positive and optimistic attitude is conducive to the progress of the disease. Humanized nursing through the observation of patients' psychological characteristics, and then give personalized psychological nursing, help patients correctly understand the condition, alleviate patients' psychological pressure, and improve patients' treatment and nursing compliance. Through this humanized nursing, we can actively treat the patients' depression, anxiety and other concurrent symptoms, improve the patients' self-efficacy and quality of life, and improve the treatment effect.

Objective: Through humanized and personalized nursing, this study improves the self-efficacy of patients from the psychological level, and has a good inhibitory effect on the anxiety and depression symptoms of epilepsy, so as to help elderly patients with epilepsy obtain better treatment effect and quality of life.

Subjects and methods: Through the method of comparative experiment, this study compares the team carrying out humanized and personalized nursing with the patient group only using traditional nursing methods, and analyzes the impact of humanized nursing methods on the treatment effect and quality of life of patients from the aspects of patient psychology and patient nursing results.

Study design: This study selected 70 patients who received surgical treatment in a hospital as the research object. The average age of the research object is between 65 and 75 years old. 70 patients are divided into intervention group and control group. The intervention group adopts humanized and personalized nursing methods, and the control group adopts traditional routine nursing methods. The nursing effect is analyzed by comparing the treatment effect and psychological state of patients.

Methods: SPSS18.0 was used in this study statistical software for statistical analysis, in which $P < 0.05$ means statistically significant.

Results: The compliance analysis of patients before and after intervention is shown in Figure 1.

Figure 1. Compliance analysis

The patient compliance in Figure 1 is mainly manifested in the patient's compliance in clinical nursing and observation, which is divided into excellent grades, that is, actively cooperating with nursing work. Good, that is, can cooperate with nursing work under the supervision of others. Poor, that is, it is difficult to cooperate with nursing work. It can be seen that the number of people in the intervention group who can cooperate with nursing work actively or under the supervision of others is relatively more than that in the control group, while the number of people who do not cooperate with nursing work is significantly less than that in the control group. The patient compliance in Figure 1 is mainly manifested in the patient's

compliance in clinical nursing and observation, which is divided into excellent grades, that is, actively cooperating with nursing work. Good, that is, can cooperate with nursing work under the supervision of others. Poor, that is, it is difficult to cooperate with nursing work. It can be seen that the number of people in the intervention group who can cooperate with nursing work actively or under the supervision of others is relatively more than that in the control group, while the number of people who do not cooperate with nursing work is significantly less than that in the control group.

Conclusions: Epilepsy is a chronic brain disease with a high incidence rate and recurrent attack. The quality of life in the long-term treatment and treatment period has a strong impact on the treatment of patients. Through the analysis of the effect of personalized nursing methods on patients with epilepsy in the process of this study. Humanized and personalized treatment includes patients' daily treatment and nursing and personalized psychological nursing. Through psychological evaluation, cycle-assignment, nursing implementation and other steps to improve patients' psychological state in the treatment process, it can increase patients' self-awareness and disease awareness, and improve the treatment instrument. Then from the perspective of positive psychology, improve the self-efficacy experienced by patients in the treatment process, and indirectly improve the treatment effect and quality of life of patients.

THE ALLEVIATING EFFECT OF ENTERPRISES' DEVELOPMENT OF DIGITAL ECONOMY ON PSYCHOLOGICAL COGNITIVE IMPAIRMENT

Zhou Wang

School of Economics, Jiaxing University, Jiaxing 314001, China

Background: In the theory of schema cognitive psychology, people's overall cognition is composed of countless human document makers who store information. These cognitive units are used to store the characteristics of external things, extract and summarize them. This cognitive structure has overall generality, that is, the knowledge extracted from a unit still has a certain degree of generality after being separated from individual situations. At the same time, this cognitive structure also has stability, that is, when people receive new knowledge, they will still use the form of assimilation with the existing structure to form the intergroup knowledge structure. Based on this theory, cognitive impairment can be roughly divided into two categories. One is conceptual cognitive impairment, that is, in the process of human cognition, the representations contained in the original information are not correctly extracted, resulting in the wrong nodes constituting the cognitive structure, resulting in cognitive impairment. The other is structural cognitive impairment, that is, although information is correctly extracted in the process of human cognition, it fails to form a stable structure in the process of assimilation with the old knowledge structure, resulting in cognitive impairment. In the process of employee training, structural cognitive impairment is a common type of obstacle. For employees with structural cognitive impairment, the development of enterprise digital platforms and related information systems is a more effective intervention means. By providing a platform for employees to transform virtual data into actual cognition, it can help employees sort out different information and remove cognitive impairment from sorting and application, in the process of training and on-the-job learning, employees often have various types of cognitive impairment caused by inadequate understanding of enterprise information system. At the same time, the digital information system can also summarize the cognitive impairment of employees in business through the mistakes of employees in operation, and then conduct centralized training for the parts with more cognitive impairment. In the training and business learning process intervention for employees with structural cognitive impairment, the development of a digital economy platform can establish a communication channel between enterprises and employees with structural cognitive impairment, and provide a means for modern cognitive impairment intervention within enterprises.

Objective: Based on the application of the digital economy system in the knowledge and innovative development of enterprises, this study explores the impact of the digital economy on the psychological cognitive impairment in the training of business knowledge and skills of enterprise employees through the effective application of the system.

Subjects and methods: This study mainly focuses on the longitudinal analysis and comparison of data, and analyzes the correlation between them by comparing the degree of cognitive impairment of employees

before and after using the digital economic system.

Study design: This study selects an enterprise adopting a digital economy system and resource allocation system as the data source. The operation records and training data of employees are collected and summarized by the digital economic system. After exporting the data, they are divided into different dimensions for impact analysis.

Methods: In this study, the chain substitution method is used to calculate the influence degree of factors in the change process of economic indicators. In this method, when multiple factors interact and act on the same indicator, one of them is regarded as a variable factor in a certain order, and other factors are regarded as fixed factors, and then the variable factors and fixed factors are replaced one by one, based on this, the replacement calculation is carried out respectively to determine whether the change of different factors has an impact on the change of the index and the degree of impact.

Results: According to the serial substitution method, the impact of employee cognitive impairment on enterprise benefits at different cognitive learning levels is finally obtained by continuously replacing factor variables, as shown in Figure 1.

Figure 1. Compliance analysis

In the cognitive learning level of employees in Figure 1, the impact of learning level, behavior level and result level on enterprise benefits is level 4, reaching a significant impact. Only the reaction layer has a level 3 impact on enterprise benefits, reaching an obvious impact.

Conclusions: Under the emphasis of the market on innovative development and knowledge-based development, enterprises need to develop not only business ability, but also talent management ability in the process of management. However, in the actual employee training, it is often difficult for employees to really understand the training or business content, resulting in cognitive impairment. The application of the digital economy system in enterprise talent management can effectively solve this problem. Through the system business operation and training transformation, it can help employees form a correct understanding of business details and improve their business level.

THE CULTIVATION PATH OF STUDENT ACTIVITIES TO COLLEGE STUDENTS' SOCIALIST CORE VALUES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xun Mo

School of Culture and Media, Hezhou University, Hezhou 542899, China

Background: Educational psychology is a science that focuses on individuals in educational situations. Educational psychology is the combination of general psychology and pedagogy system. In the research process of educational psychology, there are three different research directions from different angles. One is to take pedagogy system as the main research basis and apply psychology as a tool in classroom education

practice research and education system practice research to cultivate students with sound physical and mental development, improve students' comprehensive quality. The second is to take the psychological system as the main research basis, and think that educational psychology must take human psychological phenomena as the main research object, determine its theoretical system through the law of psychological activities in educational activities, and explore the psychological law in the process of family education, school education, social education and even lifelong education. Third, it is not necessary to deliberately distinguish between pedagogy and psychology, but should organically combine the two, explore psychology in the process of education, and use psychological laws to assist teaching. The third perspective of teaching psychology is used in this research. As a very important part of college students' study and life, student activities occupy a lot of daily time of college students. Compared with classroom teaching, many college students are more willing to participate in student activities and are more vulnerable to the psychological impact of student activities. From the perspective of educational psychology, this study integrates the socialist core values into students' activities, and carries out activities with both guiding and interesting values in students' activities. Through similar student activities, strive to make students experience the sense of belonging in the socialist core values in their personal participation, organically combine values with life methodology, comprehensively improve their comprehensive quality, and lay a positive foundation for not being misled by wrong values when contacting external society in the future.

Objective: Through the organic combination of educational psychology and socialist core values, this study carries out student activities that combine teaching with fun. In this way, it strives to provide students with a reliable value guidance system in daily student activities, help students distinguish external ideas and improve their comprehensive quality.

Subjects and methods: This study uses both theoretical analysis and factor analysis. Based on the theory of educational psychology, this study analyzes the factors of the relationship between student activities, student psychological state and socialist core values, finds the interrelated links, and further analyzes the ways in which the factors affect each other.

Study design: This study selects indicators from the three dimensions of student activities, students' psychological state and socialist core values for analysis. On this basis, it selects the element combination analysis method to analyze which elements have the most significant impact on students in the process of accepting socialist core values.

Methods: In this study, the records of student activities are provided by relevant schools, and the freshmen with the highest frequency of participating in student activities are selected as the research object. On this basis, through a large number of observation and factor combination analysis, this paper studies the positive impact of student activities on students' acceptance of socialist core values, and uses IBM SPSS Statistics 20 for statistics.

Results: In the process of students' acceptance of external ideas, the impact of different behavior elements on students' acceptance of ideas is shown in Figure 1.

Figure 1. Element combination analysis

Among the behavioral elements in Figure 1, the average scores of “doing”, “seeing”, “speaking” and “thinking” are higher, reaching more than 3.0 points. It can be seen that in the process of students' concept acceptance, the activities carried out through personal practice and thinking are easier to help them understand and accept the concept. The average score of “listening” is low, below 3.0. It can be seen that traditional classroom teaching is not enough to make students accept socialist core values, and student

activities have more advantages.

Conclusions: Compared with classroom education with a strong sense of dogma, student activities can provide students with more flexible and effective guidance on values and methodology. Based on the theory of educational psychology, integrate the socialist core values into students' activities, increase the interest and extensibility of students' activities, and promote students to feel the positive sense of belonging in the value orientation in relevant students' activities, so as to provide methodological guidance for college students' daily behavior and improve their comprehensive quality.

* * * * *

LOGICAL THINKING OF VOCATIONAL EDUCATION PROMOTING SOCIAL EQUITY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Wen Wang^{1*} & Mengxia Hu²

¹*School of Vocational and Continuing Education, Yunnan University, Kunming 650091, China*

²*Physical Education and Sports School, Soochow University, Suzhou 215021, China*

Background: According to Adams's equity theory in social psychology, the source of social equity is often not the absolute value of resource return obtained by individuals, but the relative value of resource return generated in comparison with other individuals in the same level of society. When individuals in society perceive that their individual resource return value is far less than the input value, they will feel unfair, that is to say, social equity comes from social groups receiving almost the same resources and resource returns. Although the theory of common balance from the perspective of psychology shows its subjective limitations to a certain extent, it is worth affirming that the theory of social psychology recognizes social equity as a psychological perception, which is actually based on social comparison and social comparison reference body. Human psychological perception is the reflection of the external objective world, and this reflection is not carried out independently. The difference between social comparison behavior and comparison reference can often lead to individual different attitudes towards social equity. In addition, from the perspective of social psychology, vocational education is also attractive to social individuals. On the one hand, this attraction comes from the recognition of their own value and social value. For individuals who lack the opportunity to participate in higher education, on the one hand, they are eager to realize their social value and can get a more reasonable return on resources compared with their own reference materials. On the other hand, they are worried that due to the lack of educational opportunities, they can obtain fewer social resources than other individuals in the same level of social groups, The contradiction between these two aspects is the contradiction between social individuals' fairness and efficiency from the perspective of psychology.

Objective: By analyzing the promoting relationship between vocational education and social equity, this study finds out the focus in the process of interaction, and then lays a theoretical foundation for solving the psychological problems of vocational education groups, promoting the psychological equity of vocational education groups, and improving the mental health level of vocational education groups.

Subjects and methods: Through the analysis of the current situation of vocational education, this study combines the social psychological fairness of social individuals with the allocation of vocational education resources and industry conditions from the perspective of social psychology, and analyzes the promotion relationship between vocational education and the social psychological fairness of vocational education groups through the correlation and function between them.

Study design: In this research process, the industry survey method and data analysis method are combined to study the correlation and influencing factors between the two by investigating the data status of the vocational education industry in recent years and analyzing it with the social fairness of social individuals.

Methods: The vocational education industry data in this study are mainly provided anonymously by insiders in relevant industries. In the research process, the data correlation characteristics are analyzed by data feature analysis method.

Results: The satisfaction of the current domestic vocational education group with the current situation of the domestic vocational education industry is shown in Figure 1.

As can be seen from Figure 1, at present, the largest proportion of personnel is the two sub categories of very dissatisfaction and relatively dissatisfaction in the general category of dissatisfaction, accounting for 31.35% and 32.48% of the total resources respectively. The second is the group with general feelings about the situation of domestic vocational education industry, accounting for 19.03% of the total resources, while

the very satisfied group only accounts for 6.66% and the more satisfied group 10.48%, and the sum of the two is less than 20% of the overall number. It can be seen that the current domestic vocational education groups are dissatisfied with the situation of the industry, the psychological state is difficult to balance, and the problem of poor mental health has been very common.

Figure 1. Distribution map of educational resources

Conclusions: Social equity embodied in vocational education is a reasonable demand of modern society. At the level of social psychology, this sense of social justice depends not only on the absolute distribution of resources, but also on the comparison between different social individuals. The development mode of the future society is the development mode dominated by the knowledge-based society. This environment brings about the rapid changes of society and the rapid popularization of technology. In this environment, it is very necessary to realize the fairness of vocational education. This is not only the goal of economy and politics, but also the goal of giving consideration to the psychological state of social groups and the state of social individuals. By deepening the popularization of vocational education, improving the coverage of vocational education in different social strata, making socially vulnerable groups have social skills security, and making people participating in vocational education experience a more equitable distribution of social resources, which is the best way for Chinese society to develop towards freedom and equity.

* * * * *

INNOVATIVE APPLICATION OF USER EXPERIENCE AND INTERACTION DESIGN FROM THE PERSPECTIVE OF PSYCHOLOGY

Peiping Wu

Department of Industrial Design, China Academy of Art, Hangzhou 310000, China

Background: Psychology divides the world into two closely related wholes, one is the objective world that the outside world does not change with the individual will, the other is the individual subjective world formed by mapping the external objective world, and human senses are the channels that connect the objective world with the subjective world and make it interact with each other. The process of interaction design is the distinction between the subjective world and the objective world in psychology. The system interaction module is the object in the objective world, and the psychological activity generated by users when using the interaction module is the cognition in the subjective world. In the process of design, we should not only focus on the objective object, but also focus on the psychological cognitive activities behind the object. From the perspective of cognitive psychology, when people perceive things, they have the characteristics of pursuing the internal and external harmony of things, that is, when human beings face a cognitive object with complex internal structure, they tend to perceive the overall structure of the object

first at the psychological level, and only focus on the various structures and elements within the structure. After reaching the understanding of internal structure and elements, human beings still tend to reorganize all parts in the psychological cognitive environment and preserve memory in a holistic way. This psychological cognitive process is the process of how human beings acquire, store and process external information. In interactive design, the interactive process of transmitting information to users and receiving user information feedback is extremely dependent on users' psychological experience. The product design idea of "user-centered" is actually expected to provide users with an overall impression that is easy to understand and use in the process of user use. Using the characteristics of human cognitive psychology, users' experience can be improved through the design of internal details and the overall architecture of the system.

Objective: This study uses the characteristics of human cognitive psychology in psychology to analyze the focus of users' psychological experience in the process of using the interactive system, and provides a theoretical basis for interactive design.

Subjects and methods: This study takes interactive design users as the main research object, and explores the elements that should be paid attention to in the design of the interactive system by studying the psychological experience and cognitive status of users in the interactive system, so as to provide a grasp for the design of modern information interactive system.

Study design: This study uses case analysis and quantitative and qualitative analysis to analyze the interaction between interactive system and user experience. On this basis, it uses induction and summary method to put forward practical and feasible innovative design countermeasures and put forward suggestions for the development direction of information-based interactive design.

Methods: This study exports user-related data from the background of the user interactive operating system as the data basis of case analysis.

Results: The importance of the psychological experience of operating users in the process of using the interactive system is distinguished as shown in Figure 1.

Figure 1. Importance of user psychological experience

Among the three different types of psychological experience in Figure 1, functional effectiveness, operation efficiency and experience comfort, the importance of functional effectiveness and operation efficiency reaches level 4, which is very important. Compared with the first two items, the importance of experience comfort is slightly weaker, only reaching level 3, which is more important.

Conclusions: Since the development of information interaction system, the problems that can be solved after increasing the direct cost, such as the improvement of speed and efficiency, which need to be solved in the initial stage, are no longer the main problems that need to be solved urgently between users and the system. The new interactive design needs to combine design with cognitive psychology to design and optimize the system from the user's psychological experience and cognitive effect. These small designs can be expressed through multiple classification modules such as business information, interactive experience, emotional content and visual design. Then, through system integration, a user-centered interactive system with a high possibility of realization is formed to improve the user experience on the basis of ensuring the

use effect of the system.

PRACTICE AND EXPLORATION OF COLLEGE COUNSELORS IN IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yuehui Zhang

Department of Students Affairs, Shanghai Dianji University, Shanghai 201306, China

Background: Educational psychology is the product of the combination of psychological system and pedagogical system. It takes the psychological law in the teaching process as the research object. Although the words “teaching” and “learning” have two different objects of teachers and students in the pedagogical system, educational psychology believes that teachers and students are not separated from each other. They are interrelated and interact with each other. Only when teachers and students are a dynamic whole can the psychological law exist. As a special kind of college teachers, college counselors are not responsible for students’ curriculum learning, but for students’ daily life, students’ activities and ideological guidance. In other words, counselors are teachers closest to college students’ actual study and life. Therefore, this identity is also the easiest to show the effect of ideological and political education, at the same time, the use of educational psychology can also properly guide the counselors’ contact and mutual psychological role with students in their daily study and life. Counselors play an important role in Ideological and political education, and there is also an important connection between educational psychology and ideological and political education. First of all, they have common educational objects, and they have public awareness in the guidance of students’ psychological activities and values. Secondly, the main contents of Ideological and political education and educational psychology are composed of psychological elements such as belief and will. Both of them can help students to adjust their behavior and maintain their good values. Finally, educational psychology and ideological and political education share the same goal of talent training. Both of them aim to cultivate builders and successors of socialism with Chinese characteristics with ideals, culture and morality. Therefore, in the special post of counselor, the combination of educational psychology and ideological and political education has a certain unity, which is a necessary way for ideological and political education in colleges and universities to keep pace with the times and innovate the path.

Objective: Through the combination of educational psychology and ideological and political education in the post of counselor, this study provides a unified and innovative experimental path for ideological and political education in contemporary colleges and universities, helps college students improve their psychological and behavioral control ability, and provides an effective means for cultivating high-quality socialist heirs.

Subjects and methods: This study establishes a comprehensive index system for the subjective and objective factors of counselors’ Ideological and political education using educational psychology, and analyzes the elements on the basis of the index system to explore the relationship between counselors’ psychological education behavior and the effect of ideological and political education.

Study design: The data of this study are provided by the university. In the research process, a large number of observation methods are used to observe the ideological and political work of counselors in various colleges and departments in the university, and an index system is established. In addition, the statistical inference method will be used to infer the population through typical samples.

Methods: The establishment of indicators in the research process depends on the subjective standards of counselors to a certain extent, and the personal working methods of counselors are different. Therefore, the *t*-value test and other methods are used to test the statistical values.

Results: The score statistics of relevant elements of counselors are shown in Table 1.

Table 1. Subjective score and *t*-test

Value type	Practical application	Objective ability	Subjective desire
Standard deviation	1.01	0.82	0.66
Mean value	3.03	2.10	1.73
<i>t</i>	-13.62	-31.83	-22.81

It can be seen from Table 1 that in terms of subjective desire, the counselor group tends to carry out ideological and political education guided by educational psychology, but once it is implemented in

practical application, the attitude of the counselor group will be loosened.

Conclusions: In view of the particularity of the position of counselor, using educational psychology to carry out ideological and political education in this position has become a more effective value teaching method. Counselors should make active use of the psychological activities generated by the interaction between teachers and students in educational psychology, clarify their own role orientation, improve their own knowledge literacy, and establish the working concept of “student-oriented” in students’ daily learning and activities. In addition, we should also adhere to the important concept of the combination of education and self-education, organize students to give full play to their subjective initiative, adhere to the combination of educational guidance and administrative management, and the combination of explicit education and implicit education, so as to promote students to form a perfect personal personality from multiple angles and improve their ability of concept judgment and behavior control.

* * * * *

MULTIPLE COLLABORATIVE EDUCATION MODEL OF INDUSTRIAL COLLEGES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Dong Wang

College of Art and Design, Henan Institute of Technology, Xinxiang 453000, China

Background: Mental health is a kind of good and continuous psychological state and process, which is manifested in the individual’s vitality, positive inner experience and good social adaptability, which can effectively give full play to the individual’s physical and mental potential and the positive social function as a member of the society. Mental health includes at least two meanings: first, no mental illness. There are two kinds of positive psychological development. Colleges and universities need to improve the psychological quality of all students, fully develop their potential, cultivate students’ optimistic and upward psychological quality, and promote the sound development of students’ personalities. Research shows that the standard of mental health includes correct self-awareness, interpersonal coordination, gender role differentiation, good social adaptation, positive and stable emotion, complete personality structure, educational psychology belongs to pedagogy. It mainly studies various psychological phenomena and their changes in the process of educators learning and mastering knowledge and skills under the influence of education and teaching. Educational psychology can be applied to designing courses, improving teaching methods, promoting motivation, and helping students face the difficulties and challenges they face in the process of growth, with special attention to students with special educational needs. Secondly, positive psychology in educational psychology can enable students to overcome difficulties with an optimistic and positive attitude when facing difficulties and challenges in life. In addition, there are many viewpoints in educational psychology that can be applied to college education and can bring good effects.

At present, the current modern industrial college realizes the talent training goal of higher vocational education through industry education integration mechanisms such as school-enterprise cooperation and cooperative education, combined with government services and industry guidance. However, it does not fully consider the importance of educational psychology. Only by combining educational psychology, can industrial colleges better explore the operation mechanism of industry education integration, cultivate more professional and technical talents and serve the local economy. Applying educational psychology to solve the employment difficulties caused by unreasonable talent training types, enhance students’ confidence in overcoming difficulties and challenges, and further give full play to the role of educational psychology theory in the integration of industry and education, so as to better input talents and technology for enterprises and industry participants in the integration of industry and education. Modern industrial college is to cultivate talents needed by the enterprise market. Modern industrial college based on educational psychology is to face social organizations and cultivate talents with good professional ethics, cultural literacy and psychological quality.

Objective: Therefore, the purpose of this study is to explore the construction of a multiple collaborative education model of industrial college from the perspective of educational psychology, and then analyze the mental health problems of industrial college students.

Research objects and methods: Select 300 college students from the industrial college of a higher vocational college as the research object, build a diversified collaborative education model from the perspective of educational psychology, and teach the students for 6 months. Evaluate the effect of the school before and after teaching and the mental health problems of college students.

Research design: Students’ mental health problems were judged by Eysenck Personality Questionnaire

(EPQ). The questionnaire included 88 questions, including four subscales: extroversion (E), neuroticism (N), psychoticism (P) and concealment (L). The high score of P scale indicates that the subjects have pathological personality. A high score of E scale indicates extroversion, and a low score indicates introversion. A high score of N scale indicates emotional instability, and a low score indicates emotional stability. A high score on the L scale indicates that the subject has a high ability of concealment.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After teaching, the scores of EPQ subscales of college students were compared with those before teaching, and the differences were statistically significant ($P < 0.01$). Among them, the scores of E subscale after teaching were significantly higher than those before teaching ($P < 0.01$), and the scores of P subscale, N subscale and L subscale were significantly lower than those before teaching ($P < 0.01$).

Table 1. Comparison of EPQ scores before and after teaching

Project	Before teaching	After teaching	<i>t</i>	<i>P</i>
P	5.77	4.62	-7.607	<0.01
E	10.86	13.51	8.429	<0.01
N	11.42	9.33	-5.448	<0.01
L	12.36	10.25	-6.746	<0.01

Conclusions: The diversified and collaborative education mode of colleges and universities is the requirement of the development of market economy. All walks of life must take the road of win-win cooperation. The college of modern industry should consider its own development from the following aspects: first, the school foundation, combined with enterprise experience, integrates enterprise successful experience into the school's curriculum and professional construction, jointly shoulder the important task of talent training, jointly promote professional construction, and promote the rapid implementation of school-enterprise cooperation. Second, with the bold attempt of the school, enterprises should act as a strong backing to build public service centers and serve the transformation and upgrading of local industries. Third, talent training combined with product value-added, increase industrial added value, and make the smooth transformation and upgrading of local industries, which is also the responsibility and mission of higher vocational colleges.

THE POSITIVE ROLE OF IDEOLOGICAL AND POLITICAL EDUCATION IN THE PSYCHOLOGICAL COUNSELING OF COLLEGE STUDENTS' MENTAL ANXIETY

Haijiao Zhao

School of Education Science, Yulin Normal University, Yulin 537000, China

Background: The behavioral concept of psychological counseling originated from psychology, and then formed a more modern skill system through the integration with sociology, pedagogy and other disciplines. The integration of ideological and political education and college students' anxiety psychological counseling mainly refers to the counseling method of using the guidance of the values in ideological and political education, combined with psychological theories and skills, and promoting the transformation of college students' anxiety psychology in a good direction through the communication of discourse, words, practical activities and so on. For a long time, the ideological and political education in colleges and universities is closely related to the psychological state of college students. In essence, ideological and political education is an educational method with the main goal of promoting students to form correct ideological and political ideas. Compared with the basic mental health education, ideological and political education improves the values and methodology that students can follow, makes college students have the ability to distinguish different external ideas and information, and enables college students to think and experience independently in the process of growth without the interference of malignant ideas. Using the psychological counseling of ideological and political education to help college students resolve the psychological crux and get rid of anxiety from a higher perspective of improving college students' cognitive level, emotional control level and behavior control level. This way can help college students change their perspective on the world and form a sounder psychological personality. The starting point of college students' anxiety symptoms is mostly due to their psychological pressure caused by the interference of external information and their inability to correctly treat and deal with external information. This kind of psychological pressure

will not only seriously affect college students' personal study and life, but also affect students' behavior, resulting in many behavior disorder symptoms. In severe cases, it may also affect others' normal study and life. Combined with the psychological counseling method of ideological and political education, we can take the psychological phenomenon of college students as the starting point, follow the psychological laws and psychological characteristics of college students, and improve college students' psychological cognition and emotional tendency through explanation, explanation, empathy and experiment, so as to promote them to get rid of the psychological state of anxiety and the abnormal behavior caused by anxiety. Therefore, it is necessary and effective to actively apply the theory of ideological and political education in the psychological counseling of college students' anxiety, which is in line with the inevitable trend of the integration of ideological education and psychological education in colleges and universities in the future.

Objective: This study applies ideological and political education to the psychological counseling of college students' mental anxiety, and helps contemporary college students get rid of mental anxiety and form a sounder psychological personality by integrating ideological guidance education with psychological counseling education.

Subjects and methods: This study uses experimental methods and correlation analysis to explore the positive effect of the application of ideological and political education theory on students' anxiety counseling.

Study design: In this study, a temporary anxiety counseling institution based on ideological and political education was established in a university through experiments. The institution extracted students' psychological data from the freshman's admission psychological status database as the experimental basis, and selected students with anxiety to conduct counseling experiments with different methods, in the process of counseling, the psychological status of students is evaluated by week.

Methods: In this study, anxiety self-assessment indicators are used as the evaluation system when scoring students' cases.

Results: The correlation analysis between ideological and political education and students' mental health is shown in Figure 1.

Figure 1. Correlation analysis

As can be seen from Figure 1, with the continuous growth of ideological and political education time, the psychological scores of college students with mental anxiety symptoms are also rising. It can be seen that ideological and political education can indeed play a positive role in the psychological counseling process of anxious college students.

Conclusions: With the development of information society, contemporary college students are more and more vulnerable to all kinds of wrong value-oriented information. The combination of college mental health education and ideological and political education has become an inevitable trend. Through the combination of the two, it can help students establish positive socialist core values, help students get rid of the psychological pressure brought by wrong information, promote students to form the habit of dialectically looking at things, and then fundamentally eliminate the source of anxiety psychology. The combination of ideological and political education and psychological counseling provides a more effective path for the effective implementation of efficient mental health work.

THE ROLE OF IDEOLOGICAL AND POLITICAL EDUCATION IN ALLEVIATING THE COMMUNICATION AND ADAPTATION BARRIERS OF COLLEGE STUDENTS

Xiaoyan Yu

School of Transportation and Civil Engineering, Nantong University, Nantong 226019, China

Background: Although there are some cases caused by objective conditions, most cases are caused by psychological factors of students or teachers. Therefore, when intervening in college students' psychological obstacles, we also need to start from the psychological level. College students' communication barriers are mainly divided into four types: self-caused communication barriers, objective communication barriers, environmental communication barriers and media communication barriers. A self-induced communication disorder is caused by psychological tendency. The source of self-induced communication disorder is often individual factors different from others. Under the guidance of this difference, it is difficult for individuals to establish an effective understanding and communication chain with other communicators. Objective communication barriers are communication barriers caused by the objects in the communication process, that is, there is a deviation in the cognition of the main objects of communication between the two sides, or the cognition of the main objects of communication by one side is far different from the normal social cognition, which makes it difficult for the two sides to understand each other due to the differences in cognition in the communication process, resulting in communication barriers. Environmental communication disorder mainly refers to the failure of communicators to communicate normally due to psychological pressure, behavioral inertia and other factors in some environments with obvious characteristics. For this kind of communication barrier, their communication ability can be properly restored when they leave a certain environment and reach a comfortable area. Communication obstacles are caused by the way one party uses the other party's communication. Among the above types of communication barriers, the communication barriers produced by college students are mainly self-caused communication barriers and environmental communication barriers, and the other two types appear less frequently. Self-induced and environmental communication barriers are mainly caused by students' psychological factors. College ideological and political education can help students get rid of the sense of pressure in a specific communication environment, establish positive ideas, eliminate negative psychological factors, and then help students build subjective and objective communication language and overcome communication barriers. At the same time, the application of ideological and political education in the intervention of communication and adaptation barriers of college students improves the comprehensiveness and compatibility of the education system.

Objective: This study applies ideological and political education to the guidance and healing process of communication adaptation barriers in colleges and universities, so as to help students establish a correct subject-object relationship and communication paradigm in the communication process, so as to alleviate the communication barriers of college students.

Subjects and methods: In the process of analyzing the effect of Ideological and political education on college students' communication barriers, this study uses BP neural network to classify the influencing factors between them, and judges its mitigation effect on college students' communication barriers by measuring the importance of factors in the implementation of Ideological and political treatment methods.

Study design: Through the characteristics of college students' communication barriers, this study excavates and classifies the factors that can have an important impact on communication barriers in the process of ideological and political education, and uses the characteristics of BP neural network connection weight to analyze the importance of different factors to study which factors in the treatment methods of ideological and political education have a great impact on communication barriers.

Methods: This study was conducted by factor importance test. The higher the importance, the greater the universality of the treatment of communication disorders.

Results: The importance and influence of different factors in ideological and political education on communication treatment barriers are shown in Figure 1.

The higher the importance of each ideological and political education factor in Figure 1, the greater its positive effect on the treatment of college students' communication barriers, and the more common its positive significance. The results show that the biggest impact on the enthusiasm of college students' communication barriers is the communication content factor, with a value of 0.84, followed by the communication environment factor, with a value of 0.82. The smallest impact on college students' communication barriers is individual comprehensive quality education, which is only 0.43.

Conclusions: Ideological and political education can alleviate the symptoms of communication obstacles of college students to a certain extent. It plays a positive role in college students' communication obstacles from five aspects: improving the individual comprehensive quality of communication subjects, optimizing communication content, improving communication media, improving communication environment and

coupling optimization of communication elements. In the process of ideological and political education, strengthening these factors can improve the effectiveness of dialogue, improve the understanding validity of college students for communication content, and promote the fit of communication consensus, so as to achieve the effect of intervention on the symptoms of communication obstacles of college students.

Figure 1. Correlation analysis

* * * * *

INNOVATIVE RESEARCH ON THE INTEGRATION OF TRADITIONAL HAN CLOTHING ACCESSORIES INTO WOMEN'S CLOTHING BRAND DESIGN FROM THE PERSPECTIVE OF CONSUMER PSYCHOLOGY

Zhenhua Hu

Fashion Design Institute, Zhejiang Fashion Institute of Technology, Ningbo 315211, China

Background: Consumer psychology is the psychological activity produced when consumers choose and judge consumer goods according to their own psychological needs and selection preferences. Consumer behavior is produced under the action of consumer psychology. Therefore, the diversity of consumption behavior largely depends on the complexity of consumption psychology. Consumer psychology can be simply summed up as a directional behavioral motivation psychology, that is, consumer motivation is derived from consumer demand, and then a series of psychological changes of consumer behavior are derived from consumer motivation. The psychological needs of consumers are often generated from the necessary conditions for individual or group production and development under certain conditions. It reflects a certain lack of consumers' physiological or psychological experience. This lack is directly related to consumers' desire and appeal for consumption objects. Under the influence of consumption psychology, consumers' Consumption Motivation exists as an internal driving force connecting demand and action. It is not only the result of demand, but also the cause of action. Individual consumption motivation often has the characteristics of subjectivity, recessiveness and practicality. It has four functions: starting, pointing, strengthening and stopping. The initial effect is reflected in the driving force of consumption motivation on consumption behavior; Pointing behavior is reflected in the purchase direction of consumers; Strengthening behavior is manifested in the ability of consumption behavior to hasten and strengthen the next behavior; The suspension behavior is manifested in the suspension of consumption behavior when the consumption demand is met. Consumers have different needs and motives at different stages, and their behavior will also change greatly. It is extremely important to master consumers' consumption psychology in women's clothing

design. With the rise of traditional national fashion elements, adding traditional Han clothing accessories to women's clothing brand design is more likely to awaken women's deep sense of national identity and pride, so as to manifest this part of psychological needs and add power to women's clothing design and sales.

Objective: By analyzing the psychological characteristics of women's clothing consumers, this study integrates the traditional Han clothing accessories and characteristics into women's clothing brand design, so as to awaken the national identity needs of women's consumers and urge women's clothing design innovation.

Subjects and methods: This study uses the method of assigning perceptual elements to quantitative evaluation, uses the k-means method to analyze the data of traditional Chinese clothing accessories and elements, studies the contribution of traditional Chinese clothing accessories and elements to national style in women's clothing brand design, and further associates them with women's consumer psychology.

Study design: This study will number the elements of Han clothing decoration, traditional materials and colors such as embroidery, buttons, step shaking and earrings, and finally gather them into data groups with different characteristics. Cluster analysis is carried out by K-means method to study the influence of different characteristics of traditional Han clothing accessories on the degree of national style in women's clothing design. Then, the correlation analysis is carried out by investigating women's preference for traditional elements.

Methods: The data were analyzed by SPSS.

Results: According to the five main factors of pattern, color, style, detail and fabric in the process of dress design, this study carries out grouping and style analysis. The results of different clustering centers of K-means algorithm are shown in Table 1. Table 1 shows the design combinations of six groups of ethnic styles, among which the groups with "*" are more popular with women. It can be seen that moderate ethnic styles are more popular with women.

Table 1. Cluster center results

Essential factor	Group 1	Group 2	Group 3*	Group 4*	Group 5	Group 6
Pattern	3.61	4.01	3.44	0.36	0.65	0.25
Color	3.32	3.72	2.62	2.84	2.93	0.71
Style	3.62	3.41	3.16	3.91	3.02	3.52
Details	3.53	0.75	3.82	3.52	3.62	3.56
Fabric	3.51	4.12	0.95	3.33	0.63	1.91
Total score	17.59	16.01	13.99	13.96	10.85	9.95
Strength of national style	Strong	Strong	Secondary	Secondary	Weak	Weak

Conclusions: Consumers' consumption behavior is greatly influenced by their consumption psychology. By adding traditional Han costume accessories and elements to women's clothing design, we can arouse contemporary women's deep sense of national identity, and then promote the consumption demand at the psychological level. Traditional Han clothing accessories and elements can affect the overall national style of clothing from five aspects: pattern, color, style, detail and fabric, and then affect the preferences of female consumers. By controlling different elements in the design process, we can achieve the effect of improving the national style of clothing and the love of female consumers, and provide a new path for the innovative design of female clothing.

* * * * *

THE DEVELOPMENT TREND OF NEW MEDIA IN 5G ERA BASED ON SOCIAL PSYCHOLOGY

Zhi Zhang

College of Arts and Humanities, Heyuan Polytechnic, Heyuan 517000, China

Background: 5G (5th generation) is the abbreviation of "the fifth-generation mobile communication technology". It is a new generation of broadband mobile communication technology with the characteristics of high rate and low time delay. This technology can interconnect people, machines and things, and provides great convenience for people's daily life and work. Since the release of the first 5G standard in 2018 and the subsequent networking construction, and then the combination of 5G technology with the

Internet of vehicles and the Internet, 5G technology has been integrated into all aspects of our life and greatly improved the quality of life and scientific and technological well-being. The 5G era not only represents the progress and innovation of information technology, but also accelerates people's cognitive level of innovative ways of information dissemination. Technology is an important driving force to promote information dissemination and media integration. Media integration is a new trend of media development in the digital era, and gradually presents the characteristics of media form, media pattern, communication channel, communication content, communication scope and user experience. VR technology, micro-video and artificial intelligence synthetic anchor are the products of the combination of 5G technology and new media. The innovation of forms and contents such as county-level financial media and cross-border cooperation has also greatly improved the user audience's sense of experience and satisfaction. 5G technology integrates the emerging products and forms under the development of new media, accelerates the deconstruction and reconstruction of the traditional media pattern, and connects the relationship among media, products, users and industries. However, there are still some restrictions on the popularization of its application scope, the guarantee of content emotion and the connection with the audience. The reason is that 5G new media technology takes less consideration of people's acceptance of technical products in the development process, and technology takes less comprehensive consideration of people's "individuality" and "sociality". While technology changes our way of life, we should also pay attention to the "temperature" between technology and humanities. The use of social psychology can effectively feedback people's feelings and needs to the society, so as to enable technical managers to create products and artistic presentation effects with more life, service and emotion. As a marginal science between psychology and sociology, social psychology is not only a branch of psychology, but also a branch of sociology. Its research content is a series of effects brought by the changes of individual psychological activities and their changes under specific social living conditions. The research scope of social psychology involves the individual level, group level and social level. In the process of socialization, the interaction and communication between individuals, groups and groups, individuals and groups have certain objective laws, which can better allocate resources on the basis of measuring the changes of people's psychological characteristics in society. With the help of social psychology, we can better deal with the relationship between individuals and group society, and speed up the growth and improvement of new things such as technology, so that it can provide more humanized services on the premise of conforming to the objective law. Scientific restraint of human behavior and continuous improvement of social security mechanism can effectively promote the social cycle, realize benign development, and ensure the normal promotion of social management and the vigorous development of technical media.

Objective: To further promote the depth and breadth of the combination of 5G technology and new media, promote the innovation of new media communication media and means, and make it better serve the audience. With the help of social psychology, the research effectively connects individual people with social groups, so as to explore the development trend of new media in the 5G era and make it more diversified, efficient and scientific. The innovation of technological media can effectively realize the accuracy of media products and the "boundlessness" of information dissemination, establish the conscience cycle and effective feedback among society, groups and individuals, and enrich the theoretical knowledge of social psychology.

Research objects and methods: 500 consumers, 5G technicians and media workers in a city were randomly surveyed by stratified cluster sampling, their opinions and feelings on the current development of new media were collected, and the influence of the Likert scale on the experimental data was graded, that is, from level 1-5, it indicates the degree of influence from light to heavy.

Method design: According to the differences of experience media technology products, consumers were randomly divided into experimental group and control group for comparative experimental analysis, that is, the subjects in the experimental group were invited to experience 5G new media product technology, while the control group experienced conventional media technology. The consumption feedback of the two groups before and after the experiment was collected. And feedback the two groups' demand for new media technology to technicians in order to explore the new development trend of new media in the 5G era.

Methods: SPSS statistical analysis tool and excel tool were used to analyze the experimental data as a whole.

Results: The technical products under the development of 5G technology and new media can effectively improve consumers' satisfaction with technical products, and the score data before and after the experiment are quite different, while the experience of consumers brought by conventional new media technology is poor. It is found in the data that the development needs of new media technology in the 5G era are gradually showing diversified and personalized characteristics. Table 1 shows the comparison results of the satisfaction scores of the two groups of subjects on the new media technology before and after the experiment.

Table 1. The two groups of subjects' satisfaction scores of new media technologies before and after the experiment were compared

Impact indicators		Satisfaction of basic functions of the product	Product innovation	User friendly design
Experience group	Before	4.19	3.21	3.25
	After	4.27	4.85	4.79
Control group	Before	3.92	3.46	3.18
	After	3.54	3.68	3.21

Conclusions: The application of 5G technology breaks the gap between virtual reality and the real world. Its integration with media technology enables information to construct a “virtual reality scene” in the process of communication, expands the scope of people’s contact and perception of the world, and gradually becomes a “witness” and “field observer” of news events in a three-dimensional and multi sensory reception situation. With the help of social psychology, it can promote the innovation of 5G media’s new technical means and the improvement of service quality, effectively build a communication bridge between individuals and social groups, and make the new media more humanized and accurate.

Acknowledgement: The research is supported by: Research on the development trend of new media in the 5G era, Philosophy and social science planning project of Heyuan City (Item number: HYSK21P35).

APPLICATION OF INTELLIGENT TECHNOLOGY IN ELECTRICAL AUTOMATION CONTROL UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Guojuan Zhou, Fuhua Yu, Hua Guan, Shangming Fan & Rensheng Wei

School of Artificial Intelligence, Beijing Institute of Economics and Management, Beijing 100102, China

Background: As a functional impairment disorder, cognitive impairment often leads to the reduction of the computational efficiency of human brain in calculation, orientation, structure and execution ability, and different degrees of cognitive impairment will have different effects on people’s overall function and survival function, resulting in abnormal information processing processes related to learning, memory and thinking judgment, and behavioral disorders. When patients with cognitive impairment perceive information, such as learning and memory, there is a deviation in understanding and perception of the form and content of information, which makes the functional imbalance of neural information in the process of activity, resulting in the conflict between the information person’s sense of information and the original cognition. The confusion of information increases the difficulty of information extraction. Mild cognitive impairment mainly refers to mild memory or other cognitive impairment beyond the allowable range of their age, with the normal ability of daily living. In the field of epidemiological research, it is found that the proportion of mild cognitive impairment is increasing year by year. Effective early intervention for cognitive impairment can improve the cognitive level of patients and improve their attention and understanding. The performance of the electrical automation control system will affect the group’s extraction of system software operation information, the use performance and evaluation of related products, and then produce different psychological feedback. And intelligent technology not only improves the efficiency of electrical automation control and enterprise efficiency, but also increases the difficulty for technicians to skillfully operate the control system and improves the employment threshold. Intelligent technology puts forward more requirements and standards for the performance of electrical automation control system, but the lack of technical proficiency and relevant working experience make the software designers of automation control system less consider the service needs and cognitive level of cognitive impairment groups in software performance optimization. Thus, this group has certain difficulties and potential safety hazards in the use of technology-related products. Considering the development of electrical technology and automation technology, we can further improve the cognitive ability of electrical professionals, and further improve their ability to adapt to the development of automation technology.

Objective: Starting from the needs of people with cognitive impairment, innovate and optimize the function of electrical automatic control technology, design a barrier-free electrical automatic control application system for patients with cognitive impairment, improve the optimization of electrical automatic control performance, such as the simplicity of calculation instructions and the differentiation of functions, and upgrade the application software of control engineering.

Research objects and methods: Some patients with cognitive impairment were selected as the research objects, and through their participation in the skill test of electrical automation control specialty, their problems in the practical application were collected, such as visual impairment of system instructions, difficulty in execution, etc. Then, the electronic automation application control model is designed to meet the cognitive practice needs of patients with cognitive impairment, in order to improve their professional practice ability and promote the development, application scope and promotion of electronic automation control.

Method design: After understanding the problems existing in the application and control of electrical automation in patients with cognitive impairment, optimize and improve the automatic control system, such as the integration of software function modules and the design of system instructions, and apply the improved automatic control system to patients with cognitive impairment, collect the remission of cognitive impairment and the improvement and intervention of patients with different degrees of cognitive impairment before and after the experiment, and explore the optimization direction and application prospect of intelligent technology in electrical automation control under the background of cognitive impairment through comparative experiments.

Methods: The correlation between cognitive impairment and the optimization of electrical automation system was explored with the help of principal component analysis, and then the data of cognitive score and practical ability of patients with cognitive impairment before and after the experiment were collected and sorted by the constructed optimization model and comparative experiment, and the experimental data were imported into statistical analysis tools for processing.

Results: The user needs of people with cognitive impairment are less met and reflected in the application of electrical automation control system, and the optimization of electrical automation system with the help of intelligent technology can effectively improve the cognitive level of this group in life and learning and improve their practical ability. Experiments show that the optimized electrical automation control system can effectively improve the cognitive level of patients with cognitive impairment in language understanding, mathematical logic, memory and so on. Table 1 shows the score statistics of cognitive impairment personnel on the electrical automation system before and after the experiment. The score value represents its satisfaction with the system.

Table 1. Statistics of satisfaction of patients with cognitive impairment with electrical automation system before and after the experiment

Index	Instruction pertinence	Ease of operation	Language comprehension
Before experiment	10.25±2.14	7.25±2.03	4.35±1.68
After the experiment	15.23±2.03	19.23±1.42	15.24±1.22

Conclusions: The application of artificial intelligence technology in the process of electrical automation control can not only promote the intelligent development and optimization of an electrical engineering system, but also effectively reduce the material, financial and human resources of enterprises. At the same time, from the perspective of cognitive impairment, promote the reform and innovation of automatic control application system, effectively improve the health level of patients with cognitive impairment, and promote the progress and application scope of the electrical automation industry to a certain extent.

AN ANALYSIS OF THE CURRENT SITUATION OF ANCIENT CHINESE LITERATURE FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Suhua Yao

School of General Education, Hunan University of Information Technology, Changsha 410151, China

Background: The one and only ancient China's literary works embodies the essence and infinite wisdom of ancient sages and sages. It has a high literary appreciation value and unique artistic characteristics. It is the cultural connotation and wisdom crystallization of history. In Chinese ideology and culture, people have high subjectivity and ideology. Learning Chinese ancient literature is not only the inheritance of excellent culture and helps us enhance cultural self-confidence, but also plays a guiding role in our daily life and gives us some enlightenment and perception. However, at present, there are still great problems in the study of Chinese ancient literature, and the arrangement of the literature curriculum is still unreasonable. Ancient

literary works are the combing and integration of ancient history. They have the characteristics of a large time span, and their content and form have strong style characteristics, which makes students have some difficulties in understanding and absorbing knowledge. With the change of social conditions and the increasing openness and diversity of educational background, the class arrangement of ancient literature curriculum has been greatly reduced, and the content and form have also been impacted by foreign culture, resulting in a downward trend in teaching quality. The old and boring teaching mode and the neglect of the inheritance and integration of traditional culture in the teaching process make the originally obscure literary content more unfavorable to students' learning. The curriculum of ancient Chinese literature has gradually become a kind of teaching "decoration". Lack of understanding of our own culture, it is also difficult to achieve the inheritance and dissemination of culture, which will affect our cognition and understanding of some literary contents, and often show learning obstacles and learning difficulties. Learning disability is a form of cognitive impairment. Cognitive impairment refers to the impairment of cognitive processes, including memory, structural ability, executive ability, language understanding and expression. In serious cases, it will affect the overall function and quality of life of individuals. Cognitive impairment is usually manifested in the abnormal brain function responsible for learning, memory and thinking processing. The causes of the disease are diverse, such as the change of external environment, the adjustment of mental state, the impact of inherent thinking and cognition, etc. In the process of learning ancient Chinese literature, students need to speculate and understand more theoretical knowledge, but the shortening of class hours makes it difficult to understand the essence of literature and easy to fall into thinking misunderstanding. If it is not effectively alleviated and improved, this thinking misunderstanding will further affect our learning and daily judgment. Therefore, the analysis of the current situation of Chinese ancient literature from the perspective of cognitive impairment will help us better promote the quality of teaching, promote the dissemination of ancient literature and mobilize students' learning initiative and enthusiasm.

Objective: To improve students' learning ability of Chinese ancient literature, improve their thinking level, help them find appropriate learning skills in the current learning situation of the ancient literature course, and avoid falling into thinking misunderstanding and cognitive obstacles, which will affect their learning quality. The research evaluates students' problems in learning ancient Chinese literature from the perspective of cognitive impairment, and intervenes some students with cognitive impairment to improve their mental health and cognitive status, so as to better promote the learning of ancient literature and the cultivation of logical thinking.

Research objects and methods: By selecting three classes of students studying ancient Chinese literature in a university as the research object, firstly, collect and sort out the information on the current situation and existing problems of their learning ancient literature, and evaluate and grade them according to their cognitive level differences and existing problems. Then the students with cognitive impairment are intervened, and the experimental objects are randomly divided into groups to innovate the learning means and methods of the ancient Chinese literature course and analyze the improvement of students with cognitive impairment with the help of the improved teaching model.

Method design: Students with cognitive impairment symptoms were randomly divided into experimental group and control group. The experimental group studied in the improved ancient literature course, and the control group studied in the conventional teaching mode. The experimental time was 2 months. The relief of cognitive impairment symptoms and the effect of course teaching was compared and analyzed.

Methods: Based on the collection of students' problems and cognitive obstacles in learning ancient literature, the teaching methods and effects of ancient Chinese literature were quantitatively analyzed with the help of the meta-analysis method, so as to have a clear understanding of the current situation of literature education. Then, combined with the students' learning situation and the current situation of ancient literature teaching, innovate the curriculum teaching mode, apply the innovative mode to the curriculum practice, and process the experimental data with the help of the SPSS statistical analysis tool, in order to better explore the improvement measures and development trend of ancient Chinese literature curriculum.

Results: Cognitive impairment means that individuals have difficulties in language, memory and other aspects, and there are certain deviations and deficiencies in the cognitive level of things. The causes of cognitive impairment include not only the defects of their own congenital behavior, but also the influence of the external environment. Nowadays, Chinese ancient literature is in a new wave of innovation and integration. Promoting the innovation of curriculum learning from the perspective of cognitive impairment is conducive to the dissemination and development of Chinese ancient literature. Moreover, the cognitive level and mental health status of the students using the new mode of teaching have been significantly improved after the experiment, which has greatly improved the teaching quality, and there is a significant statistical difference in the teaching effect score between the two groups ($P < 0.05$). Figure 1 shows the scoring statistics of the teaching effect of the two groups of objects in the course of ancient literature.

Figure.1 The scoring statistics of the teaching effect of the two groups in the study of ancient literature

Conclusions: Deeply excavating the literary value and social guidance in ancient Chinese literary works can effectively help us enhance the cultural connotation and value convergence, and enhance our affirmation and admiration of our own culture. Nowadays, Chinese ancient literature is in a new wave of innovation and integration. From the perspective of cognitive impairment, exploring the current situation and problems of the development of Chinese ancient literature can help us better think about the value and effective ways of cultural inheritance, and effectively help students improve their learning quality.

* * * * *

THE PATH OF “CRAFTSMAN TYPE” PROFESSIONAL DEVELOPMENT OF TEACHERS IN VOCATIONAL COLLEGES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaoyong Liu

Institute of Higher Vocational Education, Hunan Electrical College of Technology, Xiangtan 411101, China

Background: Educational psychology is the product of the combination of educational activities and psychology. It is a science to explore the psychological laws of teachers and students in the process of teaching. As a branch of psychology, educational psychology is different from psychology, which focuses on the broad laws of individual internal laws and external environment changes. It focuses on improving and strengthening teaching design, teaching principles and evaluation related teaching methods, so as to improve students' learning quality. The limitation and particularity of the research object of educational psychology make its law more practical, and pay more attention to teaching students according to their aptitude from the law of students' learning and the law of psychological change. Humanism advocates that psychology should study cognition as a whole, pay more attention to people's psychological activities, highlight the important incentive role of emotion in teaching activities, guide educational psychology to focus on students' self-improvement as the core, and believe that teaching is not only a cognitive process, but also a situational activity connecting individuals. When teachers who transfer knowledge intervene and guide students, they should pay more attention to the individual differences and group characteristics of students, and carry out targeted teaching practice. The quality of teaching effect is closely related to the degree of specialization of teachers.

Under the background of the new curriculum reform, the center of teachers' professional development lies in Teachers' continuous acceptance of new knowledge and improvement of professional knowledge literacy and teaching ability. The factors affecting their professional degree include personal factors, environmental factors and institutional factors. However, only the development motivation with internal driving characteristics can make teachers reflect and improve from their own point of view, according to their own teaching characteristics, teaching style and existing shortcomings, so as to achieve the overall improvement of their own quality. In addition to imparting theoretical knowledge, teachers in vocational colleges also focus on the cultivation and exercise of students' practical ability. In addition to implementing the teaching goal of Building Morality and cultivating people, vocational colleges pay more attention to cultivating students' practicality and professionalism. However, in recent years, the development of

vocational colleges has gradually fallen into the deadlock of “enrollment difficulty” and “graduation difficulty”. The reason for this problem is that the construction ability of teachers is not strong, students rely on Teachers’ teaching process, and students lack independent inquiry spirit and independent thinking ability in practical skills. In the context of the current teaching situation, teachers in higher vocational colleges should constantly improve their professional ability and quality, restrain themselves with “craftsman spirit”, and pay attention to the continuous polishing of teaching practice and achievements in the teaching process. At the same time, with the help of educational psychology knowledge, we can analyze the learning situation and formulate personalized plans for vocational school students, so as to improve the teaching quality and students’ professional practice ability, and encourage them to participate in professional competitions. Paying attention to the cultivation of teachers’ craftsman spirit and the exploration of professional path will help to improve the quality of teaching activities, ensure the employment rate of students and realize a virtuous circle between teaching subjects.

Objective: In order to better explore the professional development path of “craftsman” teachers and help them better carry out teaching activities, so as to improve students’ professional skills and practical operation ability. At the same time, improve the quality of Vocational Colleges and enrich the theoretical knowledge of educational psychology.

Research objects and methods: The study selected teachers and students from two secondary vocational schools to conduct a questionnaire survey, in order to evaluate the professional level of teachers and the problems existing in the current teaching, analyze their causes and explore solutions. At the same time, with the help of educational psychology, this paper constructs the professional development path model of “craftsman” teachers, so as to promote the professional development of teachers and the high-quality development of teaching.

Method design: Teachers were randomly divided into experimental group and control group. The experimental group conducted experimental teaching with the help of the professional development path model, while the control group used normal teaching methods and methods. The experimental time was three months. At the end of the experiment, the professional ability of teachers was investigated, and collect students’ feedback on classroom teaching to assist in testing teachers’ teaching effect.

Methods: The experimental data were collected and sorted out with the help of SPSS statistical analysis tool, and the results were analyzed to explore the professional development trend of “craftsman” teachers from the perspective of educational psychology.

Results: Educational psychology can effectively help teachers pay more attention to students’ psychological and emotional changes and key curriculum needs in the teaching process. When teachers use the path model to teach, they can continuously improve their teaching characteristics through students’ feedback, and greatly improve teachers’ professional knowledge ability and teaching ability. The professional knowledge ability of the two groups of teachers has significant statistical differences in the data scores before and after the experiment, and the score increases of different dimensions are also different. Table 1 shows the statistics of the proportion of students’ teaching satisfaction under different teaching paths after the experiment.

Table 1. Statistics on the proportion of students’ teaching satisfaction under different teaching paths after the experiment

Grouping	Degree of satisfaction	Proportion of people (%)
	Dissatisfied/A little dissatisfied	-
Experience group	General	12.9
	Relatively satisfactory	35.7
	With great satisfaction	51.4
Control group	Dissatisfied	9.7
	A little dissatisfied	18.3
	General	36.4
	Relatively satisfactory	18.9
	With great satisfaction	16.7

Conclusions: The change of teaching standards and the increase of students’ needs put forward higher requirements for teachers’ professional level. As an important subject in the teaching process, teachers’ teaching effect directly affects the teaching quality. Therefore, paying attention to the exploration of teachers’ professional development path and the focused cultivation of “craftsman spirit” can enable teachers to apply educational psychology to curriculum practice, keep pace with the times in teaching

reform, and realize a qualitative leap in teaching level and professional quality.

Acknowledgement: The research is supported by: 2020 humanities and social sciences research planning fund project of the Ministry of Education (Research on the internal mechanism and external path of “craftsman type” professional development of Vocational Education Teachers, Item No. 20YJA880031).

PHENOMENON OF EMPLOYMENT ANXIETY IN HIGHER VOCATIONAL COLLEGES AND ITS INFLUENCE ON STUDENTS' EMPLOYABILITY

Ping Jiang

Department of Ideological and Political Theory Teaching, Jiangxi Teachers College, Yingtan 335000, China

Background: The reform of education system and the development of socialist market economy have accelerated the change of China's employment market. Job selection has gradually changed from the original “distribution arrangement” to “independent job selection”. In order to adapt to the change of market demand, most workers begin to seek the learning and training of professional and technical ability, which makes the number of Higher vocational colleges gradually increase. The over saturation of the labor market and the high recruitment standards of employers have virtually increased the employment competition pressure of students, resulting in negative emotions such as anxiety, worry and depression. Employment anxiety refers to the comprehensive reaction of students' negative emotions caused by the cognitive deviation between internal cognition and objective reality in the process of employment. The low adaptability of their majors to their posts, the improvement of the standards of employers, the large number of competitors and other factors will make students have negative emotions such as panic and anxiety when choosing a job. Students in higher vocational colleges generally have employment anxiety, and the number shows an upward trend. Appropriate employment anxiety can help students better understand the market demand and professional skill requirements, and have a preliminary understanding of the employment situation in advance, so as to urge them to continuously strengthen their professional knowledge and practical ability, and improve their competitiveness and advantages. However, excessive employment anxiety will affect their own objective evaluation of job demand and their own understanding of value, and blindly make employment choices or choose to avoid employment. In the long run, negative emotions will produce certain behavioral barriers for students, make them miss the best period of employment and career selection, and then urge students to continuously reduce employment standards, which is not conducive to students' long-term employment planning. The group difference of employment anxiety is significant, and higher vocational students are vulnerable to the influence of environment and others, resulting in poor self-adjustment ability, and weak self-cognitive deviation and environmental perception ability. If employment anxiety is not intervened and solved in time and effectively, it will have an impact on their employability. Vocational college students who have just graduated are in the stage of high interest and fighting spirit, strong learning ability and practical ability. If they fall into employment anxiety, they will doubt their ability, lose confidence in the employment market, and then have psychological and behavioral avoidance of employment problems, which promotes them to fall into employment anxiety in advance and ignores the improvement and learning of their professional ability. With the continuous change of employment market standards and the continuous saturation of the labor market, the employment difficulty will only be higher and higher, and the employment advantage of graduates will gradually lose. Therefore, students are very easy to fall into a vicious circle between employment anxiety and employability. Therefore, the research on the influence and intervention of employment anxiety in Higher vocational colleges on students' employability has high practical value for helping students better adapt to the employment market and actively guide their employment.

Objective: In order to reduce the negative impact of employment anxiety on students' employability in higher vocational colleges, help them actively alleviate their anxiety, and make an objective evaluation of the employment market and their professional ability, that is, do not set too high expectations, nor deny their own value and ability. Only in this way can we better guide students to adjust their psychological emotions, seek their own satisfactory employment opportunities with a positive attitude, explore the intervention mechanism of anxiety on employability, and reduce the negative impact of anxiety.

Research objects and methods: Randomly select two higher vocational colleges, and collect the information about the evaluation of anxiety and their own working ability with the help of anxiety scale and vocational ability evaluation scale. Then build an employment anxiety improvement mechanism model to intervene the students' anxiety, and evaluate and judge their employability and self-cognition level.

Method design: Firstly, after reasonably evaluating and grading the employment anxiety and employability of the research object, the influencing factors of students' employment anxiety are analyzed with the help of principal component analysis. Then, the experimental subjects were intervened by psychological emotion counseling and employment practice training to help them alleviate anxiety and improve their employability. The experimental time was one month, and the data before and after the experiment were statistically compared to explore the correlation between employment anxiety and employability.

Methods: SPSS analysis tool was used to process the data, principal component analysis was used to extract the factors affecting employment anxiety and test the regression coefficient, and anxiety improvement model and intervention methods were used to explore the improvement mechanism of employment anxiety on employability.

Results: When facing job selection and employment, students in higher vocational colleges who are about to graduate often have employment anxiety due to changes in the market environment and differences in the evaluation of their professional ability, such as fear, worry, anxiety and other negative emotions, which will have a negative impact on employment choice and the learning of daily professional skills. There are many factors causing students' employment anxiety, including both subjective and objective factors. Table 1 shows the statistics of the proportion of influencing factors of employment anxiety of graduates of different genders.

Table 1. Statistics on the proportion of influencing factors of employment anxiety of graduates of different genders

Type	Limited education (%)	Lack of professional skills (%)	Less employment options (%)	There are few recruitments information channels (%)	Vague employment orientation (%)
Boy student	22.3	22.5	14.7	16.8	23.7
Girl student	18.3	24.6	12.5	15.2	29.4

Conclusions: Employment is not only a key step for students to enter society from school but also a new stage in which they begin to feel and experience social changes in the form of individuals. There is a high correlation between employment anxiety and employability. Students in higher vocational colleges should actively make planning and cognitive preparation for entering the society, correctly evaluate their own strength and reduce employment anxiety. On the basis of understanding the current situation and requirements of the employment market, students do not evade or resist employment opportunities and employment choices, but constantly improve their professional quality and ability with a positive attitude, and actively find employment with full spirit and high morale.

* * * * *

ANALYSIS ON THE GOAL CONNOTATION AND LEVEL ORIENTATION OF ANCIENT LITERATURE TEACHING FOR ANXIETY COLLEGE STUDENTS

Yakefu Guliayimu

Basic Science Institute, Xinjiang University of Finance & Economics, Urumqi 830012, China

Background: Ancient literature can effectively improve cultural cultivation, enrich spiritual life, and change a person's speaking temperament and spiritual realm from inside to outside. The course of ancient literature is also designed to help students perceive the spiritual temperament and cultural connotation contained in literary works on the basis of imparting ancient literary knowledge, and improve students' cognition and identity of their own national culture. However, with the rapid development of market economy and the rise of "fast-food culture", people's profit orientation is gradually revealed, and they often have a utilitarian and urgent attitude to learn in the process of learning and cognition. Therefore, while accepting diversified knowledge, people gradually show a single and one-sided trend in the evaluation of cultural works, gradually get used to evaluating ancient literature with secular rating standards, and make a final conclusion on its value from the perspective of marketization and commercialization. However, the disciplinary nature of ancient literature is different from that of science and engineering, which directly affects real life. Instead, it focuses on guiding people to form a spiritual value and ideal belief internalized

in practice, and helping people add more “standards and frameworks” in judgment and decision-making. It is an important embodiment of the national cohesion spirit. The teaching goal and value of contemporary ancient literature refers to that in addition to ensuring the completion of the basic teaching goal, it can provide people with ideological weapons to solve problems, greatly improve people’s ideological realm and moral restraint level, and “Nourish Qi and spirit” with knowledge to realize the stable and long-term development of society. There are certain individual differences in the perception ability of literary works, and the learning method of this course does not have formula standards that can be “applied”, but pays more attention to learners’ accumulation and perceptual cognition, which makes some students who are difficult to complete their learning tasks prone to anxiety, worry and other emotions.

As the main body of the teaching mode, the enthusiasm and learning efficiency of students participating in the classroom will affect the teaching quality and the completion of teaching objectives. The psychological status of college students has not been fully developed, and they are very vulnerable to the influence of the surrounding environment and others. Different from the high school life of strict control mode, it is difficult for relaxed and free college students to invest in a better learning situation. The unpredictability of changes in things will also make college students have negative emotions such as anxiety in their daily life and study. Anxiety disorder is a very complex psychological and emotional disorder. Its clinical manifestations are usually motor agitation and sympathetic hyperactivity, often accompanied by negative emotions such as anxiety, shame, disappointment, anxiety and fear. Appropriate anxiety can make students in a more active learning state and have a more active attitude towards themselves and the environment. However, excessive anxiety will cause students’ resistance and affect the quality of learning and daily life. The study of ancient literature course is difficult for some students. Analyzing the target connotation and level positioning of the course and innovating the teaching mode can effectively alleviate students’ anxiety and improve the teaching quality.

Objective: To give full play to the value of ancient Chinese literature, make its education model have better teaching effect, and promote the innovation of its teaching model, so as to provide ideological and theoretical guidance for anxious college students, help them alleviate their anxiety, improve their mental health level, and help them better deal with daily life and learning problems.

Research objects and methods: Three classes majoring in literature education in a university were selected as the research objects. Firstly, the basic information of students’ anxiety and learning status was collected with the help of Self-rating Anxiety Scale (SAS) and observation method. Then, on the premise of focusing on the content and objectives of the teaching course of ancient Chinese literature, the mathematical model of the teaching quality evaluation system is established with the help of neural network theory to realize the innovation of teaching mode, and construct a new targeted and personalized teaching mode of literature course, and join the psychological state assessment to test the improvement mechanism of the practice and application of innovative teaching mode on anxious college students.

Method design: Under the condition of collecting the basic information of college students with anxiety disorder, this paper constructs a teaching quality evaluation model with the help of neural network to realize the innovation of literature teaching mode, that is, teaching content, teaching method, teaching effect, students’ ability to master knowledge and other indicators as the input layer and teaching quality as the output layer, the mathematical model is used to innovate the target connotation and level positioning of ancient Chinese literature, so as to give full play to its teaching value and realize the improvement and intervention of anxiety college students. Professionals evaluated the anxiety level and mental health status of students after the experiment, and explored the intervention mechanism of ancient literature teaching on anxiety college students.

Methods: The innovation of teaching mode was realized by neural network algorithm, and the experimental data were processed and analyzed with the help of statistical analysis tools, so as to better redefine the connotation and hierarchical positioning of ancient literature teaching objectives and alleviate the anxiety symptoms of college students.

Results: The innovation of Chinese ancient literature teaching mode, that is, to realize the reform of target connotation and level positioning, can effectively improve students’ initiative and easier to understand the spiritual connotation of literary works, so as to improve their self-awareness and alleviate their anxiety. Table 1 shows the general situation of routine behavior and cognition of anxious college students.

Conclusions: Chinese ancient literature has a good guiding role for socialist core values and cultural content, can effectively play the spiritual guiding role of traditional literature and realize the improvement of students’ overall quality. As an emotional disorder, anxiety disorder is easy to make students fall into an “emotional dilemma”, and then it is difficult to realize the correct evaluation of objective things and self-cognition. Innovating the curriculum objectives and positioning of literature teaching can effectively establish a “communication bridge” between students and literary works, and then help anxious college students alleviate their anxiety symptoms.

Table 1. General situation of routine behavior and cognition of anxious college students

Dimension	Mean	S.D.
Self-recognition value	2.325	0.647
Learning enthusiasm	2.897	0.843
Learning difficulties	3.751	0.615
Emotion regulation disorder	3.304	0.676
Learning perception	2.402	0.612
Self-efficacy	2.956	0.532
Evaluation objectivity	1.252	0.663

* * * * *

ANALYSIS AND RESEARCH ON MENTAL DISORDER FACTORS IN JUVENILE DELINQUENCY

Jinling Bai

College of Business and Trade, Shenyang University of Technology, Liaoyang 111003, China

Background: Juvenile delinquency is a kind of behavior that deviates from the social code of conduct and moral standards, touches the law and has social harm. The rise of its crime rate and the younger age of the group have aroused widespread concern in the society. There are many factors causing juvenile delinquency, mainly including environmental factors and individual factors. Environmental factors mostly come from their own family environment and external environment, while the main factor causing individual differences is personality factors. Teenagers are in a critical period of physical and mental development, and their cognitive orientation is not clear and objective enough. They are vulnerable to the incorrect guidance of others and make impulsive behavior, and then step by step close to the edge of breaking the law and crime. The personality theory that is easy to cause juvenile delinquency has a more influential theory is psychoanalysis theory. Psychoanalysts generally attribute crime to internal conflict and emotional disorders, as well as unconscious feelings of insecurity and incompetence. Swiss psychoanalyst Aichhorn once proposed latent juvenile delinquency, believing that the psychological expectation of juvenile delinquency is mostly long-term and latent, and when stimulated by a certain stimulus, its criminal psychology will accelerate the emergence of criminal behavior. The main inducement of juvenile delinquency is the emotional disorder caused by personality characteristics such as the immediate satisfaction of desire, the priority of self-satisfaction and the lack of guilt. However, there is no significant guiding role between emotional disorder and criminal behavior, and the main reason for focusing on emotional disorder is that social groups pay more attention to teenagers' emotional problems during juvenile trial. Teenagers' personality is not yet perfect, and they have strong curiosity and exploration desire for external things, but they lack correct evaluation and cognition of things, so there are cognitive bias and behavior bias. The common types of juvenile delinquency can be divided into socialized crime, psychotic crime, neurosis crime and social pathological crime. Some scholars believe that personality traits are important factors affecting criminal behavior, and pay more and more attention to juvenile personality traits. Sporadic juvenile delinquency is often impulsive behavior caused by an event and stimulating behavior. For frequent delinquency, it is necessary to explore its internal motivation and influence mechanism. It is undeniable that the lack of ability to regulate their emotions and spirit is related to juvenile delinquency. Mental disorder is the manifestation of obstacles in individual perception, consciousness, emotion, thinking and behavior. Under the control of morbid psychology, patients often commit suicide or attack and hurt others. Teenagers with poor control behavior will have self-doubt and lead to spiritual internalization without the correct guidance of family and society. Exploring the mental disorder factors in teenagers' illegal and criminal behavior will help to better analyze the causes of their criminal behavior, and then guide the healthy growth of teenagers.

Objective: Juvenile delinquency has great harm to society, families and individuals, and adolescents are in a critical period of physical and mental development. Analyzing the pathological mental state in juvenile delinquency is helpful to correctly guide adolescents to recognize and evaluate themselves and their surrounding environment, reduce the crime rate and ensure the stable development of society.

Research objects and methods: Firstly, the research uses big data algorithm to collect cases of juvenile delinquency, collect individual basic information, and analyze the motivation of crime. Then, taking 100

teenagers of different types of crime in a crime Institute as the research object, first collect and sort out the basic data of teenagers' psychological and mental status with the help of psychological disorder detection scale and mental disorder scale, and then use principal component analysis to explore the correlation between illegal and criminal behavior and teenagers' mental disorder.

Method design: After collecting the basic information and scale information of juvenile delinquency, the factors affecting juvenile delinquency were analyzed by principal component analysis, and the experimental data were tested by Bartlett sphericity test. Then the subjects were divided into experimental group and control group. The experimental group was trained with targeted psychological emotional counseling and mental state guidance, while the control group was only trained with psychological counseling. The experiment lasted for three months. After the experiment, psychological experts reassessed the mental status and criminal psychological tendency of the two groups of teenagers, and compared them with the data before the experiment, so as to better explore the correlation between juvenile delinquency and mental state.

Methods: The data were processed by SPSS analysis tool, and the correlation between criminal behavior and mental disorder was analyzed by principal component analysis.

Results: Through the intervention analysis of mental disorder factors in juvenile delinquency, it was found that adolescents were prone to psychological distortion and mental problems due to environmental impact, individual differences and poor psychological tolerance. However, teenagers' poor ability to regulate their emotions and spirit will lead to criminal behavior. And the scores of the psychological scale of the two groups are quite different after the experiment. The results are shown in Table 1.

Table 1. The scores of mental disorder test scale after the experiment were compared between the two groups

Psychological barrier dimension	Experience group	Control group
Obsessive compulsive symptoms	19.7±2.6	25.2±2.4
Interpersonal sensitivity	14.1±2.5	31.2±2.9
Depressed	7.4±3.8	27.4±2.1
Anxious	13.9±2.1	22.9±2.2
Hostile	5.7±2.7	29.1±1.3
Paranoid	14.3±1.2	31.7±1.3
Psychotic	18.7±2.4	35.2±2.7

Conclusions: The motivation and performance mechanism of juvenile delinquency are relatively complex. The analysis of their behavior is helpful to better understand the psychological situation and emotional change characteristics of adolescents, give timely guidance and attention, reduce their crime rate and realize the stable and long-term development of society. Mental state and personality traits are important factors affecting juvenile delinquency. Families, society and the state should give more psychological attention and guidance to teenagers and pay attention to their physical and mental health. Only in this way can we give more protection to teenagers and create a healthy growth environment for them.

* * * * *

INFLUENCE OF LEISURE SPORTS TRAINING ON IMPROVING COLLEGE STUDENTS' PHYSICAL HEALTH LEVEL AND LEARNING ANXIETY

Li Gao

Sports Department, Henan University of Animal Husbandry and Economy, Zhengzhou 450046 China

Background: With the popularization of quality education and the promotion of the concept of comprehensive fitness in China, the social spirit and cultural forms gradually show a diversified development trend, and the society also puts forward higher requirements for the comprehensiveness and comprehensiveness of talents. Professional knowledge and ability are no longer the only standard to investigate the ability and quality of college students. The emphasis on the physical health level and mental health of college students has gradually been mentioned to an important position by school education. In view of this, the development of school physical education activities is of great significance to students'

physical health. Changing physical education teaching methods, increasing physical exercise forms and setting up a variety of courses can effectively stimulate students' physical enthusiasm, help them actively participate in physical exercise and enhance their physical health in physical training. At the same time, as the young army of the country's future development, the complexity of the social environment and the strictness of teaching standards make their mental health problems occur frequently, which further affects their life and study. The evaluation standard of mental health is whether individuals have good cognitive and understanding ability, whether they have corresponding evaluation indicators for the changes of external things, and whether they can correctly view the changes of themselves and their surrounding environment. The common psychological problems of college students are anxiety symptoms, which are mostly manifested in learning anxiety, social anxiety and individual anxiety, and the anxiety symptoms are mostly manifested in negative emotions such as worry and fear. Students' anxiety psychology is mainly learning anxiety. Appropriate learning anxiety can effectively urge students to improve learning speed and quality, but too much anxiety will make them have learning resistance. According to statistics, about one third of the students in school have varying degrees of psychological anxiety. The establishment of school physical education curriculum can effectively help students have a certain physical exercise time outside their learning time, while leisure sports can effectively mobilize physical functions to enhance immunity, help students release negative emotions, alleviate learning anxiety and study in a better mental state. Leisure sports training is not only a simple form of exercise, but also an organized, collective and planned sports activity. It can effectively strengthen the relationship between individuals and groups, and then better improve the comprehensive quality of students.

Objective: Under the basic condition of mastering students' physical exercise and psychological emotion, with the help of leisure physical training, improve college students' physical health level and interest in physical exercise, guide their cognition of physical training, alleviate their learning anxiety, and achieve the purpose of physical education teaching to enhance students' physical quality and mental health level.

Research objects and methods: 500 students in a university were selected as the research object. Firstly, the basic information of students' physical health, physical exercise and psychological emotion was collected, and then the leisure sports training of college students was carried out. The types of leisure sports training include fitness leisure sports, fitness leisure sports, health care sports and sports competition sports. The experimental time is three weeks. After the experiment, with the help of students' physical health scoring standard and Self-rating Anxiety Scale, the experimental data of students' changes after the experiment are counted and compared with the data before the experiment, so as to better explore the influence mechanism of leisure sports training on college students' physical health level and learning anxiety.

Method design: Firstly, the physical health level and learning anxiety of the subjects were evaluated and graded, and then the subjects were divided into bodybuilding group (group A), fitness group (group B), health care group (group C), competition group (group D) and no physical exercise group (group E) according to the types of leisure sports. The experiment lasted for three weeks. At the end of the experiment, the data of anxiety and physical health of different groups of experimental subjects after one week, two weeks and three weeks are counted and analyzed, in order to explore the improvement mechanism of leisure sports training on college students' physical and mental health.

Methods: With the help of SPSS22.0 statistical analysis tools to sort out and analyze the physical test scores and anxiety scale scores of the subjects before and after the experiment, and get the experimental results.

Results: After investigating the basic situation of most students' physical health test level and anxiety score, it was found that the overall quality of students was relatively poor. Leisure sports, with its characteristics of freedom, culture, initiative and non-utilitarianism, can make students exercise in a more relaxed atmosphere, reduce their psychological burden and pressure, and then significantly improve students' physical condition and psychological anxiety. After the experiment, the students who carried out leisure sports showed a positive attitude as a whole, and their sense of happiness and efficacy in the collective society were significantly improved. Figure 1 shows the score statistics of anxiety scale in Aerobics group (group A) and group without any physical training (group E).

Conclusions: As a relatively relaxed way of exercise, leisure sports can effectively connect the relationship between individual and collective, improve their health level and sports passion, improve their anxiety and improve their mental health level. At the same time, leisure sports enhance students' communication ability and promote the development of self-consciousness. Paying attention to students' health level and psychological problems is the focus of current education. It also needs the joint efforts of all parties to give full play to the positive impact of leisure physical exercise on college students and help them grow healthily.

Figure 1. Statistics of anxiety scale scores of Aerobics group (group A) and group without any physical training (group E)

IMPROVEMENT MECHANISM OF TEACHING REFORM ON STUDENTS WITH THINKING LOGIC OBSTACLES UNDER BIG DATA THINKING

Zhenghui Wang

Modern Education Technology Center, Guangdong Teachers College of Foreign Language and Arts, Guangzhou 510640, China

Background: Thinking disorder refers to the process of objective things acting on the human brain. Due to the confusion of thinking starting point, the fuzziness of thinking image, the deviation of thinking direction, the confusion of thinking logic and the interference of thinking, it is difficult for the human brain to display the normal thinking results of objective things, so that the content range and speed range exceed the normal standard. The thinking disorder can be divided into thinking process abnormality and thinking content abnormality, which is specifically reflected in the lack of due logic in the connection of semantics. Among them, the logic disorder is a more common form of thinking disorder. The thinking logic disorder mostly has the symptoms of poor thinking, slowness, mandatory thinking, pathological restatement and delusion. It is often manifested in pathological symbolic thinking, new words, logical fallacy thinking and sophistry thinking. Its essence is that thinking deviates from ordinary people's thinking process in the process of information processing and processing. Thinking logic disorder will not only affect people's thinking ability and cognitive ability, lead to their easy to fall into the inherent thinking set, and then lack of comprehensiveness and objectivity in the analysis and treatment of problems, affect the depth and breadth of people's views on things, but also cause certain physical and mental damage. With the emphasis on quality education and curriculum quality in China, paying attention to the shaping of students' personalities and psychological training is the focus of current education and teaching. With the development of big data information technology, the focus of educational research focuses on "smart education represented by personalized learning", including adaptive learning, educational big data, smart classroom, etc., focusing on the cultivation of students' quality and physical and mental health, and paying more attention to educational big data mining at the technical level and learning analysis technology with equal emphasis on technology and methods. Improving teaching quality and innovating teaching methods are the key points faced by schools at present. For students in special schools, there is a certain lack of learning ability, especially for some students with thinking logic barriers, the quality of teaching effect will affect their learning effect. The exposure of educational disadvantages such as unclear teaching positioning, unscientific teaching system, dislocation of teaching methods and unreasonable setting of teaching contents also requires the acceleration of the process of teaching reform. The persistence of traditional inherent concepts, the inertia of thinking and the neglect of students' personalized needs will affect the effectiveness and quality of special education teaching. Therefore, with the help of big data background to realize teaching reform and improve the teaching system, we can better provide higher quality teaching quality for students with logical barriers and promote the progress of China's education.

Objective: From the perspective of thinking logic disorder, accelerate the reform process of teaching in

the context of big data, improve teaching quality and teaching effect, improve students' symptoms of the logic disorder, and help them improve their learning level and mental health level.

Research objects and methods: The research takes the students with thinking logic disorder in a special school as the research object, collects the basic information such as students' learning status, existing problems and current teaching effect, and then integrates the teaching means and teaching methods with the development background of big data to reform and innovate them. In the process of reform, a teaching system that can fully consider the needs and feedback of students with thinking logic obstacles is designed in order to improve students' learning effect and school teaching quality.

Method design: After collecting and analyzing the data of students' learning status and teaching status, the experimental method is designed by using an analytic hierarchy process combined with fuzzy comprehensive evaluation theory, and the teaching quality is evaluated and the model is constructed for the teaching content, teaching method, teaching means, teaching ability, students' needs and so on, fully consider the learning difficulties and teaching problems of students with thinking logic obstacles. The model is applied to mathematics courses, Chinese courses and political courses respectively. The data of the learning effect and the improvement of thinking logic obstacles of the research objects before and after the experiment are sorted and analyzed, and the differences are compared with the scoring system, so as to better explore the optimization effect of thinking logic obstacles on teaching reform under the background of big data.

Methods: The teaching model was constructed with the help of the analytic hierarchy process and fuzzy comprehensive evaluation theory, and the data were sorted and classified with Excel.

Results: Big data thinking is actually the derivation of human and natural cognitive model based on the digitization of information, and the teaching reform under the background of big data is to actively guide and transform the generation, correlation and application of information around innovation. Paying attention to the learning needs of students with thinking logic disorder and improving their learning quality and efficiency can speed up the achievements of teaching reform, involve more aspects and tend to be perfect. The experiment found that the new model of teaching reform can effectively improve the logical misunderstanding of students with thinking disabilities and improve their learning efficiency and quality. Table 1 shows the statistics of learning satisfaction of students with different degrees of thinking logic before and after the experiment.

Table1. Statistics of learning satisfaction of students with different degrees of thinking logic before and after the experiment

Degree	Before and after the experiment	Chinese course (%)	Mathematics course (%)	Political course (%)
Mild cognitive impairment	Before	64.3	58.7	62.4
	After	82.1	76.3	84.2
Moderate cognitive impairment	Before	54.2	47.6	51.6
	After	83.2	81.4	86.3
Severe cognitive impairment	Before	47.9	42.8	46.2
	After	87.5	79.5	86.1

Conclusions: Under the background of big data and the development trend of the information age, promoting the integration of information technology and education and teaching, and promoting the reform of education service supply mode and teaching mode is an important task of current education. Under the guidance of the overall teaching logic and big data thinking, we should promote teaching reform from multiple angles and aspects to help students get out of the misunderstanding of thinking logic, develop ideal education characterized by teaching students according to their aptitude and personalized learning optimization.

* * * * *

INFLUENCE OF REGIONAL CULTURE INTEGRATION AND ART DESIGN TEACHING ON ALLEVIATING COLLEGE STUDENTS' ANXIETY

Peijia Geng

Academy of Fine Art and Design, Xuchang University, Xuchang 461000, China

Background: Anxiety, as an emotional state of fear and anxiety, is often accompanied by the sense of powerlessness caused by physical activation and efforts to deal with threats, and its threats mainly come from the fear of potential and other unknown things. There are individual differences in the forms and types of anxiety, and college students have particularity in anxiety psychology. According to the survey, anxiety disorder has become beyond depression and a common psychological problem among college students, and more than 20% of students in China have serious psychological problems of anxiety. College students often have anxiety problems in the form of examination anxiety, interpersonal anxiety, choice conflict anxiety, procrastination anxiety and so on due to unbalanced physical and mental development, excessive pressure burden, improper self-awareness and other reasons. The main mechanism of college students' anxiety is that they can't make timely decisions on unexpected behaviors, and fall into a state of repeated thinking and weighing, but can't find solutions. Learning anxiety is a kind of emotional psychology that college students often show in course learning. The rationality of content, the division of learning difficulty and the interest of classroom will affect students' enthusiasm and initiative to participate in the classroom, and then feed back to their completion of learning tasks. A good learning attitude will produce good learning results, and then produce a virtuous circle. A relatively low learning attitude and negative emotion will reduce college students' learning initiative, and a large psychological gap will increase their anxiety. At the same time, students are vulnerable to the influence of the external environment, resulting in cognitive bias and anxiety. The opening of art design teaching course is mainly to cultivate students' perception, understanding and creativity of art works through the study and practice of art design theory. However, the learning content of art design course is relatively fixed and has certain learning difficulties, so some students are prone to learning fatigue or have a learning attitude of dealing with things, resulting in learning anxiety in the practice of learning results and the completion of tasks. At the same time, change the teaching methods of art teaching courses to make their learning contents more vivid and interesting, so as to mobilize students' learning enthusiasm, help students better understand themselves, perceive the environment and improve their anxiety with the help of course teaching, which is the focus and difficulty of teaching. In recent years, with the deepening of the public's attention to regional culture, most scholars are committed to giving full play to the characteristics and charm of regional culture and integrating it with education, so as to make education and teaching more vibrant. The integration and innovation of distinctive regional culture and art design teaching can effectively help students improve their perception ability and interest in art, improve their professional ability and self-awareness level, and alleviate their anxiety.

Objective: To study the integration of regional culture into art design teaching, make teaching resources more diverse, not only reflect the characteristics of local teaching, but also give full play to students' creative thinking, make the cultural content more consistent with the teaching content, and strengthen students' initiative and emotional release in the learning process, effectively intervene and solve their anxiety and negative psychological problems.

Research objects and methods: The research takes 500 students majoring in art in a university as the research object. Before the experiment, first, evaluate the basic situation of students' anxiety level and psychological status, then innovate the teaching methods of art design course, integrate regional culture and art teaching, and explore the teaching mode of the new course. And use the new model teaching means to explore the relief of students' anxiety and mental health level.

Method design: After evaluating the anxiety level of art students, the subjects were randomly divided into experimental group and control group. The subjects in the experimental group were taught with the new model of regional culture integration art design teaching, while the control group was taught with normal art design teaching for three months. The anxiety scores and mental health status of the two groups of students after the experiment were statistically analyzed and compared with the data before the experiment.

Methods: Firstly, the analytic hierarchy process is used to screen the indicators and assign the weight of the factors affecting students' psychological anxiety, and then the teaching design in the construction of the new teaching model of proud regional culture and art design is improved according to these impact indicators, so as to better study the improvement of students' anxiety caused by the new model, the data processing in the experiment is sorted and analyzed with the help of SPSS statistical analysis tool.

Results: The combination of regional culture and art teaching can effectively improve the interest and vividness of teaching effectiveness, and the innovative new model can effectively improve students' anxiety and mental health. The scores of learning anxiety of the two groups decreased in different ranges after the experiment, and there was significant statistical difference between the two groups ($P < 0.05$). Figure 1 shows the statistics of the number of subjects with different anxiety levels after the experiment. The level 1-5 of anxiety indicates the severity from light to heavy.

Table1. Statistics of the number of subjects with different anxiety levels after the experiment

Grouping	Level 1	Level 2	Level 3	Level 4	Level 5
Experience group	267	179	30	14	10
Control group	20	13	264	105	98

Conclusions: Regional culture can not only provide rich resources for teaching and guide students to actively participate in teaching courses, but also help to show local teaching characteristics and improve students' psychological status. Therefore, in the course teaching design, we should fully permeate the connotation of regional culture and art, ensure the fit of the two, and build an innovative and regional teaching system and teaching scheme.

OPTIMIZATION STRATEGY OF COMPUTER NETWORK INFORMATION SECURITY FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Hailin Zou¹ & Qinlan Wu²

¹*Public Course Teaching Department, Jiangxi University of Engineering, Xinyu 338000, China*

²*School of Big Data and Computer, Jiangxi University of Engineering, Xinyu 338000, China*

Background: With the development of science and technology and the advent of the big data information age, the application scope of Internet technology has gradually expanded, breaking through the limitations and sense of bondage between people's time and space. The integration between the development of big data and traditional industries has expanded the development space of various industries in society and enriched the media and means of people's communication. In the big data environment, the increase in the number of users and the acceleration of the flow of information and data not only provide convenience for people's life, but also provide an opportunity for some illegal elements, resulting in the leakage of private information and data of enterprises and individuals, and even pose a great hidden danger to the network security of the state and society. Under the characteristics of virtual open big data environment, information is easily affected by objective and subjective factors in the process of processing and transmission, such as network system vulnerabilities, non-human damage of data, improper human operation and virus intrusion, and its security is difficult to guarantee. With the popularization and sinking of Internet applications, people's personal information saved on the Internet increasingly involves some highly sensitive and private information. However, compared with the rapid development of computers under the Internet, the process of Internet information security infrastructure in some parts of China is slow, this will bring great use risk and uncontrollable security to Internet vulnerable users with a certain degree of cognitive impairment. Therefore, it is particularly important to strengthen the guarantee and protection of network information security in the context of big data from the perspective of cognitive impairment. Paying attention to the use needs of this group of users can effectively improve the level and quality of network information security. Cognitive impairment refers to the impairment of memory, time and space orientation function, executive ability and language understanding. It can be divided into dysfunction and clinical disorder, and dysfunction is the main factor affecting its network use. Dysfunction includes memory impairment, problem-solving disorder, attention disorder, language understanding and expression disorder, calculation disorder and visual reading disorder, which makes it more difficult for patients with cognitive impairment to understand web pages and process information in the process of computer use. Research at home and abroad shows that people with cognitive impairment can effectively improve their daily life and cognitive activities by using a personal digital assistant and computer-assisted learning. Therefore, strengthening the design and optimization of computer network information and building a barrier-free network environment can improve the satisfaction of patients with cognitive impairment and the security of information, so that they can benefit from the network.

Objective: Based on the needs of people with cognitive impairment, constantly modify and monitor the design and maintenance of computer network, design a barrier-free network use environment for patients with cognitive impairment, and improve the security of their use of information, such as optimization and improvement in font, visual expression, concentration enhancement of attention and content and form transformation, Promote the construction of network information infrastructure services.

Research objects and methods: The study selected some patients with cognitive impairment as the research object, collected their experience and problems in the process of using the computer network,

constructed the computer network optimization model through their feedback information, such as visual impairment of language web pages and difficulty in paying attention, and designed a network security system that meets the cognitive needs of patients with cognitive impairment, In order to improve its use satisfaction and information security.

Method design: After collecting the basic information about the current situation and existing problems of Internet users with cognitive impairment, a network security system meeting the cognitive needs of Internet users was designed, and the computer web page and design were optimized in the aspects of information cognition, content memory and risk prevention. Data collection and processing will be carried out on the mitigation of cognitive impairment and the improvement and intervention of patients with different degrees of cognitive impairment before and after optimization. Through comparative experiments, the direction of computer network information security and protection under the background of cognitive impairment will be explored, and the construction of network infrastructure will be improved.

Methods: The optimized model and comparative experiment were used to collect the data of cognitive changes of netizens with cognitive impairment before and after the experiment, and with the help of SPSS22.0 statistical analysis tools to process and analyze data.

Results: The user needs of people with cognitive impairment were less met and reflected in the process of computer network. With the help of computer services, artificial intelligence and other means, it can effectively improve the cognitive level of this group in life and learning and improve their barrier behavior. experiments show that the optimized computer network security information system can effectively improve the cognitive level of patients with cognitive impairment. Table 1 shows the cognitive changes of patients with cognitive impairment before and after the experiment.

Table1. Statistics of cognitive changes of patients with cognitive impairment before and after the experiment

Experiment	Visual impairment	Information identification and processing	Concentration	Memory impairment
Before experiment	17.63±1.98	18.37±1.69	15.14±1.73	17.35±1.29
After the experiment	9.23±1.24	8.26±1.47	7.25±1.05	9.23±0.45

Conclusions: The increase in the number of users makes the information of Unicom on the Internet have the characteristics of a large number and complex content, and the network virtual environment increases the risk of information and financial disclosure. At the same time, under the trend of profit-seeking, network illegal elements will constantly update the means of virus transmission, mislead Internet users to browse the information search on the Internet through the increase of content and pop-up advertising, increase the difficulty of patients with cognitive impairment when using the Internet, and virtually increase the risk and pressure of information disclosure. The optimized computer security system can effectively help netizens with cognitive impairment use the Internet more safely, and improve their cognitive level and network use satisfaction to a certain extent.

* * * * *

INFLUENCE OF TRADITIONAL PHYSICAL EXERCISE ON COLLEGE STUDENTS' MENTAL HEALTH

Yu Hong

Sports and Health Management, Changzhou Vocational Institute of Engineering, Changzhou 213164, China

Background: With the development of China's education and the deepening attention to quality education, the proportion of physical exercise in higher education is gradually increasing. College students are in a critical period of physical and mental development. The changes of teaching forms and social environment will make students have to consider individuals in society and collective, and then require students to have better adaptability and adaptability. College education pays more attention to students' autonomy and self-discipline, and encourages students to deal with the relationship and changes between themselves and the surrounding environment. However, due to the differences between individuals, they lack good cognitive understanding ability and evaluation criteria for things, which is more prone to mental health problems. The quality of mental health will affect students' learning efficiency and their correct evaluation of their own value, so it is necessary to actively guide and intervene students' psychological problems. The main state of students is learning. In order to improve students' mental health level, we first

need to change their misunderstanding and prejudice about psychotherapy, guide them to pay attention to their inner value, and then take the initiative to seek help. Traditional sports focus on the overall view of human life as the basis, characterized by introverted application consciousness, emphasize the relationship between human life sports and nature and social environment, and pay attention to a healthy state of internal and external harmony. Through traditional physical exercise, I understand students' enthusiasm and enthusiasm to participate in sports, alleviate their psychological pressure and negative emotions, and can effectively guide students to pay more attention to their own attention and correct evaluation of their health status. At the same time, traditional sports can stimulate students' awareness and habits of consciously participating in exercise, master the basic knowledge and sports skills of sports and health, and form the awareness and habits of lifelong exercise. By choosing their favorite traditional sports, we can not only experience the fun of physical exercise, but also get rid of negative emotions, deal with and face the changes of surrounding things with a more positive attitude, so as to improve the level of mental health.

Objective: Under the condition of mastering students' basic physical exercise and psychological emotion, we can carry out physical training to enhance college students' interest in physical exercise, so as to improve negative emotion and mental health.

Research objects and methods: 684 students in a university were selected as the research object. After collecting the information of students' physical exercise and mental health, the traditional physical training was carried out for college students for one month. And select martial arts, Taijiquan, Baduanjin and stick four sports methods to intervene college students with different psychological problems. At the end of the experiment, with the help of mental health self-test scale and mood state scale, the changes of students in different stages are counted, so as to better explore the impact mechanism of traditional physical exercise on college students' mental health.

Method design: Firstly, the subjects were classified according to their mental health status and problems, and then the subjects were randomly divided into Wushu group, Taijiquan group, Baduanjin group, cudgel group and no physical exercise group. The mental health status and changes of different groups after one month were sorted and analyzed, explore the intervention mechanism of traditional physical exercise on college students' mental health.

Methods: With the help of SPSS21.0 statistical analysis tools were used to sort out and analyze the scores of mental health scale and mood state scale before and after the experiment, and the experimental results were obtained.

Results: Traditional physical exercise guided students to pay attention to endogenous value and perceive physical changes in the form of light, slow and powerful exercise, which can effectively help students look at the changes of themselves and their surrounding environment in a relatively calm state of mind, reduce negative emotions and pressure, and improve their mental health level. The results show that traditional physical exercise can effectively improve college students' negative emotions such as compulsion, depression, anxiety and hostility, and help them improve their mood and mental health. Table 1 shows the mental health scores of Wushu training group before and after the experiment.

Table 1. Mental health scores of Wushu training group before and after the experiment

Before and after the experiment	Somatization	Force	Interpersonal relationship	Anxious	Depressed	Psychotic
Before	1.42±0.28	1.98±0.63	1.65±0.41	2.03±0.51	1.96±0.64	1.62±0.23
After	1.23±0.22	1.54±0.44	1.52±0.34	1.14±0.37	1.23±0.45	1.23±0.41
t-test	P<0.05	P<0.05	P<0.05	P<0.05	P<0.05	P<0.05

Conclusions: Wushu, Taijiquan, Baduanjin and cudgel are excellent items of traditional sports health preservation, which have high theoretical and practical value for the improvement of physical function and the adjustment of mood state. While paying attention to improving college students' professional skills, higher education should pay more attention to their mental health, give full play to the positive impact of traditional physical exercise on college students and improve their mental health level through sports competitions and national fitness.

Acknowledgement: The research is supported by: 2021 research project of philosophy and social sciences in colleges and universities of Jiangsu province: research on the relationship between college students' physical health and mental health under the background of "healthy China" (subject number: 2021sjb0636).

RISK PREFERENCE OF DATA SCIENCE APPLIED TO INVESTMENT PSYCHOLOGY UNDER COGNITIVE IMPAIRMENT

Yong Ma

School of Management and Economics, University of Electronic Science and Technology of China, Chengdu 610000, China

Background: According to psychological theory, cognitive disorder is a psychological disorder developed from the perspective of cognitive psychological disorder. Psychological cognitive disorder can be called a neurocognitive disorder. Patients mainly have psychological disorders in problem-solving, perception, memory, learning and so on. In the field of medicine, psychological cognitive impairment is defined as six cognitive impairments: social cognition, complex attention, language, perceptual-motor function, learning and memory, and executive function. Patients usually have a decline in these cognitive abilities, and in severe cases, they can have a brain decline. The disease can be divided into congenital and acquired causes. The main congenital factors are autism such as growth retardation. The acquired factors are mainly HIV, prion diseases, Parkinson's disease, traumatic brain injury, Alzheimer's disease and so on. According to the different types of psychological cognitive impairment, it can be divided into three types in the field of psychology: insanity, mild neurocognitive impairment and severe neurocognitive impairment. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by the further aggravation of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show decreased overall function and develop to dementia, which will lead to delusion, indifference, lack of self-care ability and so on.

At present, the research of risk preference in investment psychology is facing great challenges, such as the inability to realize the real integration of financial investment model and business, strong subjective preference in data understanding and so on. Data science is based on professional knowledge, computer and mathematical statistics, and effectively combines the corresponding data to realize big data analysis. The licensing process of data science is to collect, clean, convert and operate data. Data modeling is realized through machine learning and exploratory analysis methods, and finally, data visualization is realized. The common data operation methods are data cleaning and preprocessing algorithms, such as sorting. Through the optimization algorithm of parameter estimation, such as least square method, Newton method and random gradient descent method. Machine learning algorithms for data analysis, such as prediction, analysis, clustering, etc. The application of data science covers many aspects, such as dealing with chaotic data, selecting the best algorithm, adjusting model parameter settings, and obtaining the best interpretation of data results. The integration of data science and investment psychology can realize risk prediction in a quantitative way, including obtaining investment laws through data processing, realizing robustness and feasibility through data algorithms, and realizing intelligent investment advisers. A large number of studies have pointed out that the integration of data science and investment psychology can reduce the symptoms of cognitive impairment, but the degree of improvement has not been confirmed.

Objective: To analyze the effect of data science applied to investment psychology risk preference on patients with mild cognitive impairment, in order to reduce the cognitive problems of cognitive impairment.

Research objects and methods: Patients with mild cognitive impairment in two regions were selected as the research object, and the improvement degree of patients with cognitive impairment was analyzed by classification and regression tree (CART). The evaluation includes four aspects: language ability, recall function, memory ability and orientation. The evaluation results are no improvement, slight improvement and obvious improvement. In order to facilitate the expression of the research results, the results of 50 patients with mild cognitive impairment in each research area were expressed.

Methods: The latest version of JMP Pro15 data statistics software is used to analyze the mitigation effect of data science applied to investment psychology risk preference on patients with cognitive impairment.

Results: Table 1 refers to the effect of data science applied to investment psychology risk preference on the improvement of patients with cognitive impairment. Applying data science to the risk preference of investment psychology, after the intervention of patients with mild cognitive impairment, the cognitive impairment of patients with mild cognitive impairment has been significantly improved, especially in language ability and recall function. Therefore, the risk preference assessment of investment psychology combined with data science can alleviate cognitive impairment and improve the level of scientific cognition.

Table 1. The application of data science in investment psychology and the effect of risk preference on the

improvement of patients with cognitive impairment

Category	No improvement	Slightly improved	Significant improvement
Language ability	1	26	23
Recall function	2	27	21
Memory ability	1	25	24
Directional force	3	26	21

Conclusions: Applying data science to the risk preference intervention program of investment psychology to improve mild cognitive impairment, especially in language ability and recall function. The results provide a new idea for the treatment of mild cognitive impairment.

* * * * *

ON THE INFLUENCE MECHANISM OF COMMUNICATION ADAPTATION BARRIERS ON COLLEGE ENGLISH CULTURAL COMMUNICATION TEACHING REFORM

Mingzhu Li & Ruijiao Wang

School of International Education and Tourism, Hainan College of Software Technology, Qionghai 571400, China

Background: According to the college English classroom teaching requirements (for Trial Implementation) issued by the Ministry of education, the teaching goal of college English teaching course should change the original “using English as a tool to obtain professional information” to “cultivate students’ comprehensive application ability of English, so that they can effectively communicate oral and written information in English”. Accelerating the cultivation of English communication talents is the problem and focus of current education. Under the background of quality education and teaching goal reform, the evaluation of students’ English quality and ability is no longer based on the five abilities to listen, speaking, reading, writing and translation, but pays more attention to the emphasis and cultivation of English majors’ communicative ability and cross-cultural communicative ability. Students’ cross-cultural communicative competence means that students can communicate with international friends smoothly and freely, and have a certain understanding of their language usage habits and cultural background. However, in the current college education, teachers often pay attention to the cultivation of theoretical knowledge and ignore the cultivation of students’ cross-cultural communicative competence, which makes the teaching effect not ideal. For language learning, if it is limited to the learning of words and grammar and ignores the understanding of the internal cultural connotation, the learning effect will only stay on the surface, resulting in the imbalance between language input and output, resulting in students’ lack of humanistic understanding and recognition in the learning process, and then produce communication and adaptation obstacles.

Communication adaptation barriers are the difficulties in opinion exchange and information transmission between people and teams, often including language barriers, conceptual barriers and temperament barriers, and different types of barriers are caused by different information senders, information receivers and information transmission channels. In the adaptive state of language communication, the emotional tendency, expression ability and judgment of the sender of information will affect the integrity of information transmission. The screening and tolerance of information by the receiver of information, psychological obstacles and the perfection of communication channel media and mechanism will also affect the communication, expression and exchange of information. Differences in thinking and cultural background make students have differences in the expression and understanding of the same language in the process of English learning, which leads to problems in the communication process, the decline of expression ability, communication anxiety and even the emergence of “Aphasia”, which affect their learning and life.

Objective: To study and analyze its impact on English cross-cultural communication teaching from the perspective of communication adaptation barriers. Based on the understanding of the current situation of English teaching and students’ communication adaptation barriers, through the innovation of teaching mode and the improvement of teaching scheme, we can alleviate their communication barriers, improve students’ English comprehensive ability and cross-cultural communication ability, and enhance their professional confidence.

Research objects and methods: The study first collected information on the level and current situation

of English use among 600 English majors of different grades in a university, and then selected the students with communication adaptation barriers as the research object, and developed the English cross-cultural communication scale based on the Chinese Communication Development Inventory (CCDI). The content includes grammatical problems, language habits, semantic ambiguity and other aspects to test the subjects' English communication. With the help of the association rule mining algorithm, the innovation of the English teaching mode is realized, so as to improve the cross-cultural communication ability and professional quality of students with communication adaptation disabilities.

Method design: Firstly, the basic information of English communication level and communication difficulty of English majors with communication adaptation disorder is collected and graded. With the help of the association rule mining algorithm, the correlation between communication adaptation disorder and the effect of college English cross-cultural communication teaching is explored, and on this basis, the content, resources means and other aspects of innovation and optimization. The new teaching model is applied to classroom teaching. The experimental time is three months. The scores of students' communication adaptation barriers and cross-cultural communication ability before and after the experiment are processed and analyzed.

Methods: Based on the correlation analysis between communication adaptation barriers and the effect of college English cross-cultural communication teaching, the association rule mining algorithm was used to realize the innovation of teaching mode, and the experimental data were collected and processed with the help of statistical analysis tools to obtain the experimental results.

Results: There are differences in teaching effect and teaching quality caused by the design of different teaching methods and schemes. The degree of emphasis on students' cross-cultural communicative competence in the English teaching classroom will affect students' learning enthusiasm and professional ability. From the perspective of communication adaptation barriers, exploring the development path of cross-cultural communication teaching in college English education can effectively improve students' communication barriers and teaching quality. Figure 1 shows the correlation results between the degree of students' communication adaptation barriers and the quality of teaching effect. The more serious the horizontal coordinate in the figure shows that the more serious the students' communication barriers increase.

Figure 1. The correlation between students' communication adaptation disorder and teaching effect

Conclusions: The differences in cultural background and language use habits often lead to the phenomena of "language inferiority complex" or "language embarrassment" in the process of English learning, resulting in communication and adaptation obstacles, which further affect the learning quality and teaching effect. From the perspective of the communication adaptation barrier, exploring its causes and its impact mechanism on cross-cultural communication ability in English learning can effectively improve students' understanding and cognition of western culture, promote the adjustment of their way of thinking, further improve students' cross-cultural communication ability and the smoothness of English communication, and then improve the quality of teaching.

* * * * *

ANALYSIS OF THE RELIEVING EFFECT OF THE MAIN MELODY ON THE AUDIENCE'S MENTAL ANXIETY IN VOCAL MUSIC SINGING

Chunlin Yang

School of Music and Dance, Nanning Normal University, Nanning 530000, China

Background: With the development of social economy and the improvement of people's living standards, people pay more attention to the quality of life and spiritual and cultural consumption. Rich and diverse cultural activities can effectively improve people's cultivation and moral concepts, and give them emotional feedback and experience. In recent years, vocal music has been loved and sought after by the public because of its wide universality and popular form. Vocal singing is a sound art based on people's own voice. Its manifestations include duet, chorus and chorus, which can trigger its emotional and spiritual resonance on the premise of meeting people's visual enjoyment to the greatest extent. Because of its high degree of freedom and strong dissemination, the scope and scale of its application are also gradually expanded. The main theme of vocal singing is the soul and essence of vocal music, which lays the emotional keynote of singing, and can directly reflect the thoughts and emotions of the work, thus creating an emotional atmosphere and giving audiences different emotional experience. Different main melody tones in vocal music singing will bring different emotional experiences to the audience. The relaxed and cheerful main melody can convey a positive and optimistic emotional experience, and the low and depressed main melody can convey a low and sad emotional experience. Vocal singing can give the audience different impressions through the style of lyrics and singing form, and adjust their emotions and psychological feelings in a sympathetic way, so as to reduce the negative emotions of the audience.

With the increase of social pressure and the limitation of individual tolerance, more and more people suffer from mental anxiety and difficulty in emotional regulation, which affect their physical and mental development. The essence of mental anxiety is anxiety disorder, which is a very complex psychological and emotional disorder. Its clinical manifestations are often motor agitation and sympathetic hyperactivity, accompanied by negative emotions such as anxiety, shame, disappointment, anxiety and fear. Appropriate mental emotion can make people in a more nervous mental state and improve the accuracy and sensitivity of judgment and handling of things. Excessive mental anxiety will make people's mental state fluctuate greatly, affect the objectivity of judgment, and cause adverse effects and losses on life and work. People who fall into mental anxiety are difficult to overcome their adverse symptoms by relying on their own strength, and their mental state and willpower are poor, so their contact with the outside world is relatively weak, which is not conducive to the recovery of their mental transformation. The intervention of mental anxiety patients in the form of vocal music singing, with the help of the power of music to strengthen its close contact with the outside world, the emotional experience and intervention mechanism brought to the audience by different types and styles of vocal music works are different. Therefore, it is of great practical significance and value to explore the influence mechanism of the main melody in vocal music singing on the audience's mental anxiety.

Objective: In order to alleviate the anxiety and discomfort of patients with mental disorders and help them better regulate their emotional and psychological problems, this paper studies the mechanism of relieving and improving the audience's mental anxiety in the form of vocal singing, so as to improve their mental health level and music appreciation ability.

Research objects and methods: 600 patients with mental anxiety were randomly selected as the research objects to collect their psychological status and anxiety level information, and through vocal performance, singing interaction by means of appreciation of music works, the Psychosomatic Tension Relaxation Inventory (PSTRI) and Symptom Checklist 90 (SCL-90) were used to collect and sort out the data of psychological stress and mental health level of mental anxiety audience.

Method design: The study first analyzes the correlation between vocal music singing and mental anxiety with the help of principal component analysis, and then randomly groups and intervenes the research objects according to different vocal music singing styles, namely bel canto (group A), ethnic group (group B) and popular group (group C). It can also classify different rhythm and emotional works according to the differences of vocal music theme. The experiment lasted for three weeks. After the experiment, the anxiety improvement of the subjects was analyzed, and the experimental results were obtained.

Methods: The correlation between vocal music singing and mental anxiety was analyzed by principal component, and the alleviation of mental anxiety of audience by different vocal music themes was explored by means of comparative experiment.

Results: The main melody in vocal music singing can reflect the characteristics of singing to a certain extent, cause the audience to resonate in the form of psychological hint, and then make the audience present different emotional feedback and emotional value, so as to realize the effect of emotional regulation. The results show that the main melody in vocal singing can effectively alleviate the audience's mental anxiety, get rid of negative emotions and effectively provide a level of mental health. Table 1 shows the score statistics of mental health scale of mental anxiety audience before and after the experiment.

Table 1. The scores of mental health scale of mental anxiety audience before and after the experiment

Scoring dimension	Before the experiment	After the experiment	Constant value
Force	1.88±0.57	1.53±0.41	1.62±0.57
Anxious	2.74±0.39	1.24±0.37	1.39±0.43
Depressed	2.05±0.63	1.38±0.50	1.50±0.59
Paranoid	1.94±0.58	1.37±0.45	1.43±0.58
Psychotic	2.63±0.46	1.21±0.32	1.29±0.42

Conclusions: Vocal music singing can improve people's perception, expressiveness and aesthetic ability of music art, and different styles and types of music works bring people different psychological feelings and emotional values. The difference of the main melody of vocal music can effectively bring different emotional experiences to the audience, make them feel "immersive", and then help them relieve their emotions in the process of vocal music singing, reduce negative emotions, effectively improve the audience's mental anxiety and improve their mental health level.

A STUDY ON THE IMPACT OF COMMUNICATION ADAPTATION BARRIERS ON WORK VALUES AND TURNOVER INTENTION OF COLLEGE TEACHERS

Jing Gu^{1,2}

¹*College of Economics and Management, Nanjing University of Aeronautics and Astronautics, Nanjing 211106, China*

²*Scientific Research and Development Division, Nanjing Institute of Tourism & Hospitality, Nanjing 211100, China*

Background: Communication adaptation disorder is manifested in the difficulties of opinion exchange and information transmission between people and teams. It often includes language barrier, concept barrier and temperament barrier, and different types of obstacles are caused by different information senders, information receivers and information transmission channels. In the adaptive state of language communication, the emotional tendency, expression ability and judgment of the sender of information will affect the integrity of information transmission. For example, the sender of information will produce different emotional values and behavior orientation under the influence of language environment, age structure and individual differences, and then affect the fluency and logic of communication and expression. At the same time, different information recipients have different ideas and views on the same thing by subjective tendency and value orientation, and there are different characteristics in information screening and tolerance. At the same time, the perfection of communication channels, media and mechanisms will also affect the communication, expression and exchange of information. Due to the certain psychological distance between college teachers and younger groups, and the differences in environmental conditions and thinking, there are differences in the expression and understanding of the same language between college teachers and students. At the same time, the singleness of communication media channels will also make teachers and students have communication problems, which will affect teachers' expression ability and produce communication adaptation obstacles. The main service object of teachers is students, and their sense of value acquisition and satisfaction mainly come from students' feedback and evaluation. However, the actual distance and psychological distance between college teachers and students affect teachers' participation and communication with students, and then have a negative impact on teaching effect and quality. The quality of classroom effect and the satisfaction of students' evaluation are the best test criteria for teachers' working ability and value. Communication adaptation barriers will affect teachers' emotional tendency and expression ability, directly affect the teaching quality and teaching effect, and then affect teachers' evaluation and doubt of their own ability and working values. Communication and adaptation

barriers will make teachers have negative emotions and affect their working state and their career planning. Therefore, exploring the impact mechanism of communication adaptation barriers on college teachers' work values and turnover intention will help teachers improve professional skills and work recognition, improve self-efficacy and job satisfaction, and provide reference for teacher training programs.

Objective: To analyze the impact of communication adaptation barriers on college teachers' work values and turnover intention from the perspective of communication adaptation barriers. Based on the understanding of the current teaching situation and teachers' communication adaptation barriers, we can alleviate their communication barriers through communication intervention, and analyze the data of teachers' work values and turnover intention, so as to improve their teaching confidence and professional skills.

Research objects and methods: Firstly, the adaptation of teachers and communication obstacles in colleges and universities are selected as the research object, and then the adaptation information of teachers and communication obstacles are collected and transformed into the research object. Then, with the help of association rule mining algorithm, this paper explores the impact of communication adaptation barriers on work values and turnover intention, and puts forward corresponding countermeasures to alleviate teachers' communication adaptation barriers, in order to improve college teachers' professional ability and literacy and help them make better career planning.

Method design: Firstly, collect and grade the basic information about the current situation of communication level and the difficulty of communication adaptation of teachers with communication adaptation barriers, and explore the correlation between communication adaptation barriers and teachers' work values and turnover intention with the help of association rule mining algorithm. The experiment lasted for three months. The data of teachers' work values and turnover intention were processed and analyzed before and after the experiment.

Methods: Based on the correlation analysis between communication adaptation barriers, work values and turnover intention, the association rule mining algorithm was used for experimental intervention, and the experimental data were collected and processed with the help of statistical analysis tools to obtain the experimental results.

Results: The ideological control of students' collective behavior was more difficult to predict and judge, and also exacerbated the communication and adaptation obstacles of teachers to a certain extent. Alleviating teachers' communication and adaptation barriers can effectively improve teachers' self-efficacy and job recognition, and reduce their turnover intention. Table 1 shows the statistics of teachers' satisfaction with different dimensions before and after the experiment.

Table 1. Statistics of teachers' satisfaction with different dimensions before and after the experiment

Timing	Communication Initiative (%)	Information fluency (%)	Difficult adaptability (%)	Work enthusiasm (%)	Self-efficacy (%)
Before experiment	22.3	22.5	14.7	16.8	23.7
After the experiment	52.3	64.6	74.5	89.4	87.2

Conclusions: The influence of internal and external environmental pressure makes college teachers have different communication and adaptation barriers, has a negative impact on their teaching work and life, and will produce negative emotions accordingly, which will shake their work values and career planning plans. From the perspective of communication adaptation disorder, help teachers improve their symptoms, improve their self-awareness and self-efficacy, and improve the quality of teaching.

SPECIAL FUNCTION DESIGN OF URBAN RAIL TRANSIT BASED ON THE WELL-BEING OF RESIDENTS WITH URBAN COGNITIVE IMPAIRMENT

Jie Zhong^{1,2} & Jing Yin³

¹Teaching Center, Chengdu Institute of Rail Technology, Chengdu 610000, China

²Razak Faculty of Technology and Informatics, Universiti Teknologi Malaysia, Kuala Lumpur 54100, Malaysia

³Department of Basic Courses, Deyang College of Urban Rail Transit, Deyang 618400, China

Background: In recent years, the development of urban transportation in China is getting better and better, and various transportation facilities are gradually improved. Rail transit routes form a network all over the city and extend to the edge of the city. The vigorous development of rail transit has brought convenience to residents' lives. At the same time, the objects of urban rail transit design are usually ordinary residents. For those urban residents with cognitive impairment, the current urban rail transit design cannot meet their needs for urban transportation. Cognitive impairment refers to the abnormal processing of learning, memory and thinking, memory and learning impairment, and the emergence of physiological diseases such as aphasia and disability. Therefore, residents with cognitive impairment will have memory decline and memory decline. They can't remember the complex rail transit map, so they can't find what station they need to get on and get off from. The difficulty of taking the bus makes these residents with cognitive impairment feel helpless and panic, and even fear and fear of going out. Then affect the well-being of residents with cognitive impairment. In addition, residents with cognitive impairment will also have a sense of direction disorder and a decline in their ability to use language. These symptoms will seriously affect their sense of the experience of rail transit, which is not conducive to the improvement of residents' well-being. Therefore, we need some designs that can help them get on the bus quickly, so that they can quickly find the route and follow the guidance to get on and off the bus. Special functions are designed for residents with cognitive impairment who show different obstacles so that they can ride without worry, feel no embarrassment on the way, and feel the love and respect of the state for them.

Objective: The design of urban rail transit shall be adjusted according to the cognitive impairment of urban rail transit and the different obstacles of residents. According to the general design principles, the characteristics of different groups of people taking rail transit shall be taken into account. The special design shall also be carried out for those special groups to ensure their safety and efficiency and help them take the means of transportation smoothly. Let them feel care all the time. For example, reduce the number of stairs, increase the number of walking elevators, and display the location of elevators through guide signs to remind people in need to take them. Add a vision impairment guidance system to guide those residents with cognitive impairment with direction impairment to take transportation through a portable voice prompt device.

Research objects and methods: The subjects were residents of a community with cognitive impairment in a city. Fuzzy evaluation is used to evaluate the impact of special function design of urban rail transit on residents' well-being. These residents include different groups such as the elderly, women and people with physical disabilities, who can communicate normally. Before fuzzy evaluation, understand their travel situation, evaluation and suggestions on the current urban rail transit, and evaluation on the special functions of urban rail transit. The fuzzy evaluation is divided into five levels, that is, the five-level scoring system. 1-5 points mean irrelevant, slight impact, general impact, obvious impact and complete impact respectively. Through the statistical analysis of the collected data by SPSS software, this paper studies the impact of urban rail transit special function design on residents' well-being. All results need to be averaged and rounded to reduce the interference of subjective factors.

Results: The collected data are sorted out and statistically analyzed by SPSS software. The impact of special function design of urban rail transit on residents' well-being is shown in Table 1.

Table 1. Impact of special function design of urban rail transit on residents' well-being

Crowd	Add escalator	Visual impairment guidance system	Carriage handles vary in height	Wheelchair lift
Decreased motor ability	3	3	2	5
Memory impairment	4	4	3	3
Disorientation	4	5	2	3

In Table 1, different urban rail transit special function designs have different effects on the well-being of different groups. For residents with cognitive impairment with decreased motor ability, wheelchair lifts can completely affect their well-being, and the corresponding impact score is as high as 5 points. Different

carriage handle heights have little impact on them, only 2 points. The cognitive impairment residents with memory impairment scored 4 points, 4 points, 3 points and 3 points respectively on the carriage handle height, visual impairment guidance system, carriage handle height and wheelchair lift. The score of the guidance system for visual impairment was 5.

Conclusions: The special function design of urban rail transit track can help those residents with urban cognitive impairment improve their sense of well-being, reduce residents' anxiety about travel and transportation, and improve residents' quality of life. These designs enhance the social care for special groups, are full of humanistic care, meet the expectations and needs of special groups for urban rail transit, enable them to better integrate into social life, improve their enthusiasm to participate in social life, and are conducive to the harmonious development of society.

RESEARCH ON THE STRATEGY OF INTERNET FINANCE HELPING RURAL REVITALIZATION IN XINJIANG FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Tianhong Han¹, Borui Liu^{1*} & Xuejian Wang²

¹*College of Information Engineering, Tarim University, Alaer 843300, China*

²*College of Economics and Management, Tarim University, Alaer 843300, China*

Background: Cognitive psychology rose in the West in the 20th century, and its research object is the individual's advanced psychological process. This psychology emphasizes the role of knowledge and believes that knowledge is the main factor affecting individual behavior. The research of cognitive psychology involves the cognitive processes of attention, memory and thinking, and studies the unobservable internal mechanisms and processes such as processing, storage and adaptation. Different from the previous psychological research, the research method of cognitive psychology is a systematic scientific method; Compared with behaviorist psychology, cognitive psychology has internal psychological states such as belief, desire and motivation.

The rural revitalization strategy is a milestone in the development of "agriculture, rural areas and farmers". The rural revitalization strategy is inseparable from the support of Internet finance. However, at present, the products and services provided by rural traditional financial institutions cannot keep up with the pace of the times. The solidified business thinking limits the development of rural finance, and rural residents have insufficient cognitive knowledge about Internet finance, without corresponding Internet financial thinking, I can't understand the role of Internet Finance in rural revitalization strategy. How to break this situation is a problem that needs to be solved at present. Xinjiang is also faced with this problem, and even the task is arduous, because the rural population of Xinjiang accounts for more than half of the total population of Xinjiang, farmers lack initial education, the educational level of rural residents is low, and the number of agricultural and non-agricultural vocational education is even less. From the perspective of cognitive psychology, it can be seen that the lack of Internet finance knowledge affects the attitude of rural residents towards Internet finance, resulting in their cautious financial management projects and lack of desire for wealth creation through Internet finance. Most of them just deposit money in banks or post offices, and the limited financial knowledge comes from the staff of major banks or post offices, even those financial products introduced by the staff cannot be well understood, and they are highly dependent on traditional finance. Due to their cautious character, they are unwilling to use Internet finance, afraid of being cheated, and their trust in Internet finance is not high. In addition, limited by the level of education, many rural residents will not use smart phones and other complex tools, and the network coverage in some remote areas is not high, which hinders the development of Internet Finance in rural Xinjiang.

Objective: In order to change the problems of rural residents in Xinjiang in Internet finance, TV, radio and other carriers are used to publicize Internet finance, so as to improve the awareness of rural residents on Internet finance. Make good use of the way of wall brushing publicity and carry out relevant publicity activities. In the activities, attract rural residents by giving small gifts to reduce their rejection of Internet finance, explain the knowledge of Internet finance, answer their questions, focus on the detailed introduction of financial services and products, and remind rural residents to pay attention to financial fraud. Increase their knowledge of Internet Finance and promote the desire of rural residents to buy financial products. Expand the network coverage in rural areas, establish some public Internet places, and teach the use skills of intelligent devices, so that more residents can use intelligent devices normally. With the help of Internet technology, we will further expand the scope of rural financial services and reduce the

cost of financial services.

Research objects and methods: The research object is the rural residents in Xinjiang. The fuzzy evaluation method is used to evaluate the satisfaction of the impact of Internet Finance on the rural revitalization strategy in Xinjiang. Before the evaluation, understand their understanding of Internet finance knowledge and satisfaction evaluation of Internet Finance Assistance Measures. The grade of satisfaction evaluation is divided. The satisfaction score adopts the five-level scoring system. 1-5 points respectively mean very dissatisfied, relatively dissatisfied, average, relatively satisfied and very satisfied. Data processing adopts Excel software and SPSS software. All results are averaged and rounded.

Results: The questionnaire data were processed to study the satisfaction of different village residents with internet financial assistance measures. The results are shown in Table 1.

Table 1. Satisfaction of residents in different villages with internet financial assistance measures

Village	Internet financial knowledge broadcasting and publicity	Internet financial knowledge campaign	Establish public Internet access places	Professor of intelligent device use
Village A	3	4	5	4
Village B	2	3	4	4
Village C	4	5	5	5

In Table 1, residents in different villages in Xinjiang are different in their satisfaction with internet financial assistance measures. The residents of village a scored 5 points on the establishment of public Internet access places, indicating that the residents of village a are very satisfied with this assistance measure. Village B residents were not satisfied with the broadcasting and publicity of Internet financial knowledge, only gave 2 points, and were satisfied with the establishment of public Internet access places and the use of smart devices. On the whole, the residents of village C are the most satisfied with the three assistance measures among the three villages.

Conclusions: The rural development in Xinjiang is relatively slow, the education level of rural residents is not high, and they are relatively excluded from Internet finance. Through the innovative research on the strategy of Internet finance to help rural revitalization, we have increased the broadcasting and publicity of Internet finance knowledge, established public Internet places and other assistance measures, so that rural residents are full of expectations for the development of rural Internet finance, and their understanding of Internet finance is slowly improving.

INFLUENCE OF THE LINKAGE DEVELOPMENT OF HUMANISTIC TOURISM AND TOURISM CULTURAL INDUSTRY ON ALLEVIATING TOURISTS' PSYCHOLOGICAL ANXIETY

Wei Niu

International Business School, Global Institute of Software Technology, Suzhou 215163, China

Background: The improvement of economic level drives the growth of various consumer industries. Tourism is more and more favored by people in the tertiary industry, and the output value of national tourism is growing rapidly. As a very important part of the tourism industry, tourists' mental health has attracted much attention. The fierce competition and fast-paced life have led to a sharp increase in people's psychological pressure, and various mental health problems occur frequently, because the number of suicides due to psychological problems is as high as more than 10 million in the world. Among the mental health problems, psychological anxiety accounts for a large proportion. Psychological anxiety is divided into realistic anxiety and pathological anxiety. The cause of realistic anxiety is the psychological anxiety caused by the occurrence of events or scenes beyond the control of individuals. This anxiety will be alleviated by the resolution or disappearance of events. Because they feel uneasy and nervous for no reason, they lead to pathological anxiety. Under this anxiety, people will feel uneasy and unwarranted fear, sometimes accompanied by physiological symptoms such as palpitation and shortness of breath. This anxiety is relatively persistent. Although the objective factors leading to anxiety have disappeared, this anxiety will continue for a period of time. Generally speaking, the reason for this situation is related to individual personality characteristics. Psychological anxiety has a great impact on people's physical and mental health, and even lead to suicide. Among many ways to alleviate neuropsychological disorders, tourism has become

the choice of many tourists. Through watching beautiful scenery and tasting delicious food in the process of tourism, release the soul, integrate the body and mind into the natural landscape, and alleviate psychological anxiety. Humanistic tourism adds cultural connotation to the tourism and cultural industry. The humanized design, management, and service allows tourists to get more considerate services, promotes the further alleviation of psychological anxiety, and enables tourists to get high-level physical and mental satisfaction, so as to promote tourists' further consumption and deepen tourists' sense of identity with the local tourism and cultural industry. Let the tourism and cultural industry develop better.

Objective: Deepen the linkage development of humanistic tourism and tourism cultural industry, establish corresponding tourism brands and tourism cultural brands according to local characteristics and tourists' consumption needs, so that tourists can enjoy visual and spiritual enjoyment in this tourism atmosphere, so as to gradually eliminate tourists' negative emotions and alleviate tourists' psychological anxiety. Pay attention to the cultivation of the comprehensive quality of tourism practitioners, transform tourism culture into drawings and images, deepen the construction of tourism cultural atmosphere, enhance humanistic value, pay attention to the tourism experience of tourists, and provide humanized services for tourists. Tourists can not only get intimate services, but also relieve their physical and mental fatigue and tension caused by psychological anxiety under this humanistic care. They can also improve their cultural literacy in a strong cultural atmosphere, so as to improve their personal cultural taste.

Research objects and methods: Taking tourists as the research object, 310 tourists are randomly selected from a cultural tourist destination. These tourists come from different regions, and there are certain differences in their occupation, hobby, education and income level. In order to study the impact of the linkage development of humanistic tourism and tourism cultural industry on alleviating tourists' psychological anxiety, a questionnaire was compiled. A total of 310 questionnaires were distributed, 302 questionnaires were recovered, and the invalid questionnaires were excluded. The number of valid questionnaires was 297, and the effective rate was 95.81%. The quantitative value of the impact of specific factors is scored at levels 1-5, with 1-3 indicating no impact, slight impact, and general impact, and 4 and 5 indicating obvious impact and complete impact respectively. The SCL symptom checklist was used to detect the changes in tourists' psychological anxiety. The symptom score was 1-5. The higher the score, the more serious the psychological anxiety. The statistical analysis of questionnaire data was carried out by SPSS software.

Results: The data collected in the questionnaire were statistically analyzed. The scores of psychological anxiety symptoms of tourists in different positions after tourism are shown in Table 1.

Table 1. The influence of college music education integrated into music culture in different regions on college students' emotional disorder

Occupation	Obsessive compulsive symptoms	Interpersonal relationship	Anxious
Junior middle school teachers	1.45±0.64	1.36±0.41	1.28±0.55
Programmer	1.68±0.68	1.33±0.53	1.52±0.62
Civil servant	1.34±0.43	1.48±0.75	1.43±0.60

In Table 1, after the tour, the psychological anxiety symptoms of junior middle school teachers, programmers and civil servants range from mild to general, and there are differences in the scores of psychological anxiety symptoms of tourists of different occupations. The anxiety of junior middle school teachers was the lightest, with a score of (1.28 ± 0.55), followed by interpersonal relationship, with a score of (1.36 ± 0.41). The score of compulsive symptoms of programmers was (1.68 ± 0.68), and the scores of civil servants on compulsive symptoms, interpersonal relationship and anxiety were (1.34 ± 0.43), (1.48 ± 0.75) and (1.43 ± 0.60) respectively.

Conclusions: Integrate culture into tourism, improve the cultural connotation of tourism projects, let tourists feel the humanistic care spirit of the tourist destination, relax their body and mind and reduce the psychological anxiety caused by pressure under the surrounding of beautiful scenery and delicious food. Under the humanistic concept of tourism destination, improve self-cultivation of quality, make self-behavior more civilized, and promote the improvement of self-taste after deeply excavating the cultural connotation of humanistic tourism.

* * * * *

TEACHING PRACTICE REFORM OF FILM AND TELEVISION MAJOR IN HIGHER VOCATIONAL COLLEGES UNDER THE GUIDANCE OF SHORT VIDEO MARKETING

Qinghong Zhu

The Institute of Architectural Engineering and Art Design, Wuxi South Ocean College, Wuxi 214081, China

Background: The ability to respond to stimuli inside and outside the receptor is called consciousness, or the ability of individuals to recognize and observe themselves and the outside world. Conscious individuals usually have good orientation, can have a clear understanding of the surrounding environment and themselves, and their conscious content in cognition, judgment and reasoning is normal. Consciousness obstacle is the obstacle in the individual's awakening state, orientation and consciousness content. Analyzing the current development of short video from the perspective of consciousness barrier, the vigorous development of short video gradually shows some problems. Short video plagiarism, infringement, handling and other phenomena emerge one after another. When a short video is popular, many short videos of the same type will appear quickly, but the actors inside change, the content is basically similar, and the copyright awareness of the short video producer Lack of legal awareness. Influenced by the general environment of short videos and the idea of putting interests first, the students majoring in film and television in higher vocational colleges are not aware of the awakening state of consciousness, weak awareness of copyright, lack of legal awareness and lack of good orientation. Driven by interests, in order to obtain more traffic, they follow the trend in the production of popular videos, weak awareness of innovation and lack of innovation in the short videos produced. Lack of awareness of the market, lack of judgment ability in the audience's video pain points, awareness content barriers, lack of market awareness, film and television students' aesthetic awareness needs to be continuously improved in order to keep up with the audience's increasing aesthetic awareness.

The development of short video market and the consciousness barrier of film and television majors in higher vocational colleges put forward new requirements for the teaching of film and television majors. In the previous teaching, short video and other related teaching contents should be added, which is not a small teaching reform for the teaching of film and television majors. We need to strengthen the cultivation of copyright awareness, legal awareness, market awareness, innovation awareness and aesthetic awareness of film and television majors, awaken the subject consciousness of film and television majors through teaching, and make their learning attitude more proactive, so as to improve their professional level and adapt to market changes.

Objective: In view of the consciousness obstacles of film and television majors in higher vocational colleges, teaching practice reform should be carried out to enable students to stimulate their subject consciousness in an equal teaching form. In the learning atmosphere of free communication, carry out discussion and Research on problems, enhance the ideological collision between students and cultivate students' interest in learning. Through the in-depth analysis of some excellent cultural works, we can understand the character and relevant background, integrate into the market consciousness, so as to improve the performance level and arouse the resonance of the audience. Let students adapt or create literary works, ponder the author's writing perspective, guess the character of the characters, and deepen their understanding of the characters, so as to improve students' cultural literacy, creative ability and performance ability, which is conducive to the improvement of students' innovative consciousness. Teach students majoring in film and television copyright knowledge and law to improve their copyright awareness and legal awareness.

Research objects and methods: The research object is the students majoring in film and television in higher vocational colleges. This paper analyzes the problems existing in the current short video market and the performance of consciousness obstacles of film and television students, studies the areas where film and television teaching in higher vocational colleges needs to be improved, and collects and processes relevant data. The teaching practice reform intervention experiment is carried out for the learning of film and television major in higher vocational colleges. The film and television students in two classes are randomly divided into control group and intervention group. There is no significant difference in the level of students in the two classes. The control group adopted the teaching practice mode before the reform, and the intervention group adopted the teaching practice mode after the reform. The intervention experiment lasted for 3 months. The teaching practice mode and its effect used in the intervention experiment were quantitatively analyzed by meta-analysis, and the collected experimental data were processed by SPSS software.

Results: SPSS software was used to process the relevant experimental data to study the effect of the reform of teaching practice mode of film and television specialty in higher vocational colleges. The results are shown in Table 1.

In Table 1, after the intervention experiment, the degree of consciousness disorder of film and television

majors in the control group and the intervention group is different. The market awareness score of the control group was (61.22 ± 2.45), and the market awareness score of the intervention group was higher than that of the control group (83.41 ± 3.17). The scores of aesthetic consciousness in the intervention group were higher than those in the control group (32.0 ± 51).

Table 1. The effect of the reform of teaching practice mode of film and television specialty in higher vocational colleges

Group	Market awareness	Innovative consciousness	Aesthetic consciousness
Control group	61.22±2.45	64.56±0.46	70.34±0.58
Intervention group	83.41±3.17	86.32±0.51	93.48±0.55

Conclusions: The rapid rise of short video has become a way of entertainment for many people in their leisure time. The problem of short video market awareness barriers has become increasingly prominent, which has brought enlightenment to the teaching practice of film and television majors in higher vocational colleges. In view of these awareness barriers, we should strengthen the cultivation of film and television Majors' relevant awareness and promote the improvement of students' relevant awareness, so as to improve the professional ability of film and television majors and promote the improvement of short video quality, provide more employment opportunities for students majoring in film and television.

THE INFLUENCE OF HUMANISTIC SPIRIT ON STUDENTS' THINKING LOGICAL OBSTACLES IN MARXIST PHILOSOPHY EDUCATION

Yanhua Li

College of Marxism, Xi'an University of Science and Technology, Xi'an 710054, China

Background: Thinking logic disorder belongs to the thinking disorder of cognitive disorder. Thinking logic disorder mainly includes four types of thinking logic disorder, such as symbolic thinking and new words. Individuals with symbolic thinking will have obstacles in the use of words, and often give some common words special meanings, which are incomprehensible to ordinary people. The pathological manifestation of symbolic thinking is the anti-wearing behavior of mental patients, or giving some meaning to some things normally, such as green symbolizes life. Individuals make up words and give them special meanings, which has become a new work of words. In addition, the individual thinking with logical inversion thinking is logically confused, without correct logic, and the relevant reasoning cannot be supported by facts or statements. Sophistry thinking individuals use a large number of empty words in word expression, which cannot be realized. The relevant remarks are farfetched, pure nonsense and empty words, stubbornly adhere to their own views and do not listen to the opinions of others. At present, under the influence of traditional education mode, college students are used to passive acceptance of knowledge and are not good at active thinking. In the face of problems, college students' thinking logic ability is insufficient and there are thinking logic obstacles, which are embodied in three aspects: new words, logical wrong thinking and sophistry thinking. The concept is the basic point of thinking logic. Due to the confusion of logical basic points, the understanding of conceptual knowledge is inaccurate, and the similarity and difference of relevant concepts cannot be distinguished, resulting in the misuse of concepts or the lack of knowledge on how to mobilize relevant knowledge. The relevant learning knowledge cannot form a complete logical thinking system, resulting in confusion of thinking logic. Lack of logical thinking method and insufficient ability to observe, analyze and deal with problems.

The humanistic spirit pays more attention to individual values and needs, which represents a kind of value concept and cultural spirit. It includes the humanistic spirit. The organic combination of scientific spirit and humanistic spirit is emphasized in Marxist philosophy education. Through humanistic spirit education, stimulate students' thinking, improve their spiritual realm, and pay attention to the development of students' psychology, thinking and personality. This paper analyzes the influence of humanistic spirit on students' thinking logical obstacles in Marxist philosophy education.

Objective: To understand the current thinking logic obstacles of college students, study the role of humanistic spirit in the all-round development of college students, make a specific analysis of the dominance of Marxist philosophy in humanistic education, and analyze the influence of humanistic spirit on students' thinking logic obstacles in Marxist philosophy education.

Research objects and methods: The research objects were college students with thinking logic disorder. 300 college students with thinking logic disorder were randomly selected from three universities. These students come from different majors and grades. Understand the situation of these students' thinking logic obstacles, analyze the causes of college students' thinking logic obstacles, record relevant thinking logic obstacle data, and evaluate the impact of humanistic spirit on students' thinking logic obstacles in Marxist philosophy education through fuzzy evaluation. The impact degree score adopts grades 1-5. The higher the score, the higher the impact. The relevant data processing software is SPSS17.0 software.

Results: Influenced by the traditional teaching mode, college students are used to the way of passive acceptance of knowledge, students' active learning ability is insufficient, and there are great problems in the logical thinking analysis of problems. The thinking logic is confused and the concept is used indiscriminately. College students of different majors have different degrees of thinking logic obstacles. After Marxist philosophy education, students majoring in business English scored 3 points on new words and expressions, which was 1 point lower than that before Marxist philosophy education. The relevant results are shown in Table 1.

Table 1. Scoring of thinking logic obstacles of college students of different majors before and after Marxist philosophy education

Major	Time	Word remaking	Logical fallacy thinking	Sophistry thinking
Business English major	Before education	4	4	4
	After education	3	2	2
Computer major	Before education	3	3	3
	After education	1	1	1
Financial management	Before education	4	4	4
	After education	2	3	2

Conclusions: Thinking logic disorder is a common thinking disorder among college students, which is manifested in the confusion of the basic points of thinking logic, the poor relevance of speech logic and the lack of logical thinking methods. The humanistic spirit in Marxist philosophy education pays attention to the all-round development of college students, which can affect the quality of college students at multiple levels and angles, and play a positive role in promoting the thinking and logic ability of college students. Under the thinking training, improve the mind of college students, so as to think effectively, improve the confusion of thinking logic, improve the ability of college students to distinguish value, and alleviate the obstacles of college students' thinking logic.

METHODS OF COLLEGE COUNSELORS INNOVATING STUDENTS' IDEOLOGICAL AND POLITICAL THEME EDUCATION PATH FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Enyu Chen

Navigation College, Jiangsu Maritime Institute, Nanjing 211170, China

Background: Educational psychology is to study and record the psychological activities and change laws related to educators and educated. The research environment is the process of education and teaching. This psychology belongs to a branch of psychology and is an interdisciplinary subject between educational science and psychological science. At the end of the 19th century, educational psychology developed into an independent discipline. With the continuous development of society and the increasing need of education, the task of educational psychology is adjusted, and the scope of research objects of educational psychology is slowly expanded. In the early stage of development, educational psychology focused on the research and discussion of learning psychology and learning laws, and these research contents were mainly intellectual

education. When people gradually pay attention to the all-around development of individuals, the educational content has been adjusted accordingly, and the moral behavior, emotion and aesthetic emotion are listed as the key training content. Educational psychology includes school education, family education and social education. The development of individual morality, intelligence, physique and beauty is mainly formed in schools. Therefore, the generally mentioned educational psychology refers to school education, and its research content refers to the psychological change law of teachers and students in the process of school education. It can also be expressed as the psychological law of studying students' learning education and teachers' education and teaching.

In college education and teaching, counselors occupy a very important position. In addition to managing students' daily life and study, they should also care about students' psychological changes and provide them with psychological counseling. In the process of psychological counseling, counselors will improve the efficiency of psychological counseling by using psychological knowledge. At present, with the rapid development of network technology, students can receive all kinds of new things and ideas in the network. However, it is the convenience of the Internet that increases the scope of the spread of social emotions. These social emotions bring a large number of negative emotions to college students, which seriously affects the mental health development of college students, so college students are driven by negative emotions and do some bad things. At this time, if someone interferes with and correctly guides the thought and behavior of college students, it will avoid the development of some bad things. Therefore, it is very necessary for college counselors to use educational psychology to innovate students' ideological and political theme education, which is conducive to the good development of college students' study and life, and help them cultivate good moral quality.

Objective: To apply educational psychology to the innovation of Ideological and political theme education, set up a reward and punishment system through counselors in class management, let students supervise each other, properly formulate a class goal and establish class honor, which is conducive to students' positive collective consciousness. Driven by the collective consciousness, students will predict the consequences of self-assessment, urge yourself to correct your words and deeds. In the daily management of students, master the psychological changes of students, widely use psychological hints, and imperceptibly promote the enhancement of students' psychological quality.

Research objects and methods: The research objects are college students. Four classes are randomly selected from a university. These classes are for freshmen and sophomores, and there are two classes in each grade. The majors of these four classes are business English, garden, computer and civil engineering. The fuzzy comprehensive evaluation method is used to evaluate the impact of ideological and political theme education innovation on the psychological status and behavior of students in these four classes. The experimental time is one semester, during which the relevant experimental data are recorded. Grade 1-5 scores are used to quantify the impact of specific factors. The higher the score, the greater the impact. The relevant experimental data were processed and analyzed by SPSS software.

Results: Educational psychology can make the ideological and political theme of education of counselors more perfect from the left, and enhance the scientific of student management. In the face of different students, counselors can carry out targeted ideological education and teaching by using educational psychology teaching to help each student grow. After the innovation of ideological and political theme education path, students' psychological quality has been significantly improved. The class learning enthusiasm score of business English major is 5 points, and the score of computers major in pressure resistance and creativity is 4 points. Table 1 shows the psychological quality scores of students in different majors after the innovation of ideological and political theme education paths.

Table 1. Psychological quality scores of students in different majors after the innovation of ideological and political theme education path

Major	Learning enthusiasm	Compressive capacity	Creative ability
Business English major	5	4	3
Computer major	5	4	4

Conclusions: The continuous development of informatization has opened up the horizons of college students and enriched their knowledge. However, there are advantages and disadvantages. Due to the small control of network information, college students will be exposed to some negative emotions, which is not conducive to their healthy growth of body and mind. The traditional way of education can no longer meet the needs of college students' ideological and political education. Educational psychology is used to innovate the traditional way of education. When psychological counseling for students, counselors teach each student according to their aptitude, have equal dialogue, improve students' psychological quality and cultivate pillars for the country.

THE CAREER OF PRESIDENT ZHONG RONGGUANG OF LINGNAN UNIVERSITY FROM THE PERSPECTIVE OF HISTORICAL PSYCHOLOGY

Muchan Lin¹ & Junlong Lin²

¹*Cultural Museum, South China Agricultural University, Guangzhou 510642, China*

²*School of Humanities, Tsinghua University, Beijing 100084, China*

Background: Historical psychology can also be called psychological history. This psychological research includes the relationship between individual psychology and activity achievement, ability and creative activity. The relationship between individual psychology and social history, the historical clues in the process of psychological development, the historical development of psychological quality, and psychological quality includes ability, consciousness and so on. The psychological characteristics of social and historical figures and the relationship between relevant historical events and them. According to these psychological bases and characteristics, the historical development process of individual psychology is summarized. Some historians believe that independent personality is related to the development of the times. It does not exist in the primitive society, but after the disintegration of the primitive commune. Under the formation of social class, different personality characteristics are formed according to the different social divisions of labor, so that individuals have a spiritual life.

From the perspective of historical psychology, this paper studies the career of Zhong Rongguang, President of Lingnan University. Zhong Rongguang, President of Lingnan University, played a very important role in the educational circles during the period of the Republic of China. “Cai Yuanpei in the north and Zhong Rongguang in the South” is a high affirmation of his contribution to the educational circles. He was the president of the first generation of universities in China. He played an important role in Chinese education and transformed Chinese traditional education into modern education. Zhong Rongguang, born in Zhongshan city, Guangdong Province, is a famous educator and social activist in modern China. He actively carried out educational reform. In 1912, he served as the director of education in Guangdong. In accordance with Sun Yat Sen’s knowledge, he vigorously promoted Cai Yuanpei’s democratic school running. Learn from the advanced education system in Europe and America, reform the old schools, implement the compulsory enrollment system for children, and advocate those men and women can study in the same school. Normal schools were restored and added to encourage women to study in schools and study abroad. During this period, the “Lingnan exchange student program” was formulated. Pay attention to overseas Chinese education, adhere to patriotism and advocate love education.

Objective: To understand the research scope of historical psychology, study the career of Lingnan University President Zhong Rongguang from the perspective of historical psychology, and understand his life stories and historical events at each important turning point of life. So as to know his achievements and specific performance in education, as well as the impact of these educational achievements on Chinese education, so as to set an example for the educational community, let everyone remember his hard work for Chinese education, and urge educators to take over the educational burden, move on and promote the continuous development of Chinese education.

Research objects and methods: The research objects are school teachers. 100 teachers are randomly selected from 20 colleges and universities. These teachers have a different political outlook, educational background and family background, understand their attitudes and views on education, record relevant data, process them with SPSS software, use fuzzy evaluation, and quantify the influencing factors with grade 1-5 score, the lower the score, the smaller the impact. This paper studies the impact of Lingnan University President Zhong Rongguang’s career on Chinese education.

Results: Historical psychology can study the psychological characteristics of social and historical figures and the relationship between relevant historical events and them. From the perspective of historical psychology, it can study the career of Zhong Rongguang, President of Lingnan University, analyze the important events at each stage of life, the impact on Chinese education and the enlightenment to Chinese educators. Through fuzzy evaluation, from the perspective of different teachers, ideological and political teachers have the highest proportion of people who understand the career of President Zhong Rongguang of Lingnan University, accounting for 74.19%. The relevant results are shown in Table 1.

Conclusions: Zhong Rongguang was a famous educator and social activist in the period of the Republic of

China. He occupied an important position in the educational circles at that time and had a far-reaching influence. He is still remembered by many people today. From the perspective of historical psychology, this paper studies Zhong Rongguang's life. He made different contributions to China's education in different stages of life, which had a great impact on that time and now. In order to commemorate his outstanding contribution to the University, Lingnan University was honored as the "father of Lingnan University". At that time, his office in Lingnan University was also regarded as a "holy land".

Table 1. Proportion of different teachers who know about the career of Lingnan University President Zhong Rongguang

Teacher	Number of people (%)	Do not understand (%)	A little understanding (%)	General understanding (%)	Better understanding (%)	Very well (%)
Ideological and political teachers	31 (100)	0 (0.00)	3 (9.68)	4 (12.90)	23 (74.19)	1 (3.23)
Senior teachers	34 (100)	1 (2.94)	6 (17.65)	9 (26.47)	18 (52.94)	0 (0.00)
Philosophy teacher	35 (100)	1 (2.86)	3 (8.57)	5 (14.28)	25 (71.43)	1 (2.86)

APPLICATION OF COOPERATIVE LEARNING IN ENGLISH LANGUAGE ANXIETY REDUCTION STRATEGIES

Yuefeng Li

English Department, Changzhi Preschool Education College, Changzhi 046000, China

Background: When individuals fail to achieve their goals or encounter the threat of insurmountable obstacles, they will attack their self-confidence, feel frustrated self-esteem, and produce anxiety and even fear, which is anxiety. In the process of language learning, language anxiety often occurs because the learning effect cannot achieve the desired effect. Especially in English learning or second language learning, students often harden their heads to read, write and speak for self-esteem. They are afraid of being ridiculed by their classmates after making mistakes, and are always in a state of high anxiety. Some students have a strong personality. When they see that their classmates learn better than themselves, they will feel uncomfortable. After a long time, they will have anxiety. When answering the teacher's questions, they often dare not say their uncertain answers in English, hesitate, full of timidity and anxiety, and even dare not speak because their pronunciation is not standard, afraid of the teacher's roll call. In addition, the atmosphere of English language learning will also affect students' learning mood. In the repressed classroom atmosphere, students often dare not be afraid of teachers' questions, and the whole classroom will be in a state of tension and anxiety. If the classroom atmosphere is boring, students' learning enthusiasm will be greatly reduced. In order to improve the efficiency of students' English learning, we need to solve the problem of students' English language anxiety.

Cooperative learning promotes students' learning through the establishment of learning groups and the interaction of teaching dynamics. The scoring standard of this learning model is group achievement. Cooperative learning involves many educational theories such as cognitive psychology and educational sociology. It creates a good learning atmosphere in the joint learning of groups. In the form of health and happiness, students' negative emotions will gradually weaken, gradually form a positive learning attitude, actively participate in classroom activities, and promote the improvement of English learning efficiency. In this process, students' English language anxiety will also gradually reduce. When cooperative learning is divided into groups, the number of groups should be controlled at about 4, which is conducive to the construction of interactive security. In group activities with a relaxed learning atmosphere, students will have a sense of belonging and identity.

Objective: To intervene college students' English language anxiety through cooperative learning, reduce college students' English language anxiety, improve college students' enthusiasm for English learning, enable college students to learn from each other in English groups, improve English performance, improve students' English-speaking ability, and no longer be afraid to answer teachers' questions in class. So that

those students with strong personality can cultivate a sense of benign competition in active interactive learning, so as to live in harmony with the team members. In addition, through cooperative learning, exercise college students' communication ability, use English to communicate among team members, and deepen college students' understanding and mastery of English.

Research objects and methods: The research objects are non-English majors in a university. Two classes of the same major in freshman year are randomly divided into control group and experimental group. There is no significant difference in students' English level between the two groups. The number of students in the control group was 40 and the number of students in the experimental group was 41. During the experiment, the control group adopted the traditional teaching mode, and the experimental group adopted the cooperative learning teaching mode. The teaching contents of the two groups were the same, and the experimental time was 1 semester. In the cooperative learning teaching mode, students are divided into balanced groups according to their personality and learning ability, with 5 people in each group and a clear division of labor. The team leader is assumed by the team members in turn. During the experiment, collect and sort out relevant experimental data, evaluate college students' English learning by using principal component analysis, and record the change data of students' English language anxiety. The relevant experimental data processing software is SPSS software.

Results: SPSS software was used to statistically analyze the relevant experimental data and study the changes of English average scores of the two groups before and after the experiment. The results are shown in Figure 1.

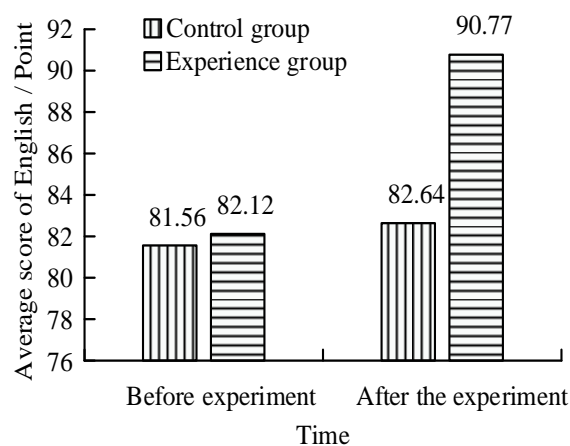

Figure 1. Changes in average English scores of the two groups before and after the experiment

In Figure 1, in the English test, the full score is 100. Before the experiment, there was little difference in the average English scores between the two groups. After the experiment, the average score of the students in the experimental group is significantly higher than that in the experimental group. The average score of the students in the experimental group is as high as 90.77 points, and the English ability of the students in the control group is basically not improved. Through the changes of English scores of the two groups of students, it can be seen that cooperative learning can improve students' English learning ability.

Conclusions: Due to personal character, classroom atmosphere and teaching quality, college students will have varying degrees of English language anxiety and fear and exclusion of English communication. Through the cooperative learning teaching mode, college students' English learning level has been significantly improved, their learning enthusiasm has been greatly improved, their English language anxiety has been significantly reduced, and the classroom atmosphere has become active.

* * * * *

INNOVATIVE APPLICATION OF MULTIMEDIA FILM IN COLLEGE CLASSROOM TEACHING FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Qi Deng^{1,2}

¹College of Architecture and Design, Jiangxi University of Science and Technology, Ganzhou 341000, China

²Film Media Industry Discipline, Cheongju University, Cheongju 28453, South Korea

Background: Cognitive psychology mainly studies the information processing process of attention and

perception. After being stimulated by visual, auditory and other sensory organs in the learning process, learners will convert it into neural information and register it. The registered information is processed by working memory. This processing method belongs to memory storage. The memory storage time is about 30 seconds. The amount of relevant stored information is relatively limited. When the storage capacity exceeds seven, the original information will be forgotten. When the amount of information exceeds seven, it will become long-term memory. This memory method encodes information and stores it permanently. The way of information extraction can be directly extracted through reactors such as hands and eyes, or the information can be transformed into short-term memory, and then the reactor can be used to extract the information. This is the information processing mode involved in the learning process of college students. For example, by analyzing the reasons for the poor effect of college English classroom teaching, we can start from the information processing mode of learning. We can see that the teaching mode is lack of novelty and cannot bring obvious stimulation to college students in vision and hearing. Most students only accept it passively, and their pragmatic ability has not been exercised. In English classroom teaching, the lack of a relevant language environment and scene is not conducive to students' memory, association and learning, and lack of interest. The way teachers convey information is relatively simple, and the interpretation of words is somewhat stiff, which makes it difficult for students to understand. English movies are a means for college students to learn English, which can help them better understand English, practice English, understand the cultural differences between China and the west, and then improve their English learning ability. Therefore, English movies can be combined with multimedia technology and applied in college English classroom teaching.

Objective: The application of multimedia films in foreign language classroom teaching in colleges and universities can help college students improve their language pragmatic competence, so that college students can understand and learn some fixed expressions and language habits used in real life in various films. And the multimedia video film is relatively novel, which can strongly stimulate college students, stimulate their learning enthusiasm and initiative, and help them remember and associate in the process of English learning. In addition, multimedia movies can create a real context for college students and improve their social pragmatic competence.

Research objects and methods: The research objects are college students. Randomly select students from four classes from sophomores in a university. These classes come from different majors, and the number of students in each class is 45. Before the experiment, understand the learning situation of students in each class and make corresponding records. The experimental time is one semester. During the experiment, these students were taught in the reformed English classroom teaching mode. SPSS software is used to process and count the experimental data, and the original analysis method is used to quantitatively analyze the impact of the reformed English classroom teaching mode on college students' English learning.

Results: The traditional English classroom teaching model is not innovative enough to stimulate students' enthusiasm for English learning. It is necessary to reform the teaching model. After the reform, multimedia films are used to create a good language learning atmosphere for students, so that students can better remember and associate through listening and vision. Students' learning enthusiasm is greatly improved. Students majoring in language and literature have higher English scores than students majoring in mathematics. The relevant results are shown in Table 1.

Table 1. College students' English achievement before and after the reform of English classroom teaching mode

Time	Language and literature major	Mathematics major	English major	Computer major
Before reform	71.05	70.33	84.36	73.84
After reform	87.52	82.67	95.17	86.58

Conclusions: From the perspective of cognitive psychology, this paper analyzes the problems of college English classroom teaching mode. The traditional teaching mode is lack of innovation, cannot stimulate students' learning enthusiasm, and cannot meet the needs of the development of the times. Multimedia movies can vividly express knowledge which is related to English through three means: sound, text and image, which can leave a deep impression. Therefore, the traditional teaching mode should be reformed in combination with multimedia technology, so that students can no longer passively accept English knowledge and increase students' participation and enthusiasm. With the help of multimedia movies, it can promote the improvement of college students' English learning ability, provide college students with the ability of social language exercise, and enhance their listening and speaking ability. Let students know the language use habits and behavior habits between different cultures, and understand the differences of language use in different contexts.

THE INFLUENCE OF LEISURE SPORTS BASKETBALL TRAINING ON IMPROVING COLLEGE STUDENTS' PHYSICAL HEALTH LEVEL AND LEARNING ANXIETY

Qiang Yue

China National Basketball Academy, Shandong Sport University, Rizhao 250102, China

Background: The modern development of science and technology not only brings convenience to people's life, but also indirectly reduces people's exercise. The convenience of the Internet has reduced the number of college students shopping in physical stores and eating in restaurants. Even many college students are addicted to the Internet. In addition to necessary activities, they are basically just staying in their dormitories, staying up late to surf the Internet and play games. In the long run, the physical health level of college students has seriously decreased and their body is in a sub-health state. If it continues, it may lead to sudden death or major diseases. In addition to the worrying physical health level of college students, the mental health status of college students also needs to be paid attention to. College students' learning anxiety is one of college students' psychological problems. After entering the university, many students do not adapt to the way of free learning in the university. Some students have weak autonomous learning ability, cannot keep up with the pace of teachers' teaching, and the learning effect is poor, resulting in learning anxiety. In the state of learning anxiety, there will be lax attention, unable to remember the learning knowledge and unclear learning ideas. Gradually, these students will become grumpy, reject learning, and even have physiological symptoms such as headaches and dizziness. Students with learning anxiety will panic about the exam. They will become nervous during the exam, and their palms will sweat. It is difficult to calm down, and sometimes their minds will be blank. There are two reasons for students' learning anxiety, which are divided into internal reasons and external reasons. Internal reasons, such as students' low self-confidence, strong desire for success, introverted personality, etc., external reasons come from academic pressure, fear of exams, pressure from parents and teachers, etc.

In view of the fact that college students spend their leisure time in their dormitories and have learning anxiety, leisure sports can be used to fill the leisure time of college students, which can not only exercise and improve the physical health level of college students, but also alleviate their emotions and reduce their learning anxiety. Among them, leisure sports refer to the use of leisure time for sports activities, so that the human body can be exercised and the emotion can be vented. Leisure sports include fitness, basketball training, aerobics and other sports. Therefore, according to the function of leisure sports, this paper studies the impact of leisure sports basketball training on Improving college students' physical health level and learning anxiety.

Objective: Through leisure sports basketball training, promote the metabolism of human function, improve the physical health level of college students, exercise the willpower of college students under unremitting basketball training, learn to unite and cooperate with classmates in group cooperation, and cultivate the spirit of collective righteousness. At the same time, let college students divert their attention and adjust their psychological status in the process of sports, so as to slowly reduce their learning anxiety. It can also improve students' sports personality, obtain success and satisfaction from leisure sports basketball training, and let them gradually fall in love with basketball training, so as to stick to it all the time.

Research objects and methods: The research objects are college students. Using data mining technology, 300 college students with learning anxiety were randomly selected from the student mental health database in the mental health consulting room of a college student, and their physical quality was in a sub-health state. According to the actual situation, these college students are divided into learning anxiety group, basketball training group, fitness group and aerobics group. In addition to normal teaching activities in the learning anxiety group, other groups carried out corresponding leisure sports, 2 class hours a week for one semester. During this period, the relevant experimental data were recorded, and the influencing factors were quantified by using grade 0-4 score. The higher the score, the greater the impact. SPSS software was used as data processing and statistical software to study the impact of leisure sports basketball training on Improving college students' physical health level and learning anxiety.

Results: Anxiety is a common psychological problem among college students' mental health problems, and learning anxiety belongs to one kind of anxiety. Due to personal character, low self-esteem, lack of learning ability and pressure brought by parents, college students have learning anxiety, and learning has become a painful thing for college students. In addition, unhealthy work and rest habits reduce the physical health level of college students. In order to improve college students' physical and mental health, leisure sports basketball training is carried out. After leisure sports, the classroom anxiety score of the basketball

training group is 1 point lower than that of the fitness group. The relevant results are shown in Table 1.

Table 1. Scoring of college students' learning anxiety after leisure sports

Group	Classroom anxiety	Test anxiety	Inattention
Learning anxiety group	4	4	4
Fitness group	2	2	1
Basketball training group	1	2	1
Aerobics group	2	1	2

Conclusions: Leisure sports basketball training can promote the metabolism of college students, help them improve their bad living habits, alleviate some negative emotions, such as learning anxiety, and improve the physical and mental health level of college students.

* * * * *

MOTIVATION OF NON-OSTENTATIOUS PSYCHOLOGY OF LUXURY CONSUMPTION POST-95S BASED ON THE OBSTACLE OF THINKING LOGIC

Zhiyan Wu

School of Management, Shanghai University of International Business and Economics, Shanghai 201620, China

Background: Thinking logic disorder belongs to cognitive disorder. If the description is more accurate, thinking logic disorder belongs to thinking disorder. Thinking logic barriers can be divided into four types: symbolic thinking, new words, logical fallacy thinking and sophistry thinking. In symbolic thinking, a person uses more common words and actions to express some meanings that ordinary people can't understand. Symbolic thinking shows the association barrier between image concept and abstract thinking. For example, schizophrenic patients wear clothes backwards. In the new works of words and expressions, patients will fuse and piece together some concepts, and create text symbols with special concepts. Most of this thinking logic disorder is juvenile schizophrenia. The logical fallacy thinking will appear logical oddity. Without logic, we can't find the basis of reasoning and understand this kind of thinking expression. Sophistry thinking belongs to the association barrier. The understanding of views is relatively vague and has no exact basis. It is just talking with confidence. The patient's relevant speech statements are far-fetched and will not accept other people's suggestions and criticisms.

With the rapid development of economy, people's living standards have been greatly improved, the capital investment of consumption has increased to a certain extent, and the proportion of luxury goods in the market has increased year by year. In luxury consumption, there is a situation of "showing off wealth", and the purchased luxury goods are displayed through the Internet, which is disgusted by morality. People's "hatred of wealth" is not only a simple resentment, but also a moral value judgment. This psychology belongs to symbolic thinking in the logical barrier of thinking. And in the process of the continuous development of luxury consumption, there is a symbolic trend of luxury, that is, luxury can reflect social status, which is still the performance of symbolic thinking. However, with the passage of time, the luxury consumption post-95s gradually tend to be rational, and the impulsive consumption behavior gradually decreases. In view of this, under the obstacle of thinking logic, this paper studies the motivation of the non-conspicuous psychology of luxury consumption post-95s.

Objective: To understand the performance of consumers with thinking logic disorder in luxury goods, and to study the relationship between non-ostentatious consumption of luxury goods and self-realization needs. This paper makes a specific analysis of the motivation of non-conspicuous consumption psychology, studies the relationship between non-conspicuous consumption psychology and four motives: quality follow, cultural identity, group ownership and risk avoidance, and understanding the impact of each factor on it. This paper makes a specific analysis on the motivation of non-conspicuous psychology of luxury consumption post-95s, and understands the relationship between education level, family income level, occupation, habitual residence, gender and conspicuous degree.

Research objects and methods: The research objects are post-95s social people who consume in high-end luxury places. 210 post-95s social personages who consume luxury goods were randomly selected from five major luxury stores in a city understand the luxury consumption experience of these social people, record their occupation, education level, gender, family income and other relevant personal information,

record relevant research data in the investigation and research, and judge the motivation of showing off or non-showing off with a score of 1-5. The following three points indicate non-showing off, and more than three points indicate showing off. The influencing factors of non-conspicuous consumption are detected by principal component analysis. The larger the variance of the common factor, the more effective it is in explaining the relevant results. Using SPSS software for data processing and analysis, this paper studies the motivation of post-95s non-conspicuous psychology of luxury consumption based on the obstacle of thinking logic.

Results: The non-ostentatious motivation of consumers with thinking logic disorder in luxury consumption was studied. Through principal component analysis, the common factor variance of four motives and non-ostentatious psychology was tested. It was found that the common factor variance of these indicators was greater than 0.4, indicating that the selection of these indicators can significantly affect the overall results. In the mean value of relevant conspicuous degree factors, the factor scores of consumers with high school education or below is higher than that of consumers with a college education. The factor score of consumers with a college education is 2.71. The relevant results are shown in Table 1.

Table 1. Factor score of conspicuous degree of post-95s thinking logic barrier consumers in luxury consumption

Education level	High school and below	Junior college	Undergraduate	Graduate and above
Factor mean	3.39	2.71	2.52	2.80

Conclusions: With the change of luxury consumption psychology, women and public institutions are more inclined to non-conspicuous consumption. The consumption behavior of the rich class began to change, and their consumption behavior became more rational. The symbolic meaning of luxury goods has been weakened to a certain extent. By studying the consumption psychology of luxury consumer groups, we can promote social healthy consumption and make the consumption psychology of luxury consumer groups more rational and legal, so as to promote social fair consumption.

HUMAN RESOURCE MANAGEMENT IN THE MANAGEMENT OF COMMUNICATION ADAPTATION OBSTACLES AND EXECUTIVE ADAPTABILITY OF ENTERPRISE EMPLOYEES

Fang Tian

International Education Department, Inner Mongolia Business Vocational College, Hohhot 010070, China

Background: Patients with communication adaptation disorder will have poor communication in the process of communication, so that communication adaptation patients will produce negative emotions, resulting in emotional disorders such as anxiety, depression, uneasiness and cramping. It will produce a kind of exclusion and avoidance psychology for communication, which will seriously affect life and work. The cause of the disease is the comprehensive effect of psychosocial stress and individual quality. Patients with communication adaptation disorder will have emotional disorders and short-term mild troubles. For employees with communication adaptation barriers in the enterprise, in the actual work process, due to the employees' own personality, the work communication with other employees or leaders is not smooth, and the actual problems and personal work needs cannot be solved, which affects the work progress, has a certain impact on the performance of the department, and makes the employees with communication adaptation barriers feel great pressure, produce negative emotions such as anxiety, anxiety, self-doubt and self-denial, which will affect the normal work of employees and even the work of other colleagues. In the long run, it will form a vicious circle, which is not conducive to human resource management and company development.

In addition, communication adaptation barriers and employees' executive adaptability also affect the development of enterprises. Executive adaptability includes executive ability and adaptability. Executive ability refers to the ability to effectively use resources to achieve goals with quality and quantity. In the face of different objects, the interpretation of executive ability is different. The executive ability of

enterprise employees means the ability of employees to handle affairs, the executive ability of the team represents the combat effectiveness of the team, and the executive ability of the enterprise means the business ability of the enterprise. Whether the enterprise can succeed has a great relationship with the executive ability of these three aspects. The ability to cope with changes means the ability of employees to solve problems timely and effectively after changes in the environment and opponents. The ability to cope with changes is affected by experience, knowledge, individual intelligence and so on. Through the training and reasonable allocation of human resources, we can stimulate the enthusiasm of employees and enhance the value of human resources. According to the characteristics of human resource management, this paper analyzes the management of communication and adaptability of employees in enterprises.

Objective: To understand the performance of communication adaptation barriers of employees with communication adaptation barriers in enterprises and their executive adaptability, determine the importance of communication in human resource management, analyze the reasons for their poor communication and insufficient executive adaptability, and put forward solutions. By strengthening the two-sided communication between managers and employees, creating a favorable communication environment, improving the communication system and building an effective communication platform, we can alleviate the communication adaptation barriers of employees. Promote the improvement of employees' executive ability through the construction of executive culture, and strengthen employees' awareness of executive adaptability under the training of executive ability and adaptability.

Research objects and methods: The research objects were employees with communication adaptation disorder. 120 employees with communication adaptation disorder were randomly selected from 4 large enterprises. These employees came from different occupations, education levels and ages. Understand their communication skills, executive adaptability, relevant work needs and work progress in the process of work. Record relevant data and adopt fuzzy evaluation to study the satisfaction evaluation of employees with communication adaptation barriers to human resources management reform and the changes of employees' communication adaptation barriers. Using SPSS17.0 software processes and analyzes the data. The satisfaction evaluation adopts a grade 1-5 score. The higher the score, the higher the satisfaction.

Results: In many enterprises, employees have different degrees of communication and adaptation barriers, and their executive adaptability is different. Through the reform of human resources management, the communication adaptation obstacles of employees have been alleviated to varying degrees. The satisfaction score of employees with high school education and below in strengthening the two-sided communication measures between managers and employees is 4 points, which is 1 point lower than that in creating a favorable communication environment. The relevant results are shown in Table 1.

Table 1. Evaluation of employees with communication adaptation barriers' satisfaction with human resource management reform

Education level	Strengthen the two-sided communication between managers and employees	Create a favorable communication environment	Carry out executive adaptability training	Establish competitive incentive mechanism
High school and below	4	5	4	5
Specialty	5	5	5	4
Undergraduate	4	4	4	4
Graduate student	5	4	4	5

Conclusions: How to solve the communication adaptation obstacles and executive adaptability of employees is a problem that enterprises need to solve at present. By strengthening the two-sided communication between enterprise leaders and employees, we can timely understand the work needs of employees, correctly treat the work opinions of employees, and adopt and communicate appropriately. In the relevant human resource management communication measures and implementation response capacity measures, the communication adaptation obstacles of employees are alleviated and the implementation response capacity of employees is improved.

* * * * *

INFLUENCE OF THE INTEGRATION OF NATIONAL TRADITIONAL CULTURE INTO MODERN FASHION DESIGN ON PATIENTS WITH COMMUNICATION ADAPTATION DISORDER

Shanshan Xiao

College of Humanities and Arts, Hainan College of Economics and Business, Haikou 571127, China

Background: Communication adaptation disorder means that in the process of communication, the communication is not smooth, resulting in patients with emotional disorders such as worry and depression. Among them, communication has been in trouble for a long time. Communication adaptation disorder will lead to maladaptive behavior, such as irregular life, and lead to physiological dysfunction such as poor sleep, which will affect social function. The cause of the disease is the comprehensive effect of psychosocial stress and individual quality. Patients with communication adaptation disorder will have emotional disorders and short-term mild troubles. It will change into a mental illness, but it will not affect the quality of life. Communication adaptation disorder can be divided into six types: anxiety, depression, abnormal conduct, mixed emotion and conduct, mixed emotional performance and so on. Each type has corresponding symptoms. For example, patients with anxiety communication adaptation disorder will show tension, uneasiness, upset, palpitation, sometimes panting and fidgeting. Patients with abnormal conduct and communication adaptation disorder are mostly seen in teenagers. These patients will have bad behaviors such as truancy, absenteeism and theft, which will infringe on the rights of others.

There are 56 ethnic groups in China. There are great cultural differences among ethnic groups. Many ethnic groups have their own cultural language. If the culture and language are not interlinked and do not understand each other's cultural habits, it will be difficult for ethnic communication, which is very difficult for patients with communication adaptation disorder. In order to prevent the stimulation of inter-ethnic cultural barriers to patients with communication adaptation disorder, resulting in large fluctuations in their emotions, we can integrate the national traditional culture into modern fashion design, reduce the sense of ethnic differences, and make them feel familiar when communicating face-to-face. Therefore, we can integrate national traditional culture into modern fashion design and make a specific analysis and research on the impact of communication adaptation disorder patients.

Objective: To analyze the national traditional culture, understand the clothing characteristics of various nationalities, list the elements of national clothing, and analyze the characteristics of these elements. For example, the pattern elements adopt the way of giving up the shape and taking the meaning, which visually symbolizes all kinds of animals and creatures and turns them into the pattern of clothing. In the process elements, a variety of processes are adopted, such as tie-dyeing and embroidery, and accessories are used to match, to increase the beauty and coordination of clothing. In addition, the elements of national clothing also include structural modeling elements and fabric elements. Integrating these national clothing elements into modern clothing design can not only meet the material needs of patients with communication disorders, but also meet their spiritual needs so that they can increase their sense of national familiarity and draw the distance between them when communicating among different nationalities.

Research objects and methods: The research objects are college students with communication and communication disabilities. Using data mining technology, 310 college students with communication and communication disabilities are randomly mined from the mental health database of three universities to understand their usual behavior and psychological status, grasp their views on fashion design and their understanding of national traditional culture. Record the relevant data through SPSS18.0 software to process data, and analyze and study the impact of the integration of national traditional culture into modern fashion design on patients with communication adaptation disorder. When quantifying relevant influencing factors, grade 1-5 is adopted. 1-3 points indicate no impact, slight impact and general impact, and 4 and 5 points respectively indicate obvious impact and complete impact.

Results: Stimulated by the long-term difficulties of the outside world, patients with communication adaptation disorder will become irritable and bored, produce a lot of negative emotions, and show them in words and deeds. When communicating with people of different nationalities, the differences of national cultural habits will aggravate the stimulation of communication difficulties and make the mood of patients with communication adaptation disorder fluctuate. In order to reduce this cultural strangeness, the traditional national culture is integrated into modern fashion design, and the familiarity with other national cultures is increased imperceptibly. Freshmen with communication and adaptation barriers believe that the integration of pattern elements of national clothing into modern clothing design has a complete impact on them. The score is 5 points. The specific results are shown in Table 1.

Conclusions: Patients with communication adaptation disorder have certain obstacles in communicating with others, which will produce negative emotions such as tension and uneasiness, and do not know what to

say to others. Starting from modern fashion design, integrate the traditional national culture, get familiar with the culture of other nationalities imperceptibly, and promote communication.

Table 1. The influence of the integration of national traditional culture into modern fashion design on patients with communication adaptation disorder

Grade	Pattern element	Process elements	Fabric elements	Structural modeling elements
Freshman	5	4	3	5
Sophomore	4	5	4	5
Junior	4	5	5	4

* * * * *

CAUSES AND COUNTERMEASURES OF COLLEGE STUDENTS' ANXIETY IN ENGLISH SPEECH

Xiaozhong Song & Ning Liu

School of Foreign Languages Hnu, Huaiyin Normal University, Huaian 223300, China

Background: Anxiety is an internal conflict of individual psychology or emotion, which leads to irrational fear or excessive worry. Anxiety has many social manifestations, such as emotional anxiety, post-traumatic stress, obsessive-compulsive disorder and phobia. Speech anxiety is a kind of state anxiety reflected in special scenes. It belongs to a series of physical and mental discomfort feelings or behaviors that individuals show in the process of expected activities. In the process of speech, the speaker's anxiety usually shows certain symptoms in physiology, psychology and language thinking, such as limb trembling, rapid heartbeat, voice trembling, forgetting words, sweaty palms, etc., so that the coordination of behavior and language is reduced. Especially when using non-native language to make a speech, the speaker's anxiety will become more serious. As an auxiliary means of teaching, public speech helps to improve students' oral communication skills, enhance their critical thinking ability, stimulate their learning enthusiasm and improve their comprehensive language application ability. Successful public speaking not only shows the speaker's solid language skills and skilled nonverbal skills, but also shows the speaker's good psychological state. However, many studies have shown that most people and even experienced speakers show varying degrees of anxiety.

With the continuous advancement of college English teaching reform in China, college students' English speech has attracted more and more attention. There have been many high-level English speech competitions, which have promoted the cultivation of college students' quality and ability. Studies have shown that college students can improve at least five abilities after speaking in English, which are English language level, psychological quality, cultural cultivation, critical thinking and aesthetic ability. From the perspective of teaching, English speech can improve language communication ability, listening and speaking ability and application ability, and then enhance college students' interest in learning. Therefore, many domestic colleges and universities take English speech as an elective or compulsory course. However, English speech anxiety has always restricted the improvement of college students' English speech level. In order to effectively alleviate speech anxiety, a large number of scholars have also carried out many related studies. Research shows that the main cause of anxiety in English speech is the lack of speech skills. Therefore, college students must strengthen their basic speech skills training, so as to reduce the anxiety in English speech and finally achieve the success of speech.

Objective: Classroom teaching practice based on English speech for college students aims to provide targeted guidance for eliminating learners' speech anxiety and language shock, so as to help them improve their English speech level and communicative competence.

Research objects and methods: The subjects were 64 sophomores majoring in English in a university, including 7 boys and 57 girls, who participated in the classroom teaching practice of English speech for one semester. After one semester, compare the English speech level of all subjects before and after teaching practice.

Research design: The self-designed anxiety scale was used to evaluate the teaching effect of English before and after the speech. Negative items adopt the 5-level scoring method, with a score of 1-5. The lower the score, the more inconsistent with their own feelings, and the higher the score, the more consistent with their own feelings. Positive items are scored in reverse, with a score of 30 - 150. The higher the score, the higher the degree of speech anxiety.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: Before the experiment, the number of high, medium and low anxiety groups were 23, 23 and 18 respectively. After training, the number of people with high anxiety level decreased to 12 and the number of people with low anxiety level increased to 32. The average anxiety level of 64 students (76.55 ± 15.11) was much lower than that before training (84.45 ± 14.10), and the difference was statistically significant ($P = 0.001$).

Table 1. Comparison of students' English speech anxiety before and after the experiment (n)

Anxiety level	Score	Before teaching	After teaching
High	91-150	23	12
Secondary	76-90	23	20
Low	30-75	18	32
General situation		64	64

Conclusions: In the language environment of English as a foreign language, affected by the speaker's personal factors and external factors, the speaker often shows varying degrees of anxiety, which may lead to the speaker's "language shock". The learner training based on English speech classroom teaching is not only language training, but also different from the simple intensive training of speech skills. It takes into account the three aspects of language, nonverbal and psychology, pays attention to students' emotion, strengthens self-concept, especially strengthens the cause analysis and coping strategy training of speech anxiety, and gives all-round guidance to the study of speech theory and practical practice. Learner training based on English speech classroom teaching can help students use speech strategies, reduce their speech anxiety and improve their speech effect.

INFLUENCE OF THE INHERITANCE AND DEVELOPMENT OF MINORITY MUSIC EDUCATION IN COLLEGES AND UNIVERSITIES ON ALLEVIATING COLLEGE STUDENTS' MENTAL ANXIETY

Lixia Yang

School of Music and Dance, Wenhua College Yunnan Arts University, Kunming 650502, China

Background: In the era of increasing cultural diversity, integrating the mission of the inheritance and development of national music into the work of music education in colleges and universities in China will help to promote the inheritance and development of national music. The world's diversified music culture can strengthen the integration and collaborative progress with national music, so it is of great value to carry forward China's national music. First of all, due to the continuous development of the cultural level in the new era and the influence of the cultures of various countries, some western music cultures have entered, which makes China's traditional culture challenged by the assimilation of European and American music. This is a difficult problem that must be faced in order to better realize the inheritance of China's current national music culture. Music major in colleges and universities is a key area for cultivating national music. We should start with this, strengthen the promotion and dissemination, and popularize the education of inheriting culture in our country. The direct beneficiaries of minority music education are college students. In order to improve the efficiency of education, it is necessary to study and explore the psychological factors of college students. With the continuous development of society and the increasing competition for talents, self-awareness and values are also changing in people's hearts. At present, college students generally pay more attention to their achievements and honors, and are under increasing pressure from society, school and family, which makes college students have varying degrees of anxiety. In the past minority music education in colleges and universities, teachers often ignored the mental health problems of students, and even some people thought that national music had nothing to do with students' mental health. Teachers only taught national music itself and did not integrate students' psychological quality education into teaching. Minority music is a special language with physiological, therapeutic, emotional and memory functions, which can regulate the physiological functions of breathing, circulation and endocrine system. Research shows that the impact of music on human psychology is also complex and diverse. Integrating the mission of inheritance and development of national music into music education in colleges and universities in China can stimulate students' willingness and enthusiasm to participate in intervention and treatment of

mental anxiety and enhance students' initiative in learning.

Objective: To integrate the mission of the inheritance and development of national music into the work of music education in colleges and universities in China, in order to provide targeted guidance for alleviating college students' mental anxiety, so as to help college students improve their psychological quality.

Research objects and methods: 450 students from the department of folk music of a university were selected as the research objects to participate in a one semester music professional course. During this period, the inheritance and development of folk music were integrated into the music teaching. After one semester, the mental anxiety status of all subjects before and after teaching practice was compared.

Research design: After teaching, the teaching effect was evaluated by General Self-Efficacy Scale (GSEs), Self-rating Anxiety Scale (SAS), simple coping assessment and other methods. The correlation of the three psychological evaluation results was analyzed in detail, and the regression analysis was carried out with self-efficacy and anxiety as independent variables.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: There was a significant correlation among self-efficacy, anxiety and coping style. Specifically, there is a significant positive correlation between self-efficacy and anxiety, while there is a significant negative correlation with coping style ($P < 0.05$), which shows that college students with higher self-efficacy are more likely to have higher anxiety level and lower coping style level.

Table 1. Correlation analysis of three psychological levels

Psychological level	Self-efficacy	Anxiety	Coping style
Self-efficacy	-	-	-
Anxiety	0.236*	-	-
Coping style	-0.789*	-0.201*	-

Note: * $P < 0.05$.

Conclusions: In order to improve the inheritance and development of China's national music, the problems existing in the teaching process of China's national music need to be solved by adopting corresponding measures, and corresponding reforms should be carried out in the aspects of teacher team, textbook compilation and practical teaching, so as to promote the development of China's national music, so as to further alleviate the mental anxiety of college students. The results show that anxiety has the characteristics of increasing in grade, that is, with the increase of grade, the anxiety of college students in the Department of national music is also increasing step by step. In general, the influence of gender on anxiety does not vary with different majors and grades, that is, the influence of gender on anxiety is relatively stable in majors and grades. There is a significant positive correlation between self-efficacy and trait anxiety, but a significant negative correlation with coping style.

* * * * *

THE MEDIATING ROLE OF LEARNING ADAPTABILITY IN THE RELATIONSHIP BETWEEN EMOTIONAL INTELLIGENCE AND PSYCHOLOGICAL ANXIETY OF COLLEGE STUDENTS

NAMIER^{1,2}, Munkhjargal Odonkhoo³ & Xiulan Liu⁴

¹School of Education, Hulunbuir University, Hulunbuir 021000, China

²Department of Psychology and Methodology, School of Education, Mongolian State University of Education, Ulaanbaatar 210648, Mongolia

³Department of Education and Methodology, Khovd State University, Khovd 84000, Mongolia

⁴Propaganda Department, Hulunbuir University, Hulunbuir 021000, China

Background: The university stage is a key time in students' life. During this time, students must carry out a series of problems such as autonomous learning, independent life and employment, which is very easy to produce adverse emotions such as psychological anxiety. Some scholars pointed out that the mental health problems of contemporary college students are very serious, which are mainly reflected in psychological anxiety and depression. It is necessary to analyze the health status and influencing factors of contemporary college students' psychological anxiety in time. At the same time, a large number of research results show that the greatest impact on college students' psychological anxiety is emotional intelligence

and learning adaptability. Emotional intelligence is often called “emotional intelligence”, which belongs to the ability to find the differences between others and their own emotional states, so as to begin to deal with their own emotions and control their own thinking and action. The traditional concept of emotional intelligence is to regard it as a comprehensive ability to process and process emotional information, which mainly includes four aspects: emotional perception, emotional application, emotional understanding and emotional management. Among them, emotional perception refers to the ability to feel, perceive, evaluate and express emotions. Emotional use refers to the ability to use emotions to promote problem-solving. Emotional understanding refers to the ability to understand and analyze emotional knowledge. Emotion management refers to the ability to skillfully regulate and comprehensively manage emotions and promote the development of emotions and intelligence. Learning adaptability is the ability of individuals to adjust their own state and adapt to the changes and needs of learning environment. Some studies have also pointed out that learning adaptability is also affected by emotional intelligence, which jointly affect college students’ psychological problems such as psychological anxiety. The relationship between emotional intelligence and psychological anxiety is positive, which can effectively promote the mental health of college students. The higher the mental health level of college students, the stronger the learning adaptability. The strength of learning adaptability directly affects the level of students’ psychological anxiety.

Objective: This study attempts to explore the relationship between emotional intelligence, learning adaptability and mental health, so as to provide basis for alleviating the level of psychological anxiety of college students.

Research objects and methods: 1200 freshmen majoring in nursing in a university were selected as the research object. Various psychological indexes of the tested college students were obtained by using various scales, and the mediating role of learning adaptability in the relationship between emotional intelligence and psychological anxiety was analyzed.

Research design: there are 33 items in the Emotional Intelligence Scale (EIS), and the scores of each item are 1-5 points. The higher the score, the more consistent it is. The higher the total score, the higher the emotional intelligence. There are 29 items in the college students’ learning adaptability scale, which adopts grade 1-5. The higher the score, the more consistent it is, and the higher the total score, the better the learning adaptability. Symptom checklist 90 (SCL-90) includes 10 aspects of mental health status, a total of 90 items, and adopts grade 1-5 scores. The higher the score, the more serious the symptoms are, the higher the total score, and the lower the mental health level. The results of the three scales were analyzed, and the mediating role of learning adaptability in emotional intelligence and mental health was tested.

Methods: the relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics, Pearson correlation analysis is used for correlation analysis, and bootstrap method with deviation correction is used for simple mediation effect analysis.

Results: the 95% confidence interval (-0.34, -0.16) of indirect effect did not include 0, and $P < 0.05$, indicating the existence of intermediary effect. The 95% confidence interval (-0.04, 0.20) of direct effect includes 0, and $P > 0.05$, indicating that direct effect does not exist, and learning adaptability completely mediates the effect of emotional intelligence on mental health.

Table 1. Test on the mediating effect of learning adaptability between emotional intelligence and psychological anxiety (non standardized)

Variable	Effect	Point estimate	95% deviation correction confidence interval	
			Upper limit	Lower limit
Emotional intelligence - mental health	Total effect	-0.16	-0.25	-0.08
	Indirect effect	-0.23	-0.33	-0.16
	Direct effect	0.07	-0.04	0.20

Conclusions: Students with high level of emotional intelligence can keenly capture the changes of learning environment and living environment, adjust their state in time to adapt to the environment, maintain stable emotion, and make correct choices and decisions, so they can better adapt to university learning and life. Emotional intelligence is the influencing factor of college students’ psychological anxiety. The higher the level of emotional intelligence, the higher the level of psychological anxiety. Learning adaptability is the influencing factor of college students’ psychological anxiety. The better the learning adaptability is, the higher the level of psychological anxiety is. From the mediating results, learning adaptability plays a complete mediating role in emotional intelligence and psychological anxiety. Learning adaptability and emotional intelligence are important influencing factors of college students’ psychological anxiety. Individuals with high emotional intelligence can accurately evaluate the surrounding environment and emotional atmosphere, improve their adaptability by adjusting their own and others’ emotions, and

improve their adaptation levels such as learning adaptation, role adaptation, interpersonal relationship adaptation and life self-care adaptation. A good adaptation should be conducive to a positive attitude and mental health.

* * * * *

INNOVATION OF NEW RETAIL MODEL AND THE DIFFERENCE BETWEEN INTERNET MARKETING MODEL FROM THE PERSPECTIVE OF CONSUMER PSYCHOLOGY

Yunfei Huang

Department of Business Administration (Modern Circulation National Experimental Teaching Demonstration Center), Shanghai Business School, Shanghai 201400, China,

Background: Relying on the Internet, new retail combines consumption with cloud computing, big data, Internet of things and AI technology to achieve a business structure and ecosystem that consumers can recognize, touch and experience. In the buyer's market, commercial competition can win the market only by carefully studying the law of psychological changes and activity motivation of consumers. However, the change of consumers' psychology is unpredictable and will be affected by factors such as consumption motivation, emotional attitude and values, which is very challenging for new retail. The psychological changes of consumers are determined by the influence of external environment and internal psychological characteristics. In the context of new retail with special emphasis on consumption experience, combined with the reconstruction of Internet formats, the boundaries of formats are blurred. Traditional retail needs to go deep into consumers' store network, while new retail also needs to strengthen the optimization of consumers' store to store experience. As an external influencing factor, format environment cannot be ignored. The change of consumer psychology also focuses on the influence of internal psychological characteristics, which endows consumer self-concept and even becomes a part of personality. A person's consumption psychology always starts from product cognition. If this product characteristic conforms to his own value system, consumers will have greater interest in product purchase, and this interest may rise to emotional loyalty to the brand, which will affect the purchase decision. The change of new retail is characterized by interaction and sharing. With the help of social media, information media or film and television media, consumers establish consumption perception from different channels and affect other consumers' perception through sharing and forwarding. Consumers' psychological cognition starts from browsing information and reaches mutual influence through evaluation and word-of-mouth transmission.

However, no matter Internet marketing or new retail, the existence of consumer demand cannot be ignored. It is with demand that consumer motivation will be generated. The cognitive bias of consumption may come from other people's views or specific scenes, but the rationality or impulse of purchase always depends on people's needs. The demand for products will bring subjective consumer psychological changes, but people's needs are objective. Any retail format serves the change of consumer demand, and the new retail must face the change of current consumer demand. New retail cannot ignore the existence of consumption motivation. New retail service is to meet the changes of consumer demand and return to the essence of retail and technology application. Any new retail format should emphasize new customer-oriented thinking, so that consumers can feel the unity of material and spiritual satisfaction.

Objective: This study attempts to compare the psychological status of consumers under the new retail innovation mode and Internet marketing mode, hoping to provide some reference for the innovation of new retail and traditional retail.

Research objects and methods: In order to ensure the availability and scientificity of research samples, data were collected from residents in multiple districts of a city, and the new retail model and Internet marketing model were evaluated respectively. The consumer psychological differences between the two models have been found.

Study design: The happiness index scale (IWB) is mainly used to investigate the happiness experienced by residents after using the new retail and traditional retail models. IWB scale is mainly divided into two parts: overall emotion index scale and life satisfaction questionnaire. Among them, the total emotion index scale has 8 items, which describe the connotation of emotion from various angles. The life satisfaction questionnaire has only one item. All items of the questionnaire adopt the 7-level scoring method. The overall emotion index (weight is 1). The closer the score is to 1, the more hopeful it is, and the closer it is to 7, the more hopeless it is.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The total score of subjective well-being index, life satisfaction score and emotion index score of

residents in the new retail mode were significantly higher than those in the Internet marketing mode ($P < 0.05$).

Table 1. The scores of the two groups were compared

	New retail model	Internet marketing model
Affective index score	5.98	5.12
Life satisfaction score	5.82	5.13
Total score of happiness index	12.38	10.76

Conclusions: From the birth of department stores to new retail, the development of retail industry has generally experienced five stages, and the trend of diversification is obvious. The pattern of retail format depends on the classification standard, focusing on the three construction elements of “goods, field and people”, and finally forming a certain retail format according to the requirements of business scale, target customers, commodity structure, store facilities, business mode, service function and price strategy. With the progress of technology, retail formats accelerate the integration and reconstruction, and it is inevitable that multiple formats coexist and their boundaries are blurred. New retail is not only the result of the application of advanced technologies such as the Internet, big data and artificial intelligence, but also the result of the reconstruction of the three elements of “goods, market and people”. It highlights the importance of “people”. With consumers as the main body of the market, the impact of consumer psychological changes on factor combination and format integration cannot be ignored.

Acknowledgement: The research is supported by: Key Courses in Shanghai, First-class undergraduate courses in Shanghai (Shanghai Municipal Education Commission).

A QUALITATIVE STUDY ON THE COLLECTIVE EFFICACY OF MIDDLE SCHOOL STUDENTS' SPORTS TEAMS BASED ON CHINESE CULTURE FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Liangtao Li¹, Jian Yang² & Huihui Zhong¹

¹Department of Physical Education, Suzhou Vocational University, Suzhou 215104, China

²School of Physical Education and Health, East China Normal University, Shanghai 200241, China

Background: Middle school students in China are in a critical period of rapid development and change in physical health, mental health and social adaptation. The overall situation of their physical and mental health has attracted the attention of the whole society. On the premise of the great development of individual consciousness and subjective initiative, exploring the way of physical and mental health development of middle school students from the level of collective behavior has important theoretical significance and practical value. As a subjective perception of members' ability and confidence in their collective, collective efficacy has an important impact on individual behavior performance and behavior motivation in the collective. It also directly or indirectly affects the behavior performance and behavior results of the whole team. The research shows that the research of collective efficacy is mainly based on investigation, so the research conclusion is essentially related rather than causal. In the future, it may be necessary to intervene in the experimental method to manipulate the different levels of individual perceived collective efficacy through different information feedback, so as to explore the effect of perceived collective efficacy on middle school students' exercise psychology and behavior.

Self-efficacy is a subjective evaluation of an individual's ability to complete a certain aspect of work. The results of the evaluation will directly affect a person's behavioral motivation. Once the theory of self-efficacy was put forward, it aroused great interest in motivational psychologists. In the research on the influencing factors of collective efficacy, the influencing factors from the individual level, such as personal skills, attitudes, personality and so on, more belong to a person's objective ability or personality characteristics. Once formed, they will be more stably rooted in the individual value system and difficult to change. The external environmental factors, such as social system, task characteristics and family environment, have certain objectivity and uncontrollability and are difficult to operate and control. Therefore, people pay more attention to the importance of influencing factors from the collective level to the formation and development of collective efficacy. The research shows that the main factors affecting the formation of middle school students' collective efficacy include individual self-efficacy and team identity, successful experience at the team level and the influence of the family environment. In collective

or organizational life, the influencing factors from the collective level have a greater and more stable impact on individual motivation and behavior. Therefore, in the research of middle school students' collective efficacy, the research value of the influencing factors at the team level is greater. The research on the influencing factors of middle school students' collective efficacy in this study only proves the important influence of successful experience at the collective level on middle school students' collective efficacy from the level of investigation and research. There is no experimental research to prove the causal relationship between a successful experience and middle school students' collective efficacy.

Objective: This study mainly compares the differences in the perception of team collective efficacy between middle school students with and without successful experience feedback in collective tasks, and tests whether team successful experience is an important factor affecting team members' collective efficacy.

Research objects and methods: 36 boys in the first grade of a middle school were selected as the research objects, and there was no significant difference in the comparison of physical qualities such as speed, strength, endurance, and sensitivity of all subjects ($P > 0.05$). The comprehensive physical fitness test scores were 80-85 points, so as to ensure that the students have similar homogeneity in sports ability and physique.

Research design: (1) Experiment on the influencing factors of collective efficacy. The measurement time is the internal variable of subjects (ex-ante and ex-post measurement). The experimental treatment was inter-subject variables (with and without successful experience feedback). The dependent variable is the subjects' sense of collective efficacy. (2) Experiment on the effect of students' collective efficacy in sports situations. The measurement time is the internal variable of subjects (ex-ante and ex-post measurement). The experimental treatment was inter-subject variables (high and low collective efficacy). The dependent variables were sports performance and teamwork consciousness. After the experiment, the middle school students' collective efficacy evaluation scale was used for evaluation. There were 3 dimensions and 22 items, and the scores of each item were 1-6. The higher the score, the more consistent it was.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: Before and after the experimental intervention, the scores of collective consciousness and team competence in the experimental group were significantly different ($P < 0.01$).

Table 1. The scores of collective efficacies of subjects before and after experimental intervention were different

Dependent variable	Experimental time	n (Group)	M	SD	t	Sig.
Collective consciousness	Before experiment	6	37.31	2.37	17.69	0.00*
	After the experiment	6	40.84	2.78		
Team competence	Before experiment	6	42.72	2.48	15.44	0.00*
	After the experiment	6	46.62	3.24		
Goal achievement	Before experiment	6	18.11	1.54	2.69	0.11
	After the experiment	6	19.06	2.27		

Note: * $P < 0.01$.

Conclusions: On the premise of the same initial conditions, the team receiving successful experience feedback has a significant improvement in collective efficacy, and the team without successful experience feedback has no significant change in collective efficacy. The sports performance of the team with significantly improved collective efficacy is significantly higher than that of the team with no obvious change in collective efficacy. Collective efficacy directly and positively predicts the sports performance of the team. The team with significantly improved collective efficacy has significantly higher team cooperation consciousness than the team with no obvious change in collective efficacy. Collective efficacy directly predicts the team cooperation consciousness.

EXPLORATION ON THE TEACHING REFORM PATH OF MINORITY ART EDUCATION CURRICULUM FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Chuanfu Liu

College of Art and Design, Qiqihar University, Qiqihar 161006, China

Background: China is a multi-ethnic country. Each ethnic group has rich cultural and artistic resources. However, the effect of school art education in some ethnic minority areas is very poor. The curriculum development of rich traditional art in schools can not only effectively improve the effect and quality of art education. It can also stimulate students' interest in art learning to a great extent, and greatly promote the inheritance and protection of ethnic minority traditional culture. At present, the art resources of ethnic minorities are gradually applied to the practice of art education. However, the current education still does not develop the deepest artistic spirit of ethnic minorities. How to excavate the art resources of ethnic minorities and apply them in art education has become a hot spot in the field of education. The research shows that integrating educational psychology into the art education curriculum of ethnic minorities can effectively improve the effect of curriculum teaching. Art education psychology is a subject that studies the psychological phenomenon of art education. Art educational psychology is an educational activity with art as the medium. It is different from art creation and art appreciation activities, and emphasizes the effect of implementation as art education. As the basic theory of the psychological activities of art education, the psychology of art education is the result of the infiltration and integration of art, pedagogy and psychology.

The application of psychology in minority art teaching is to help students try to eliminate psychological troubles and alleviate psychological contradictions through appreciation when appreciating art works. Let students use art creation to obtain a sense of achievement and satisfaction, timely correct bad learning psychology, correct bad habits and personality, reduce the negative impact of bad psychology, and give full play to the value of minority art education. At present, there are still many problems in minority art education. First, the importance of curriculum teaching is still not high enough. Second, the teaching ideas of some teachers need to be updated. Third, the class hours are limited and the teaching conditions need to be updated. Therefore, it is very necessary to explore the reform path of minority art education curriculum teaching.

Objective: Based on educational psychology, this study explores the teaching reform path of minority art education curriculum. It mainly integrates the art resources of ethnic minorities, compiles art education textbooks with modernity and national characteristics, and constructs a digital art education resource database and sharing platform for ethnic minorities. Finally, it analyzes the practical effect of students in curriculum teaching.

Research objects and methods: 500 first grade students in a middle school were selected as the research objects. The students were divided into control group and experimental group for one semester of teaching. The experimental group used the teaching reform path of the constructed minority art education curriculum to teach students, and the control group used the conventional minority art teaching curriculum.

Research design: Before and after teaching, the two groups of students were evaluated with the self-designed evaluation of psychological state in middle school minority art teaching classroom. The scale is divided into four dimensions: worry, nervousness, fear of painting and fear of classroom questioning, including 32 items. Each question has 5 answers to choose from. Using Likert 5-point scale, the score is 1-5 points, the higher the score, the more consistent with the situation, that is, the more serious the psychological problem. The internal consistency coefficient of the scale is 0.875, which shows that it has very good reliability and institutional validity and can be used for measurement.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After teaching, the scores of worries, nervousness, fear of painting and fear of classroom questioning in the experimental group were significantly lower than those in the control group ($P < 0.05$).

Table 1. Compare the psychological status of the two groups of middle school students after national art classroom teaching

Factor	Control group	Experience group
Worry	3.14	2.84
Nervous and tense	3.18	2.85
Afraid to speak English	3.12	2.87
Fear of classroom	3.17	2.78

Conclusions: The educational development of minority art resources is not a simple work, in which there are many problems that need in-depth research and thinking. However, by adhering to such an artistic vision and awareness of development, we will be able to highlight the characteristics of ethnic minority art resources and the advantages of education, so as to better inherit and develop ethnic minority art education, and combine psychology with art appreciation teaching in junior middle school, so that students can enter the art classroom with enthusiasm. It can enrich the content of school education and teaching

methods to a great extent, and then improve students' value system, artistic cognition level and spiritual structure.

Acknowledgement: The research is supported by: Fundamental scientific research business expenses of colleges and universities in Heilongjiang Province (Item Number: 135509239): Research on the Integration of Minority Folk Art in Western Heilongjiang and Aesthetic Education in Local Colleges; Heilongjiang Province Education Science "14th Five-Year" Plan 2022 Key Project: "Integration of National Folk Art into Painting Professional Innovative Talent Training" (Project No.: GJB1422307).

THE INFLUENCE OF COLLEGE BASKETBALL TEACHING REFORM ON COLLEGE STUDENTS UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Ke Huang* & Qianqian Zhong

College of Physical Education and Health, Changsha Medical University, Changsha 410219, China

Background: Mild Cognitive Impairment (MCI) is a transitional state between healthy aging and Alzheimer's Disease (AD). It is recognized by researchers and clinicians as a "window" for teaching and delaying the development of AD. Moreover, the global prevalence of MCI is 9.6%-21.6%, which is considered to be a precursor of AD, so it is particularly important to study cognitive impairment. Research shows that physical exercise teaching has a positive impact on the cognitive function of MCI patients, and it is a non-pharmacological method to delay the decline of the cognitive function of MCI. At present, the mental health problems of college students in China have attracted more and more attention. Because college students are generally under the pressure from school, family, society, employment and other aspects, there are more and more mental health problems, especially mental diseases such as cognitive impairment. Therefore, it is necessary to reform the teaching of college physical education in order to integrate physical and mental health. Physical education curriculum should be guided by the thought of "health first". Students should achieve progress in five target areas in the physical education curriculum, namely sports participation, skill formation, physical health, mental health and social adaptation. The goal of colleges and universities should also change from the initial strengthening of the physique to paying attention to students' mental health education.

In the past college basketball courses, due to the single curriculum structure, paying too much attention to skills and examination results in the implementation process, there was not too much teaching on students' mental health problems, and students were too passive in the learning process, so it was difficult to mobilize students' enthusiasm. They simply emphasized the cycle to strengthen action skills, ignoring the educational and psychological functions of the curriculum. As a result, some students like physical education, but do not like that.

Objective: By comparing and analyzing the major elements of Chinese and western public physical education curriculum, China's college public physical education curriculum should transform from strengthening physical education to perfecting personality education, and pay attention to students' mental health and personality. This study takes the teaching reform of college basketball courses as an example to explore the improvement effect of the course teaching after the teaching reform on students' cognitive impairment.

Research objects and methods: 200 college students with cognitive impairment in 9 colleges and universities in a certain area were selected as the research object. The students were divided into the control group and experimental group, with 100 students in each group for three months. The experimental group used the curriculum after the teaching reform of college sports basketball, and the control group used the conventional teaching curriculum. Analyze and compare the remission of cognitive impairment between the two groups of college students before and after teaching.

Research design: MMSE was used to evaluate before and after teaching (3 months), including memory, attention, understanding and time orientation. The total score was 0-30, and the score was directly proportional to ability. The Ability of Daily Living (ADL) was evaluated before and after teaching (3 months), involving eating, dressing, grooming, toilet and other dimensions. The total score was 0-100, and the score was in direct proportion to the ability.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The two groups were compared after teaching, and the two groups were significantly higher than that before teaching ($P < 0.05$). There was no significant difference between the two groups before teaching ($P > 0.05$), and the score of the observation group was significantly higher than that of the control

group after teaching ($P < 0.05$).

Table 1. Comparison of cognitive function and activities of daily living between the two groups

Scoring method	Teaching time	Control group	Experience group
MMSE	Before teaching	12.5	11.5
	After teaching	20.5	22.7
ADL	Before teaching	43.2	44.3
	After teaching	60.3	65.1

Conclusions: Physical exercise interventions have always been the focus of research on preventing or delaying the decline of cognitive ability of patients with cognitive impairment. Although the research results are inconsistent and there are still some problems to be solved, they have a positive impact on the population level. Few other practical intervention strategies can be compared with it. Therefore, more people should be encouraged to participate in physical exercise, and more mental health interventions should be added to physical education. It is suggested that the evaluation system should be followed up and refined. It is suggested that the final grade evaluation should be excessive to the combination of stage teacher evaluation and student self-evaluation, which can promote students' enthusiasm to participate in basketball learning in real-time and improve the effectiveness of learning feedback. The organic integration of college sports associations and public physical education courses can be used as an important supplementary form of college physical education curriculum teaching organization. For example, the integration of basketball associations, clubs and new basketball courses will provide support for basketball classroom organization and various basketball events, which can not only revitalize the vitality of college basketball teaching, but also enhance the cultural value of campus basketball.

CULTURAL DIFFERENCES AND STUDENTS' OBSTACLES TO THINKING AND EXPRESSION IN COLLEGE ENGLISH TEACHING UNDER THE BACKGROUND OF MULTICULTURALISM

Jianfen Jian

Changsha Aeronautical Vocational and Technical College, General Education Department, Changsha 410124, China

Background: The process of normal thinking is purposeful, coherent and logical. The specific practice of thinking can get a result and correct the result. At the same time, people's normal thinking activities have their corresponding introspective experience and can control their own thinking activities. If the thinking activity is abnormal and changes the normal thinking characteristics, it can be called thinking obstacle. Thinking disorder belongs to a group of important symptoms of mental patients. Because the symptoms of such patients are mainly expressed through language, we can judge whether they have thinking disorder through the expression of patients. At present, the specific manifestations of thinking disorders in clinic mainly include four categories: Thinking speed disorder, thinking form disorder, thinking control disorder and thinking content disorder. This classification is suitable for clinical diagnosis, but it focuses on the research of schizophrenic thinking disorder, and pays less attention to organic encephalopathy or other mental thinking disorders. College students should get rid of their own logical thinking obstacles, such as the inability to accurately grasp the connotation of concepts, the misjudgment of reasoning premise, the inversion of cause and effect and so on.

With the formation of cultural diversity in the world today, it also improves the requirements of college English Teaching in China. College English teaching should not only pay attention to language teaching, but also cultivate students' cross-cultural communication ability in order to improve college students' comprehensive quality. Intercultural communicative competence refers to the ability that people from different cultural backgrounds need to communicate successfully, including language, thinking, behavior and social development. To cultivate students' cross-cultural communication ability, specifically, is to strengthen students' application of English language, so that students can have a certain language application ability in cross-cultural communication. Train students' thinking of seeking differences in the multicultural background, help students understand the behavior norms in different cultural backgrounds,

improve students' interpersonal communication ability in social communication, and enable students to quickly adapt to the diversified cultural environment. The research shows that there are many factors that hinder the cultivation of college English cross-cultural communicative competence, among which the obstacle of thinking expression is one of the most important factors. These factors will cause students to not better understand foreign culture and use the language they have learned. Thinking is the process of human brain indirectly and summarizing objective things, which reflects the essence of things and the internal relationship between things. Therefore, it is particularly urgent to analyze the current situation of College Students' thinking logic obstacles, find problems in time and take appropriate measures to solve psychological obstacles. Thinking disorder is an important and common symptom of mental illness, mainly including thinking form disorder and thinking content disorder (mainly delusion). The obstacles of thinking form are mainly the obstacles of association process, such as the acceleration and deceleration of association process, and the irregular combination between appearance and concept. The obstacles of thinking content are mainly manifested in delusion, over price concept and compulsion concept.

Objective: Starting from the obstacles of students' thinking and expression, this study studies the importance of cultivating students' cross-cultural communication ability under the multicultural background, puts forward effective teaching strategies, and analyzes the improvement effect of teaching on students' thinking and expression obstacles.

Research objects and methods: 180 college students with thinking and expression barriers were selected as the research objects. The students were taught English teaching program based on multicultural model, and all subjects were taught for one semester. Analyze the symptoms of thinking expression disorder of college students before and after teaching.

Study design: In this study, the Chinese version of Toronto Alexithymia Scale (TAS-20) was used to evaluate all subjects. There were 20 items, which were structurally divided into three factors: inability to distinguish emotion, inability to describe emotion and extraversion thinking. The scoring method is grade 5, with a score of 1-5. The higher the score, the more agree. The total score is between 20 and 100. The higher the score, the more serious the symptoms are. The correlation between the results of TAS-20 and depression and anxiety was analyzed.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics, and Pearson correlation analysis is used for correlation analysis.

Results: After teaching, the scores of all factors of the subjects were significantly lower than those before teaching ($P < 0.05$).

Table 1. Comparison of TAS-20 scores before and after teaching

Time	Emotional discrimination	Emotional description cannot	Extroverted thinking	Total score
Before teaching	26.74	16.91	27.61	70.86
After teaching	17.14	13.63	22.41	53.18

Conclusions: With the development of modern information technology, colleges and universities have applied multimedia and network teaching technology, and opened network teaching base and network teaching and research system. Teachers should build a network teaching model to promote the reform and innovation of the informatization development of English teaching with network teaching, so as to promote the teaching efficiency of cultivating cross-cultural communicative competence in college English. Under the multicultural background, it is particularly urgent for teachers to keep up with the pace of the times, continuously improve their comprehensive quality, make full use of the teaching content of cross-cultural communication, analyze the current thinking logic obstacles of college students, find problems in time, and take appropriate measures to solve the psychological obstacles.

THE INTEGRATION OF COLLEGE MUSIC EDUCATION AND CHINESE TRADITIONAL MUSIC FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Haiying Liu

College of Music Education, Shenyang Conservatory of Music, Shenyang 110004, China

Background: Psychology believes that people's psychological process includes cognitive process, emotional process and will process. Among them, the cognitive process includes perception, memory,

thinking, imagination and so on. Emotional process refers to people's emotional expression of things. The process of will is the psychological process of transforming ideal into reality. In music teaching, teachers should understand students' psychological state before they can correctly guide and control students' psychological process, that is, guide students' cognitive process from sensibility to rationality, stimulate students' rich emotion and cultivate students' good psychological quality. In specific teaching activities, music teachers should master the psychological characteristics of students of different ages and teach students to feel, understand and master the connotation of music. Research shows that the integration of Chinese traditional music into music education in colleges and universities is conducive to the mental health of college students. Chinese traditional music is an important part of Chinese traditional culture, which has laid a deep foundation for the development of Chinese music. There are many types of Chinese traditional music, which together form a brilliant Chinese music history and highlight the bright light of Chinese traditional culture. In the process of music education in colleges and universities, the introduction of Chinese traditional music elements is a necessary measure to innovate music education, which is of great significance to enrich and deepen the connotation of music education. As an important base for cultivating music talents, colleges and universities provide opportunities and platforms for young students to learn music. In order to cultivate the music literacy of young music scholars, we must strengthen the education of Chinese excellent traditional music, make them appreciate the charm of Chinese excellent traditional music, and constantly enhance the music heritage of young students. Therefore, music teachers should not only have the required music quality and theoretical knowledge, but also master the laws and methods of music teaching, and have the knowledge that can master students' psychology.

Objective: As an important part of quality education, music education in colleges and universities plays an important role in improving students' psychological quality. Music education in colleges and universities is an important way to implement aesthetic education. It plays a positive role in developing students' intelligence and improving students' psychological quality. Starting from students' psychology, this study integrates Chinese traditional music into music education in colleges and universities, in order to explore the promoting effect of this teaching method on students' mental health.

Research objects and methods: An experiment was conducted on 300 college students in a university. The music teaching method integrating with Chinese traditional music was used to teach students for one semester. Analyze the changes in psychological quality of college students before and after teaching.

Research design: Combined with the current situation of music teaching in colleges and universities in China, and referring to a large number of domestic and foreign literature, this study adopts the self-designed traditional music integration teaching evaluation scale for investigation and research, from the aspects of students' learning interest, learning attitude, music knowledge learning, learning habits, and quality, students' classroom participation. The communication between teachers and students in the classroom is evaluated from six dimensions, including a total of 15 items. Each dimension in the scale adopts the 5-level scoring method, with a score of 0-4. The higher the score, the better the learning effect.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The evaluation scale of traditional music fusion teaching is shown in Table 1. After the integration of Chinese traditional music into college music education, the scores of students' learning interest, learning attitude, music knowledge learning, learning habits and quality, students' classroom participation and classroom teacher-student communication were significantly higher than those before teaching ($P < 0.01$).

Table 1. Evaluation results of traditional music fusion teaching evaluation scale

Dimension	Before teaching	After teaching
Learning interest	2.47	2.82
Learning attitude	2.75	3.13
Music knowledge learning	2.69	2.92
Learning habits and quality	2.15	2.53
Students' classroom participation	2.62	3.13
Classroom teacher-student communication	1.69	2.19

Conclusions: Inheriting and developing Chinese traditional music is not only an important cause of music education in colleges and universities, but also an important move to promote the innovation and progress of music education in colleges and universities. Among young students, carrying forward the essence and connotation of Chinese traditional music can cultivate young students' character, cultivate students' sentiment, guide students to establish a lofty pursuit of music spirit, and enhance students' comprehensive musical ability and psychological quality. In the process of music education in colleges and universities, we

should not only pay attention to the cultivation of young students' music skills, but also blindly focus on the study of music-theoretical knowledge. We also need to change the utilitarian educational concept from the perspective of cultivating students' comprehensive quality. In order to inherit Chinese traditional music, music education in colleges and universities should abandon the impetuous learning atmosphere, firmly follow the road of traditional music learning, step by step, and imperceptibly enhance students' music heritage and music literacy.

* * * * *

INFLUENCE OF RESIDENTS' PSYCHOLOGY ON RURAL TOURISM DEVELOPMENT AND TOURISTS' BEHAVIOR IN TOURISM CITIES

Lang Wang

School of Economics and Management, Xianyang Normal University, Xianyang 712000, China

Background: Cultural psychology is the deep structure of national and national cultural traditions, which has been in the human value system for a long time. Cultural psychology is different from the culture of the population itself, which is gradually formed in the process of its own long-term development. Social psychology is that people may change casually with the change of their own situation in their own living environment, and there is a certain instability. Cultural and social psychology only have different cognition of status, and there is no implicit or explicit difference. Cultural psychology has great commonalities in the same population. For example, the folk customs in rural tourism areas have their own characteristics, but cultural psychology has great commonalities. However, there is great variability in social psychology. For example, it is impossible to classify the residents' psychology in tourism development areas in various periods, which is precisely because individuals will show great personality in social psychology. Therefore, we must study the changes of social psychology on the premise of cultural psychology. The research shows that the psychological research of tourism city residents needs to include two perspectives of social and cultural psychology, and the observation centers of the two psychologies are also different. Social psychology is to consider the impact on individual psychology from the perspective of society. It is changeable compared with cultural psychology. It focuses on the process and mode analysis of individual psychological change when society changes. Cultural psychology puts more emphasis on the differences under different cultural backgrounds. For the development of rural tourism, it breeds different cultures and soils with cities, and there are great cultural differences.

Both urban tourism and rural tourism have certain mobility, including the flow of tourists, information and cultural subjects. For the development of rural tourism, although the degree of modernization is low, it is more rooted in Chinese traditional culture. Therefore, the psychology of urban residents and the development of rural tourism can be regarded as the differences between modern and traditional culture. Different regional cultural differences are also one of the important reasons for tourism flow. Different cultural backgrounds will inevitably lead to psychological differences, and different psychology will also lead to different behaviors.

Objective: From the perspective of cultural psychology, this study will analyze the impact of the psychology of urban residents on the development of rural tourism, and the psychological changes of residents in the face of the changes of local economy, social life and living environment.

Research objects and methods: Taking a tourism city as an example, through the methods of literature review and expert interview, according to the composition requirements of Analytic Hierarchy Process (AHP), combined with the internal and external hidden factors of situation analysis (SWOT), this paper analyzes the influencing factors of residents' psychology on the development of rural tourism.

Research design: Combined with AHP and SWOT, the AHP-SWOT analysis method is obtained, and the impact index system of tourism city residents' psychology on rural tourism development is constructed. The SWOT strategic decision-making of the index system is deeply explored based on AHP-SWOT, and the usability of the analysis results is analyzed.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: For the decision analysis of internal and external key factors in quantitative SWOT, the weighted weight is the product of weight and score, and the sum of weighted values of internal and external key factors is 0.659 and 1.663 respectively.

Conclusions: Based on the principle of sustainable development, while paying attention to economic benefits, the development of tourism must comply with the local social ethics, and the impact of tourism on local traditional habits and social activities must be considered to reduce the degree of psychological shock

of destination residents. In view of the blindness and conformity of people in judging things, we should make full use of local culture and habits of some ethnic groups to properly guide local residents' consumption consciousness and behavior, and strengthen the psychological endurance of residents to the influence of foreign culture, so as to correctly absorb the essence of foreign culture and eliminate the invasion of unhealthy factors. Resist the influence of foreign bad behavior. Pay attention to the excavation of local cultural connotation to realize residents' self-cognition, self-evaluation and self-transcendence of tourism destination culture. In the process of developing tourism, we should pay attention to maintaining the values, ethics and aesthetic purports of the daily life and traditions of ethnic groups in specific regions, so as to make them develop naturally according to the logic of their own cultural evolution.

Figure 1. Positioning of influencing factors of residents' psychology in tourism cities on rural tourism development in quadrant diagram

APPLICATION OF CURRICULUM THOUGHT AND POLITICS IN BASIC NURSING TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yan Wang

School of Medicine, Zhengzhou University of Industrial Technology, Xinzheng 451100, China

Background: In educational psychology, learning theory can be roughly divided into connectionist learning theory, cognitive learning theory and humanistic learning theory. Connective learning theory holds that learning is a process of establishing a connection between stimulus and response. The process of learning is a gradual process of trying many times and gradually reducing mistakes. Connectionist learning theory emphasizes the mechanical training of language and holds that learners' learning habits are the result of repeated practice and reinforcement. Once the learning habit is formed, as long as similar stimulating situations reappear, the habitual response will appear automatically. Cognitive learning theory holds that learning is not a reaction habit formed through simple and repeated practice and reinforcement, but a process in which learners reprocess the information of the original cognitive structure, so as to form and develop a new cognitive structure. Cognitive learning theory emphasizes students' learning autonomy, sociality and situational. It believes that learning motivation is the driving force to promote learning. As long as students have learning motivation, they will have learning enthusiasm and initiative. Humanistic learning theory starts from natural human nature and advocates the self-realization of humans or personalities. Pay special attention to the healthy growth of individual emotion and personality. It believes that learning is a process of self-realization of personality, potential and value. Teaching is to create a safe, relaxed and no pressure and burden learning environment for students' self-realization so that students can

dare to express their personalities and give full play to their potential.

As the guardian of people's health, nurses should have good professional quality. In 2018, many national ministries and commissions jointly proposed to strengthen nursing humanistic education and professional quality education, cultivate the professional quality of nursing students and transform them into corresponding nursing behavior, which is an important responsibility of nursing educators. In recent years, in order to strengthen the professional quality of nursing students, nursing educators in China have explored different professional quality education models. Among them, the integration of curriculum thought and politics into nursing curriculum is the most important educational model. Using the relevant theories of educational psychology, organically combine the course Ideological and political education with the basic teaching content of nursing, excavate the ideological and political elements, and integrate the ideological and political elements into the taught knowledge to affect students' thoughts and behaviors, so as to achieve the purpose of education. Among all the factors affecting the effectiveness of Ideological and political education in basic nursing courses, students' subjective initiative plays a key role, and teachers' teaching methods and school evaluation and incentive system play an important role that cannot be ignored.

Objective: Based on educational psychology, to integrate the curriculum ideological and political education into the basic teaching practice of nursing, and to infiltrate mental health education in the teaching process, so as to construct the basic teaching mode of curriculum ideological and political nursing from the perspective of educational psychology.

Research objects and methods: 98 sophomores majoring in nursing in a college of nursing were selected as the research objects, including 16 boys and 82 girls, with an average age of 19.47 ± 0.79 years.

Research design: The subjects' psychological well-being was evaluated by the Index of Well-Being (IWB) before and after teaching. Among them, the subscale of the overall emotion index analyzes the emotional connotation from multiple angles, with a total of 8 items. There is one item in the life satisfaction evaluation, which is the score of intention satisfaction. Each item of the scale adopts the 7-level scoring method. The weight of the emotion index is 1 and the score is 1-7. The higher the score, the more hopeful it is, and vice versa.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: After teaching, the scores of students were significantly higher than those before teaching ($P < 0.05$), indicating that the basic teaching mode of ideological, political and nursing in colleges and universities from the perspective of applied educational psychology has higher effect and application value than conventional teaching.

Table 1. Comparison of total scores of students' happiness index before and after teaching

	Total score of happiness index	
	Before teaching	After teaching
Index	10.14 ± 2.03	12.21 ± 1.01

Conclusions: The reflection depth of nursing students on professional quality needs to be further improved, which may be related to the cooperation of students. Ideological and political teachers in colleges and universities should actively guide college students in the process of self-moral cultivation and social practice, adhere to the unity of moral code theory and their own practical actions, adhere to the unity of inheriting glorious traditions and carrying forward the spirit of the times, adhere to the unity of transforming the objective world and the subjective world, and adhere to the unity of strengthening personal moral cultivation and receiving education and guidance, internalize the power of example into the driving force of their own practical actions, consciously practice moral norms, make moral norms become personal moral quality and value standard, constantly improve their moral cultivation, and become a person with noble moral quality. However, this result also reflects that the impact of the current teaching methods and methods on the depth of students' professional quality reflection needs to be improved. In the future teaching, how to promote students' professional quality reflection and improve students' reflective ability needs to be further explored.

* * * * *

IMPACT OF TOURISTS' COGNITIVE IMPAIRMENT ON THE PROTECTIVE TOURISM DEVELOPMENT OF INTANGIBLE CULTURE HERITAGE

Chaojun Li

Tourism and Historical Culture College, Zhaoqing University, Zhaoqing 526061, China

Background: Cognitive impairment refers to the abnormal condition of the brain in the process of thinking and memory, which will lead to the impairment of memory and learning function, and even develop into aphasia, apraxia, cognitive loss, and other problems in serious cases. Cognitive impairment consists of executive ability, visual space, language, memory, orientation, and other obstacles in a variety of cognitive fields. The main causes of the disease are education, diet, living habits and so on. The behavioral characteristics of cognitive function are mainly manifested in the changes of executive ability, attention, language ability and social cognition. For social cognitive ability, it is mainly manifested in anxiety in social communication, weakening of emotional control ability, decline of resonance ability and reduction of recognition of social clues. For attention, it is mainly manifested in the reduction of information processing speed, selectivity, and other types of attention changes. For the executive ability, it is mainly manifested in the decline of organization and decision-making ability and the inability to complete complex tasks. For language ability, it is mainly manifested in grammatical errors, ignoring social etiquette, the phenomenon of words failing to express their meaning in communication with people, and problems in abstract language expression and understanding.

Tourists' cognitive impairment will have an important impact on the protection and tourism development of intangible cultural heritage. Intangible cultural heritage is a cultural heritage passed down from generation to generation. It is the continuation and cohesion of the spirit of all nationalities in the world, including traditional handicraft skills; knowledge and practice of nature and universe; festivals, etiquette, and social customs; Performing arts; oral statements and legends. In the context of cognitive impairment, the current difficulties faced by the development of intangible cultural tourism resources are mainly reflected in the following points: modernization and internationalization strategy, poor experience, single form of tourism products, high talent mobility and weak awareness of innovation. On the premise of improving cognitive impairment, the development of intangible cultural heritage conservation tourism of tourism experience needs to meet the following requirements: supply agglomeration, demand trend, social environment, and secondary circle. The development mode constructed is a dialectical unity and closely related system. The secondary circle includes education, information, and media. Its purpose is to realize the networking of information communication, strengthen the publicity effect of media and realize student communication through the education system. The demand trend faces consumers. Designers can adjust and improve the development strategy through the feedback information of consumers, to ensure the registration and production of brand goods and timely adjust the strategy according to the market demand.

Objective: This paper analyzes the impact of tourists' cognitive impairment on the protective tourism development of intangible cultural heritage, and puts forward the development strategies under the promotion of cognitive impairment, in order to provide new ideas for the sustainable development of intangible cultural heritage.

Research objects and methods: Tourists from two intangible cultural heritage areas are selected as the research objects. According to different tourism experience models, the research objects are divided into four groups: extreme tourism experience, cognitive tourism experience, reclusive tourism experience and compensatory tourism experience. The number of people in each region and group is 20. Through Apriori algorithm, the correlation between different groups and good factors of intangible cultural heritage conservation tourism development is analyzed. The influencing factors include supply agglomeration degree, demand trend, social environment, and secondary circle. Set the association rules with more than 85% confidence as trusted rules, and the rest within the confidence range are untrusted rules. In order to ensure the authenticity and reliability of the results, the average value of tourists is taken as the result.

Methods: Through SPSS22.0 data statistical analysis software counts the effects of tourists' cognitive impairment on the development strategies of intangible cultural heritage conservation tourism before and after the improvement of tourism experience.

Results: Table 1 refers to the confidence of intangible cultural heritage conservation tourism development strategy under the promotion of cognitive impairment. The extreme tourism experience group and supply agglomeration have the highest confidence, the cognitive tourism experience group and demand trend have the highest confidence, the reclusive tourism experience group and social environment have the highest confidence, and the compensatory tourism experience group and secondary circle have the highest confidence. Therefore, the intangible cultural heritage conservation tourism development strategy formulated under the background of cognitive impairment is suitable for different types of tourists.

Conclusions: Under the background of tourists' cognitive impairment, the degree of supply agglomeration, demand trend, social environment and sub circle confidence of intangible cultural heritage protective tourism development are low. The development strategy of intangible cultural heritage conservation tourism in the environment of cognitive impairment can meet the needs of tourists with

various types of tourism experience modes, and the proposed development strategy can be further popularized and applied.

Table 1. Confidence degree of tourism development strategy for intangible cultural heritage protection in P region under cognitive impairment

Group	Supply agglomeration	Demand trend	Social environment	Secondary layer circle
Extreme tourism experience	92	75	72	76
Cognitive tourism experience	75	89	76	73
Reclusive tourism experience	74	73	87	78
Compensatory tourism experience	72	76	75	91

APPLICATION OF INTERACTION DESIGN IN INTELLIGENT HOUSEHOLD APPLIANCES UNDER COGNITIVE IMPAIRMENT

Yini Shi¹ & Tao Zhang^{2*}

¹*School of Industry Design, Hubei University of Technology, Wuhan 430068, China*

²*School of Fashion, Wuhan Textile University, Wuhan 430073, China*

Background: Cognitive impairment consists of executive ability, visual space, language, memory, orientation and other obstacles in a variety of cognitive fields. The main causes of the disease are education, diet, living habits and so on. Clinically, cognitive impairment is a transitional state between normal people and early Alzheimer’s disease. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further aggravation of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show decreased overall function and develop to dementia, which will lead to delusion, indifference, lack of self-care ability and so on. Under the background of cognitive impairment, there are many problems in the interactive design of smart home appliances, including poor operability experience, unable to meet the emotional experience needs and sensory experience needs. The poor sense of operability experience is reflected in the fact that the user’s feelings are not considered, and the designed products usually show low quality or complex operation. The emotional effect that cannot be achieved by the product design is the emotional resonance that cannot be met.

The interactive design integrates the theory of personalization and high technology and is widely favored by people. It is a product model that simulates human operation and functional design. Under the promotion of cognitive impairment, the application of interaction design in smart home appliances needs to meet the following points. First, pay attention to the dominant position of consumers. When designing smart home appliances, it is necessary to reflect the core position of consumers and integrate high-tech concepts and humanized design into the product design process, to make the operation simple and convenient, which can bring customers a new experience. Second, simplify the operation of smart home appliances. In the design process of smart home appliances, it is necessary to ensure that the products are more efficient and convenient, to enrich the various functions and interfaces of the products. At the same time, in the process of designing products, we also need to ensure that the use link is more efficient and more valuable, to bring unique and wonderful life experience to users. Third, the design of smart home appliances is relatively simple. When the product operation steps are relatively simple, users will use it more frequently, and users will have a higher probability of repurchasing or recommending products. Fourth, ensure that the functions of smart home appliances are effective and orderly. The design of intelligent household appliances needs to improve the performance of the products and design a reasonable interactive interface, which maximizes the design effect of the products.

Objective: This paper analyzes the application effect of interaction design in intelligent household appliances under the promotion of cognitive impairment, in order to provide new research ideas for the intelligent development of intelligent household appliances.

Research objects and methods: Consumers in two smart home appliance markets are selected as the research object through C45 decision tree algorithm analyzes the application effect of interactive design in

intelligent household appliances under the promotion of cognitive impairment. The evaluation includes four aspects: paying attention to the dominant position of consumers, simplifying smart appliances, relatively simple design of smart appliances, and ensuring the effective and orderly function of smart appliances. 50 consumers in each market are randomly selected and rated as dissatisfied, satisfied and very satisfied. The corresponding scores are 1-4 points, 5-7 points and 8-10 points. In order to avoid the influence of personal subjective factors on the research results, the lowest score and the highest score are omitted in the experiment, and the average score of other consumers is taken as the result.

Methods: SPSS23.0 data statistical analysis software to obtain the application effect of interactive design in intelligent household appliances under the promotion of cognitive impairment.

Results: Table 1 refers to the improvement of cognitive impairment. It can be seen from Table 1 that in terms of simple design and normal function, the application effect of interactive design in intelligent household appliances is ideal under the background of cognitive impairment. In the future, this interactive scheme can be applied to other regions to improve the design problems of smart appliances caused by cognitive impairment.

Table 1. Management effect of assembly construction project in Q area after fine management under cognitive impairment

Category	Dissatisfied	Satisfied	Very satisfied
Pay attention to consumers	8	24	18
Easy to operate	9	24	18
Simple design	14	21	15
Orthergasia	12	21	17

Conclusions: The research on the design and application of this scheme can further improve the cognitive function of home appliances, especially in the normal design and application of this scheme.

THE MEDIATING ROLE OF LEARNING ADAPTABILITY IN THE RELATIONSHIP BETWEEN EMOTIONAL INTELLIGENCE AND PSYCHOLOGICAL ANXIETY OF HIGHER VOCATIONAL STUDENTS

Xiaoqin Hu

The School of Information Engineering, Jiangxi Modern Polytechnic College, Nanchang 330095, China

Background: Anxiety disorder of college students is a very complex psychological and emotional disorder. Its clinical manifestations are usually motor agitation and sympathetic hyperactivity. The causes of the disease are depression, mental stimulation, personality, congenital heredity, etc., which are manifested in negative emotions such as anxiety, shame, disappointment, anxiety, fear and so on. After entering the university, college students are facing great changes in learning styles. At the same time, with the increase of learning pressure and learning tasks and their poor psychological tolerance, their mental health problems are becoming increasingly prominent. International Health Organization claims that the number of patients with anxiety and depression among college students still shows a growing law of change, and the incidence group shows a younger and younger trend. With the increasingly serious phenomenon of students' anxiety, colleges and universities must take corresponding measures to intervene in students' anxiety. At present, college teachers do not pay attention to students' psychological needs in the teaching process, which leads to a serious phenomenon of students' anxiety. A large number of studies at home and abroad show that there is a great correlation among higher vocational college students' emotional intelligence, psychological anxiety and learning adaptability.

Emotional intelligence of higher vocational college students refers to the ability of individual adaptability to perceive, understand, adjust and make use of their own and others' emotions. Learning adaptability refers to the ability of individuals to adjust their own state to adapt to the changes in the learning environment and the needs of schools. There is a positive correlation between emotional intelligence and mental health. Emotional intelligence is an important psychological resource to promote personal mental health. In the past, a large number of literatures have analyzed that factor such as learning adaptability and emotional governance are affected by mental health factors, and emotional intelligence is affected by learning adaptability. Some scholars clearly pointed out that students with better mental health

levels have good learning adaptability. If students have better learning adaptability. Many medical journals point out that the main factor of students' adaptability in higher vocational schools is emotional intelligence. The higher the level of emotional intelligence, the better the adaptability of students. Students with higher emotional intelligence can better analyze the sudden changes in their learning environment and living environment, which enables them to adapt to the environment by adjusting their state, so that they can maintain stable emotions, help them make correct decisions and decisions, and then better complete their college study. Students with low level of emotional intelligence will have bad emotions such as lack of confidence, irritability and anxiety in the face of a strange environment, which makes them unable to objectively analyze the surrounding environment and make reasonable decisions, making their adaptability very poor, which makes it difficult for them to adapt to university study and life. Therefore, students in higher vocational colleges need to face the heavy pressure of work and study.

Objective: This paper analyzes the correlation among higher vocational college students' mental health, learning adaptability and emotional intelligence, in order to provide scientific guarantee for higher vocational college students' physical and mental health.

Research objects and methods: 500 students in higher vocational colleges were selected as the research object. The correlation of students in higher vocational colleges was evaluated by emotional intelligence scale, college students' learning adaptability scale and Symptom Checklist90. Pearson correlation analysis was used to analyze the correlation among mental health, learning adaptability and emotional intelligence.

Methods: The mental health analysis of students in higher vocational colleges through SPLM software. The measurement data conforming to the normal distribution are expressed by the mean \pm standard deviation. The *t*-test is used for the comparison between groups, and the bootstrap method with deviation correction is used for the analysis of the intermediary effect. $P < 0.05$ indicates that the gap has significant statistical difference, and $P < 0.01$ indicates that the gap has very significant statistical difference.

Results: Table 1 refers to the correlation among students' mental health, learning adaptability and emotional intelligence in higher vocational colleges. It can be seen from Table 1 that the correlation between emotional intelligence and learning adaptability is 0.39, and the significance value is lower than 0.01. The correlation between emotional intelligence and mental health was -0.14, and the significance value was lower than 0.01. The correlation between learning adaptability and mental health was -0.36, and the significance value was lower than 0.01.

Table 1. Correlation among students' mental health, learning adaptability and emotional intelligence in higher vocational colleges

Category	Relevance	Significance
Emotional intelligence and learning adaptability	0.39	<0.01
Emotional intelligence and mental health	-0.14	<0.01
Learning adaptability and mental health	-0.36	<0.01

Conclusions: Emotional intelligence of higher vocational college students is directly related to mental health. Emotional intelligence can predict mental health through learning adaptability. Higher vocational colleges can improve students' emotional intelligence through community activities, psychological lectures, related courses and other forms of activities, which is of great significance to the improvement of their mental health level.

A STUDY ON AFFECTIVE DISORDERS IN COLLEGE ENGLISH TEACHING UNDER THE CROSS-CULTURAL BACKGROUND

Wenjing Zhou

School of Foreign Languages, Wuhan Textile University, Wuhan 430072, China

Background: Affective disorder is a common clinical disease, and depression and anxiety are the most common clinical manifestations. Research has found that with the increasing pace of life and increased working pressure, the incidence rate of affective disorders is increasing. The disease itself will affect the patient's health, but also have a great impact on the patient's family. Affective disorder refers to mental illness caused by emotion or mood change. This type of population is mainly manifested in low behavior or

high behavior. Specifically, there may be moody emotions such as anxiety and irritability. In severe cases, patients may have negative emotions such as despair and sadness. Anxiety is mostly closely related to learners' past experience, especially when learners suffer negative evaluations and personal injury from people around them. Inferiority complex is a psychological phenomenon. It refers to the emotion that individuals underestimate their abilities and experience failure in the process of learning. The sense of inferiority affects not only English learning, but also the individual ability and potential. The occurrence of affective disorder is closely related to the patient's life attitude and the patient's view of things. If appropriate measures are not taken for effective intervention, it will have very serious consequences, and even hurt others or commit suicide. Positive intervention measures taken by patients with affective disorders can have a positive effect on their body and mind. Under the multi-cultural background, there will be a variety of emotional barriers in the process of college English teaching. The influencing factors are the negative transfer of Chinese acquisition to English, traumatic emotional experience, the temperament and personality of power translators, and the deviation of value cognition.

At present, there are relatively few influencing factors of affective disorder in English translation at home and abroad, and the corresponding research results have not made outstanding achievements, especially in the multicultural environment. Affective barriers in college English teaching should be prevented from the aspects of affective attitude, learning strategies, cultural background, cognitive style, mother tongue transfer and so on. English teachers need to accumulate more cultural backgrounds and cultural characteristics of countries around the world, constantly improve their learning strategies, adjust and optimize their emotional attitudes, and ensure that the language they deliver can deliver positive information. Pay attention to the motivation education of internal translation and guide translators to have interest in English. Cultivate the translator's healthy personality and pay attention to the cultivation of the translator's good character. Establish a good and equal relationship between teachers and students and form a harmonious and inclusive classroom environment. Improve the current education management system and build corresponding evaluation methods. Affective disorder in English learning is caused by the destruction of the law of English learners' emotional activities. It will lead to the disorder of learners' attitude in the process of English learning, which specifically refers to the attitude and emotional state that hinders the smooth progress of learning.

Objective: To analyze the intervention scheme of affective disorder in college English teaching under the cross-cultural background, and evaluate the effect of the intervention scheme through satisfaction, in order to improve college students' affective disorder in English teaching.

Research objects and methods: The students and teachers of two schools are selected as the research object, and the satisfaction evaluation of affective disorder before and after intervention in college English teaching under the cross-cultural background is carried out by clustering feature tree algorithm. The number of students and teachers in each school is 50. The evaluation contents include students' learning initiative, students' learning enthusiasm and application flexibility. The evaluation results are measured by very satisfied, relatively satisfied, satisfied, slightly satisfied and not very satisfied. The satisfaction rate refers to the ratio of the number of very satisfied, relatively satisfied and satisfied people to the total number of people. The study takes the average value of the evaluation results of all research objects as the final result, so as to ensure the reliability of the results.

Methods: The satisfaction before and after affective disorder intervention in college English teaching under the cross-cultural background is analyzed by the statistical analysis software.

Results: Table 1 shows the satisfaction before and after affective disorder intervention in college English teaching. On the whole, after the implementation of the affective disorder intervention program in the process of college English teaching, teachers and other evaluators have high satisfaction with students' learning initiative, students' learning enthusiasm and application flexibility, with values exceeding 85%. This shows that after the introduction of the affective disorder intervention program, college English teaching can be generally recognized by students and teachers, and the intervention program can be applied to college English teaching in a cross-cultural context.

Table 1. Satisfaction before and after affective disorder intervention in college English teaching

Time	Students' learning initiative	Students' learning enthusiasm	Application flexibility
Before intervention	73	72	73
After intervention	89	90	88

Conclusions: The intervention program of affective disorder in college English teaching proposed by the research can greatly alleviate students' affective disorder, which can not only help students better adapt to the English teaching methods of cross-cultural background in colleges and universities, but also improve the overall education level of colleges and universities.

THE TRAINING MODE OF BIG DATA INNOVATION AND ENTREPRENEURSHIP TALENTS FROM THE PERSPECTIVE OF PSYCHOLOGY

Mengli Zheng

School of Innovation and Entrepreneurship, Zibo Vocational Institute, Zibo 255000, China

Background: Developmental psychology is a branch of psychology, which aims to reveal the internal mechanism of personal development and help and guide individuals to achieve all-round comprehensive development by analyzing the factors affecting human development. The research contents of developmental psychology include geriatric psychology, middle-aged psychology, child psychology, comparative psychology and so on. In a narrow sense, developmental psychology can be regarded as child psychology. In a broad sense, developmental psychology includes child psychology, evolutionary psychology, national psychology, comparative psychology, animal psychology and so on. The educational significance of developmental psychology lies in providing theoretical basis and support for the current educational and teaching activities. First, draw a conclusion through the psychological research of science specialty and apply it to the development of education and teaching to ensure the scientificity of education and teaching activities. Second, it is of great help to assist teachers in carrying out targeted education and teaching activities, especially for teachers with less experience. Third, developmental psychology plays an important role in the development of human society and individual development and self-improvement. It can enhance the scientificity of the teaching mode. Psychological knowledge is widely used in the education process of college students' talent training mode, and the educational results have achieved satisfactory results. At present, developmental psychology is effectively combined with philosophy, computer and other disciplines and fields, and it has played a very important role. Therefore, it is of great practical significance to study the training mode of innovative and entrepreneurial talents suitable for big data from the perspective of developmental psychology.

From the perspective of developmental psychology, the big data system needs to solve the following problems: balance ideological education and political education to help solve psychological confusion. Pay attention to the practical activities of mental health and set up activity classes outside the classroom. Establish and improve the long-term archives of ideological education for freshmen. Improve the ability of teaching specialization and constantly expand the ideological education team. The big data innovation and entrepreneurship talent training mode for development psychology needs to be improved and optimized from the following aspects, including setting up a professional career planning courses for innovation and entrepreneurship talents, building diversified innovation and entrepreneurship theme education activities, adhering to the combination of individual consultation and classified counseling, establishing a talent training system in the whole life cycle actively carry out innovation and entrepreneurship practices and activities. Among them, paying attention to individual experience is the most critical. Teachers' teams should adopt teaching forms such as theme exchange and role-play according to the individual's educational background, specialty and discipline. At the same time, teachers meet the individual sense of experience through the setting of different teaching experience scenes, and tap their potential to complete innovation and entrepreneurship. Perfect training shall be provided for teachers to form a professional teaching team. Each teacher needs to have new innovative and entrepreneurial thinking and developmental psychology theory.

Objective: Build a big data innovation and entrepreneurship talent training mode from the perspective of developmental psychology, and evaluate the new big data innovation and entrepreneurship talent training mode through consensus, in order to improve the success rate of college students entering the society and entrepreneurship.

Research objects and methods: Select 500 students from four universities in a city who want to start a business as the research object, and analyze the recognition of big data innovation and entrepreneurship talent training mode before and after innovation through Gaussian mixture clustering algorithm. The assessment includes five aspects: professional career planning courses for innovation and entrepreneurship talents, building diversified innovation and entrepreneurship themed education activities, adhering to the combination of individual consultation and classified counseling, establishing a talent training system in the whole life cycle, and actively carrying out innovation and entrepreneurship practices and activities. The evaluation index is recognition degree. The recognition degree is set as low, medium and good grades, and the corresponding scores are 1-2, 3-4, and 5-6 respectively. The recognition rate is the ratio of the number of people with and good recognition to the total number of people. The study takes the average value of all

research objects as the result, so as to ensure that the results are not affected by subjective factors.

Methods: Through Epi Info statistical analysis software, analyze the recognition of students on the training mode of big data innovative and entrepreneurial talents before and after the application of development psychology.

Results: Table 1 refers to students' recognition of big data innovation and entrepreneurship talent training mode before and after the application of development psychology. On the whole, the new big data innovation and entrepreneurship talent training mode is based on professional innovation and entrepreneurship talent career planning courses (D1), building diversified innovation and entrepreneurship theme education activities (D2), adhering to the combination of individual consultation and classified counseling (D3), establishing a talent training system in the whole life cycle (D4), actively carry out innovation and entrepreneurship practices and activities (D5) is highly recognized in five aspects, with values exceeding 80%. Therefore, the big data innovation and entrepreneurship talent training mode combined with development psychology have better practical significance.

Table 1. Students' recognition of big data innovation and entrepreneurship talent training mode before and after the application of development psychology

Time	D1	D2	D3	D4	D5
Before application	71.0	71.2	72.4	76.2	72.0
After application	85.2	86.4	86.4	89.2	89.0

Conclusions: The big data innovation and entrepreneurship talent training mode of applied developmental psychology proposed by the research has practical significance. Educators can promote and apply this talent training mode in other colleges and universities.

* * * * *

INFLUENCE OF THE REFORM OF COLLEGE EDUCATION MANAGEMENT SYSTEM ON ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY

Weijiang Wang

Academy of Fine Arts, Guangzhou College of Technology and Business, Guangzhou 510850, China

Background: Anxiety is an abnormal psychological bad emotion produced by the human body. Most patients are disappointed and sad. Medical psychologists believe that anxiety usually refers to people's adverse feelings such as risk, pressure and pain that exceed their acceptable range. At the same time, it is difficult for people to face and solve these problems. In the training process of different majors, college students need to have a variety of knowledge and skills, which will aggravate students' anxiety to a certain extent. The physiology of college students is at the dividing point between maturity and immaturity. When they face increasing pressure of study and work, they are easy to have very big psychological obstacles. College students spend most of their time in a noisy and crowded living environment, which can easily lead to psychological problems such as fatigue, slowness and irritability, and anxiety in serious cases. At present, the common intervention measures are offering lectures on professional knowledge of mental health and targeted personalized psychological intervention. The former popularizes common psychological problems and the adverse effects of psychological problems to students through regular lectures on mental health knowledge, and provides students with channels to obtain psychological assistance. The latter alleviates and improves students' psychological problems through active psychological intervention measures, and sets up a special psychological counseling room to complete psychological counseling. However, these anxiety intervention programs are difficult to implement, poor effect and low real-time, so it is difficult to fundamentally solve the anxiety problems of middle school students in the process of professional training.

With the increasingly severe psychological anxiety of college students, the optimization of college education management system plays a very important role in cultivating comprehensive talents. It can not only shape students' excellent moral quality, but also enhance students' humanistic quality. The goal of higher education management is to improve students' moral, intellectual, physical, aesthetic and labor levels, and shape students' ability of innovative consciousness. The reform of college education management system can not only help students develop good labor consciousness and labor attitude, but also enable students to develop good labor habits. After the optimization of college education management system, it can not only exercise students' spirit of hard work, but also help students improve their

competitiveness and sense of mission, make them have a strong will not afraid of hardship, and then alleviate the anxiety of college students to a certain extent. At present, many research reports at home and abroad show that college education management should pay attention to students' mental health and the development of students' all-round ability, to provide support for modern education. The goal of educational management reform in colleges and universities is to cultivate all-round high-quality talents with high psychological endurance.

Objective: This paper analyzes the effect of the reform of college education management system on alleviating college students' psychological anxiety, in order to provide scientific suggestions for the level of college education management.

Research objects and methods: This paper selects 1000 colleges and universities in a certain area as the research object, and analyzes the effect of the reform of college education management system on alleviating college students' psychological anxiety through the improved decision tree algorithm. The evaluation contents include cognition, emotion, will and belief. Cognition refers to the patient's cognition of self. Emotion refers to the patient's own emotional situation. Willingness refers to the patient's attitude towards something. Faith refers to the patient's identification with something. The evaluation result is the impact value, and the range of setting the impact value is 1-5. 1, 2, 3, 4, and 5 respectively mean no impact, little impact, impact, comparative impact and obvious impact. In order to ensure the reliability of the research results, the average value of the evaluation results of all research objects is taken as the result.

Methods: Through the latest version of PEMS statistical analysis software, this paper analyzes the effect of the reform of the college education management system on alleviating college students' psychological anxiety.

Results: Table 1 shows the results of alleviating college students' psychological anxiety before and after the reform of the college education management system. It can be seen from Table 1 that after applying the reform mode of the education management system in colleges and universities, the anxiety symptoms of college students have been significantly improved, and the improvement effect of college students' anxiety disorder is mainly reflected in willingness and emotion.

Table 1. Alleviating results of college students' psychological anxiety before and after the reform of the college education management system

Factor	Cognition	Emotion	Will	Faith
Before reform	2	1	2	3
After reform	3	4	5	4

Conclusions: The reform of the college education management system has an ideal effect on alleviating college students' psychological anxiety, especially in the two aspects of will and emotion. The follow-up research can apply the proposed innovation system of college education management to the management of other colleges and universities.

* * * * *

THE INFLUENCE OF BADMINTON PLAYERS' PSYCHOLOGICAL ANXIETY ON THE STABILITY OF COMPETITION

Shouling Gao

College of Physical Education and Health, Changsha Medical University, Changsha 410219, China

Background: Mental health is a very broad concept, which shows a very good state of internal and external regulation at the macro level. It involves not only the stability of the internal environment, but also the dynamic adaptability of the external environment. For people with different life cycles, mental health standards have certain heterogeneity, but this difference is quite different. For athletes, they are often in a tense environment, which will also lead to corresponding changes in their psychology. Anxiety disorder is a very complex psychological and emotional disorder. Its clinical manifestations are usually motor agitation and sympathetic hyperactivity. The causes of the disease are depression, mental stimulation, personality, congenital heredity, etc., which are manifested in negative emotions such as anxiety, shame, disappointment, anxiety, fear and so on. Badminton players will face greater negative emotions in the preparation stage of the game. At the same time, with the approaching of the game time, students' anxiety will further increase and their poor psychological tolerance. Their mental health problems

are becoming increasingly prominent. The international health organization claims that the number of athletes with anxiety and depression is increasing and the incidence rate is becoming younger.

In most clinical studies, in clinical research, sports competition anxiety scale and sports cognitive trait anxiety scale are the most common anxiety evaluation scales. Sports competition anxiety scale is a tool to measure athletes' trait anxiety. It has good discriminant validity, aggregate validity and test-retest reliability. The sports cognitive trait anxiety scale includes cognitive anxiety and physical anxiety. Cognitive anxiety refers to athletes' cognitive concerns about their own ability, performance and competition results, excluding physiological reactions caused by autonomic nervous system. The research points out that if athletes are in a state of anxiety for a long time, it will have a negative impact on their mood and reduce the training efficiency. Teachers should pay close attention to the mental health of athletes. If teachers have a certain level of self-confidence and regulation, athletes will not have a high level of anxiety. Some scholars also believe that there is a close relationship between psychological state and competition anxiety, and anxiety can damage sports training to a certain extent. It is worth noting that whether badminton players can play a normal level in the process of competition is of great significance to the athletes themselves and coaches. However, at present, there are relatively few studies on psychological anxiety and stability in the process of competition, and the research results have not been analyzed quantitatively and deeply.

Objective: This paper analyzes the correlation between the psychological anxiety of badminton players and the stability of competition results, in order to provide a scientific basis for the normal play of badminton players' competition level.

Research objects and methods: 30 badminton players in a city were selected as the research object, and the correlation between the psychological anxiety of badminton players and the stability of competition results was analyzed by Pearson product-moment correlation coefficient. Badminton players' psychological anxiety is obtained by sports competition anxiety scale and sports cognitive trait anxiety scale. The stability of the competition results is obtained through the scores of two coaches, ranging from 1 to 100 points. The higher the score, the better the athletes' competition. In order to avoid the influence of subjective factors on the research results, the average score of the two coaches is taken as the result.

Methods: Through SPSS23.0 statistical analysis software is used to analyze the correlation data between badminton players' psychological anxiety and the stability of competition results. The measurement data in line with normal distribution is expressed by mean \pm standard deviation. $P < 0.05$ indicates that the gap has a significant statistical difference, and $P < 0.01$ indicates that the gap has a very significant statistical difference.

Results: Table 1 refers to the correlation between badminton players' psychological anxiety and the stability of competition results. It can be seen from Table 1 that the correlation between the sports competition anxiety scale and competition stability is -0.856, and the significance value is lower than 0.05. The correlation between sports cognitive trait anxiety scale and competition stability was -0.878, and the significance value was lower than 0.01. This shows that the psychological anxiety of badminton players is negatively correlated with the stability of competition results.

Table 1. Correlation between psychological anxiety of badminton players and stability of competition results

Gauge	Relevance	Significance
Sports competition anxiety scale	-0.856	<0.05
Motor cognitive trait anxiety scale	-0.878	<0.01

Conclusions: The correlation between badminton players' psychological anxiety and the stability of competition results is negative. Subsequent research can alleviate athletes' anxiety before competition through psychological intervention measures, so that badminton players can play a normal level in the process of competition and increase the possibility of winning the game.

* * * * *

RELATED SOCIAL PSYCHOLOGICAL FACTORS OF COLLEGE STUDENTS' NETWORK INTERPERSONAL RELATIONSHIP

Yunling Wang

School of Marxism, Hangzhou Polytechnic, Hangzhou 311402, China

Background: Network is a very important communication platform. At present, most college students are easy to fall into network interpersonal communication, which will have a serious impact on individual psychological and social functions. Internet addiction is a psychological abnormal symptom caused by individuals' high dependence on the Internet, and it will appear physiological abnormalities. Internet relationship addiction is a type of Internet addiction, which specifically means that individuals overuse the communication function of chat rooms, Internet forums and other Internet platforms, resulting in them indulging in the establishment, development and maintenance of intimate relationships on the Internet, without considering whether there is the development and maintenance of interpersonal relationships in the real world. According to the data of China Internet Network Center, the number of Internet teenagers in China has reached 300 million, accounting for about 85% of the proportion of teenagers in China. Most educators point out that more than 60% of Internet addiction groups are Internet relationship addiction and online game addiction. Most studies at home and abroad analyze the correlation between Internet addiction and external variables and personal trait variables, and pay little attention to the correlation between the types and influencing factors of Internet addiction. Among them, most researchers believe that college students' online interpersonal relationship is closely related to psychological factors such as self-orientation, social self-esteem and social anxiety.

Anxiety is an abnormal psychological bad emotion produced by the human body. Most patients are disappointed and sad. Medical psychologists believe that anxiety usually refers to people's adverse feelings such as risk, pressure and pain that exceed their acceptable range. At the same time, it is difficult for individuals to face and solve these problems. The state of anxiety and depression is the result of disharmony with the outside in the process of growth. Anxiety plays a media role in depression and self-differentiation, and the degree of depression is often affected by self-differentiation and anxiety. Self-orientation refers to obtaining a more stable social attribute, psychological characteristics, physiological status and so on through the individual's observation of society, external activities and so on. Self-orientation determines an individual's understanding of experience and expectations. The higher the corresponding score of self-positioning, the higher the corresponding level of mental health. As an important part of individual self-esteem structure, social self-esteem is an individual's evaluation of his communication status and social communication ability. If individuals have a high evaluation of their social self-esteem, they are likely to gain positive emotional experience, help them accept and like themselves, and then maintain a better psychological state. The research shows that college students' self-positioning, social self-esteem and social anxiety of Internet addiction have certain characteristics. Individual self-positioning such as being friendly to themselves may be closely related to Internet addiction.

Objective: This paper analyzes the related social and psychological factors of college students' Internet addiction, in order to provide scientific suggestions for the benign communication of college students' Internet interpersonal relationships.

Research objects and methods: Students from five schools were selected for a single factor comparative analysis of social and psychological factors related to college students' Internet interpersonal relationship, and the addiction tendency of college students' Internet interpersonal relationship was set as the dependent variable. The risk factors with statistical significance were obtained by logistic regression analysis. The relative risk was determined by Odds Ratio (OR), and the 95% confidence interval was determined, or a value greater than 1 indicates that the influencing factor is a risk factor. $P < 0.05$ showed significant difference.

Methods: NOSA statistical analysis software was used to analyze the influencing factors of network interpersonal relationship in colleges and universities, and to judge the independent risk factors of network interpersonal relationship in colleges and universities.

Table 1. Logistic regression analysis of multiple psychosocial factors on college students' Internet addiction

Independent variable	Regression coefficient	Standard error	Chi-square value	OR	Lower limit of 95% confidence interval	Lower limit of 95% confidence interval	P
Ambition	0.958	0.085	13.241	1.705	0.606	0.826	0.019
Communication	-1.569	0.894	3.885	0.812	-2.004	3.654	0.001
Friendly	-2.326	1.210	3.785	1.239	-3.036	4.231	0.004
Studies	-0.113	0.068	0.278	1.987	-2.041	2.011	0.032
Self-acceptance	-1.284	1.268	9.865	1.365	-4.261	8.236	0.005
Social self-esteem	-1.131	0.695	0.832	11.032	-1.365	4.028	0.003
Social anxiety	2.312	1.023	2.921	7.562	3.856	7.361	0.002

Results: Table 1 refers to the results of logistic regression analysis of various social and psychological factors on college students' Internet addiction. The results of regression analysis showed that the more serious the students' social anxiety, the higher the tendency of Internet addiction. The independent risk factors of Internet addiction are communication, friendliness, self-acceptance, social self-esteem and social anxiety.

Conclusions: The independent risk factors of Internet addiction are communication, friendliness, self-acceptance, social self-esteem and social anxiety. Therefore, teachers, parents and other supervisors should pay attention to these risk factors in college students' online interpersonal relationships to avoid students falling into the vortex of the Internet to the greatest extent.

INFLUENCE OF INDOOR SPACE ENVIRONMENT DESIGN OF PREFABRICATED BUILDINGS ON IMPROVING PATIENTS WITH COGNITIVE IMPAIRMENT

Tian Zhao

College of Architectural Engineering, Taizhou Vocational & Technical College, Taizhou 318000, China

Background: Cognitive impairment refers to the abnormal knowledge processing in the process of thinking judgment and learning. In most cases, machine experience is manifested as memory function and learning dysfunction, and even serious psychological abnormal behaviors such as loss of line, recognition, and use. The causes of cognitive impairment are chronic brain injury, chronic systemic diseases, mental and psychological abnormalities, among which mental and psychological abnormalities are the main causes. Cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment according to different types of impairment. The clinical manifestations of thinking disorder include delusion, thinking logic disorder, association process disorder, abstract generalization stage disorder and so on; In clinical practice, memory impairment mainly includes memory error, memory fragment loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. The treatment of patients with cognitive impairment has become a topic of great concern to clinical scholars. The common treatment methods are behavior therapy, music therapy, environmental therapy and so on. Psychological journals point out that the design of indoor space and environment in prefabricated buildings can help alleviate the symptoms of patients with cognitive impairment.

The research of space environment design on alleviating cognitive impairment is mainly reflected in improving the cognitive ability of the elderly, taking space environment design as an auxiliary means, and promoting public communication. Under the requirements of alleviating cognitive impairment of the elderly, the strategies of indoor space and environment design of prefabricated buildings are as follows. First, the design of lighting environment. The visual characteristics of elderly patients with cognitive impairment were significantly lower than those of young people or healthy groups of the same age. With the increase of age, the ability of pupil to adapt to light changes decreases. In terms of lighting environment design, it is necessary to promote public communication behavior, including selecting electric light source with good display performance, illumination, and color temperature, and preventing glare. Second, the design of color environment. According to the cognitive impairment of the elderly, the perceptual characteristics of the color environment should be designed accordingly. It is necessary to activate the space atmosphere through the decorative colors in the space, pay attention to the primary and secondary colors, and avoid the use of large areas of green, blue and white. With the help of the characteristics of color, it can help association, alertness and identification. In addition, you need to adjust your mood through color. Third, the rational use of decorative materials. The interior decoration space of wooden materials can make people get a more positive emotional experience. Designers should pay attention to the matching use of materials in the design process, and give full play to the emotional and physical characteristics of different materials in touch and vision. Special attention should be paid to the selection of flexible finishing materials, the use of integrated material matching, the use of thermal insulation materials, and the use of regular and delicate texture materials as far as possible. Fourth, pay attention to home display, including the way and location of furniture layout, the aging and comfort of furniture, and the color matching of furniture. Fifth, other indoor environmental elements, including form characteristics, spatial scale, climate environment, sound, etc.

Objective: To analyze the improvement effect of indoor space environment design of prefabricated

buildings on elderly patients with cognitive impairment, in order to help elderly patients with cognitive impairment provide intervention measures.

Research objects and methods: 120 elderly people with different degrees of cognitive impairment in two cities were selected as the research object. The mitigation of indoor space environment design of prefabricated buildings on elderly patients with cognitive impairment was evaluated by fuzzy evaluation method and analytic hierarchy process. The evaluation index includes five aspects: lighting environment, color environment, decorative materials, home display and other elements. There are five grades: obvious improvement, general improvement, improvement, slight improvement and no improvement. The corresponding scores are 1-20, 21-40, 41-60, 61-80 and 81-100 respectively.

Methods: Through SPSS22.0 data statistical analysis software to obtain the improvement effect of indoor space environment design of prefabricated buildings on elderly patients with cognitive impairment.

Results: Table 1 refers to the improvement effect of urban D prefabricated building indoor space environment design on elderly patients with cognitive impairment. It can be seen from Table 1 that lighting environment; color environment and decorative materials have the most obvious effect on the improvement of cognitive impairment.

Table 1. Improvement effect of indoor space environment design of urban D prefabricated building on elderly patients with cognitive impairment

Category	Significant improvement	General improvement	Improve	Slightly improved	No improvement
Illumination environment	34	41	17	16	12
Color environment	28	37	23	14	18
Decorative materials	26	35	29	16	14
Home display	21	25	30	21	23
Other elements	22	24	35	20	19

Conclusions: The indoor space environment design of prefabricated buildings has a good improvement effect on elderly patients with cognitive impairment, especially in three aspects: lighting environment, color environment and decorative materials. This scheme can be applied to the improvement of elderly patients with cognitive impairment.

* * * * *

INTEGRATION OF INDUSTRY AND EDUCATION AND THE DEVELOPMENT OF INFORMATIZATION IN COLLEGES AND UNIVERSITIES TO ALLEVIATE THE ANXIETY OF COLLEGE STUDENTS

Xiaoguang Tian & Xiaozhong Ren

School of Mechanical and Electrical Engineering, Huanghe Jiaotong University, Jiaozuo 454950, China

Background: As the core content of vocational education, the integration of industry and education plays an important role in the process of cultivating applied high-quality talents in colleges and universities. As early as 2017, China has issued a programmatic document on the integration of industry and education, which takes the integration of industry and education as an important development strategy in the process of China's education reform. The integration of industry and education is not only to establish a simple school-enterprise cooperation relationship, but also to organically combine the teaching of professional courses in colleges and universities with the training of enterprise internships, so that students can apply what they have learned, and be trained and improved in theory and practice. Moreover, the continuous development of big data technology has made a breakthrough in the reform and optimization of the teaching mode of integration of production and education. The university has established a mode of integration of production, teaching and information, laying a solid foundation for the advanced teaching mode of "Internet plus education". The main way of information development of the integration of industry and education in colleges and universities is to build a virtual training platform, which can improve the practical operation ability of college students to a certain extent. In the traditional teaching and training

mode of colleges and universities, students may have certain negative emotions and even anxiety due to the separation between theoretical knowledge infusion and practical operation, low mastery of theoretical and practical operation ability, high employment pressure and many other factors. Anxiety psychology mainly refers to the tension generated by individuals under the influence of external pressure or frustration events. At present, a large number of college students will feel confused or uneasy about their employment prospects in the graduation season. It is usually difficult to maintain concentration, lose interest in the surrounding things, excessive pride or inferiority. College students' anxiety psychology will have a huge negative impact on their study, employment and interpersonal communication, which is not conducive to the improvement of their professional ability and the realization of the goal of all-around development. The informatization development of the integration of industry and education in colleges and universities can play a positive guiding role in different aspects. By improving the mastery of their theoretical knowledge and practical ability, it can effectively alleviate the anxiety of college students.

Objective: In the process of continuously improving the development level of industry education integration informatization in colleges and universities, it is inevitable to face diversified practical difficulties, including the poor significance of the main role of industry education integration informatization construction, the prominent demand contradiction between schools and enterprises, the imperfect construction performance of industry education integration informatization platform, and the urgent need to improve the informatization operation ability of college teachers. The research will take corresponding improvement measures according to different problems, in order to promote the development process of industry education integration informatization in colleges and universities, and then explore its alleviating effect on college students' anxiety symptoms.

Research objects and methods: 76 college students, a total of 228, were randomly selected from each of the three colleges and universities. They were selected as the research objects to participate in the teaching intervention experiment of industry education integration and information development for 4 months. Before and after the intervention, record the relevant data of 228 college students' anxiety psychology, and compare the anxiety state of college students before and after the intervention, so as to obtain the research results of alleviating college students' anxiety through the development of industry education integration and informatization in colleges and universities.

Research design: Before and after the intervention experiment, the intervention effect was evaluated by Beck Anxiety Inventory (BAI) and Self-rating Anxiety Scale (SAS). Bai contains 21 evaluation items. The level 4 score is used to evaluate the subjective anxiety of the evaluation object. The evaluation standard is "1", which means no anxiety, "2" indicates mild anxiety, "3" indicates moderate anxiety, and the degree of anxiety is in a tolerable range, "4" indicates severe anxiety, that is, the degree of anxiety is extremely serious and unbearable. The Bai score is positively correlated with the anxiety degree of the subject. If the Bai score of the subject is less than 5, it means that the subject has no anxiety. A score between 5 and 25 indicates mild anxiety. A score in the range of 26 to 35 indicates that the subject is accompanied by moderate anxiety. If the score is 36 or above, it indicates that the subject is accompanied by severe anxiety. SAS mainly evaluates the frequency of the name of anxiety symptoms, and also adopts the 4-level scoring standard. "1" indicates that the frequency of anxiety symptoms is not or very little, indicating that the anxiety degree of the subject is light, "2" means a small part of the time, "3" means more time, "4" indicates that anxiety symptoms occur most or all of the time. SAS score was positively correlated with the severity of anxiety symptoms, and 50 was the critical value.

Note: Compared with that before intervention, * $P < 0.05$; Compared with that before intervention, # $P < 0.05$.

Figure 1. Comparison results of scores at different time nodes before and after intervention

Methods: The total score obtained by adding the scores of Bai and SAS items needs to be multiplied by 1.19 and 1.25 respectively, and then rounded to obtain the final Bai score and SAS score. For all data obtained before and after the intervention, Excel and SPSS25.0 were used for calculation and analysis.

Results: Figure 1 shows the changes in Bai and SAS scores before and after the intervention. It can be seen that with the progress of the intervention experiment, the Bai scores of college students showed a gradual downward trend, from severe anxiety symptoms to mild anxiety. As for the change trend of SAS score, the anxiety of college students has been significantly improved.

Conclusions: The informatization development of the integration of industry and education in colleges and universities can reduce the Bai score and SAS score of college students in the process of practical application, and effectively alleviate their anxiety.

ENTERPRISE ACCOUNTING AUDIT RISK AND THE CONSTRUCTION OF INFORMATION AUDIT SYSTEM UNDER THE OBSTACLE OF THINKING LOGIC

Ye Liao

School of Digital Economics, Sichuan Vocational and Technical College, Suining 629000, China

Background: Thinking logic disorder means that patients' thinking lacks or loses inherent logical connection, and their thinking is in a pathological state, which is difficult to be understood by normal people. Among the manifestations of thinking logic obstacles, it mainly includes four different types: symbolic thinking, new words, logical fallacy thinking and sophistry thinking. Symbolic thinking refers to the abstract processing of a specific thing to obtain an abstract concept. In normal symbolic thinking, tradition and habit are the basic basis in the symbolic process. In pathological symbolic thinking, what is used to represent abstract concepts cannot be understood by others. New works of words refer to that patient with thinking logic disorder can create some words, graphics and symbols that only they can understand. Patients have given them a certain special meaning, and although it is difficult for others to understand, patients think others should understand. Logical inversion thinking refers to that patients take the existing logical obstacles in the process of thinking association as the main feature, and show the characteristics of bizarre reasoning process and inversion of cause and effect on the basis of lack of premise and logical basis. Sophistry thinking mainly refers to that the patient's view on a certain problem seems reasonable, but it will be found that its view is completely illogical, lacks basis and rationality.

Under the obstacle of thinking logic, there are great disadvantages in the construction and research of enterprise accounting audit risk and information audit system, which are embodied in three aspects: market competition and legal loopholes, auditors' ability and auditors' sense of responsibility. The reasons leading to the risk of enterprise accounting audit have a certain diversity, mainly covering three different levels: the rapid expansion of audit object and audit scope, the lack of perfection of social system, and the fierce market competition in the finance and taxation industry. In essence, the rapid expansion of audit objects and audit scope is mainly caused by the continuous promotion of the process of economic integration. The communication between domestic and international platforms is gradually strengthened, which promotes the international development of enterprise business, making the accounting and audit industry more responsible and facing greater challenges. The lack of perfection of the social system is mainly reflected in the continuous development of accounting audits. The policies and laws of fiscal and tax audit are difficult to effectively restrict the accounting audit and increase its risk. The market competition in the finance and taxation industry is intensifying, and the old accounting and audit methods are difficult to meet the diversified needs of relevant work.

Objective: To explore the changes of enterprise accounting audit risk before and after the improvement of thinking logic obstacles, and put forward targeted measures for the construction of an information audit system, in order to improve the accounting audit process and improve the effectiveness of accounting audit work.

Research objects and methods: Auditors from four enterprises were selected as the research object. There were 15 auditors in each enterprise, a total of 60. Using the Naive Bayesian algorithm, this paper makes data mining and analysis on the enterprise accounting audit risk before and after the improvement of thinking logic obstacles.

Research design: Take the market competition and legal loopholes in the enterprise accounting audit

risk, the ability of auditors and the sense of responsibility of auditors as the evaluation indicators, and make 60 auditors rate the risk of each evaluation index. The risk level is divided into four different levels, i.e., no risk, low risk, medium risk and high risk, which are expressed as 0-3 from low to high.

Methods: The combination of matrix analysis and comparative analysis was used to explore the evaluation results of auditors' risk level before and after the improvement of thinking logic barriers.

Results: Before and after the improvement of thinking logic barrier, the role of enterprise accounting audit risk showed some differences. Before the improvement of the thinking logic barrier, auditors' professional level and sense of responsibility in daily audit work were affected to varying degrees, and their risk rating results were 3 respectively. Audit risks at all levels are embodied in the low level of professional ability of auditors and poor mastery of professional knowledge, theory, and practical ability, which makes it difficult to effectively ensure the accuracy and reliability of enterprise accounting audit results. The accounting audit work is complicated, and the relevant knowledge changes with each passing day. It is difficult for some auditors to insist on continuous training, learning and serious work, which increases the risk of enterprise accounting audit work. After the improvement of the thinking logic barrier, the risk evaluation value of each evaluation index has decreased to 0, 1 and 1 respectively, indicating that the risk level of enterprise accounting audit has decreased to no risk or low risk level. See Table 1 for details.

Table 1. Enterprise accounting audit risk evaluation results before and after the improvement of thinking logic barriers

Risk evaluation index	Before improvement		After improvement	
	Risk rating	Number (%)	Risk rating	Number (%)
Market competition and legal loopholes	2	13 (21.67)	0	9 (15.00)
Auditor competence	3	24 (40.00)	1	25 (41.67)
Auditors' sense of responsibility	3	23 (38.33)	1	26 (43.33)

Conclusions: The risk of enterprise accounting audit under the thinking logic barrier is mainly reflected in three levels: market competition and legal loopholes, auditors' ability and auditors' sense of responsibility, and its risk level are in a high-risk state. By improving the thinking logic barrier, the risk rating level of three different levels can be effectively reduced, based on this, we can realize the construction of an information audit system and ensure the smooth development of enterprise accounting audit.

BASED ON THE TRANSFORMATION OF READERS' ANXIETY TO LIBRARY SERVICE IN THE READING PROMOTION OF UNIVERSITY SMART LIBRARY

Shifeng Cui

Henan Institute of Science and Technology Library, Xinxiang 453003, China

Background: Since entering modern society, with the rapid change of life mode and the intensification of social competition, anxiety has become a common problem in daily life. Anxiety psychology, as a psychological disease, has not been widely concerned, but it has an important impact on all fields of society. From the perspective of conceptual analysis, anxiety is mainly due to the tension and fear derived from the inability to achieve their own goals or overcome the potential threats around them. Being anxious for a long time will not only frustrate people's self-esteem and self-confidence, but also distract people's attention, and then have a negative impact on people's normal daily life. From the physiological level, the increase of psychological anxiety is the result of disturbing brain memory and thinking, making people show anxiety, tension, indecision and disturbing emotional changes. Anxiety can lead to neurological dysfunction, mental illness or abnormal anxiety. However, if these manifestations are excessive, they will evolve into anxiety disorders, even physical and language stiffness, mental breakdown, or common mental diseases in medicine, which will undoubtedly bring great threats and challenges to people's body and mind, study and work. At the same time, anxiety, as a common and common psychological disease, also has an important impact on people's judgment and thinking in their daily life, that is, people in a state of anxiety will not be able to deviate from the normal track of daily life and fall into a kind of self-repression that cannot extricate themselves, so it is difficult to practice their goals, and linger in place in depression. Relevant studies have pointed out that the anxiety of different groups or occupational groups will have a negative significance to

their work or related affairs in their field. For example, readers' anxiety will affect their judgment of library service, which is manifested in their dissatisfaction and contradiction with library service, which will have a negative effect on their own reading and learning. In short, anxiety has spread to all areas of people's daily life, which should be paid attention to.

With the subtle progress of information technology, our daily life is changing rapidly. Reading promotion activities will be reasonably combined with modern information technology, that is, the emergence of smart library can not only strengthen book promotion, but also expand the coverage and let more people know the specific information of reading promotion. The integration of information technology and library is not limited to this. Smart library also improves the collection ability and serviceability of the library, and expands the reading mode through library digital reading, making people's learning and reading more convenient. Smart library mainly integrates modern network technology and intelligent technology on the basis of the university library, and operates and services through intelligent device terminals. However, whether traditional library or intelligent library, its ultimate goal is people-oriented and serve users. Let more people love reading and learning, guide people to develop good reading habits and learn knowledge from books, so as to improve their cultural reserves. Therefore, from the perspective of readers' anxiety psychology, this paper discusses the important role of reading promotion of university smart library in alleviating readers' anxiety psychology, so as to change the service direction and ways of the university library and comprehensively improve the service level and quality of university library.

Objective: This paper analyzes the positive significance of reading promotion of university smart library in alleviating readers' anxiety, so as to fundamentally change the service direction of the university library and achieve the goal of comprehensively improving the service level and quality of university library.

Research objects and methods: 400 college students' readers were randomly selected from five university libraries in our city as the research objects. Before the experiment, the psychological measurement of readers' anxiety was carried out, that is, the psychological measurement of readers' anxiety was carried out in combination with the diagnostic test of anxiety tendency. The higher the score, the more serious the readers' anxiety. Then, carry out the reading promotion intervention of the university smart library for one month, compare the changes of anxiety psychology of college students' readers before and after the intervention, and take this as the basis to evaluate the service quality of the university library.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the changes in readers' anxiety psychology after the reading promotion intervention of the university smart library. Compared with before the intervention, after the implementation of the reading promotion intervention of the university smart library, the anxiety psychology of college students' readers has been improved, and there is a statistical difference before and after the intervention ($P < 0.05$).

Table 1. Based on the changes in readers' anxiety after the reading promotion intervention of university smart library

Factor	Before intervention	After intervention	<i>P</i>
Anxious learning	4.65	1.55	<0.05
Communication anxiety	3.62	1.55	<0.05
Loneliness tendency	3.43	1.33	<0.05
Self-reproach tendency	3.34	1.44	<0.05
Sensitive tendency	3.47	1.49	<0.05
Physical symptoms	4.34	2.44	<0.05
Terrorist tendency	3.46	1.49	<0.05
Impulsive tendency	3.35	1.44	<0.05
Total score	68.49	31.47	<0.05

Conclusions: Because the reading promotion of university smart library can significantly improve the anxiety psychology of readers, in the service of the university library, we should actively implement the smart library and change the service direction, so as to reduce the anxiety psychology of readers, so as to greatly improve the service level and quality of university library.

Acknowledgement: This paper is the result of Henan Library and Information Research Project "Research on Library Reading Promotion under 5G Background" in 2021 (No. HNTQL-2021-08).

THE EFFECT OF RESIDENTIAL SPACE DESIGN ON ALLEVIATING ANXIETY FROM THE PERSPECTIVE OF HUMANISTIC PSYCHOLOGY

Jile Chen

Fine Arts Academy, Hunan Normal University, Changsha 410000, China

Background: The development of modern western philosophy breeds the ideological tradition of people-oriented and advocates people's unique nature and unique research methods. This tradition provides the necessary ideological soil for the emergence of humanistic psychological methodology. Common sense psychology, religious psychology and philosophical psychology, which exist and develop in psychology, are the rudiments of humanistic psychology methodology, corresponding to the criticism of scientism and the promotion of human's unique essence and unique research methods in the field of philosophy of science. Humanistic psychology is committed to building a complete image of man and pursuing research methods suitable for man's unique nature, so as to resist the narrowness and hegemonism of scientific psychology. It presents five characteristics of methodology. The research orientation of humanities is the scientific essence of problem centrism, the research path of holism and the subjective research paradigm of intuitionism. It advocates taking the research mode of humanistic psychology as the basic research object of humanities and the research mode of humanistic psychology as the research object of natural science. It can be said that humanistic psychology criticizes the methodological centrism of scientific psychology, and advocates that psychological research should pay attention to problems that are meaningful to people and society, and the methods should adapt to the problems and choose the methods according to the problems. In view of this, humanistic psychology advocates "problem-centered theory", that is, psychological research must start from the research problems and choose methods and means according to the research problems, not the opposite. The proposal of problem-centered theory helps psychology get rid of the shackles of scientific methods and pay attention to real meaningful problems, so that psychology fundamentally constructs a psychological methodology suitable for studying "people" from a broader perspective. In short, humanistic psychology advocates human uniqueness and puts forward some methodological propositions suitable for human nature. This makes the construction of psychological methodology return to the correct starting point, so as to lay the foundation for the construction of more reasonable and perfect psychological methodology.

With the development of psychology from simple design to a comfortable living place, the psychological consciousness begins to rise. The interior design of living space has changed from modernism to postmodernism. The rigid shape makes people feel bored and tired, and they begin to pursue psychological space and psychological beauty. In other words, with the continuous development of informatization, people's thoughts are seriously affected by the media and lose themselves. Living space is a place for self-venting, which needs to be beautified in combination with the content of humanistic psychology in order to alleviate the anxiety of modern people. Relevant studies have pointed out that incorporating humanistic psychology into residential space design can not only effectively improve the problems existing in traditional residential space design, but also greatly improve the anxiety of residents, which is of great positive significance for residential space design. In view of this, from the perspective of humanistic psychology, this paper launches the influence of residential space design on alleviating residents' anxiety, so as to provide a new design idea and design direction for modern residential space design.

Objective: This paper explores the design of residential space based on humanistic psychology, and explores the effect of residential space design based on humanistic psychology on alleviating residents' anxiety. It aims to effectively improve the widespread anxiety problems of modern people in residential space, and provide a psychological perspective for modern residential space design.

Research objects and methods: 200 patients with anxiety were selected as the research object and randomly divided into control group and experimental group, with 100 in each group. The control group was intervened with conventional living space design, while the experimental group was intervened with living space design based on humanistic psychology. The intervention period was 1 month. The changes in the anxiety of the two groups were compared and analyzed.

Methods: Complete the data analysis through SPSS19.0 data statistical analysis software.

Results: Table 1 shows the changes in anxiety psychology of patients in the two groups after the implementation of humanistic psychology residential space design intervention. Compared with the control group of patients with conventional residential space design intervention, after the implementation of humanistic psychology residential space design intervention, the anxiety psychology of patients in the experimental group improved more significantly, and there was a significant difference between the two groups ($P < 0.05$).

Table 1. Changes of anxiety psychology of patients in the two groups after the intervention of humanistic

psychology and residential space design (n=200)

Dimensions of anxiety measurement	Control group (n=100)	Experience group (n=100)	P
Anxious learning	3.47	1.44	<0.05
Communication anxiety	4.34	1.49	<0.05
Loneliness tendency	3.46	2.44	<0.05
Self-reproach tendency	3.35	1.49	<0.05
Sensitive tendency	3.47	1.44	<0.05
Physical symptoms	4.34	2.36	<0.05
Terrorist tendency	3.96	2.01	<0.05
Impulsive tendency	3.35	1.49	<0.05
Total score	50.91	31.47	<0.05

Conclusions: On the one hand, humanistic psychology criticizes the methodological centrism of scientific psychology, and advocates that psychological research should pay attention to the problems that are meaningful to people and society. The methods should point to the problems and choose the methods according to the problems. Therefore, it has important application value in the design of residential spaces. On the other hand, residential space design based on humanistic psychology also has important application value in alleviating anxiety. It can not only provide a new idea for residential space design, but also provide a new strategy for alleviating anxiety.

ENTERPRISE GRASS-ROOTS MANAGEMENT STRATEGY CONSIDERING ALLEVIATING EMPLOYEES' MENTAL PRESSURE

Yanzhao Pan¹ & Jian Lei²

¹*Innovation and Entrepreneurship Development Center, Tianjin Sino-German University of Applied Sciences, Tianjin 300350, China*

²*Human Resources Department, Tianjin Electronic Information Technician College, Tianjin 300350, China*

Background: As a fixed term, the term “mental stress” developed with the fuzzy edge of various disciplines, and began to enter the fields of anthropology, sociology and medicine, and further refined and extended from these fields to behavioral science, management and other disciplines. On the basis of theoretical research, many experts consciously expand it to practical application, especially in enterprise stress management. Enterprise stress management mainly studies work stress. The body’s response to all mental stress is the same, that is, the pituitary gland rapidly secretes adrenal hormone and growth hormone in response to stress. Therefore, the impact of stress actually has both positive and negative aspects. On the negative side, too much pressure and too long a duration will have many adverse consequences. For employees, this will lead to a series of adverse changes in their physiology and psychology. Most surveys believe that work rhythm, heavy work tasks, and fierce competition among employees can lead to mental stress. For enterprises, huge work pressure will have a negative impact. Research shows that job stress is directly proportional to the turnover rate of employees. If the work pressure is too great and employees leave one after another, the enterprise needs to recruit employees again, and then carry out career setting and related training, which will inevitably increase the cost. In addition, with the continuous improvement of the legal system, more and more cases are brought by employees to enterprises due to work pressure. Even if the lawsuit is won, the enterprise will have to pay the corresponding labor and time costs. If the lawsuit is lost, it will have to pay high compensation to further increase costs. As we all know, human resources are the largest resources of enterprises. Employees are under too much pressure, which is bound to be difficult to focus on their work and achieve actual performance, affecting the overall development of the enterprise. At the same time, stress will also directly affect performance. Research shows that there is a complex relationship between “mental stress” and “job performance”, and appropriate stress will improve job performance. Without pressure, like boiling a frog in warm water, there will be no driving force to move forward and work performance will decline. People with too much pressure pay too much attention to pressure, but ignore how to improve performance, which eventually leads to performance decline.

In view of the fact that the mental stress of employees has become an important factor affecting the development of enterprises, the grass-roots management of enterprises should attach great importance to it, make rational use of the benign pressure of employees, turn pressure into power and give full play to the

potential of employees. On the contrary, to diagnose the negative pressure of employees, we should take appropriate strategies to solve, disperse and reconcile, so as to reduce the obstacles of employees' negative pressure to the development of enterprises. At the specific level, the grass-roots management of enterprises can promote the positive pressure of employees by establishing the reward mechanism, but pay attention to the appropriate range of pressure to ensure that the pressure is within the positive range. For negative pressure, enterprises should take timely and effective intervention measures to prevent the further expansion of employees' mental pressure, which will hinder the development and progress of employees themselves and enterprise organizations. In short, in the grass-roots management of enterprises, we should pay special attention to the mental pressure of employees, and take corresponding measures to intervene to ensure the physical and mental health of employees, so as to realize the benign and sustainable development of enterprises.

Objective: In order to alleviate the negative mental pressure of employees in the work of the enterprise, this study constructs an enterprise grass-roots management strategy considering the mental pressure of employees, which aims to alleviate, reconcile or solve the mental pressure of employees, so that employees can coordinate the relationship between stress and work, so as to ensure the healthy development of the enterprise.

Research objects and methods: 500 employees were randomly selected from five enterprises in our city as the research object, and the mental stress status of employees was measured in combination with the diagnostic test scale of work mental stress. The scale includes 9 factors: rules and regulations, task setting, specific requirements, condition creation, workability, role cognition, workload, interpersonal relationship. For career development, 5-level scoring is adopted. The higher the score, the more serious the employee's mental pressure is. Then, the enterprise grass-roots management model considering employees' mental pressure constructed in this paper is intervened for three months. The changes in employees' mental pressure before and after the intervention are compared and analyzed, so as to evaluate the application effect of the enterprise grass-roots management model constructed in this paper.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the changes in employees' mental stress after the intervention of enterprise grass-roots management strategy considering employees' mental stress. Compared with before the intervention, after the implementation of the enterprise grass-roots management strategy considering employees' mental pressure, the employees' mental pressure was improved, and there was a significant difference before and after the intervention ($P < 0.05$).

Table 1. Changes of employees' mental stress after the intervention of enterprise grass-roots management strategy considering employees' mental stress

Factor	Before intervention	After intervention	<i>P</i>
Rules and regulations	3.47	1.33	0.00
Task setting	4.34	1.44	0.00
Specific requirements	3.46	1.49	0.00
Condition creation	4.35	2.44	0.00
Working ability	3.47	1.49	0.00
Role cognition	4.34	1.33	0.00
Workload	3.46	1.44	0.00
Interpersonal relationship	3.35	1.49	0.00
Career development	4.47	2.44	0.00

Conclusions: The enterprise grass-roots management strategy considering the mental pressure of employees constructed in this paper can effectively alleviate the mental pressure of employees and ensure the physical and mental health of employees, which plays an important role in the development and progress of enterprises.

RESEARCH ON THE INTEGRATION OF INNOVATION AND ENTREPRENEURSHIP EDUCATION AND PROFESSIONAL EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Minghao Wang¹ & Juanxia Zhao²

¹*Innovation and Entrepreneurship Development Center, Tianjin Sino-German University of Applied Sciences, Tianjin 300350, China*

²*School of Economics and Management, Tiangong University, Tianjin 300387, China*

Background: Innovation and entrepreneurship education is a new educational concept put forward by China in recent years in order to be in line with international standards, keep up with the pace of the times and cultivate innovative talents. Innovation and entrepreneurship education aims to help students fully understand the current social enterprise business environment, entrepreneurial opportunities, entrepreneurial risks and enterprise development model. At the same time, helps students fully understand the concept and characteristics of entrepreneurship, and effectively cultivate students' entrepreneurial awareness and innovative spirit. Therefore, through innovation and entrepreneurship education, students' innovation awareness and entrepreneurship level can be improved, and high-quality innovative talents can be trained for society, which is of great significance to students' personal development and the overall development of society. The integration of innovation and entrepreneurship education and professional education is an important way to cultivate students' professional ability, entrepreneurial ability and innovation ability under the current economic development trend, and can provide more opportunities for students' future development. However, there are many problems in the integration of innovation and entrepreneurship education and professional education in colleges and universities, which need only one step of improvement.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Through educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. Based on educational psychology, the research carries out teaching design for the integration of innovation and entrepreneurship education and professional education in colleges and universities, and puts forward strategies to promote the deep integration of innovation and entrepreneurship education and professional education in colleges and universities, improve students' professional ability, entrepreneurship and innovation ability, transport high-quality compound talents for the society and meet the market demand for new innovative talents.

Objective: Innovation and entrepreneurship education are new educational concepts put forward by China in recent years in order to be in line with international standards, keep up with the pace of the times and cultivate innovative talents. The research puts forward strategies based on educational psychology to promote the deep integration of innovation and entrepreneurship education and professional education in colleges and universities, improve students' professional ability, entrepreneurial ability and innovation ability, and transport high-quality compound talents for society.

Research objects and methods: 200 students were selected as the research object in a university, and the teaching effect was evaluated by using the students' professional course scores and teachers' innovative ability to students.

Research design: Using the random number table method, 200 students were randomly divided into research group and control group, with 100 students in each group. Among them, the students in the research group are taught based on educational psychology, integrating innovation and entrepreneurship education and professional education. The students in the control group only carried out professional education and teaching. After three months of teaching, the teaching effects of the two groups of students were compared.

Methods: The software SPSS17.0 and Excel were used to count and analyze the relevant data.

Results: After 3 months of teaching, the test scores of the students in the research group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Conclusions: The integration of new entrepreneurship education and professional education is an important way to cultivate students' professional ability, entrepreneurship ability and innovation ability under the current economic development trend, and can provide more opportunities for students' future development. However, there are many problems in the integration of innovation and entrepreneurship education and professional education in colleges and universities, which need only one step of improvement. The research puts forward strategies based on educational psychology to promote the deep integration of innovation and entrepreneurship education and professional education in colleges and universities. The results showed that after three months of teaching, the test scores of students in the research group were

significantly higher than those in the control group ($P < 0.05$). It shows that the deep integration of innovation and entrepreneurship education and professional education in colleges and universities is helpful to improve students' professional ability, entrepreneurial ability, and innovation ability, and transport high-quality compound talents for society.

RESEARCH ON THE TEACHING REFORM PATH OF METALLOGRAPHY AND HEAT TREATMENT FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yulin Ma

School of Mechanical Engineering, Shenyang University, Shenyang 110044, China

Background: Metallography and heat treatment course is a compulsory course for mechanical specialty in higher vocational schools, including basic properties of metal materials, material selection of mechanical equipment, heat treatment and other related knowledge and contents, which can cultivate high-quality talents for relevant industries. This course involves a lot of theoretical knowledge and abstract concepts, and due to the limitations of teaching equipment and teaching environment, most schools lack practical teaching, resulting in poor mastery of this course and unsatisfactory learning effect. Therefore, it is necessary to reform the teaching of metallography and heat treatment based on educational psychology.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Through educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. Based on the theory of educational psychology, the research improves the teaching content, teaching methods and classroom organization of metallography and heat treatment course, so as to improve the teaching effect, increase students' learning initiative, improve students' comprehensive quality and cultivate high-level professional talents for the society.

Objective: The course of Metallography and heat treatment involves a lot of theoretical knowledge and abstract concepts. Due to the limitations of teaching equipment and teaching environment, most schools lack practical teaching, resulting in poor mastery of such courses and unsatisfactory learning effects. Based on the theory of educational psychology, the research improves the teaching content, teaching methods and classroom organization of metallography and heat treatment course, so as to improve the teaching effect and cultivate high-level professional talents for the society.

Research objects and methods: Two classes were randomly selected from the mechanical specialty of a higher vocational school as the research object, and the teaching effect of the two classes was evaluated by using the examination results of metallurgic and heat treatment courses of the two classes.

Research design: Among the two classes, one is class A, with 72 people. The other class is class B, with 70 people. Among them, class a adopts the improved teaching mode of metallography and heat treatment based on educational psychology. Class B adopts the traditional teaching mode of metallography and heat treatment. Three months later, the teaching effects of the two classes were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After teaching, the examination results of metallography and heat treatment of the students in the research group were significantly improved ($P < 0.05$). And it was significantly higher than that of the control group ($P < 0.05$). The examination results of the metallurgic and heat treatment courses of the two groups are shown in Table 1.

Table 1. Examination results of metallurgic and heat treatment courses of the two groups of students

Timing	Examination results		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	63.4±10.9	62.5±11.3	0.304	0.653
After teaching	86.7±11.7	73.1±10.9	6.420	0.013
<i>t</i>	6.371	4.421	-	-
<i>P</i>	0.006	0.029	-	-

Conclusions: Metallography and heat treatment course is a compulsory course for mechanical specialty in higher vocational schools, including the basic properties of metal materials, material selection of mechanical equipment, heat treatment and other related knowledge and contents, which can cultivate high-quality talents for relevant industries. This course involves a lot of theoretical knowledge and abstract concepts, and due to the limitations of teaching equipment and teaching environment, most schools lack practical teaching, resulting in poor mastery of this course and unsatisfactory learning effect. Therefore, it is necessary to reform the teaching of metallography and heat treatment based on educational psychology. Based on the theory of educational psychology, the study improved the teaching contents, teaching methods and classroom organization of metallurgic and heat treatment courses. The results showed that after teaching, the examination results of the metallurgic and heat treatment course of the students in the research group were significantly improved ($P < 0.05$). And it was significantly higher than that of the control group ($P < 0.05$). Therefore, the teaching reform of metallography and heat treatment based on educational psychology can improve the teaching effect, increase students' learning initiative, improve students' comprehensive quality, and cultivate high-level professional talents for society.

PROTECTION AND DEVELOPMENT COUNTERMEASURES OF MINORITY MUSIC CULTURE UNDER COGNITIVE IMPAIRMENT

Xuejie Li

Conservatory of Music, Changchun Normal University, Changchun 130000, China

Background: In the process of economic and social development, the competition is becoming more and more fierce. Therefore, many people have too much psychological pressure and suffer from social anxiety, which leads to cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. The process of cognition, it will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. Cognitive impairment is a pathological process involving brain function. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment and aphasia, which seriously affect their daily life and reduce their quality of life. Therefore, we need to find an appropriate way to alleviate social anxiety and treat cognitive impairment. Based on cognitive psychology, this study discusses the therapeutic intervention effect of ethnic minority music culture on patients with cognitive impairment.

Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition. Cognitive psychology is an important school of contemporary psychological research. It explains how people deal with information in cognitive activities. The basic principles of cognitive psychology mainly include five points: emphasizing the structural and organizational principles in the process of cognition, emphasizing the internal process, that is, the processing of symbol information, emphasizing the driving role of ideas, emphasizing the role of cognitive feedback, emphasizing the individual differences of cognitive style. Based on the analysis of cognitive psychology, we can know that the emotional transmission, cultural identity and emotional relief

function of ethnic minority music culture can have a positive effect on the cognitive function of patients with cognitive impairment, so as to alleviate the negative emotions of patients and treat cognitive impairment. Therefore, the protection and development of minority music culture can not only inherit and carry forward China's traditional intangible cultural heritage, but also be of great significance to the rehabilitation of patients with cognitive impairment. Based on the above contents, the research puts forward strategies to protect and develop the music culture of ethnic minorities, so as to provide new ways and means for the treatment of cognitive impairment.

Objective: To explore the therapeutic intervention effect of ethnic minority music culture on patients with cognitive impairment based on cognitive psychology. The emotional transmission, cultural identity and emotional relief function of ethnic minority music culture can have a positive effect on the cognitive function of patients with cognitive impairment, so as to alleviate the negative emotions of patients and treat cognitive impairment. Therefore, the research puts forward strategies to protect and develop the music culture of ethnic minorities, so as to provide new ways and means for the treatment of cognitive impairment.

Subjects and methods: 60 patients with cognitive impairment were selected as the research object. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the emotional state of patients. The cognitive impairment of patients was evaluated by the concise Mini-mental State Examination (MMSE) and the Mental Health (MH) part of the 36-Item Short Form Survey (SF-36).

Study design: The patients were randomly divided into study group and control group, with 30 people in each group. The patients in the study group were intervened with ethnic minority music culture based on cognitive psychology; Patients in the control group received blank intervention. After 3 months, the degree of cognitive impairment and emotional state of the two groups were compared.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: There was no significant difference in MMSE score between the two groups before treatment ($P > 0.05$). After treatment, the MMSE scores of patients in both groups increased significantly ($P < 0.05$), and the MMSE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. MMSE scores of patients in both groups

Timing	MMSE Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before treatment	15.1±4.9	15.3±5.2	0.157	0.721
After treatment	25.0±2.8	20.3±4.7	6.417	0.028
<i>t</i>	7.263	3.214	-	-
<i>P</i>	0.001	0.035	-	-

Conclusions: Intangible culture is a dynamic culture. Every intangible cultural heritage is the inheritance and evolution of China's traditional culture, which needs everyone to protect, inherit and carry forward consciously. Minority music culture is an important intangible cultural heritage. Each kind of minority music has excellent and unique value, and together constitutes a rich and colorful music system. Based on the analysis of cognitive psychology, we can know that the emotional transmission, cultural identity and emotional relief function of ethnic minority music culture can have a positive effect on the cognitive function of patients with cognitive impairment, so as to alleviate the negative emotions of patients and treat cognitive impairment. The results showed that there was no significant difference in MMSE score between the two groups before treatment ($P > 0.05$). After treatment, the MMSE scores of patients in both groups increased significantly ($P < 0.05$), and the MMSE scores of patients in the study group were significantly higher than those in the control group ($P < 0.05$). Therefore, the research puts forward strategies to protect and develop the music culture of ethnic minorities, so as to provide new ways and means for the treatment of cognitive impairment.

CONSTRUCTION OF IDEOLOGICAL AND POLITICAL CONTENT AND PRACTICE SYSTEM OF NEWS AND COMMUNICATION PROFESSIONAL COURSES IN THE NEW MEDIA ERA FROM THE PERSPECTIVE OF COMMUNICATION PSYCHOLOGY

Chang Xu

Department of Journalism and Communication, Anhui Vocational College of Press and Publishing, Hefei 230000, China

Background: News refers to the information transmitted through newspapers, television, radio and other media. It is a special style that records social changes, disseminates timely information and reflects the characteristics of the times. Its essence is a kind of object unknown news. The journalism and communication undertaking undertakes the important responsibility of monitoring and supervising the situation of all sectors of society, inheriting culture and educating the audience. Journalism and communication major is an important way to cultivate journalism talents, so it has attracted the attention of people from all walks of life. In view of the particularity of journalism and communication, students majoring in journalism and communication must have good cultural literacy, constitutional and legal awareness, moral cultivation, political identity and family and country feelings. Therefore, the construction and practice of curriculum ideological and political education system are very important. Curriculum ideological and political education is an educational concept that takes “building morality and cultivating people” as its own task, constructs an all-round education pattern, and then complements and cooperates with other courses and ideological and political courses, so as to form a synergistic effect.

Communication psychology is a branch of psychology rising in the West in the 1940s. Its main research contents are the law of psychological activities of communicators, the law of psychological activities of information receivers, the psychological role of communication channels on communicators and information receivers, and the effectiveness analysis and selection of communication strategies. With the development of computer technology and Internet technology and the advent of the network era, the development of communication psychology also has a new direction and expansion space. The psychological changes of the audience in the network era have led to certain changes in the structure, methods, and ways of news communication. The theory of communication psychology is also developing and gradually forming an independent discipline. Nowadays, the theory of communication psychology mainly has three characteristics: paying attention to the combination of theory and practice, the development of knowledge structure from single to multiple, and the combination of qualitative and quantitative research. Based on the above contents, this paper studies and puts forward strategies to realize the construction and practice of curriculum ideological and political education system. The syllabus, task and teaching mode of the course of journalism and communication are consistent with the law and logic of the course of ideological and political education in colleges and universities, highlighting the hidden educational value of the course. In the teaching of students' knowledge and skills, we should also integrate relevant ideological and political education content into the teaching, guide students' ideological value, carry out moral education for students, and then form efficient complementarity and interaction with the ideological and political education curriculum in colleges and universities. Based on communication psychology, constructing the ideological and political system of journalism and communication courses can help students shape positive, healthy and upward ideals and beliefs, establish correct outlook on life and values, and improve students' mental health level.

Objective: To construct the ideological and political system of journalism and communication courses based on communication psychology, which can help students shape positive, healthy and upward ideals and beliefs, establish correct outlook on life and values, and improve students' mental health levels.

Research objects and methods: In a university, 100 students majoring in journalism and communication were selected as the research objects. Self-rating Anxiety Scale (SAS) was used to evaluate students' mental health. The teaching effect of the curriculum ideological and political system is evaluated by using the students' professional course scores and ideological and political education course scores.

Research design: Students were randomly divided into research group and control group, with 50 students in each group. The students in the research group used the curriculum ideological and political teaching system for teaching. The students in the control group were taught with the traditional teaching system. Three months later, the mental health level and teaching effect of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the SAS score of the students in the research group was higher than that of the control group, and the difference was significant ($P < 0.05$), as shown in Figure 1.

Note: * It means $P < 0.05$ compared with that before the test; # It means that compared with the control group at the same time, $P < 0.05$.

Figure 1. Choice anxiety of two groups of consumers

Conclusions: In view of the particularity of journalism and communication, students majoring in journalism and communication must have good cultural literacy, constitutional and legal awareness, moral cultivation, political identity and family and country feelings. Therefore, the construction and practice of curriculum ideological and political education system is very important. This paper studies the construction of the ideological and political system of journalism and communication courses based on communication psychology. The experimental results show that after teaching, the SAS score of students in the research group is higher than that of students in the control group, and the difference is significant ($P < 0.05$). Therefore, the construction of ideological and political system of journalism and communication courses based on communication psychology can help students shape positive, healthy and upward ideals and beliefs, establish correct outlook on life and values, and improve students' mental health level.

THE CONSTRUCTION OF HIGH-QUALITY TEACHERS IN VOCATIONAL EDUCATION UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Guohong Zhao

College of Humanities, Zhuhai City of Technology, Zhuhai 519000, China

Background: Vocational education is an important part of China's education. It is also an important way to cultivate diversified talents, inherit technical skills, and promote employment and entrepreneurship. The quality of teachers in some vocational schools is poor, which leads to the unsatisfactory academic performance and practical ability of students. Therefore, some students are worried about the dual pressure of study and future employment. They have too much psychological pressure and a backlog of negative emotions, resulting in psychological diseases such as anxiety and depression. When mental illness cannot be alleviated for a long time, it will lead to the damage of students' cerebral cortex, which will lead to cognitive impairment. Cognitive impairment is a pathological process involving brain function. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment and aphasia, which seriously affect their daily life and reduce their quality of life. Therefore, we need to find an appropriate way to improve the quality of teachers in vocational schools, so as to improve the teaching quality of vocational education, improve students' performance and practical ability, alleviate students' negative emotions, and avoid students suffering from cognitive impairment.

Educational psychology is a psychological theory put forward for teaching reform. It has important

theoretical and practical significance in deepening the reform of education. Educational psychology theory is more complex, including learning theory, learning motivation, learning strategies, learning styles, learning transfer, network and learning, learning and teachers and so on. The main research content of educational psychology is the change and development law of students' psychological activities under the relief of education, including the psychological law of students' mastering knowledge and skills and the psychological law of students' personality formation. The application of educational psychology in teaching can help teachers analyze students' behavior psychology, help students dredge psychological problems, improve the pertinence and effectiveness of teaching work, optimize teaching ideas, and improve teaching methods and teaching modes. Therefore, the research is based on educational psychology to build a high-quality teaching staff of vocational education, improve the teaching quality of vocational education, improve students' performance and practical ability, alleviate students' negative emotions, and then avoid students suffering from cognitive impairment.

Objective: The quality of teachers in some vocational schools is poor. Out of concern about the dual pressure of study and future employment, students have too much psychological pressure and a backlog of negative emotions, resulting in cognitive impairment. The research is based on educational psychology to build a high-quality teaching staff of vocational education, improve the teaching quality of vocational education, improve students' performance and practical ability, alleviate students' negative emotions, and then avoid students suffering from cognitive impairment.

Research objects and methods: 200 students were selected from a vocational school. Self-rating Anxiety Scale (SAS) was used to evaluate the mental health status of students. The Mental Health (MH) part of the Quality-of-Life Questionnaire (SF-36) was used to evaluate the degree of cognitive impairment. Using students' professional course results to evaluate the teaching effect.

Research design: Using the random number table method, the two groups of students were randomly divided into research group and control group, with 30 people in each group. Among them, the students in the research group use high-quality teachers based on the construction of educational psychology to teach. The students in the control group used the original teaching staff for teaching. After a period of time, the mental health status, cognitive impairment and academic performance of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the anxiety and cognitive impairment of the students in the study group were significantly lower than those in the control group ($P < 0.05$). The results were significantly higher than those of the control group ($P < 0.05$). The scores of the two groups of students are shown in Figure 1.

Figure.1 Results of two groups of students

Conclusions: Vocational education is not only an important part of China's education, but also an important way to cultivate diversified talents, inherit technical skills, and promote employment and entrepreneurship. The poor quality of teachers in some vocational schools leads to students' unsatisfactory academic performance and practical ability, and suffering from anxiety and cognitive impairment under excessive psychological pressure. The research is based on educational psychology to build a high-quality teaching staff of vocational education and improve the teaching quality of vocational education. The results showed that after teaching, the anxiety and cognitive impairment of the students in the study group were

significantly lower than those in the control group ($P < 0.05$). The results were significantly higher than those of the control group ($P < 0.05$). Therefore, the construction of high-quality teachers of vocational education based on educational psychology can improve students' performance and practical ability, alleviate students' negative emotions, and then avoid students suffering from cognitive impairment.

ON THE AESTHETIC APPROACH OF SHORT VIDEO FROM THE PERSPECTIVE OF FILM AESTHETICS UNDER THE BACKGROUND OF MASS PSYCHOLOGY

Chang Tian & Zhizhong Yuan

School of Journalism and Communication, Southwest University, Chongqing 400715, China

Background: in recent years, with the accelerating process of economic globalization, people's pace of life is getting faster and faster, and the competition in society, work and study is becoming more and more intense. Many people have mental health problems, which are more likely to be overwhelmed by pressure and produce negative emotions. The long-term backlog of negative emotions leads to teenagers suffering from mental anxiety disorder. The objective purpose of anxiety is to guide people how to quickly take various measures and urgently mobilize various value resources, so as to effectively prevent the serious deterioration of the value characteristics of real or future things and make them develop in a favorable direction. However, excessive anxiety will form emotional or physiological diseases, which will seriously damage the physical and mental health of patients. Therefore, we need to find an appropriate way to imperceptibly improve the public's mental health level, alleviate the public's negative emotions, and then alleviate the public's mental anxiety disorder.

With the progress of Internet technology, the rise of short video has gradually become the main way of entertainment for the public, which can help the public alleviate their negative emotions. But now many short videos are relatively vulgar, aesthetic value is not high, and the therapeutic effect on anxiety patients is not significant. Design psychology is a kind of popular psychology, which can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Design psychology contains many contents, including visual design, color psychology, consumer psychology, product design, environmental design, personality tendency, hierarchical demand and so on. Based on the theory of design psychology, it can enhance the aesthetic value of short videos from the perspective of film aesthetics, and then deliver more high-quality value output and emotional expression to the public. Finally, it can alleviate the negative emotions of the public, treat psychological diseases such as anxiety and depression, and contribute to the construction of a harmonious society.

Objective: People's pace of life is getting faster and faster, and the competition in society, work and study are becoming more and more fierce. Many people have problems with their mental health. The short video has become the main form of entertainment for the public, which can help the public alleviate their negative emotions. But now many short videos are relatively vulgar, aesthetic value is not high, and the therapeutic effect on anxiety patients is not significant. The research is based on the theory of design psychology to improve the aesthetic value of short videos, so as to alleviate the negative emotions of the audience, and to treat psychological diseases such as anxiety and depression.

Research objects and methods: 80 students with different degrees of anxiety were randomly selected from a university as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the mental health status of students.

Research design: 80 students were randomly divided into research group and control group with 40 people in each group. Among them, the students in the research group watch short videos based on design psychology to improve aesthetic value for 20 minutes every day, and the students in the control group watch general short videos for 20 minutes every day. After a period of time, the mental health status of the two groups of students was compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the SAS score, SDS score and HADS score of children in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). The SAS scores of the

two groups of students are shown in Figure 1.

Figure 1. SAS scores of two groups of students

Conclusions: In recent years, with the accelerating process of economic globalization, people's pace of life is getting faster and faster, and the competition in society, work and study is becoming more and more fierce. Under the huge competitive pressure, some people suffer from anxiety symptoms, which affect their daily life and study. With the progress of Internet technology, the rise of short video has gradually become the main way of entertainment for the public, which can help the public alleviate their negative emotions. But now many short videos are relatively vulgar, aesthetic value is not high, and the therapeutic effect on anxiety patients is not significant. Based on the theory of design psychology, the research improves the aesthetic value of short video from the perspective of film aesthetics, and then transmits more high-quality value output and emotional expression to the public. The results showed that after teaching, the SAS score, SDS score and HADS score of children in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). Therefore, integrating the theory of design psychology into the short video can effectively improve the aesthetic value of the short video, and finally alleviate the public's negative emotions, treat the public's anxiety, depression and other mental diseases, and contribute to the construction of a harmonious society.

EVALUATION MODEL OF ADVERTISING COMMUNICATION EFFECT BASED ON SOCIAL PSYCHOLOGY AND ITS APPLICATION

Yanjun Gao

Culture Creativity & Management School, Communication University of Shanxi, Jinzhong 030619, China

Background: Advertising communication effect refers to the impact of advertising on the audience's psychology, behavior, understanding and memory. Therefore, the evaluation of broadcasting communication effect is very important. The traditional evaluation methods of advertising communication effect are inefficient, time-consuming and heavy workload. The staff are often unable to get accurate results within the specified time, so they have great psychological pressure. In addition, the evaluation of radio communication effect is relatively boring, and the staff often have negative emotions such as irritability and anxiety. Over time, negative emotions cannot be alleviated, which will lead to psychological diseases such as anxiety and depression, affect the physical and mental health of staff, affect daily life and work, and have a negative and negative impact on individuals and enterprises. Therefore, we need to find a fast, efficient and convenient evaluation method of advertising communication effect to improve work efficiency, alleviate the negative emotions of staff, and then treat the anxiety and depression of staff.

Social psychology is a branch of psychology, which mainly studies the occurrence and change law of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so

on. Social psychology is generally divided into three fields: individual process, interpersonal process and group process. Among them, individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. Interpersonal process is to explore the interpersonal relationship between individuals and the impact of interpersonal relationship on individual psychology. Group process studies individual psychology and behavior law from the perspective of macro environment, including the psychological impact of group and organization on individual and the psychological impact of surrounding environment on individual. Based on the theory of social psychology, this study discusses the psychological impact of advertising communication on the audience in all aspects, and then constructs the evaluation model of advertising communication effect. The evaluation model of advertising communication effect can quickly and accurately complete the evaluation of advertising communication effect, greatly improve work efficiency, reduce workload, and then alleviate the anxiety and depression of staff.

Objective: The evaluation of radio communication effect is relatively boring. Staff often have negative emotions such as irritability and anxiety, which leads to staff suffering from psychological diseases such as anxiety and depression, which affects the physical and mental health of staff, as well as their daily life and work. Based on the theory of social psychology, this study constructs an advertising communication effect evaluation model to improve work efficiency and reduce workload, so as to alleviate the anxiety and depression of staff.

Research objects and methods: In 21 advertising companies in C City, 60 patients with varying degrees of anxiety engaged in the evaluation of advertising communication effect were selected as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the mental health status of patients.

Study design: 60 patients were randomly divided into study group and control group with 30 people in each group. The patients in the study group used the advertising communication effect evaluation model based on social psychology to work. The patients in the control group used the traditional method to work. After a period of time, the mental health status of the two groups was compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After a period of work, the SAS score, SDS score and HADS score of patients in the study group were significantly lower than those in the control group ($P < 0.05$). The SAS scores of the two groups are shown in Figure 1.

Figure 1. SAS scores of patients in both groups

Conclusions: The traditional evaluation methods of advertising communication effect are inefficient, time-consuming and heavy workload. The staff often cannot get accurate results within the specified time. Therefore, they are under great psychological pressure and are prone to negative emotions, which eventually leads to psychological diseases such as anxiety and depression. Based on the theory of social psychology, this study discusses the psychological impact of advertising communication on the audience in all aspects, and then constructs an evaluation model of advertising communication effect, so as to improve work efficiency and reduce workload. The results showed that after a period of work, the SAS score, SDS score and HADS score of patients in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). Therefore, the construction of advertising communication effect evaluation model based on social psychology theory can improve work efficiency, reduce workload, and then alleviate the anxiety and depression of staff.

THE IMPACT OF NIGHT ECONOMIC DEVELOPMENT ON “NEW” CONSUMERS’ PSYCHOLOGY AND BEHAVIOR IN DAWAN DISTRICT OF GUANGDONG, HONG KONG AND MACAO FROM THE PERSPECTIVE OF FINANCE AND TAXATION

Lina Zhu

Department of Economics and Management, Guangzhou College of Applied Science and Technology, Zhaoqing 511370, China

Background: In the process of rapid economic and social development, people’s pace of life has become faster and faster, and they are facing more and more pressures, such as work pressure, competition pressure, family pressure and loan pressure. In this case, modern people are prone to psychological imbalance and suffer from psychological diseases, such as anxiety, depression, cognitive impairment and so on. In order to alleviate their negative emotions, many people will choose an appropriate way to relax after work to release pressure and regulate their emotions and state. Night economy is an economic development model based on consumption, which is closely related to residents’ consumption behavior and consumption psychology. At the same time, it is also an important way to release residents’ psychological pressure and environmental anxiety.

Consumer psychology is a subject that studies the law of consumers’ consumption decision-making psychology and consumption behavior. Its core idea is to take consumers as the core, provide consumers with high-quality products and services, and promote consumers to carry out consumption behavior. Consumer psychology mainly studies the psychological phenomena and behavior laws of consumers in consumption activities. Its purpose is to study the laws of psychological activities and individual psychological characteristics in the process of daily consumption and daily purchase behavior. In the theory of consumer psychology, it is believed that consumers have a series of complex psychology in the process of making purchase decisions, such as seeking truth, beauty, convenience, comparison, preference, conformity, pride, possession, preservation, nostalgia, love to take advantage, fear of regret and so on. Guangdong Hong Kong Macao Great Bay area is a hub connecting domestic circulation and international circulation. There are many fiscal and tax preferential policies, and the nighttime economy also develops rapidly. Based on consumer psychology, this study discusses the therapeutic effect of the night economic development of Guangdong, Hong Kong and Macao on consumers’ anxiety from many aspects, provides a new way for the release of pressure and anxiety relief of urban residents, and also promotes the night economic development of Guangdong, Hong Kong and Macao.

Objective: Modern people are easy to suffer from psychological imbalance and mental diseases, such as anxiety, depression, cognitive impairment and so on. Based on consumer psychology, this study discusses the therapeutic effect of night economic development on consumers’ anxiety in Dawan District of Guangdong, Hong Kong and Macao from many aspects, so as to provide a new way for urban residents to release pressure and alleviate anxiety.

Research objects and methods: 80 anxiety patients who had never spent money at night were selected as the research objects in a third-class hospital. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the mental health status of patients.

Study design: Using random number table method, 80 patients were randomly divided into study group and control group, with 40 people in each group. In addition to routine treatment, the patients in the study group are recommended to spend money at night in the Dawan District of Guangdong, Hong Kong and Macao every day to release the pressure. The patients in the control group were only treated with routine treatment. After a period of time, the mental health status of the two groups was compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After a period of time, the SAS score, SDS score and HADS score of patients in the study group were significantly lower than those in the control group ($P < 0.05$). The SDS scores of the two groups are shown in Table 1.

Conclusions: In the process of rapid economic and social development, people’s pace of life has become faster and faster, and they are facing more and more pressure. Therefore, they are very prone to mental diseases, such as anxiety, depression, cognitive impairment and so on. Based on consumer psychology, this study discusses the therapeutic effect of the night economic development of Guangdong, Hong Kong and Macao on consumers’ anxiety from many aspects, provides a new way for the release of pressure and anxiety relief of urban residents, and also promotes the night economic development of Guangdong, Hong

Kong and Macao. The results showed that after a period of time, the SAS score, SDS score and HADS score of patients in the study group were significantly lower than those in the control group ($P < 0.05$). The above results show that the nighttime economic development of Guangdong, Hong Kong and Macao Dawan district plays an important role in the stress release and anxiety treatment of urban residents.

Table 1. SAS scores of two groups of patients

Timing	SDS scores		<i>t</i>	<i>P</i>
	Research group	Control group		
Before intervention	72.2±12.3	71.5±13.1	0.304	0.653
After Intervention	52.6±6.7	62.5±7.9	4.420	0.013

THINKING MODE OF CULTIVATING STUDENTS WITH THINKING LOGIC OBSTACLES IN OIL PAINTING TEACHING IN COLLEGES AND UNIVERSITIES

Yuting Deng^{1,2}

¹*School of Arts, Guangdong Peizheng College, Guangzhou 510830, China*

²*College of Education, University of Taipei, Taipei 100234, China*

Background: Thinking is the reaction and generalization of human brain to objective things. Individual thinking includes image, logic and epiphany. Among them, logical thinking is an advanced form of thinking. Logical thinking refers to a way of thinking formed by individual judgment and reasoning in the process of cognition. It is an abstract response to objective reality. It has strong abstract characteristics and reveals the essential attributes of things. Students’ thinking logic obstacles are mainly caused by three reasons: concept, appearance and tool. Students’ cognition of the connotation and extension of things is relatively vague, and they cannot grasp the essential attribute characteristics and core connotation of things, resulting in thinking logic obstacles to the concept of things. Due to the lack or interference of the representation of things, students may also have thinking logic obstacles. Students fail to rebuild the image of objective things in the process of learning, and do not establish the correct things in their mind. It is difficult for the representation to connect the connotation of things with the representation, so as to form thinking logic obstacles. And in the process of cognitive learning, students cannot establish a reasonable thinking model, which may also lead to thinking logic obstacles.

Oil painting is a foreign art form introduced from western countries. It has a short development time in China. China’s oil painting technology is slightly backward. The understanding and technical development speed of oil painting. Therefore, it is necessary to reform the oil painting teaching system and system in colleges and universities, strengthen the innovative education in oil painting art teaching in colleges and universities, and drive the further upgrading of China’s oil painting industry through the innovative development of oil painting. In recent years, China’s oil painting industry has made some achievements, but the cultivation of innovative thinking in oil painting needs to be strengthened. Colleges and universities are required to actively adjust the existing oil painting art teaching mode, emphasize the cultivation of students’ creative thinking in oil painting art teaching, and stimulate students’ enthusiasm and enthusiasm for optimization and creation.

Objective: To study and analyze the current situation of oil painting teaching in colleges and universities, understand the problems existing in oil painting art teaching in colleges and universities, promote the innovation education reform of oil painting art teaching in colleges and universities, and find a reasonable and scientific creative thinking teaching mode of oil painting art on this basis. Through the reform and upgrading of the teaching mode of oil painting art in colleges and universities, the research hopes to cultivate the thinking mode of students with thinking logic obstacles and enhance the learning ability and

efficiency of students with thinking logic obstacles through the education of creative thinking of oil painting art in colleges and universities.

Research design: Through the combination of questionnaire survey and comparative experiment, this study understands the current situation of oil painting art teaching in colleges and universities, analyzes the shortcomings of oil painting art teaching in colleges and universities, and excavates the optimization direction and path of oil painting art teaching reform in colleges and universities, so as to provide help to improve students' thinking logic obstacles. Combined with the questionnaire, this study analyzes the role of optimizing the cultivation of creative thinking in improving the thinking mode of students with thinking logic obstacles from the perspectives of grasping the essence of concepts, constructing the image of things and establishing the thinking model. The research uses the way of comparative experiment to understand the treatment effect of the new college oil painting art teaching mode on the students with thinking logic disorder. Through the comparison of the grades of thinking logic disorder between the experimental group and the control group, it studies the application role of oil painting creative thinking training in the cultivation of thinking mode of students with thinking logic disorder.

Results: The effect of creative thinking training on improving the thinking mode of students with thinking logic disorder is shown in Table 1. The cultivation of creative thinking in oil painting has important improvement value for students with thinking logic disorder in the construction of essential concept, object image and thinking model.

Table 1. The role of creative thinking training in improving the thinking mode of students with thinking logic obstacles

Survey object	Freshman	Sophomore	Junior	Senior
Grasp the essence of concept	4	3	4	4
Construction of object image	3	4	3	3
Establishment of thinking model	4	4	3	3

Conclusions: Through the cultivation of students' creative thinking in oil painting, improve the thinking mode of students with thinking logic obstacles, require colleges and universities to reform the teaching mode of oil painting art, combined with the cultivation of students' divergent thinking, and inspire students' creative quality from many aspects. Moreover, colleges and universities can take a variety of auxiliary tools in oil painting teaching to help students establish the image feature model of objective things, change the appearance of things through a variety of auxiliary means, and exercise the image connection ability of students with thinking logic obstacles to art forms.

INTEGRATION OF CHINESE TRADITIONAL MUSIC AND COLLEGE MUSIC EDUCATION UNDER MUSIC AESTHETIC PSYCHOLOGY

Jianguo Wang

School of Conservatory of Music, Hexi University, Zhangye 734000, China

Background: Perception is an individual's comprehensive stimulus response to the representation of objective things. It is a more advanced perceptual feature formed on the basis of feeling. The individual music aesthetic perception is the psychological stimulus response of the value object to the specific music phenomenon in the process of music aesthetic practice. When individuals appreciate specific music works, under the comprehensive action of aesthetic perception and rational thinking, individuals will produce emotional associations from the aesthetic perception of music works and obtain individual different aesthetic experience. When the aesthetic experience obtained by individuals from music works is consistent with their emotional needs, individuals will obtain positive music aesthetic emotional experience, so as to achieve the purpose of helping individuals relax their body and mind. Music aesthetic psychology takes individual music aesthetic perception psychology as the research object, organically integrates the theoretical knowledge of music psychology, aesthetic psychology and music aesthetics, analyzes the changing characteristics of individual psychological activities in the process of music appreciation, and studies the internal development law of individual music aesthetic psychological activities.

The quality of music education in colleges and universities is directly related to the practical effect of music education in colleges and universities. Music education in colleges and universities is also one of the

effective ways to inherit Chinese traditional music. Using the art theory of western music, this paper examines Chinese traditional music art from a new perspective, excavates the entry point and connection point between Chinese traditional music art and the development of the times, and provides reference for promoting the development and inheritance of Chinese traditional music art in modern society. In order to realize the innovative integration of Chinese traditional music art and music education in colleges and universities, we need to make an in-depth analysis of the two. Under the guidance of music aesthetic psychology theory, we need to analyze the characteristics and laws of students' psychological changes when appreciating Chinese traditional music, and explore the internal relationship between Chinese traditional music and music education in colleges and universities, so as to put forward the integration and innovation path of Chinese traditional music and college music.

Objective: To analyze the connotation of Chinese traditional music and music education in colleges and universities, understand the interaction between Chinese traditional music and music education in colleges and universities, and explore the impact of the new music education mode integrating Chinese traditional music on the aesthetic cognitive ability of music students, so as to provide help for improving the aesthetic cognitive level of music students in colleges and universities, promote the integration and innovative development of Chinese traditional music and music education in colleges and universities.

Study design: This study uses logistic regression analysis to analyze the correlation between college music education integrating Chinese traditional music and the aesthetic cognitive level of music majors. Starting from the internal relationship between Chinese traditional music and college music education, this paper explores the effect of the integrated development of Chinese traditional music and college music education on college students' music aesthetics. On this basis, it puts forward the reform path of the integration of Chinese traditional music and college music education.

Results: The correlation analysis results of college music education integrating Chinese traditional music and the aesthetic cognitive level of music majors are shown in Figure 1. The aesthetic cognitive level of music majors increases with the integration of Chinese traditional music and college music education, and the two show a significant positive correlation. It proves that the integrated development of Chinese traditional music and music education in colleges and universities can effectively promote the aesthetic cognition level of music majors.

Figure 1. Results of correlation analysis between college music education integrating Chinese traditional music and students' aesthetic cognition

Conclusions: Chinese traditional music art is the treasure of Chinese excellent traditional culture and the artistic expression form of national spirit and culture. The combination of Chinese traditional music art and college music education to realize the coordinated and innovative development of the two can effectively realize the publicity and development of Chinese traditional music art, improve the quality level of college music education and enrich college music education resources. Integrating Chinese traditional music elements into college music education can effectively improve the level richness of college music education resources and expand the aesthetic coverage of college music education, which is of great value to improve the music aesthetic cognition level of college music majors. For the organic integration of Chinese traditional music and college music education, the pilot work of a new model of traditional music teaching can be carried out by inviting well-known music experts to guide and teach. Colleges and universities should also summarize the teaching experience, analyze the practical experience of the new teaching mode of the coordinated development of Chinese traditional music and college music education,

and adjust the problems existing in the new teaching mode in time.

* * * * *

ON THE PROFESSIONAL DEVELOPMENT MODEL OF COLLEGE ENGLISH TEACHERS BASED ON EDUCATIONAL PSYCHOLOGY

Haiyan Liu

School of International Studies, Hunan Institute of Technology, Hengyang 421002, China

Background: Educational psychology is an interdisciplinary field between pedagogy and psychology. Educational psychology integrates pedagogical theory and psychological theory, analyzes the characteristics of educational subjects' psychological activities in the process of teaching practice, and discusses the internal laws of teachers' and students' psychological activities in the process of teaching. Educational psychology extends the theoretical basis of psychology to the field of educational application, and takes psychological theory as the basis to guide the implementation and development of educational activities. In recent years, due to the needs of social development, educational development is constantly updating and iterating, and the tasks of educational psychology are increasing. Therefore, the scope of research objects of educational psychology is also expanding. In the early stage of the development of educational psychology, educational psychology paid more attention to the research of students' learning psychology and learning rate, and focused on the cultivation of students' knowledge. With the transformation of the concept of social education, education is not only the indoctrination of knowledge, but also shoulder the role of cultivating students' moral behavior and aesthetic emotion. Therefore, the research scope of educational psychology is also expanded from knowledge teaching to students' mental health and moral cultivation.

Under the traditional college English teaching mode, teachers often ignore students' psychological and emotional factors in the teaching process, only pay attention to the teaching of English knowledge, and ignore the impact of students' psychological factors on their learning ability and efficiency. As one of the main bodies of the educational process, teachers play an important role in the teaching process. Teachers should fully consider every part of teaching practice in the teaching process, including students' psychological and emotional factors in the process of receiving education. Therefore, under the guidance of educational psychology, teachers should reform the college English teaching mode, optimize their own English teaching methods and promote the professional development of college English teachers.

Objective: Based on the theory of educational psychology, this study analyzes the current situation of college English teaching, explores the problems existing in college English teaching mode, and puts forward the direction and path of college English teaching mode reform. Under the guidance of educational psychology theory, this study analyzes the importance of students' psychological and emotional factors in the process of education, discusses the impact of students' psychological and emotional factors on their learning ability and learning efficiency, excavates the value of students' psychological and emotional factors in college English teaching, and provides help for the professional development of college English teachers.

Research design: This paper studies and counts the current English learning situation of 300 college English majors, and analyzes the problems existing in college English teaching mode. This paper uses the fuzzy comprehensive evaluation method to obtain the students' psychological and emotional factors affecting college English teaching, analyzes the importance of students' psychological and emotional factors, deeply excavates the value and significance of students' psychological and emotional factors to college English teaching reform, and puts forward the direction and strategy of college English teaching reform. It also puts forward some suggestions on the professional development model of college English teachers.

Results: The evaluation results of the path of college English teachers' professional development model are shown in Table 1. The respondents have a high overall score on the three directions of college English teachers' professional development: optimizing teaching ideas, creating a learning atmosphere and reflecting on teaching behavior.

Conclusions: To promote the professional development of college English teachers, college English teachers are required to change the traditional English teaching ideas and teachers' beliefs, actively participate in teachers' professional skills training, and learn from others' teaching experience and skills. Moreover, college English teachers should comprehensively use the theory of educational psychology in teaching practice, pay attention to the students' learning emotional factors in the teaching process, and

create a good English learning atmosphere and environment for students. College teachers should also timely adjust their own teaching plans and arrangements according to the characteristics and needs of students, cultivate students' learning emotion through various means, stimulate students' interest and enthusiasm in learning English knowledge, and enhance students' learning motivation. In the process of teaching, teachers should fully recognize their intermediary role, emphasize the dominant position of students in the process of English learning, help students establish English learning cognition, and help students learn to think and learn independently. After the end of teaching activities, teachers should also reflect and summarize their teaching behavior, review the whole process of teaching practice, deeply analyze the deficiencies and deficiencies in the teaching process, and promote the improvement of their professional skills.

Table 1. Evaluation results of the path of college English teachers' professional development model

Survey object	Freshman	Sophomore	Junior	Senior
Optimize teaching philosophy	3	4	4	4
Create a learning atmosphere	4	3	4	3
Reflective teaching behavior	3	4	3	4

LABOR RIGHTS AND TANGLED LEGAL PROTECTION OF PATIENTS WITH MENTAL DISORDERS

Huaer Cheng & Junya Lian

School of Law, Beijing Institute of Technology, Beijing 100081, China

Background: Since the reform and opening up, China's economy has developed rapidly. On the one hand, the guidelines of national leaders are correct, on the other hand, the labor security provided by the working people. From the macro point of view, economic development is brought about by the continuous optimization of the economic market, but from the micro point of view, the optimization and integration of economic resources of various regional industries are inseparable from the working people in the regional industries. However, in real life, most working people are not properly resettled, and the treatment without human rights received by patients with mental disorders is more obvious. Mental disorder refers to the disorder of various functions of the body caused by brain damage. Patients with mental disorder will have great obstacles in cognition and communication, which are often manifested in external symptoms such as unreasonable behavior and words. Some patients with severe mental disorders even have hallucinations, and eventually their consciousness gradually declines. What's more, they have mental deterioration and severe mental disorders such as schizophrenia. However, it has to be mentioned that most patients with mental disorders do not think they have mental disorders, which leads to few patients with mental disorders who actively seek medical treatment, resulting in an increasing number of patients with serious mental disorders in the society.

In order to protect the legitimate rights and interests of patients with mental disorders, China has formulated special requirements for their actual capacity in a number of laws and regulations, and the more significant laws and regulations are reflected in the labor rights of patients with mental disorders. In China's labor rights for patients with mental disorders, it is said that for the working people with mental disorders, the legal protection of their personality rights has effectively stopped some enterprises from violating the personality of patients with mental disorders. If the working people with mental disorders still belong to workers, workers should enjoy fair and equal social welfare security. Moreover, in the labor security of mental illness, it is also proposed that the working people also enjoy the same labor income as other working people, and should not have labor entanglement. It is also necessary to meet the right to know of patients with mental disorders, ensure that the human rights of mental disorders know their labor

protection in the process of labor, and avoid labor entanglement. However, it is worth noting that there are still some unclear judgment standards for mental disorders in China's labor law, so there are omissions in the protection of the rights of some workers with mental disorders. Therefore, in order to protect the basic labor rights of patients with mental disorders, it is necessary to summarize the problems existing in the labor law and learn from the relevant provisions of other legal protection, so as to provide theoretical reference for the protection of labor rights of patients with mental disorders.

Objective: To explore the legal protection of labor rights and labor entanglement of patients with mental disorders, and put forward relevant suggestions to ensure that the basic rights and interests of patients with mental disorders are protected, so as to provide development support for the development of harmonious society in China.

Study design: Using the literature method, this paper summarizes the labor rights of working patients with mental disorders proposed in recent 10 years, extracts the legal protection regulations of working patients with mental disorders from a large number of other laws and regulations, extracts the relevant provisions worthy of reference, and puts forward suggestions on the labor rights and tangled legal protection of working patients with mental disorders.

Results: Three suggestions are put forward from the previous literature. First, appropriately restrict the rights of patients with mental disorders, and restrict other rights and interests of patients with mental disorders, such as the right to freedom, while ensuring that the labor rights of patients with mental disorders remain unchanged, so as to avoid wounding events of patients with mental disorders. The second point is that no protective measures have been formulated for patients with mental disorders, including the establishment of guardians and other measures, in order to ensure that the rights and interests of patients with mental disorders can be reflected at the first time. The third point is to improve the relevant laws and regulations for patients with mental disorders, including improving the definition of mental patients to ensure that laws and regulations can cover every patient with mental disorders. The impact of the three suggestions on the labor rights and entanglement of patients with mental disorders is shown in Table 1.

Table 1. Impact of relevant suggestions on mental disorders

Project	Patient restrictions	Patient protection	Improve laws and regulations
Mental disorder	4	4	4

Conclusions: Workers with mental disorders are part of many working people in China. To protect the relevant rights of workers with mental disorders is to protect the relevant rights of working people. It is of positive significance to obtain the current situation of the rights of working people with mental disorders through literature law, analyze the existing problems, and improve the labor rights of patients with mental disorders with the help of other relevant laws and regulations. In addition, while providing labor protection for patients with mental disorders, it is also necessary to restrict their rights to ensure that patients will not have dangerous behaviors under the influence of restrictions.

* * * * *

ANALYSIS OF THE INFLUENCE OF APPLIED LINGUISTICS ON THE EXPRESSION ABILITY OF STUDENTS WITH THINKING LOGIC DISORDER

Ying Shen

School of Foreign Languages, Guangxi University, Nanning 530004, China

Background: In the process of students' growth, their ideological cognition is also in a state of continuous growth. In the growth of students' ideological cognition, they receive a variety of information, but there will be deviations in the ideological cognition of some students in the research and development among many students. The reason is that in the construction process of students' ideological logic system, the complex system composed of different external information will affect students' cognitive judgment. The serious consequence of students' wrong cognitive judgment is that students have thinking logic obstacles. On the one hand, the emergence of thinking logic obstacles slows down the growth rate of students, on the other hand, it inhibits the improvement of students' expression ability. According to the research results of psychology, the mechanism of the influence of students' thinking logic disorder on their expression ability is to hinder the growth of relevant brain tissues of students, lead to students' deviation in problem interpretation, and then affect students' expression ability. In psychological treatment, the

ideological obstacles in students' growth are mainly helped to re-establish the information processing mechanism through the reconstruction of thinking logic system. Among them, applied linguistics, as an important way of thinking logic reconstruction, has gradually been supported by a large number of psychologists.

Applied linguistics is a branch of linguistics. In its early application, applied linguistics was mainly introduced into the problem construction and solution of other disciplines. Through language processing of other disciplines, the problems were resorted to determine the primary and secondary relationship in the problems, so as to facilitate the solution of the problems. At present, applied linguistics can be divided into language teaching, the establishment of standard language, book compilation and translation. With the gradual application of Applied Linguistics, a large number of research applications have also appeared in the links of students' thinking logic obstacles. Facing the lack of language expression ability caused by students' thinking logic obstacles, some studies have proposed that language teaching in applied linguistics can effectively alleviate it, but some studies have pointed out that the improvement effect of Applied Linguistics on the expression ability of students with thinking logic obstacles is limited. On this basis, in order to understand the practical application effect of applied linguistics, this study deeply discusses the influence mechanism of applied linguistics on the expression ability of students with thinking logic disorder, in order to provide relevant reference for the treatment of students with thinking logic disorder and ensure the healthy growth of students.

Objective: By analyzing the positive role of applied linguistics in the recovery of thinking logic disorder, this paper evaluates the impact of applied linguistics on the expression ability of students with thinking logic disorder, puts forward suggestions for the healthy growth of Chinese students, and also provides theoretical support for the development of psychology in China.

Study design: Select 100 students from primary school, middle school and university to participate in the survey, design a questionnaire to evaluate the thinking and logic ability of all students, screen the students with thinking and logic obstacles, and evaluate the expression ability of the students with thinking and logic obstacles. Applied linguistics is used to cultivate the expression ability of students with thinking logic disorder for 6 months. After 6 months, the expression ability of students is evaluated for the second time, and the differences between the two evaluation results are compared and analyzed.

Results: There were 27, 16 and 11 students with thinking and logic disorders in primary school, middle school and university respectively. The expression ability of the above students was evaluated, and the language expression ability of students was cultivated by using applied linguistics. After 6 months, the evaluation results of students' expression ability were statistically analyzed again. The difference between the two scores of expression ability was statistically significant ($P < 0.05$). And the score of the second evaluation is higher than that of the first, as shown in Table 1.

Table 1. Changes in students' expression ability

Group	The first time	The second time	<i>P</i>
Pupil	45.67±2.37	65.62±2.75	<0.05
Middle school student	57.32±2.06	70.57±2.36	<0.05
College student	68.26±1.97	76.88±2.04	<0.05

Conclusions: In the process of establishing a logical system, students will inevitably be guided by a variety of logical obstacles, which will inevitably lead to a variety of thinking errors in the process of establishing a logical system. The emergence of thinking logic disorder completely affects students' language expression ability, so it is very important to treat students' thinking logic disorder. It is found that applied linguistics plays a significant positive role in the cultivation of language expression ability of students with thinking logic disorder, and can alleviate the problem of patients with thinking logic disorder to a great extent. In the process of students' growth, parents and teachers should pay close attention to students' thinking and logic ability, judge students' language expression ability, and intervene students with ideological and logical obstacles to ensure their healthy growth and development.

IMPACT OF COLLEGE EDUCATION INFORMATIZATION CONSTRUCTION ON STUDENTS' ANXIETY UNDER THE BACKGROUND OF BIG DATA

Lin Xu

School of Teacher Education, Shangqiu Normal University, Shangqiu 476000, China

Background: There are many and miscellaneous teaching contents in colleges and universities. Generally speaking, college students will study multiple disciplines during the semester. The purpose is that colleges and universities hope to cultivate students' comprehensive quality and ability and provide basic educational support for national talent training. However, in college teaching, some students are difficult to meet the teaching requirements of the school, and they will have anxiety due to heavy learning tasks during their study. There are generally two main factors in the generation of students' anxiety psychology. The first is personal psychological factors. Students' psychological tolerance is poor. Therefore, when facing a variety of learning contents, there will be anxiety psychology and then anxiety. On the other hand, the unreasonable arrangement of teaching contents will also cause students' anxiety. From the current teaching situation, due to the continuous development of information technology, a large number of teaching contents are integrated into some information technology, so that teachers can realize concrete teaching in teaching. In information-based teaching, the teaching content will show a more complex logical relationship, resulting in improper connection between the contents, and students are more prone to anxiety. Therefore, how to reduce students' learning difficulty on the basis of improving the convenience of teaching in the information age is an urgent problem to be solved.

According to the current situation of information-based teaching, the main reason for the variety of teaching contents is that the teaching data processing is unreasonable. Therefore, building information-based teaching with multi data influence based on big data technology will effectively improve the previous unsatisfactory information-based teaching mode. In the construction of big data information-based teaching, we mainly use the advantages of big data to realize the data processing of teaching content. Big data is a database integrating a variety of teaching schemes and teaching data. Big data technology has certain data processing ability, which can identify and classify the teaching contents in information-based teaching and reduce the workload of teachers' teaching scheme formulation, and can ensure the accuracy of teaching content. The construction of information-based teaching scheme in the context of big data has gradually become the main means of basic teaching construction in colleges and universities in China, and some teachers have found in teaching practice that the information-based teaching constructed with the support of big data can affect the anxiety of classroom students and stimulate students' learning enthusiasm to a certain extent. Therefore, in order to more clearly understand the mechanism of college information teaching construction on the alleviation of college students' anxiety under the background of big data, more in-depth research is needed.

Objective: Understand the current situation of college students' learning anxiety psychology in college teaching, analyze the influence degree of students' anxiety psychology by teaching mode, explore the changes of college students' psychological anxiety emotion in the construction of college education informatization under the background of big data, and evaluate the improvement effect of college students' anxiety emotion, in order to provide theoretical support for college students' talent training.

Study design: 100 college students with psychological anxiety were selected to evaluate the anxiety of all students with SAS anxiety scale. 100 subjects were randomly divided into experimental group and control group, with 50 students in each group. The students in the experimental group were taught by the information-based teaching mode under the background of big data, and the students in the control group were taught by the conventional teaching mode for 6 months. Finally, the differences of college students' psychological anxiety scores before and after teaching were compared and analyzed.

Result: Before teaching, there was no significant difference in the anxiety score data between the two groups, which was not statistically significant. After receiving different teaching, the anxiety scores of the two groups of students were significantly reduced after teaching, and the difference was statistically significant ($P < 0.05$). In the comparison between the two groups, there was a significant difference in the anxiety score between the two groups after 6 months of teaching, and the anxiety score of the students in the experimental group was significantly lower than that in the control group ($P < 0.05$). See Table 1 for details.

Table 1. Changes of students' anxiety

Group	Before teaching	After teaching	<i>P</i>
Experience group	65.64±2.16	37.15±1.06	<0.05
Control group	67.39±2.13	52.48±1.37	<0.05
<i>P</i>	>0.05	<0.05	-

Conclusions: In college education, the control of students' anxiety can effectively improve students' learning ability and the overall quality of school teaching. Using big data technology to build an

information-based teaching model can effectively reduce college students' learning anxiety and actively promote students' learning ability. Therefore, in university teaching, we should make full use of information technology and optimize the construction in combination with the existing data processing foundation, which can effectively alleviate students' negative emotions, improve students' professional level and contribute to the development of talent training in colleges and universities.

IMPACT OF THE IMPROVEMENT AND HIGH-QUALITY DEVELOPMENT OF INTELLIGENT LOGISTICS INFORMATION SYSTEM ON PEOPLE WITH COMMUNICATION AND ADAPTATION BARRIERS

Yu Liu & Han Wu

School of Logistics Engineering, Chongqing College of Finance and Economics, Chongqing 400010, China

Background: Communication adaptation disorder refers to a psychological disease in which patients can not accurately understand others or express their thoughts in communication due to the obstruction of some factors, and cannot adapt to the communication environment. There are four main causes of communication barriers: language barriers, ideological barriers, emotional barriers and technical barriers. Language barriers refer to communication barriers caused by different language habits of both sides of communication, and ideological barriers refer to barriers caused by different values, educational backgrounds and other aspects related to thinking of both sides of communication. Emotional barrier refers to the communication barrier caused by bad psychology and emotion, and technical barrier refers to the barrier caused by the problem of communication media in the process of non-face-to-face communication. In modern society, the cooperation and connection between people are getting closer and closer, and communication barriers will greatly affect the efficiency of human communication. Although the concise and clear online operation mode of intelligent logistics information system has brought convenience to people, it has also removed a large number of communication links, which may not be conducive to the recovery of people with communication adaptation barriers. Therefore, this study will explore the impact of intelligent logistics information system on people with communication adaptation barriers.

Objective: To understand the composition, function and use mode of the current domestic main smart logistics system, and then design experiments to verify the impact of smart logistics system on people with communication and adaptation disabilities.

Objects and methods: All measurement type features in the study were displayed in the form of mean \pm standard deviation for *t*-test, and counting type features were displayed in the form of number or proportion of number for Chi-square test. The significance level of difference was taken as 0.05. Four intelligent logistics information systems with large application population were selected from China, and then 322 people with different degrees of cognitive impairment were selected as the research objects. They were divided into experimental group and control group, with 161 people in each group. First, make statistics on the basic information of the two groups, including the age, gender, work type, working years, marital status, etc. of the users in the two groups. After confirming that there is no significant difference in the basic information of the two groups, conduct a comparative experiment. The personnel in the experimental group are required to randomly select one from the intelligent logistics information system in 4, while the control group is required not to use the intelligent logistics system. The experiment lasted for 3 months. A questionnaire survey was conducted to all personnel before and after the experiment. The survey content was the symptom scale of communication adaptation disorder designed by the research team. The total score on the scale was 50. The severity of communication adaptation disorder of samples with scores in the range of [0,10], [10,20], [20,30], [30,40], [40,50] were asymptomatic, mild, moderate, mild severe. In addition, in the whole experimental process, it is necessary to ensure that there is no communication between all research objects, so as to avoid irrelevant experimental errors caused by mutual communication between research objects.

Results: The questionnaire survey results of the two groups before and after the experiment are shown in Table 1.

Table 1. Questionnaire survey results of two groups of subjects before and after the experiment

Group	Before experiment	After the experiment	<i>t</i>	<i>P</i>
Experience group	24.6±4.2	29.5±4.4	0.127	0.006
Control group	24.7±3.8	24.8±3.6	0.845	0.712
<i>t</i>	0.674	0.284	-	-
<i>P</i>	0.773	0.005	-	-

It can be seen from Table 1 that before the experiment, the *P* value of the questionnaire score *t* test of the experimental group and the control group was 0.773, which was greater than the significance level of 0.05. It is considered that the data difference was not statistically significant, that is, the severity of communication adaptation disorder symptoms of the two groups before the experiment was at the same level and comparable. After the experiment, the *P* value of the questionnaire score *t* test of the experimental group and the control group was 0.006. Far less than the significance level, it is considered that the data difference is statistically significant. Specifically, after the experiment, the average scores of the experimental group and the control group are 29.5 and 24.8 respectively. The former is significantly higher than the latter, indicating that the use of intelligent logistics system will aggravate the symptom severity of communication adaptation disorder.

Conclusions: On the one hand, the promotion and application of intelligent logistics information system has brought more convenience to people's life. People can know the location and status of logistics packages directly through mobile phone application without going to logistics outlets to inquire or call, and realize the unmanned management of package communities. But on the other hand, it also reduces the opportunities for people to communicate in life. For people with communication adaptation disorder, the reduction of communication opportunities may further aggravate their symptoms. In order to verify this conjecture, a comparative experiment is designed. The experimental results show that the average score of the questionnaire on communication adaptation disorder of the experimental group required to use the intelligent logistics information system after the experiment is 29.5, which is significantly higher than that of the control group, which proves that the use of the intelligent logistics system will aggravate the severity of the symptoms of communication adaptation disorder. The analysis found that this is because after using this tool, patients' communication opportunities in daily life are further reduced, and their psychological views on the importance of communication are more negative. Some people even think that even if there is no communication in the future, it will not affect their life, so they relax their attention and Practice on communication, resulting in further deterioration of symptoms.

COMPUTER TEACHING STRATEGY BASED ON BIG DATA ENVIRONMENT FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xinfa Dong¹ & Qing Cong²

¹*Student Affairs, Yellow River Conservancy Technical Institute, Kaifeng 475004, China*

²*Academic Affairs, Yellow River Conservancy Technical Institute, Kaifeng 475004, China*

Background: The research object of educational psychology is the learning process of learners and the teaching process of teachers. It is a collection of accumulated knowledge, wisdom and intuitive ideas of psychological methods and theories in the field of education. Teachers should master this discipline to effectively solve the problems in peacetime teaching. Its most intuitive application occurs in the typical two-way interaction between teachers and students in the teaching process. It requires teachers to carefully study all aspects including teaching content, teaching methods, teaching cases, teaching means and teaching environment. In addition, educational psychology also requires teachers to have a necessary understanding of students' psychological state and activities, so as to further improve the effectiveness of teaching. Educational psychology holds that students, as independent individuals, have different thinking abilities and are in different psychological environments. With the approach of the era of the Internet of all things, the application of big data technology in the computer field is becoming more and more extensive,

and the knowledge of big data is integrated into computer teaching. However, the knowledge and technology of big data are quite different from the traditional computer teaching content. For example, the former requires students to have more statistical and mathematical foundation, and needs more programming practice. These characteristics lead to an obvious increase in students' learning difficulties. Therefore, we can use the method of educational psychology to analyze the psychological state and thinking mode of different students and find a more effective teaching method, so as to improve the teaching quality of computer specialty in our country.

Objective: To explore the possibility and specific feasible measures of applying educational psychology methods to the teaching of big data and computer science-related majors, so as to improve the employment competitiveness and personal professional ability of graduates of related majors in China.

Participants and methods: A nationally representative university in terms of teachers, teaching equipment and educational financial support was selected from domestic universities, and 204 college students majoring in big data and computer science who were willing to participate in the experiment were randomly selected as the research objects. The research objects were evenly divided into intervention group and control group. First, count the basic information of the two groups of students and confirm that there is no significant difference between their basic information. Then carry out the teaching experiment to let the two groups of students accept the teaching of big data and computer courses, and the teaching content is completely consistent. However, during the teaching of the experimental group, teachers are required to start from the perspective of educational psychology. Observe the psychological state of students and reasonably adjust the teaching progress and teaching content according to their psychological state. If necessary, carry out separate targeted teaching for some students, and give more encouragement when students encounter difficulties in learning. The control group was only taught in the traditional way. The teaching experiment lasts for one semester, and teachers are required to conduct a 100-point test on students' curriculum professional ability before and after the experiment. After the experiment, the teachers will provide the quantitative scores of students' abilities related to various courses to the research team in combination with the test data.

Results: In the study, the measurement data were displayed in the form of mean \pm standard deviation for *t*-test, and the counting data were displayed in the form of number or proportion of number for Chi-square test. The significance level was taken as 0.05. See Table 1 for the scores of the two groups of students after the experiment.

Table 1. Statistical results of professional ability scores of two groups of students after the experiment

Comparison items	Intervention group	Control group	<i>P</i>	Change value (%)
Big data knowledge	15.2 \pm 4.1	9.2 \pm 3.2	0.002	66.2
Big data processing	25.3 \pm 4.8	16.9 \pm 3.6	0.003	49.7
Fundamentals of computer	13.2 \pm 3.1	11.8 \pm 3.3	0.015	11.9
Computer programming	29.8 \pm 4.5	27.2 \pm 5.4	0.073	9.6

It can be seen from Table 1 that the scores of the two groups of students in various majors are different after the experiment. The *P* value of the quantitative score *t*-test of the two groups of students in computer programming is 0.073, which is greater than the significance level. It is considered that the data difference is not statistically significant, while the two groups of students in big data knowledge, big data processing. The *P* value of the quantitative score difference significance test of the three aspects of computer foundation is less than 0.05, which means that the data difference is significant. Specifically, the average scores of the experimental group on big data knowledge, big data processing and computer foundation are 15.2, 25.3 and 13.2 respectively, which are 66.2%, 49.7% and 11.9% higher than those of the control group.

Conclusions: In view of the problems that students' learning difficulty increases and learning efficiency decreases after integrating big data technology into the current university computer professional courses, this research is based on the analysis of the current teaching situation of computer major. Combined with the characteristics of big data teaching and educational psychology methods, a comparative teaching experiment is designed. The experimental results show that after the experiment, the quantitative score difference significance test *P* value of the experimental group in three aspects of big data knowledge, big data processing and computer foundation is less than 0.05, and it is considered that the data difference is significant. Specifically, the average scores of the experimental group based on big data knowledge, big data processing and computer were 15.2, 25.3 and 13.2 respectively, which were 66.2%, 49.7% and 11.9% higher than those of the control group. The data shows that using educational psychology to analyze students' learning psychology and thinking state in the teaching process, and taking this as the basis to adjust the teaching content and teaching methods will help to improve the learning effect of students majoring in big data and computer technology.

ANALYSIS AND EXPLORATION OF FARMERS' PSYCHOLOGY IN AGRICULTURAL SCIENCE AND TECHNOLOGY EXTENSION ACTIVITIES

Jianhan He, Yuhua Wu & Zengyu Gao

Institute of Cereal and Oil Crops, Hebei Academy of Agriculture and Forestry Sciences, Shijiazhuang 050000, China

Background: With the development of science and technology in China, more and more scientific and technological products and applications are being applied in the field of agriculture. However, due to the overall low level of education, the deep influence of traditional ideas and the poor ability to accept and adapt to new things, the popularization of agricultural science and technology in some agricultural areas of China is greatly hindered. The root cause of these phenomena is a variety of bad psychology of farmers, among which the more typical psychological states are conformity psychology, conservative psychology, stability seeking psychology and contradictory psychology. The influence way of conformity psychology is that if most residents around farmers do not use scientific and technological products, they will probably choose not to apply. The influence mode of conservative psychology is that even if technicians have explained the application mode of scientific and technological products, farmers are reluctant to believe in the reliability of new technologies if they do not see successful use and economic benefits. It refers to the fear of using new technologies to reduce the yield of new products or reduce the quality of cultivation. Ambivalence means that although they want to adopt new technologies, they are skeptical about the effectiveness of new technologies and hesitate to take action. These psychological phenomena of farmers have certain objective rationality, but the extension personnel of agricultural science and technology products can also use psychology to improve the success rate of product promotion, which is the focus of this research.

Objective: To explore the common psychology of farmers in the promotion of agricultural science and technology products and services and its impact on the promotion work, so as to put forward some countermeasures to improve the service promotion efficiency of agricultural science and technology products, so as to provide some useful decision-making basis for improving the level of agricultural science and technology and the output and quality of agricultural products in China.

Objects and methods: Select a town with serious obstacles in the promotion of agricultural science and technology products, and then select two villages with roughly the same promotion level of agricultural science and technology products, farmers' living habits, living environment, overall economic level, farmland area and the distribution of planted crop varieties. Select 100 villagers from each of the two villages to form an intervention group and a conventional group. Firstly, the relevant data statistics of the two groups are carried out, including the income level, gender, age, education level, family population, marriage, etc. After confirming that the differences of these data between the two groups are not statistically significant. The agricultural science and technology extension personnel shall be trained on the psychological status of farmers, so that the extension personnel can know the common psychological status of farmers in the face of these new technology products, and introduce some effective coping methods. After one year, the settlement rate of agricultural science and technology products and the annual output value of agricultural products of the two groups of farmers in recent two years (i.e., one year before and one year after training) were collected from the relevant departments of the local government.

Results: The characteristics of all measurement types in the study were displayed by means of mean \pm standard deviation, and *t*-test was conducted. The significance level of difference was set to 0.05. One year after the training, the settlement rate and annual output value of agricultural science and technology products of the two groups of farmers are listed in Table 1.

Table 1. Statistical results of experimental data of two groups of farmers

Statistical indicators	Within one year before training		Within one year after training	
	Settlement rate (%)	Annual output value/¥	Settlement rate (%)	Annual output value/¥
Intervention group	6	26541 \pm 1254	85	43116 \pm 1762
General group	7	26262 \pm 1466	53	27245 \pm 1537
<i>t</i>	-	0.648	-	0.127
<i>P</i>	-	0.952	-	0.001

“Annual output value” in Table 1 specifically refers to the average single household farmland output value of farmers in the corresponding group in the corresponding time period, “settlement rate” refers to the proportion of the number of farmers in the corresponding group who decide to use the promoted agricultural science and technology products in the corresponding time period in the number of farmers in the group. It can be seen from Table 1 that there is little difference in the settlement rate of agricultural science and technology products between the two groups before the training, and there is no significant difference in the data of annual average output value of farmland. After the training, the average settlement rate of farmers and the annual average output value of farmland in the intervention group are 85% and 43116, 32% and 58.25% higher than those in the control group respectively.

Conclusions: Aiming at the problem that the promotion of agricultural science and technology products is blocked due to various psychological reasons of farmers, this study designs and implements a comparative experiment after understanding the current psychology and promotion mode of farmers when they are promoted. The experimental results show that the average settlement rate of farmers and the average annual output value of farmland in the intervention group after training are 85% and 43116, which are 32 percentage points and 58.25% higher than those in the control group respectively. The data show that considering the psychological situation of farmers in the promotion of agricultural science and technology products can effectively improve the success rate of product promotion. After the interview, it is found that the main reason for this result is that farmers feel the concerns of extension personnel and their own concerns, and give effective responses and countermeasures, so that they can use the promotion products without worries.

* * * * *

CURRENT SITUATION AND COUNTERMEASURES OF IDEOLOGICAL AND POLITICAL EDUCATION OF COLLEGE STUDENTS FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Weibo Qiu¹, Yitong Shen², Xi Zhou³, Guoan Ruan⁴ & Lin Li⁵

¹*School of Applied Law and Public Service, Guangdong Nanhua Vocational College of Industry and Commerce, Guangzhou 510507, China*

²*Department of Food and Biological Engineering, Guangdong Polytechnic of Science and Trade, Guangzhou 510430, China*

³*Party and Administration Office, Guangdong Polytechnic of Science and Trade, Guangzhou 510430, China*

⁴*Department of Student Affairs, Guangdong Polytechnic of Science and Trade, Guangzhou 510430, China*

⁵*School of Marxism, Guangdong Polytechnic of Science and Trade, Guangzhou 510430, China*

Background: Educational psychology is the combination of psychology and pedagogy. Psychological theory divides individual psychology into two main categories: psychological process and personality psychology. Among them, psychological process is the main research type in educational psychology. In the process of education, the psychological activities of students and teachers will affect each other, In the teaching environment, these psychological activities have unique psychological laws. Psychological process refers to the reflection process of the brain to external things and phenomena, which is divided into three main categories: cognitive process, emotional process and will process. Among them, cognitive process refers to the reaction process of the human brain to objective phenomena in the process of individual contact with the outside world. In the process of education, this is the most basic psychological phenomenon of students, that is, the change of individual psychological cognition and the law of related activities in the face of new knowledge. Individuals will have a variety of subjective attitudes and emotional experiences in the process of understanding external things. Driven by individual attitudes and experiences, people’s behavior will change accordingly with the emotional experience. In the process of education, students’ emotions and attitudes towards learning and the classroom determine whether they have motivation in the learning process, which is one of the main factors that directly affect the final learning effect. Will process refers to the process in which an individual achieves his goal by overcoming difficulties when he encounters difficulties in the objective world. This process determines whether students have enough toughness in the learning process, whether they can overcome various difficulties in the learning process and finally achieve the learning goal. By using educational psychology to study college ideological and political education, we can explore the psychological needs of students in the process of Ideological and political learning, and then take the psychological needs as the starting point, establish a more ideological and political education mode with ideological guidance, shape students’ positive mentality in the process of

ideological and political learning, and provide methodological guidance for students' learning and life.

Objective: This study uses the theory of educational psychology to analyze the psychological needs of college students in the process of Ideological and political learning, so as to help modern colleges and universities establish an ideological and political education system that can meet the psychological needs of students and has ideological guidance, so as to improve students' learning enthusiasm and learning effect.

Subjects and methods: For the group of students whose ideological and political education is difficult to reach, this study uses the random forest algorithm to classify the group, analyzes the reasons why the ideological and political education is difficult to reach, and puts forward corresponding countermeasures according to the reasons.

Study design: In the student online course selection system, this study takes the student group who selects the ideological and political education course as the object to collect data, and on this basis, uses the random forest algorithm to classify the reasons why the student group is difficult to respond to the ideological leadership, and analyzes the current situation of the ideological leadership in contemporary Ideological and political education through classification.

Methods: In this study, the online course background statistics system is used for preliminary data summary, and then the algorithm program is used for classification and statistics.

Results: The distribution of reasons why students are difficulty responding to their thought leadership is shown in Figure 1.

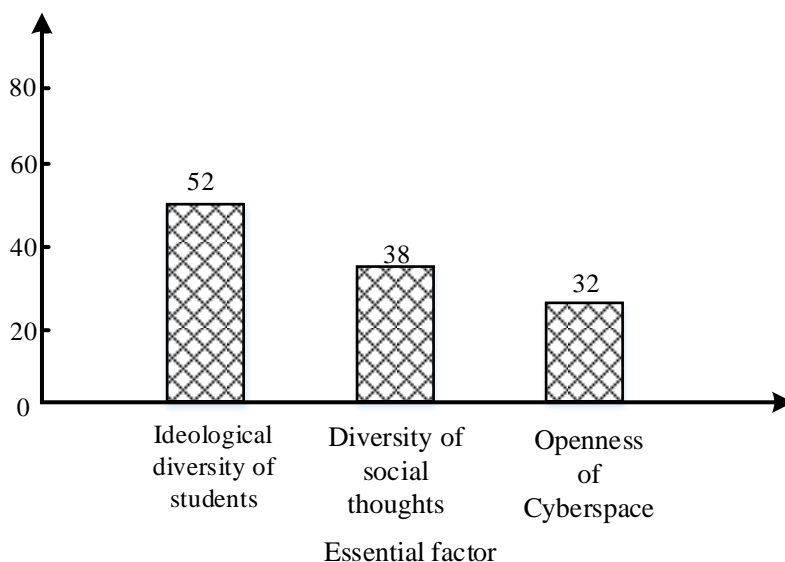

Figure 1. Reasons why students are difficult to respond to ideological leadership

In Figure 1, 52% of the students are difficult to respond to the ideological leadership due to the diversity of students' thoughts, 38% of the students are difficult to respond to ideological leadership due to the diversity of social thoughts, and 32% of the students are difficult to respond to the ideological leadership due to the openness of the network. It can be seen that in the modern social environment, the main reason affecting students' response to ideological leadership is the diversity of ideas formed by students so far. Although the diversity of social thoughts and the openness of the network will also have an impact on students' response to ideological guidance, it is relatively weak, only distributed between 30% and 40%.

Conclusions: The traditional ideological and political education is too rigid in the process of education, and the way is old, which cannot meet the psychological needs of students in the learning process of the new era, resulting in the lack of ideological guidance in Ideological and political education. It is difficult for students to fully combine ideological and political learning with their own learning life, resulting in a lax attitude towards ideological and political learning. The new ideological and political education method designed according to the theory of educational psychology can fully meet the psychological needs of students, provide methodological guidance for students through the educational method of practical learning and life, improve the ideological guidance in the process of education, and help students apply the content of Ideological and political education to their own learning and life.

EFFECT OF TRADITIONAL PHYSICAL TRAINING ON ALLEVIATING ANXIETY DISORDER OF IDEOLOGICAL AND POLITICAL STUDENTS

You Peng

College of Sports Sciences, Jishou University, Jishou 416000, China

Background: Anxiety is a complex psychological state composed of anxiety, tension, worry and other psychological experiences. According to different classification standards, anxiety can be divided into state anxiety and trait anxiety from the duration. State anxiety refers to anxiety with a relatively short duration caused by specific situations. This anxiety is more common in modern people’s daily life. When people associate the perceived threat with their own success at this stage, they will feel nervous and uneasy temporarily, and even produce physiological pain symptoms in severe cases. State anxiety can help people quickly perceive the surrounding crisis and force people to take immediate action. Therefore, moderate state anxiety is beneficial to the study and life of Ideological and political students. Trait anxiety, on the contrary to state anxiety, is long-term continuous anxiety. This excessive anxiety will have a great adverse impact on the study and life of Ideological and political students. Ideological and political students have been in the process of theoretical learning for a long time, and they lack exercise. Due to the particularity of their discipline, the guidance at the conceptual level is likely to have an insufficient effect on the anxiety symptoms of Ideological and political students. Therefore, this study proposes to take traditional physical training as the main way to alleviate the anxiety of Ideological and political students. Besides strengthening the body and enriching life, physical exercise also has a certain positive impact on mental health. Because physical exercise itself is an activity that constantly challenges their physical conditions, ideological and political students can exercise their sensitivity to sense of crisis and worry through physical exercise, which can effectively reduce students’ anxiety sensitivity. At the same time, physical exercise can improve the self-efficacy of Ideological and political students. Through the effective cycle of formulating sports goals, implementing sports goals and completing sports goals, students’ self-confidence and sense of achievement can be continuously improved, and then the habit of implementing the cycle can be substituted into daily learning to enhance their ways and means to fight anxiety.

Objective: According to the discipline characteristics of Ideological and political students, this study applies traditional sports training to the intervention behavior of anxiety symptoms of ideological and political students, improves students’ comprehensive quality through the positive impact of traditional sports on students’ psychological status, and then gives students the means to fight anxiety, so as to alleviate anxiety symptoms.

Subjects and methods: This study uses the methods of difference analysis and intermediary effect analysis to analyze the correlation between physical exercise and students’ state anxiety and characteristic anxiety.

Study design: This study takes the state-trait anxiety questionnaire data as the research data basis, on which the difference analysis is carried out. At the same time, the intermediary effect analysis method is used to establish a relationship model for the impact of physical exercise on anxiety symptoms under the influence of student behavior intermediary effect, and analyze the action relationship between the elements through the relationship model.

Methods: SPSS20.0 was used in this study sort out and descriptive analysis of basic research data, and analyze the basis of difference analysis, and then use Mplus8.0 to analyze the intermediary effect of the data.

Results: The difference analysis results of Ideological and political students are shown in Table 1.

There are two coping styles with statistical significance ($P < 0.05$) in Table 1: solving and asking for help. It can be seen that what is helpful to the anxiety symptoms of Ideological and political students is often the response in practical action. It can be seen that physical exercise is a reliable intervention way to provide

students with counseling channels in practical action. It can provide students with motivation to escape from the traditional emotional problems and solve practical problems through sports training.

Table 1. Differences of coping styles in urban and rural areas

Coping style	Male		Female		t	P
	M	SD	M	SD		
Solve	8.15	2.74	7.28	2.98	2.992	0.003
Self-reproach	3.32	2.84	3.07	2.92	0.871	0.386
Seek help	5.69	2.36	5.12	2.46	2.388	0.017
Fantasy	4.23	2.17	3.95	2.31	1.112	0.266
To retreat	3.98	2.36	3.91	2.63	0.404	0.685
Rationalization	3.82	1.86	3.56	2.08	1.235	0.218

Conclusions: Due to the particularity of the discipline, psychological counseling often has a poor effect on alleviating the anxiety symptoms of Ideological and political students. Through the difference analysis, it can be seen that the best way to dredge the anxiety symptoms of Ideological and political students is often the way of action. Therefore, giving students psychological experience of self-efficacy through traditional physical exercise can improve students' action ability, and then provide students with the driving force to solve the anxiety content in their learning life, so as to solve the source of students' anxiety from the level of practical action. Then help students alleviate anxiety and form a sounder personality.

RETHINKING THE THEORY OF CULTURAL RELATIVITY UNDER THE OBSTACLE OF THINKING – FROM THE PERSPECTIVE OF ETHNOMUSICOLOGY AND MUSICAL ANTHROPOLOGY

Jiang Qi

School of Art, Nantong University, Nantong 226019, China

Background: Thinking disorder refers to the phenomenon that people violate the normal thinking law or thinking form when thinking and processing external things or information by using thinking forms such as conceptual cognition, logical reasoning and choice judgment. Phenomena such as the inability to accurately grasp the connotation represented by some logical concepts, the misunderstanding of premise or process in the process of judgment, and the inversion of cause and effect all belong to the manifestations of thinking obstacles. In the process of human thinking, the most basic cognition and mode of thinking is the conceptual definition of external information and errors. In the process of thinking and speculation of cultural relativity, the negative effects of thinking obstacles will be amplified to a certain extent, because cultural relativity itself has the problems of use boundary and effectiveness. It makes people with thinking disabilities unable to accurately grasp the definition in the process of learning cultural relativity. In addition, from the perspective of cognitive thinking, cultural relativity itself has a logical paradox that is not friendly to people with thinking disabilities, that is, the cognitive concept of "relativity" does not exist in essence. When learners discuss ethnomusicology and musical anthropology, cultural relativity cannot admit that complete detached and neutral psychological cognition does not exist at the level of thinking logic. That is, if one-sided emphasis on relativity, it will lose the individuality of national music. On the one hand, it needs to use the sexual perspective to explain the development of musical anthropology. The misunderstandings and paradoxes of this theoretical logic will make it difficult for thinking impaired learners to correctly understand the essence of the theory, which will lead to logical errors in the case of premise errors, resulting in more difficulties in learning. Therefore, in the process of helping people with thinking disabilities learn cultural relativity, we should adopt the concept interpretation and logical relationship that are more beneficial to the cognition and understanding of people with thinking disabilities, and help people with thinking disabilities learn cultural relativity more correctly and deeply through the obstacles of

theoretical expression and surface paradox.

Objective: By combing the theory of cultural relativity and innovating methods on the learning path of cultural relativity, this study tries to help learners with thinking disabilities overcome various obstacles in the process of theoretical learning and carry out cultural relativity learning more comprehensively and deeply.

Subjects and methods: This study adopts the methods of on-site investigation and correlation analysis. In the form of an on-site test, it detects the degree of thinking disorder of thinking disabled learners in the process of learning cultural relativity, analyzes the theory of cultural relativity, and expounds on the relationship between the degree of paradox and the degree of thinking disabled learners.

Study design: In this study, patients with thinking disorders were randomly selected from medical institutions. After soliciting the consent of patients, the on-site centralized examination questions were tested. The examination papers were divided into two main parts: the learning part and the testing part. The learning part mainly expounded on the theories of cultural relativity, ethnomusicology and music anthropology for patients with thinking disorders to learn. The test part carries out the thinking test for the content of the learning part, and the test time is 90 minutes in total. After collecting the data, this paper uses correlation analysis to explore the theory of cultural relativity, and expounds on the correlation and effect between the degree of paradox and the degree of thinking disability learners.

Methods: In this study, Excel was used to count the test results, and SPSS software was used for correlation analysis.

Results: The theory of cultural relativity expounds the correlation between the degree of paradox and the degree of obstacle of thinking disabled learners. The analysis results are shown in Figure 1.

Figure 1. Correlation analysis

The sample trend in Figure 1 clearly shows the correlation between the degree of paradox expounded by cultural relativity theory and the degree of obstacle of thinking disabled learners. It can be seen that with the increase of the degree of paradox expounded by cultural relativity theory, the degree of obstacle score of thinking disabled learners also increases gradually, and the two show a positive correlation.

Conclusions: Through the analysis of the paradox between the characteristics of thinking disabled learners and the theory of cultural relativity, this study helps thinking disabled learners to overcome obstacles and innovate paths in the process of theoretical learning. The results show that there is a positive correlation between the paradox of cultural relativity theory and the degree of obstacles of thinking disabled learners. In the process of helping thinking disabled learners with theoretical learning, we need to optimize the elaboration of cultural relativity theory according to the characteristics of learners' thinking obstacles, help thinking disabled learners determine the logical premise and sort out the logical relationship, reduce the difficulties encountered by thinking disabled learners in learning and improve the learning effect.

* * * * *

STRENGTHENING CHINESE CULTURE EDUCATION IN CHINESE INTERNATIONAL EDUCATION UNDER LANGUAGE BARRIERS

Lina Xue

School of Foreign Languages, Xinyang Normal University, Xinyang 464000, China

Background: Language is an important tool for human beings to describe the external world and inner feelings. Different from the interactive communication mode of behavior, the interactive communication mode of language can break away from the constraints of time and space and communicate with concepts that have nothing to do with current time and space. Human language ability is divided into two main types: acquisition and learning. Therefore, the source of language barriers often comes from these two stages. Natural acquisition is the main ability used by individuals in the process of learning the first language after birth. Most children's first language acquisition speed is roughly the same. Children who grow up in a bilingual or multilingual environment can often naturally acquire two or more languages. However, this stage is also the initial stage of language barriers. Usually, such barriers are manifested in the process of language expression, understanding and communication. The types of language barriers that children are prone to are more complex, which can be divided into congenital stuttering, acquired stuttering, delayed language development and developmental language difficulties. Acquired aphasia, etc., in adulthood, some patients will still have language disorders, but some will be relieved in adulthood. Even if an individual has normal language ability in childhood, he may still have Dean in adulthood. This disorder is often manifested in the accompanying diseases of other neurological diseases or post-traumatic diseases, such as vocal organ and nerve organ diseases caused by frostbite, post-traumatic language disorders caused by stroke, etc. In addition, with the increase of social life pressure, the number of patients with language disorders caused by social-environmental problems and psychological pressure problems has also increased. Due to the diversity of the sources of language barriers and the accompanying social communication barriers, how to carry out educational assistance for language barrier groups has become one of the difficult problems in today's education system. Especially in the process of Chinese international education, for language disabled groups, there are many obstacles in their understanding of Chinese cultures, such as cross-cultural understanding obstacles, cross-language cognitive obstacles, their own language obstacles and so on. How to improve Chinese culture and education strategies for language disabled groups is one of the important topics of the current Chinese international education system.

Objective: Aiming at the various difficulties of language barrier groups in Chinese culture learning in Chinese international education, this study puts forward educational auxiliary strategy suggestions from the characteristics of language barrier, so as to help students with speech barrier overcome the dual barriers of culture and language and achieve better learning effect.

Subjects and methods: This study combines the field investigation method with particle swarm optimization algorithm to conduct investigation, research and data analysis in the order of current situation investigation, current situation sorting, proposal and seeking the optimal scheme.

Study design: This study obtains basic data through field investigation. According to the obstacle characteristics of language barrier groups in Chinese culture learning in Chinese international education, this paper puts forward different educational assistance strategies with different emphasis, and then uses particle swarm optimization algorithm to calculate the fitness and solve the optimal scheme for the educational assistance strategies with different emphasis.

Methods: In this study, Excel table is used to uniformly sort out the survey data, and particle swarm optimization program is used to optimize the scheme.

Results: The types of obstacles encountered by language barrier groups in the process of Chinese culture education in international Chinese education are shown in Table 1.

Table 1. Chinese culture learning disability factors

Chinese culture learning disability factors	Number of people	Proportion (%)
Language barrier	151	75.5
Limited level of Chinese	127	63.5
Transnational cultural cognitive impairment	92	46.0
Wrong way of cultural education	86	43.0
Insufficient cultural education	78	39.0

Table 1 classifies the barrier factors encountered by language barrier groups in the process of Chinese culture and education in Chinese international education. Among them, the language barrier accounts for

the highest proportion, reaching 75.5%, followed by the barrier caused by Chinese level, reaching 63.5%. The least number of people is the obstacles, accounting for only 39.0% of the whole.

Conclusions: In Chinese international education, the Chinese culture learning of language barrier groups is often accompanied by language and cultural barriers. Therefore, it is necessary to adopt teaching strategies that meet the learning characteristics of language-disabled groups in Chinese cultural education for language disabled groups. Through the teaching auxiliary optimization of teaching strategies, students can improve their enthusiasm for Chinese cultural learning and avoid the delay of learning progress caused by their own language barriers in the learning process. At the same time, it also avoids the students' psychological inferiority complex caused by the backward learning progress, and improves the students' self-efficacy from the other two aspects of psychology and behavior, so as to achieve the purpose of improving the learning effect of Chinese culture.

ON THE REFORM MODE OF TEACHING MANAGEMENT IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Jia Wang

School of Information Engineering, Tianjin University of Commerce, Tianjin 300134, China

Background: Educational psychology is a branch of psychology combined with education, that is, educational intervention with the help of relevant psychological theories or research results. It refers to the conscious and phased application according to the psychological laws and change characteristics of both teaching subjects and objects in a specific educational situation. Educational psychology can intervene students' psychological problems from the psychological level, and help teachers make teaching design and curriculum plan from the aspects of curriculum design, teaching method improvement and teaching motivation guidance, so as to achieve better teaching effect and teaching quality. Educational psychology is a psychological theory put forward to serve the teaching reform. By exploring the relationship between students' personality development and educational environment, the relationship between ability development and knowledge learning, social development and standardized learning, and the regularity between the effectiveness of teaching and talent training, we can strengthen the formation of the cultivation concept of people-oriented and students as the main body. The content of educational psychology includes learning psychology, teaching psychology, teacher psychology and education. As a positive educational concept, it can effectively intervene the psychology and laws of both sides of teaching, realize the innovation of teaching methods and models, and improve teaching quality. Under the background of continuous enrollment expansion of higher education, there are great individual differences in students' quality, and the simplification and modularization of teaching means and teaching effect further limit the improvement of teaching quality, and make students have frequent psychological problems, which seriously affect the teaching quality and reform process. Exploring the reform mode of teaching management in colleges and universities with the help of educational psychology has important theoretical and practical value for promoting the deepening reform of higher education. Exploring the new mode of teaching management with educational psychology can effectively improve the level of educational management, help students clarify their value orientation in the collective society and guide the establishment of their correct values.

Objective: In order to improve the teaching quality and psychological management of students, we should analyze the current situation and improve the teaching quality of students in the process of psychological education and management.

Research objects and methods: Taking teachers and students of a university as the research object, the research first collects data on the problems existing in the current educational management and teaching status, then innovates the teaching management mode, constructs a new teaching management mode from the perspective of educational psychology, and tests the effect of educational application with this mode.

Method design: With the help of principal component analysis, this paper makes factor analysis on the influencing factors affecting the effect of teaching management, and then innovates the educational management mode from the two aspects of teachers and students, such as learning and training teachers' mental health knowledge, carrying out mental health education for students under the ideological guidance of educational psychology, and so on. The experiment lasted for two months. After the experiment, data collection and statistics were carried out on the teaching management effects under different modes to explore the influence mechanism of educational psychology on the teaching management reform of colleges

and universities.

Methods: SPSS22.0 analysis tool to process the experimental data, extract the influencing factors and test the regression coefficient with principal component analysis, and analyze the teaching application effect before and after the experiment with different teaching management modes.

Results: From the perspective of educational psychology, examining the psychological characteristics of teachers and students in the teaching process and finding out the measures of teaching improvement can cultivate practical talents with high comprehensive quality to adapt to the development of the times and effectively improve the quality of teaching management in colleges and universities. The research explores the reform mode of educational management in colleges and universities from the perspective of educational psychology. The results show that educational psychology can effectively improve students' psychological problems, improve students' enthusiasm for teaching participation and teachers' professional skills. Table 1 shows the scoring statistics of students' teaching dimensions under different classroom teaching modes.

Table 1. Statistics of students' scores on teaching dimensions under different classroom teaching modes

Evaluation dimension	Enthusiasm of classroom participation	Solution of psychological problems	Innovation of learning	Effectiveness of teaching management
New mode	21.35±4.52	14.16±3.34	19.25±7.13	23.86±3.47
Old mode	19.78±3.14	25.37±1.25	12.44±5.11	18.24±4.13

Conclusions: Teaching management in colleges and universities has important theoretical and practical value for cultivating students' comprehensive quality. Carrying out teaching management with educational psychology as the basic theory can make educational managers fully aware of students' psychological problems, better intervene students and teachers, and constantly improve teaching plans and means. So as to improve the efficiency and quality of education management.

INNOVATIVE THINKING OF TEACHING REFORM OF NEWS BROADCASTING AND HOSTING SPECIALTY BASED ON SOCIAL PSYCHOLOGY

Qiang Xu

College of Communication Science and Art, Chengdu University of Technology, Chengdu 610051, China

Background: Social psychology is a science that studies people's social behavior and its psychological basis in social communication. The psychological and behavioral activities of individuals and groups in social psychology are different and diverse, and are affected by many factors. The main research objects of social psychology are divided into two levels: the individual level and the group level. The individual's social-psychological phenomenon is mainly manifested in the thoughts, feelings and behaviors with strong individual color restricted by the external environmental conditions, and the group level is composed of the consciousness consensus and norms jointly expressed by the individual, including group communication structure and racial prejudice. Social psychology includes micro-level, meso-level and macro-level. Looking at individual development and social changes from the perspective of social psychology can effectively link the close relationship between individuals and social groups, strengthen the "sociality" of individuals, and make their behavior and decision-making conform to the law and cognition of social development. At the same time, using social psychology to guide the intervention of groups to individuals can effectively and significantly enhance the individual's cognition of their own ability and the importance evaluation of their social status, and realize the coordination and unity of their "individuality" and "sociality". Bringing social psychology into teaching reform can not only make the teaching process not divorced from reality, but also respect individual differences while practicing educational ideas, which helps to strengthen students' social attributes and promote their all-round development. At present, the "lecture" based teaching method and single fixed teaching mode of news broadcasting and hosting major make the actual teaching process and content divorced from the actual news media operation system, and its timeliness and application characteristics are greatly reduced, which makes the employment rate of students in this major difficult, and the teaching reform is imminent. Therefore, studying the teaching reform path of news broadcasting and hosting specialty with the help of social psychology will help to improve students' professional skills and strengthen its application in reality.

Objective: In order to better promote the innovation of the teaching reform path of news broadcasting

and hosting specialty and improve students' professional skills and quality, this paper studies the innovation and optimization of the teaching mode path based on the understanding of the current situation of news broadcasting teaching and the learning situation of students in this specialty from the perspective of social psychology, so as to help students better adapt to the needs of social development and improve their professional skills and practicality.

Research objects and methods: Based on the theory of the developing relationship between individuals and groups in social psychology, this study selects the students majoring in news broadcasting and hosting in a university as the research object, evaluates their teaching status and professional ability, constructs a diversified teaching mode with the help of social psychology, and promotes the innovation of the teaching mode of news broadcasting and hosting. In order to explore the reform path of integrating social psychology into the teaching of news broadcasting and hosting specialty.

Method design: With the help of principal component analysis, the factors affecting the teaching effect are extracted and analyzed, and then the news broadcasting presided over the teaching classroom is innovated and optimized, and the teaching means, teaching concept, teaching scheme and teaching practice are improved to improve the application and practicality of teaching. The new model is used to collect the learning quality and learning effect of the subjects within three months, and the data are statistically analyzed to obtain the experimental results.

Methods: The experimental data were processed by tableau software analysis tool, the influencing factors were extracted by principal component analysis, and the teaching effect was tested by the new classroom teaching mode.

Results: With the help of social psychology, it can effectively strengthen the application practice of teaching classroom, improve students' awareness of self-social consciousness, group psychology and social role, help students better deal with social professional changes and improve their skills. Figure 1 shows the score statistics of students' professional practice ability and literacy overtime under the new teaching mode.

Figure 1. The score statistics of students' professional practice ability and literacy over time under the new teaching mode

Conclusions: Integrating social psychology into teaching reform and practice can effectively guide teachers to grasp the characteristics of the teaching process and the psychological law of students, and innovate teaching design and teaching mode according to professional development planning, so as to meet the needs of students and improve their professional knowledge, skills and literacy. Higher education should pay attention to the active integration of social psychology into teaching practice in the future educational practice, and cultivate practical professionals for the country on the premise of meeting the educational concept of building morality and cultivating people.

* * * * *

THE WAY TO STRENGTHEN THE GUIDANCE OF COLLEGE STUDENTS' IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yuejia Dong

School of Journalism and Communication, Northwest University, Xi'an 710127, China

Background: Educational psychology refers to the use of psychological theories or research results to carry out educational intervention, carry out conscious intervention according to the psychological laws and change characteristics of both teaching subjects and objects, and explore its teaching effect in a specific situation. Educational psychology can help teachers effectively intervene and solve students' psychological and learning problems in curriculum design, teaching method improvement and teaching motivation guidance. Based on psychology, educational psychology constructs the relationship between pedagogy and psychology, discusses the relationship between students' personality development and educational environment, the relationship between ability development and knowledge learning, social development and standardized learning, and the regularity between teaching effectiveness and talent training, and is committed to improving teaching quality and meeting the needs of teaching subjects. On the basis of practicing the cultivation concept of people-oriented and cultivating people through moral education, educational psychology actively intervenes in the teaching process and teaching subject and object with the help of psychological theory, which is imperceptibly internalized in mind and practice, providing ideological weapons and innovative ideas for curriculum design. The teaching method is the link between teachers' teaching design and students' actual learning effect. It is the best test means of curriculum effect. In terms of ideological and political education, various schools of pedagogy in history have directly established their own theoretical system based on the corresponding psychological point of view. The teaching process is the process of teaching interaction. Its essence is the choice of methods, and the psychological characteristics of teachers and students will make the teaching effect and teaching focus different. Different psychological characteristics and goal orientation will lead to the difference and enthusiasm of students' learning attitudes. At present, efficient college students often ignore the importance and urgency of ideological and political education and study with the mentality of coping with exams and single pursuit of achievement, which makes it difficult for students' ideological and moral cultivation to be greatly improved. At present, the current situation of ideological and political education mainly focuses on teachers' teaching, and the teaching means are relatively single and solidified, which makes teaching a mere formality, and there are still some deficiencies in improving students' enthusiasm and initiative to participate in the classroom. It is unable to give full play to the guidance and guidance of ideological and political education, and it is difficult to improve students' ideological and political level. Therefore, from the perspective of educational psychology, it is of great practical significance and value to carry out teaching reform from the aspects of the design of teaching content, the selection of teaching resources and the evaluation of teaching mode, pay full attention to the needs and psychological change characteristics of students, innovate the teaching path of ideological and political education and give full play to its leading power.

Objective: To analyze the law and characteristics of students' psychological changes in the process of ideological and political education with the help of educational psychology, so as to improve the goal and teaching effect of ideological and political education on students' ideological guidance and moral quality training, improve the teaching quality, and explore a new promotion path of ideological and political education.

Research objects and methods: Taking the students of three majors in a university as the research object, the research first collects information on the current situation of ideological and political teaching and the learning problems and needs of college students, then innovates and optimizes the teaching mode of ideological and political education, and constructs a new promotion path in line with students' psychological needs and ideological and political teaching objectives from the perspective of educational psychology. This model is used to test the quality and effect of teaching and the changes in students' ideology and morality.

Method design: Explore the correlation between educational psychology and ideological and political education with the help of principal component analysis, innovate and optimize the original ideological and political education classroom on this basis, analyze the learning effect and ideological and moral improvement of the experimental objects within three months with the new model, and make statistical comparison of the experimental data. To explore the influence mechanism of educational psychology on college students' ideological education level.

Methods: Principal component analysis was used to explore the correlation between educational psychology and ideological and political education 0 analysis tool to process the experimental data, and

with the help of the teaching situation changes before and after the application of the new ideological and political teaching model.

Results: From the perspective of educational psychology, strengthening the innovation of teaching means of ideological and political education will help to improve students' ideological level, enrich the diversification of ideological and political education, and play its leading and guiding exemplary role. The research explores the innovation of the teaching path of ideological and political education from the perspective of educational psychology. The results show that educational psychology can greatly improve students' enthusiasm to participate in the classroom and their ideological and moral level on the basis of considering students' needs and ideological and political teaching objectives. Table 1 shows the score statistics of students' ideological and political teaching effect before and after the improvement of classroom teaching mode.

Table 1. The score statistics of students' ideological and political teaching effect before and after the improvement of classroom teaching mode

Time	Ideological and moral level	Ideological knowledge reserve	Learning enthusiasm	Establishment of correct values
Before improvement	17.79±3.15	14.16±3.31	12.44±5.32	18.24±4.15
After improvement	24.35±4.52	28.37±1.26	19.45±7.15	27.87±3.46

Conclusions: Educational psychology can lay a psychological scientific foundation for China's teaching reform, and is committed to serving practical education so that teachers can improve teaching level and quality on the basis of grasping the psychological laws and teaching characteristics of teaching subjects and objects. The application of educational psychology in ideological and political teaching can make the coordinated development of educational resultant force and the leading force of ideological and political education, and promote the formation of correct values of college students.

* * * * *

APPLICATION OF NATIONAL TRADITIONAL PHYSICAL EXERCISE BEHAVIOR AND AEROBIC EXERCISE IN ADULT PSYCHOLOGICAL ANXIETY

Jixiang Cheng¹ & Wentao Guan²

¹*School of Physical Education, Kaili University, Kaili 556011, China*

²*College of Education, Graduate University of Mongolia, Ulaanbaatar 14192, Mongolia*

Background: In essence, psychological anxiety refers to a strong and lasting emotional experience produced by individuals in the face of irresistible external pressure. At the same time, psychological anxiety will also produce corresponding physiological and behavioral changes, which is an adaptive response formed in the process of human evolution. Individuals with different degrees of psychological anxiety have different effects. Moderate psychological anxiety can make people in a more urgent and positive psychological state, and then provide motivation for their work and life. Excessive psychological anxiety will cause people's emotional regulation imbalance, and then fall into an "emotional trap" and have a negative impact. Studies have shown that 30%-50% of adults have varying degrees of psychological anxiety, and the factors affecting their psychological anxiety mainly include social cognitive factors, personality factors and work pressure. Adults have certain differences between their own cognitive level and social cognition, as well as differences in individual personality and psychological tolerance, which makes adults produce great psychological pressure and anxiety in complex working environment and social competition. The psychological anxiety of adults will not only affect their physical and mental health, but also lead to work efficiency, family situation and other problems. Some experts and scholars have put forward the "work demand control support" model for adults' psychological anxiety in order to improve their mental health level, but the effect of the model mainly depends on adults' control and binding on their own ability, which is not conducive to the dredging of their psychological emotions to a certain extent. The key to alleviating adults' psychological anxiety is to help them realize correct self-cognition and social cognition and find ways to vent their emotions. The traditional national physical exercise and aerobic activities focus on the overall view of human life, emphasize the relationship between human life activities and the natural environment, and pursue a harmonious internal and external health state, which can effectively regulate people's emotional and psychological problems. Therefore, with the help of physical exercise forms and aerobic activities, helping adults release their emotions and guiding them to pay attention to their cognition

and correctly evaluate their health status can help to form the awareness and habit of lifelong exercise, so as to alleviate their psychological anxiety, improve their mental health level, and deal with the changes around them with a more positive and peaceful attitude.

Objective: To help adults with psychological anxiety get rid of negative emotions and improve their interest in physical exercise, so as to release bad emotions and improve their mental health level.

Research objects and methods: Adults with psychological anxiety were selected as the research objects. After collecting the information of students' physical exercise and mental health, they were then trained for one month. And select martial arts, Taijiquan, aerobics and other sports methods to intervene adults with different degrees of psychological anxiety. After the experiment, the changes of the subjects in different stages were counted with the help of the mental health self-test scale and mood state scale, so as to better explore the impact mechanism of physical exercise on adult mental health.

Method design: Firstly, the subjects were classified according to their mental health status and problems, and then the subjects were randomly divided into different groups according to different physical exercise intervention methods. After three months, the mental health status of different groups was sorted and analyzed to explore the intervention mechanism of traditional physical exercise and aerobic exercise on adult psychological anxiety.

Methods: With the help of SPSS21.0 statistical analysis tools were used to sort out and analyze the scores of the mental health scale and mood state scale before and after the experiment, and the experimental results were obtained.

Results: Traditional physical exercise guided adults to pay attention to endogenous value and perceived strength in the form of light, slow and powerful exercise, helped them look at the changes in themselves and their surrounding environment in a relatively calm state of mind, and aerobic exercise can relieve people's body and mind, alleviate the psychological pressure and psychological anxiety of the subjects, and improve the level of mental health. The results show that traditional physical exercise can effectively improve adults' negative emotions such as compulsion, depression, anxiety and hostility, and help them improve their mood and mental health. The score of adults' mental health before and after Wushu training in Table 1.

Table 1. The mental health scores of adults in Wushu training group before and after the experiment

Time	Somatization	Interpersonal relationship	Anxious	Depressed	Psychotic
Before experiment	1.52±0.28	1.75±0.41	2.13±0.51	1.96±0.69	1.62±0.27
After experiment	1.23±0.21	1.53±0.34	1.15±0.35	1.23±0.32	1.23±0.40
<i>P</i>	<0.05	<0.05	<0.05	<0.05	<0.05

Conclusions: Traditional physical exercise and aerobic exercise can effectively improve people's physical function and mood state, and have high theoretical and practical value for people's health state. With the characteristics of relaxation and freedom, these sports help adults focus on themselves and reduce their psychological pressure and burden from external environmental conditions. Greatly alleviated psychological anxiety. As a relatively relaxed way, physical exercise can effectively help adults release negative emotions and cultivate their awareness of physical health through lifelong exercise.

* * * * *

ON THE GUIDANCE AND CULTIVATION OF STUDENTS' SINGING PSYCHOLOGY IN VOCAL MUSIC TEACHING IN COLLEGES AND UNIVERSITIES

Yaping Zeng

Music Teaching Department, Zhengzhou Preschool Education College, Zhengzhou 450000, China

Background: Vocal music majors in colleges and universities have certain standards for their evaluation views and ways of thinking, and their psychological state has begun to take shape, but it has not reached the mature stage. The contradiction of psychological thinking is the main feature of vocal music majors at this time. At the same time, the differences in singing ability and self-cognition level will make students have negative psychological emotions such as anxiety, anxiety, tension and conflict in vocal music singing, and produce psychological problems such as obsessive-compulsive disorder, anxiety disorder, hypochondriac disorder and depressive disorder, among which anxiety psychology is the most common psychological problem. Anxiety psychology refers to students' anxiety about unknown things under the influence of

complex environment and their own psychological cognitive limitations. At the same time, interpersonal relationships, test pressure, social fear and other factors will make students have psychological burdens and pressure, and then show negative mentality and psychological problems such as anxiety in vocal music singing teaching. Positive emotional psychology can help students better deal with the psychological emotions brought by the changes of environmental conditions, and help them improve their psychological problems and classroom performance. Negative emotional psychology will increase college students' worry and anxiety about uncontrollable behavior, affect their study and life, and attack their enthusiasm and confidence. In the process of vocal music teaching in colleges and universities, the interactive influence process of teaching and learning includes psychological suggestion, the psychological response, psychological control and the cultivation of spiritual will, which can effectively transmit skill information to students, and then produce different psychological feedback to students through the perception of auditory information and brain information processing, so as to affect students' emotional expression and psychological regulation. Vocal singing is a sound art based on people's own voice, which can produce emotional and spiritual resonance with the audience to the greatest extent. Therefore, exploring the guidance and cultivation of college vocal music teaching on students' singing psychology can alleviate students' psychological problems and guide and cultivate students' singing psychology with the help of the psychological regulation of enunciation and resonance and the cultivation of emotion.

Objective: To study from the vocal music teaching classroom as the starting point, explore the psychological problems of students in the process of singing teaching, and actively intervene them, effectively alleviate the negative emotions and psychological problems of vocal music students in teaching practice, pay attention to the guidance and cultivation of their singing psychology, and improve their mental health level and learning quality.

Research objects and methods: Firstly, the study screened the mental health of students majoring in national vocal music in a university, and took the students with singing psychological obstacles and psychological problems as the research object. Then, with the help of the analytic hierarchy process, the index level and target level were constructed to innovate the current vocal music teaching mode. The innovative vocal music teaching model is applied to the research object. The experimental time is four weeks to explore the guidance and training mechanism of college vocal music teaching on students' singing psychology.

Method design: After analyzing the singing psychological characteristics and mental health problems of the research objects, bring them into the process of teaching design improvement, and optimize the teaching means and teaching scheme, in order to design the classroom teaching mode and means in line with the singing psychology of vocal music students. And collect and analyze the data of the subjects' singing psychological changes, mental health status and learning effect before and after the experiment, so as to draw the experimental conclusion.

Methods: The optimization and innovation of vocal music teaching mode was realized by analytic hierarchy process, and SPSS21.0 statistical analysis tool to process and analyze data.

Results: Vocal music teaching can cultivate students' perception and understanding of art with the help of vocal music singing form. The teaching effect will directly affect the changes in students' learning psychology and learning quality. Innovating and optimizing the vocal music teaching mode can effectively help teachers optimize the design of teaching plans, teaching means and teaching courses from the individual differences and psychological needs of students, and then strengthen the correct guidance and cultivation of students' singing psychology. The results show that the innovation of vocal music teaching means and the diversity of programs greatly alleviate the negative emotions and psychological problems of vocal music majors and improve their mental health level. Table 1 shows the scores of the singing psychological anxiety scale of the subjects before and after the experiment.

Table 1. The scores of singing psychological anxiety scale of the subjects before and after the experiment

Anxiety dimension	Before the experiment		After the experiment	
	Average value	Standard deviation	Average value	Standard deviation
Boredom	3.74	2.32	1.35	1.06
Anxiety	3.24	1.41	1.76	1.15
Escape emotion	4.63	2.16	1.45	1.18
Resistance	3.97	1.64	1.75	1.47

Conclusions: Higher national vocal music education can improve students' understanding and creativity of art through the study of basic theoretical knowledge and the appreciation and practice of artistic ability. Through the innovation of teaching mode, it can greatly improve students' psychological problems, meet

their psychological needs and improve their professional ability. In the process of vocal music teaching in colleges and universities in the future, teachers should pay attention to the grasp of students' singing psychological and emotional value, pay attention to their psychological change law in time, and promote the diversified development of vocal music education and teaching and the all-round and healthy growth of students.

* * * * *

LEGAL PROTECTION OF THE RIGHTS OF PATIENTS WITH MENTAL DISORDERS FROM THE STANDPOINT OF MARXISM

Tian Liang

*Institute of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, Peking University,
Beijing 100871, China*

Background: Mental disorder is a kind of mental disease, which refers to the disorder or abnormality of perception, emotion, thinking and other activities caused by various reasons, resulting in obvious psychological pain or social adaptation and other functional damage of patients. Mental disorders can be divided into general mental disorders and serious mental disorders according to the severity of the disease. Serious mental disorders refer to mental disorders with serious disease symptoms, resulting in serious damage to patients' social adaptation and other functions, unable to fully understand their own health status or objective reality, or unable to deal with their own affairs, mainly including schizophrenia, paranoid psychosis schizoaffective disorder, a mental disorder caused by epilepsy and mental retardation. Since the implementation of China's mental health law on May 1, 2013, the rights of patients with mental disorders have been formally, comprehensively and systematically protected. Previously, statements about "mental illness" or "mental illness" appeared more in laws and regulations such as the criminal law, the administrative punishment law and the criminal procedure law. The term "mental disorder" is used in national legislation for the first time in the mental health law, which is connected with the expression of "mental disorder" used in relevant documents of the World Health Organization (WHO) and reflects the human and humanistic care for patients with mental disorders. Finding the best governance balance between the safety of public order and the protection of basic human rights of patients with mental disorders is not only a major theoretical problem but also a thorny practical problem. In the manuscript of economics and philosophy in 1844, Marx pointed out that there are differences between man and animals, that is, man, as the subject, not only carries out objectified activities, but also takes himself as the object for research and creation, which is the special place that man is superior to animals. The universality of human is manifested in that the scope of human control and objectification of nature is much larger than that of animals, while animals lack this universality and can only cling closely to nature in a narrow range and consume the ready-made limited resources of nature. Patients with mental disorders have neurological disorders or disorders, which are manifested in abnormalities in perception, consciousness, thinking, emotion, intelligence and behavior. Although the functions of patients' natural and social attributes are weakened or damaged, it does not mean the lack of human nature and should share human dignity.

Objective: The protection of the rights of patients with mental disorders mainly involves the medical security system, guardianship system and admission system. Taking the Marxist theory of "human" and human rights as the logical starting point, through the analysis of the specific system of the protection of the rights of patients with mental disorders, it is found that the values behind the system are supported, which constitute the legal basis of the legitimacy of the protection of patients' rights, and these values come from the moral concepts, history and culture of our times and space political and economic factors. Finally, looking back at the reality of the protection of the rights of Chinese patients with mental disorders, we should protect the legitimate rights and interests of patients to the greatest extent from the perspective of the rule of law.

Research objects and methods: 300 patients with mental disorders were randomly selected. According to the main causes of mental disorders, taking the Marxist theory of "human" and human rights as the logical starting point, the patients were given a rule of law guarantee scheme combining Marxism, and the effect was observed after application.

Study design: The patients were randomly divided into study group and control group, with 150 cases in each group. The control group was given the conventional treatment plan for mental disorders, and the study group implemented the rule of law guarantee plan based on Marxism on the basis of the conventional group. After treatment, the self-designed statistical table was used to calculate the improvement rate of

clinical symptoms before and after treatment, including indifference, poor thinking, low willpower, attention disorder, sleep disorder and hallucination. The statistical results were compared and analyzed to judge the psychiatric status of patients before and after the intervention of the rule of law guarantee scheme based on Marxism.

Methods: The relevant data were calculated and counted by Excel and SPSS17.0.

Results: The results showed that after the intervention treatment, the clinical symptoms of indifference, poor thinking, low willpower, attention disorder and hallucination in the study group were significantly better than those in the control group ($P < 0.05$). There was no significant difference in sleep disorders between the two groups ($P > 0.05$). It shows that the rule of law guarantee scheme combined with Marxism is far better than conventional therapy on the whole. See Table 1.

Table 1. Comparison of clinical symptom improvement effect between the two groups before and after treatment (n)

Group	Emotional indifference	Poverty of thought	Will decline	Attention disorders	Sleep disorders	Hallucinatory delusion
Research group	124	118	96	112	134	44
Control group	84	78	72	78	94	60
χ^2	6.625	5.852	7.593	8.286	1.29	1.149
P	<0.05	<0.05	<0.05	<0.05	>0.05	<0.05

Conclusions: The value concept of the protection of the rights of patients with mental disorders in China is heavy control and restriction, and lack of attention and attention to their rights. Especially when patients endanger social and public safety, the legitimacy and rationality of the protection of their rights are questioned by the public, and the protection of the rights of patients with mental disorders as a socially vulnerable group has been absent for a long time. The protection of the rights of patients with mental disorders is not only related to their own personal health, employment, marriage and family, but also a comprehensive social management problem beyond the scope of medicine. Therefore, long-term and effective provision of legislative security, administrative security, judicial security and social security system will improve the legal protection mechanism of the rights of patients with mental disorders, and the rights and interests of patients will be safeguarded to the greatest extent.

ON THE TEACHING REFORM OF MONGOLIAN INFORMATION PROCESSING COURSE FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Guobin Wang

College of Mongolian Studies, Inner Mongolia Minzu University, Tongliao 028000, China

Background: As a scientific way of organically combining pedagogy and psychology, educational psychology can explore the basic psychological laws and development modes between education and learning in various practical situations of education and teaching. Not only that, educational psychology can also apply psychology to the process of education. It is effective practical educational research means. In the application category of educational psychology, it includes the internal and external situations of teachers and students, mainly reflected in teaching psychology and teaching behavior, and students' psychology and learning behavior. Under the guidance of scientific teaching theory, educational psychology can study and discuss the basic laws and the interaction between teachers and students in the teaching process, which is helpful to improve the teaching quality and teaching effect, and play a significant role in the smooth development of teaching work. In diversified teaching scenarios, educational psychology can have different positive effects, and even speed up the reform and optimization of related courses. Mongolian information processing course is a basic course of Mongolian Chinese bilingual teaching for Mongolian majors. Its main teaching contents are Mongolian language and characters with a long history and the way of processing Mongolian codes. Mongolian information processing involves the relevant knowledge of many different disciplines, including linguistics, logic, psychology, computer science and so on. In the information age, using computers to accurately process and analyze Mongolian language and text information can help the Mongolian nation realize the development of social modernization. Therefore, it is urgent to carry out effective reform on the teaching of Mongolian information processing course. Integrating

the relevant theories of educational psychology into the teaching reform of Mongolian information processing course can improve the reform efficiency to a certain extent and ensure the teaching quality of Mongolian information processing course.

Objective: At present, there are few colleges and universities offering Mongolian information processing courses in China, and the teaching effect of Mongolian information processing course is not satisfactory due to the particularity of language in ethnic minority areas and the shallow mastery of Mongolian information knowledge by staff. This research will reform the teaching mode of Mongolian information processing course from the perspective of educational psychology, in order to study the psychological phenomenon of middle school students in the process of Mongolian information teaching, emphasize the importance of Mongolian information processing course, and improve the teaching effect of Mongolian information processing course.

Research objects and methods: From the perspective of educational psychology, 150 students of Mongolian information processing course in three universities were randomly selected, 50 in each university. This paper evaluates and analyzes the psychological phenomena of all college students in the teaching process of Mongolian information processing course, and compares the changes of college students' psychological phenomena before and after the teaching reform of Mongolian information processing course.

Research design: 150 college students were taught Mongolian information processing course after integrating into the theoretical reform of educational psychology. After a three-month teaching intervention, the teaching evaluation method was used to evaluate and analyze the Mongolian information processing level of college students. In addition, the decision tree classifies the psychological phenomena of college students in Mongolian information processing course, and obtains the comparison results of the changes of their psychological phenomena before and after the reform.

Methods: For the evaluation scores and psychological phenomena of Mongolian information processing courses of college students, Excel software and SPSS24.0 are used for calculation and analysis, in order to explore the reform effect and teaching results of Mongolian information processing course from the perspective of educational psychology.

Results: The changes of students' psychological phenomena before and after the teaching reform of Mongolian information processing course are shown in Table 1. According to Table 1, from the perspective of educational psychology, in the teaching process of Mongolian information processing course, college students mainly have four psychological phenomena: weak learning motivation, poor learning enthusiasm, prone to burnout and fear of difficulties or resistance. Before the reform, there were a large number of students with these four negative psychological phenomena among all the tested college students. Among them, the students with poor learning enthusiasm and prone to burnout accounted for more than 50%, 56.67% and 52.67% respectively. After the teaching reform of Mongolian information processing course, the proportion of students with four psychological phenomena has decreased, and the decline is large. This shows that the teaching reform of Mongolian information processing course can effectively improve the negative psychological phenomenon of college students and improve their learning enthusiasm and learning effect.

Table 1. Changes of college students' psychological phenomena before and after the reform

Psychological phenomenon	Before reform		After reform	
	Number of people	Proportion (%)	Number of people	Proportion (%)
Weak learning motivation	47	31.33	11	7.33
Poor learning enthusiasm	85	56.67	32	21.33
Prone to burnout	79	52.67	34	22.67
Fear of difficulties or resistance	64	42.67	25	16.67

Conclusions: The research and development of Mongolian information processing technology is of great significance for the Mongolian nation to realize social modernization as soon as possible. However, at present, the construction of Mongolian information processing curriculum in China is still in the primary stage, and its teaching mode and teaching effect need to be improved and improved. From the perspective of educational psychology, reforming the teaching mode of Mongolian information processing course can significantly improve the negative psychological phenomenon of college students.

CREATIVE THINKING MODE AND COGNITIVE IMPAIRMENT OF KNOWLEDGE FILM AND TELEVISION EDITORS AND DIRECTORS FROM THE PERSPECTIVE OF NEW MEDIA COMMUNICATION

Biwei Jiang

Faculty of Media & Arts, Sichuan Vocational College of Culture & Communication, Chengdu 611230, China

Background: In the process of traditional media constantly being impacted by emerging media, in order to comply with the changes of the trend of the times and the development of society, an innovative professional group, namely film and television editors and directors, has been formed in the mass media. Under the influence of the wide popularization of the Internet, film and television editors and directors have developed to a certain extent and established the core position of the media. From the perspective of new media communication, knowledge film and television editors and directors can give full play to their characteristics of wide coverage and strong functionality. However, in order to adapt to the changing trend of the public and mainstream media, knowledge film and television editors and directors should carry out continuous innovation and optimization. It can be seen that the relevant practitioners of knowledge film and television editing and directing not only need to have excellent professional knowledge and high professional quality, but also should have innovative thinking mode. Therefore, the practitioners of knowledge film and television editing and directing bear great work pressure in a severe working environment, which is prone to mental and psychological abnormalities and even cognitive impairment. Among the common mental diseases, cognitive impairment is one of the most serious symptoms and negative effects. It is mainly manifested in a series of symptoms, such as memory impairment, learning impairment, executive dysfunction, aphasia, apraxia and so on. There is an interactive relationship between various symptoms of cognitive impairment, which will accelerate the deterioration of patients' condition, resulting in cognitive impairment becoming a serious psychological disease, which is difficult in the process of diagnosis and treatment. Cognitive impairment will have a great negative impact on patients' thinking logic level and self-care ability, which is a heavy burden for patients themselves and their families.

Objective: From the perspective of new media communication, the cognitive impairment of the innovative thinking mode of knowledge film and television editors and directors will significantly affect the work quality of film and television editors and directors, and hinder the work and development of knowledge film and television editors and directors from different aspects. In order to optimize the innovative thinking mode of knowledge film and television editors and directors and cultivate their innovative thinking ability, this research will focus on the perspective of new media communication, and conduct an in-depth exploration on the cognitive obstacles of innovative thinking mode of knowledge film and television editors and directors, in order to eliminate the cognitive obstacles and their negative effects, so as to promote the improvement and optimization of innovative thinking mode.

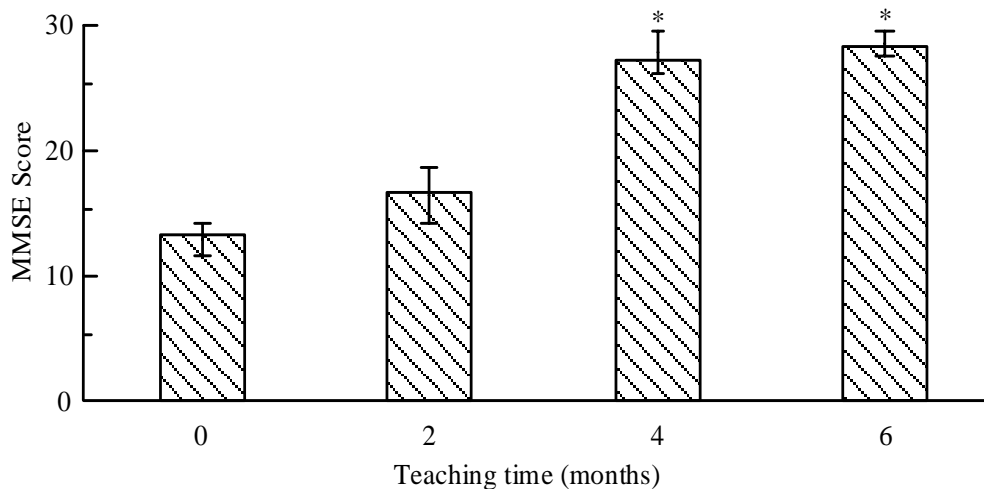

Research object and method: 90 knowledge film and television editors and directors with cognitive impairment were selected as the research object. The level of innovative thinking and the severity of cognitive impairment symptoms were evaluated by Torrance Tests of Creative Thinking (TTCT) and Mini-mental State Examination (MMSE).

Research design: For all knowledge film and television editors and directors with cognitive impairment, the training of knowledge film and television editors and directors from the perspective of new media communication is adopted, and the training intervention time is set as 6 months. After the intervention, the data indexes of knowledge film and television editors and directors with cognitive impairment, namely TTCT score and MMSE score, were analyzed.

Methods: Before and after the intervention, TTCT and MMSE were used to evaluate the level of innovative thinking and the severity of cognitive impairment symptoms of all subjects. The total MMSE score was 30. If the MMSE score of the subjects was less than 27, they were accompanied by cognitive impairment, and the evaluation data were statistically analyzed by Excel software and SPSS22.0 software. The difference was statistically significant ($P < 0.05$).

Results: Before the intervention, the MMSE score of 90 knowledge film and television editors and directors with cognitive impairment was low, indicating that they all had cognitive impairment. After 2 months of intervention, MMSE score increased, but the increase was small, which was not statistically significant compared with that before intervention ($P > 0.05$). After 4 months of intervention, the MMSE score of knowledge film and television editors and directors with cognitive impairment increased significantly to less than 27 points, which showed that the knowledge film and television editors and directors were no longer accompanied with cognitive impairment, and the difference was statistically significant ($P < 0.05$). After 6 months of intervention, the increase of MMSE score of all knowledge film and television editors and directors decreased, but still maintained a continuous upward trend. The MMSE score

decreased significantly compared with that before the intervention, and the difference was statistically significant ($P < 0.05$).

Note: * $P < 0.05$ compared with that before teaching.

Figure 1. Comparison of MMSE scores at different time nodes before and after intervention

Conclusions: The innovative thinking mode and ability of knowledge film and television editors and directors play a decisive role in their career development and the normal development of film and television editors and directors. From the perspective of new media communication, exploring the creative thinking mode and cognitive impairment of knowledge film and television editors and directors, and carrying out targeted training can significantly improve the cognitive impairment of knowledge film and television editors and directors.

* * * * *

THE OPTIMIZATION STRATEGY OF COMMUNITY PUBLIC SPACE TRANSFORMATION BASED ON THE BEHAVIOR CHARACTERISTICS OF PATIENTS WITH COGNITIVE IMPAIRMENT

Ze Liu

*Faculty of Architecture, Civil and Transportation Engineering, Beijing University of Technology, Beijing
100124, China*

Background: The high-frequency symptoms of cognitive impairment are the abnormalities of human brain advanced functions such as emotion, memory, logic and thinking, and the cognitive impairment of patients in one aspect is likely to cause cognitive impairment in other aspects. The causes of cognitive impairment diseases are mostly the abnormal activity of human cerebral cortex, which is generally treated with antioxidants Glutamate receptor antagonists and other drugs or surgical treatment. At present, most patients with cognitive impairment still live in urban areas. Whether the public space layout of the community is reasonable and scientific will also affect their symptoms. Moreover, the unreasonable layout of public space may stimulate the intense negative emotions of patients with cognitive impairment. For example, planning the parking area to the entrance and exit downstairs of the patient's room may make the patients have angry psychological emotions and even make some acts of damaging others' property. Therefore, in the process of community public space transformation, we should consider the feelings of patients with cognitive impairment as much as possible, and this may help to alleviate the symptoms of patients with cognitive impairment, but the correctness of this conclusion needs to be verified by social experiments.

Objective: To understand the life and behavior patterns of Chinese patients with cognitive impairment in residential areas, and design experiments to verify the impact of different community space optimization and transformation strategies on their disease severity.

Participants and methods: Through visits, interviews and other means, from community managers, property managers and patients with cognitive impairment in the community, to understand the life and

behavior patterns of patients with cognitive impairment in residential areas. To analyze the relationship between the symptoms of patients with cognitive impairment and their community public space. Then a social experiment was designed. Six communities with cognitive impairment living in China and requiring public space transformation were selected, and then 214 residents with different degrees of cognitive impairment were selected as the research objects. They were divided into experimental group and control group. Each group came from three communities, and the communities of members in each group could not overlap. Before the start of community transformation, all selected patients with cognitive impairment were interviewed with semi-structured interview of the same standard to understand the severity of cognitive impairment symptoms before the experiment. The severity was divided into four categories: asymptomatic, mild, moderate and severe symptoms according to the frequency of onset, intensity of onset emotion and duration of onset, four numbers 1, 2, 3 and 4 are used for quantification. The communities of the members of the experimental group are required to think from the perspective of patients with cognitive impairment and meet their needs of action and thinking mode as much as possible. For example, the roads should be straight and easy to observe as much as possible, while the community transformation process of the control group does not interfere. Six months after the reconstruction of the selected community space, the research objects in the community will be interviewed again with the same standards and contents, and the contents of each interview will be recorded for subsequent analysis.

Results: All the measurement type features in the study were displayed in the form of mean \pm standard deviation for *t*-test, and the counting type features were displayed in the form of number or proportion of number for Chi-square test. The significance level of difference was taken as 0.05. After the interview of all research objects in the community, the statistical interview contents are shown in Table 1.

Table 1. Statistics of cognitive impairment severity of subjects

Interview time	Experience group	Control group	<i>P</i>
Before community reconstruction	2.74 \pm 0.20	2.75 \pm 0.18	1.174
After community reconstruction	1.62 \pm 0.21	2.95 \pm 0.22	0.002
<i>P</i>	0.001	0.025	-

It can be seen from Table 1 that before the transformation of community space, the *t*-test output *P* value between the quantitative scores of cognitive impairments of the two groups was 1.174, which was greater than the significance level. It is considered that the data difference is significant. After the transformation of community space, the average quantitative scores of cognitive impairments in the experimental group and the control group were 1.62 and 2.95 respectively. The former was significantly lower than the latter, and the results of *t*-test showed that the data were significantly different. In addition, there was also significant difference in the quantitative score of cognitive impairment before and after the transformation in the control group, and the value after the transformation was higher as a whole.

Conclusions: In order to deal with the deterioration of the condition of Chinese patients with cognitive impairment because the transformation of community space in their residential area is not in line with their own wishes, this study designed and carried out a social experiment on the basis of investigating and understanding the life and behavior patterns of Chinese patients with cognitive impairment in residential areas. The experimental results show that after the transformation of community space, the average quantitative scores of cognitive impairments in the experimental group and the control group without additional intervention were 1.62 and 2.95 respectively. The former was significantly lower than the latter, and the results of *t*-test showed that the data were significantly different. The experimental results show that in the process of community transformation, considering the psychological needs of patients with cognitive impairment, adjusting the spatial layout, the style and color allocation of public decorations will help to alleviate the symptoms of patients.

Acknowledgement: The research is supported by: National Natural Science Foundation of China – Research on Evaluation Methods for the Vitality of Public Space in Old Cities Under the Background of Population Decentralization – Take Beijing as an Example, (No. 51808010).

CHINESE TRADITIONAL CULTURAL ELEMENTS UNDER COGNITIVE IMPAIRMENT ARE INTEGRATED INTO THE TRADITIONAL IDEOLOGICAL EXPRESSION OF ANIMATED FILMS

Yinghong Deng

School of Art and Design, Xiangsihu College of Guangxi University for Nationalities, Nanning 530225, China

Background: Chinese traditional culture has a strong historical heritage and has a profound influence in painting, architecture, opera, poetry, thought and other aspects. With the rapid development of science and technology, Chinese traditional culture still plays a positive role in the operation and development of all walks of life, among which cultural edification is the most significant. In recent years, the reconstruction and dissemination of Chinese traditional culture by animated films has attracted much attention. More and more animated film production has integrated a large number of Chinese traditional cultural elements, and made an in-depth analysis on the application of Chinese traditional cultural elements from the aspects of subject selection, scene design, character modeling, music special effects and so on. As a product of the development of science and technology, animated films show earth shaking changes in their forms of expression in the process of continuous optimization and renewal of science and technology. Although the development of audio-visual technology of animated film makes the audience enjoy more unique aesthetic pleasure, the internal essence and artistic details of animated film still exist in its ideological purport. Integrating Chinese traditional cultural elements into animated films can realize the expression of traditional ideas to a certain extent. Cognitive impairment and memory impairment are the main symptoms of cognitive impairment and memory impairment. Patients with severe cognitive impairment may gradually lose their basic self-care ability, causing a heavy psychological burden on patients and their families. In the process of appreciating animated films, patients with cognitive impairment will have different understanding of the traditional thought expression of integrating Chinese traditional cultural elements into animated films due to their different severity of cognitive impairment. The effect of traditional thought expression in animated films will also react on patients with cognitive impairment and play a certain role in alleviating their cognitive impairment.

Objective: As a valuable material for film and television creation, Chinese traditional culture plays an important role in guiding and promoting the development of film and television. Its thick historical heritage and rich story content make the creation of animated films tend to diversified development. Integrating Chinese traditional elements into the creation of animated films can promote the formation of national style of animated films in China to a certain extent. However, in the process of practical application, there are still some urgent problems to be solved, such as how to combine the spirit of the times, optimize aesthetic ideas, and fully express traditional cultural ideas. Based on this, from the perspective of cognitive impairment, this study will explore the current situation and problems of traditional thought expression of Chinese traditional cultural elements into animated films, and put forward corresponding solutions, in order to promote the innovation and application of Chinese traditional cultural elements in animated films, and then provide strong support for the elimination of patients' cognitive impairment.

Research objects and methods: 500 animated film viewers with cognitive impairment were investigated. The level of cognitive impairment was evaluated and analyzed by Severe Impairment Battery (SIB) and Mini Mental State Examination (MMSE).

Research design: SIB is mainly used to evaluate the cognitive impairment level of patients with cognitive impairment before and after Chinese traditional cultural elements are integrated into animated films. Nine evaluation factors are set in SIB, including attention, visual perception, structure, social communication and so on. The lower the SIB score, the more serious the cognitive impairment of the patient.

Methods: Integrate Chinese traditional cultural elements into animated films as an intervention means, and compare and analyze the SIB score and MMSE score of all animated film viewers before and after the intervention. Using Excel software and SPSS25.0 software for statistical analysis of all evaluation data, with $P < 0.05$ as the standard with statistical significance.

Table 1. Evaluation results of cognitive impairment level of audience before and after the integration of Chinese traditional cultural elements into animated films

Evaluation scale	Before intervention		After intervention		<i>t</i>	<i>P</i>
	Mean scale score	Standard deviation	Mean scale score	Standard deviation		
SIB	59.44	2.13	83.47	2.53	162.470	0.000
MMSE	24.13	1.24	28.05	1.03	54.376	0.000

Results: Table 1 shows the evaluation results of the cognitive impairment level of the audience before and after the integration of Chinese traditional cultural elements into animated films. According to Table 1, before the intervention, the cognitive impairment of the tested audience was relatively serious, and their sib scores and MMSE scores were low. After the intervention, the average scores of the two items were

significantly improved, in which the SIB score increased to more than 63 and the MMSE score increased to more than 27, indicating that the cognitive impairment symptoms of the audience were effectively alleviated.

Conclusions: The integration of Chinese traditional cultural elements into animated films can significantly enhance the script charm of animated films and express the corresponding cultural connotation on the basis of enhancing their visual effect. From the perspective of cognitive impairment, it can effectively improve the audience's SIB score and MMSE score, and significantly improve their cognitive impairment.

CHINA'S PARTICIPATION IN GLOBAL VALUE CHAIN, INNOVATION CHAIN AND COLLABORATIVE UPGRADING OF INDUSTRIAL CHAIN UNDER COGNITIVE IMPAIRMENT

Zhendong Zhu^{1,2}

¹*Business School, Xiangsihu College of Guangxi University for Nationalities, Nanning 530031, China*

²*School of Development Economics, National Institute of Development Administration, Bangkok 10240, Thailand*

Background: As an abnormal manifestation of the brain's advanced intelligent processing process, cognitive impairment has a great influence on patients, mainly including learning impairment, memory impairment, executive dysfunction, visuospatial disorder, agnosia, apraxia and other related symptoms. Patients with early cognitive impairment still have certain social functions, and their main clinical manifestations are memory impairment and intellectual decline. With the continuous deterioration of the disease, the judgment and cognitive ability of patients with cognitive impairment will gradually disappear, showing emotions and behaviors that are difficult for ordinary people to understand, and even completely divorced from society. The cognitive level and severity of cognitive impairment in patients with cognitive impairment are not invariable. Both of them can change under the influence of external factors. Since the reform and opening up, China's socio-economic level and development capacity have continued to improve, from the stage of rapid economic growth to the stage of high-quality economic development. In this context, China has actively participated in the division of labor in the global industrial chain, effectively promoted the adjustment of industrial structure and promoted the transformation and upgrading of industry under the function of maximizing its comparative advantage. At present, China is in the middle of the global value chain. Because the United States still stably occupies the top level of the global value chain and innovation chain, and Germany and Japan occupy the high value-added link of the global value chain under the development mode of "production + innovation", China still has great dependence on the sending country in the process of participating in the global value chain and innovation chain. In the actual development process of China's innovation intensive industries, external related factors will have a certain negative impact on them. For example, major public health emergencies lead to the phenomenon of broken chain and demand at the import and export ends respectively. In order to achieve high-quality economic development, China must effectively adjust and improve the way of participating in and leading economic globalization, mainly through the deployment and optimization of innovation chain around biomedicine, aerospace and other related industries, so as to maximize the advantages of China's super large-scale market potential and complete industrial chain. It will help to realize the double spiral leap between innovation chain and industrial chain, and achieve the purpose of embedding high-quality into global innovation intensive industries. Under the background of China's participation in the collaborative upgrading of global value chain, innovation chain and industrial chain, from the perspective of cognitive impairment, we can more deeply and comprehensively explore the collaborative upgrading of China's participation in global value chain, innovation chain and industrial chain, and explore the improvement of patients with cognitive impairment under the influence of this factor.

Objective: As an active contributor to the global value chain, China needs to optimize the interactive relationship between the innovation chain and the industrial chain on the basis of achieving high-quality economic development, so as to promote the coordinated upgrading of the two. This study will focus on the perspective of cognitive impairment, analyze the impact of China's economic development on the global value chain, dig out the weaknesses and weaknesses of China's economy to achieve high-quality development, and put forward corresponding solutions, in order to achieve the goal of coordinated development of innovation chain and industrial chain. In addition, it is also necessary to explore the effect

of China's participation in the coordinated upgrading of global value chain, innovation chain and industrial chain on the relief of symptoms of patients with cognitive impairment.

Research objects and methods: Select 380 people with cognitive impairment as the research object, through data research and K-means clustering algorithm, explore effective measures to promote China's participation in the global value chain, innovation chain and industrial chain collaborative upgrading, and explore the improvement of symptoms of patients with cognitive impairment.

Research design: The main content of the research is divided into two aspects. On the one hand, it refers to the influence of collaborative upgrading promotion measures of innovation chain and industrial chain from the perspective of cognitive impairment, expressed by 1-5 respectively. The greater the number, the stronger the influence. On the other hand, it refers to the recovery of various cognitive functions of patients with cognitive impairment. The evaluation results of patients with cognitive impairment were analyzed by Clinical Global Impression (CGI). CGI mainly includes three evaluation items: severity of illness (SI), general evaluation of curative effect and curative effect index. Here we mainly explore the severity of illness. Using the 8-level scoring method, 0-7 respectively represent the different levels of cognitive impairment symptoms from mild to severe.

Methods: Using Excel and SPSS22.0 collect, calculate and analyze the results obtained from the questionnaire survey.

Results: The research results show that from the perspective of cognitive impairment, the influence of the four measures to promote the collaborative upgrading of innovation chain and industrial chain is different, as shown in Figure 1. In Figure 1, A, B, C and D represent four promotion measures, namely, optimizing fiscal policy, building an embedded pattern of internal and external innovation chains and productivity, promoting a high degree of integration and optimization of regional value chains, and promoting the coordinated development of leading enterprises and small and medium-sized enterprises. C has the lowest influence, only 3. The influence level of the two promotion measures a and B is in the middle, and their influence is 4, D has the greatest influence.

Figure 1. Influence of promotion measures for collaborative upgrading of innovation chain and industrial chain under cognitive impairment

Table 1. Symptom improvement of patients with cognitive impairment under the background of China's participation in the coordinated upgrading of global value chain, innovation chain and industrial chain

SI score	Symptom severity	Before collaborative upgrade	After collaborative upgrade
0	Disease free	1	34
1	Basically disease-free	4	57
2	Extremely light	13	92
3	Light	33	115
4	Moderate	146	43
5	Lay particular stress on	138	39
6	Severe	40	0
7	Extremely heavy	5	0

Table 1 shows the symptom improvement of patients with cognitive impairment before and after the collaborative upgrading of innovation chain and industrial chain. Compared with before the upgrading, the severity of patients with cognitive impairment after the collaborative upgrading has been significantly alleviated, the number of patients with severe and extremely severe cognitive impairment has decreased to

0, and a large number of patients with cognitive impairment have been evaluated as disease-free, basically disease-free and very mild.

Conclusions: Under the background of China's participation in the coordinated upgrading of global value chain, innovation chain and industrial chain, the severity of symptoms of patients with cognitive impairment can be effectively alleviated and improved, and even some patients can completely eliminate cognitive impairment.

EMPIRICAL RESEARCH AND OPENING STRATEGY OF INTERNATIONAL COMPARISON OF CHINA'S SECURITIES MARKET FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Xue Li

Department of Accounting and Finance, Inner Mongolia Business & Trade Vocational College, Hohhot 010070, China

Background: Cognitive impairment is a loss of cognitive function caused by many factors, mainly manifested in learning impairment, memory impairment, aphasia and other symptoms. In the trading process of the securities market, there are certain financial risks and loss probability. Investors are very likely to produce negative psychological emotions under the negative impact of a large loss of investment amount, resulting in the loss of different types of cognitive function and cognitive impairment. As the core supporting point of market economy, stock exchange plays an important role in the development of market economy. The efficiency and stability of its operation play a decisive role in the sustainable and healthy development of market economy. The role of the stock exchange is not only to provide a safe and convenient place for the smooth circulation of securities, but also has other diversified functions, including price discovery, fund disclosure, fund raising, resource allocation and so on. With the global stock exchanges interconnected, the listing and trading of major securities exchanges have formed a severe competitive trend. For a country, the relative competitiveness of the securities market is extremely important, affecting the operation efficiency of the securities market and symbolizing the country's international status. The competitiveness of China's securities market in international comparison needs to be analyzed from the perspective of listed companies and investors. From the perspective of listed companies, it is found that when companies in Europe choose stock exchanges for listing, they prefer stock exchanges with stronger protection of investors' rights, better liquidity, higher efficiency and larger scale, and stock exchanges with strict accounting rules will be excluded. From the perspective of investors, data envelopment analysis is used to compare and rank the top 45 stock exchanges in the world. It is found that the stock exchanges in New York and Hong Kong have strong listing competitiveness and trading competitive advantages. Even the ranking of Indian stock exchange is also ahead of Shanghai Stock Exchange and Shenzhen Stock Exchange. It can be seen that the financial supervision of the capital market can have a positive impact on the listing competitiveness of the stock exchange to a certain extent. From the perspective of investors with cognitive impairment, exploring the empirical research and opening strategy of international comparison of China's securities market will help to promote the steady development of China's securities market and eliminate the cognitive impairment of investors.

Objective: At present, there are few international comparative studies on the competitiveness of stock exchanges, mainly because the A-share market itself and its comparison with H-shares consume a lot of time and energy. The continuous downturn of the market competitiveness of the stock exchange may lead to varying degrees of cognitive impairment for investors. This research will study the international comparison of China's securities market from the perspective of cognitive impairment. Based on the perspective of psychology and relevant theories, this research will explore the empirical data and opening strategies of international comparison of securities market, in order to eliminate the cognitive impairment of investors and promote the steady development of China's securities market.

Research objects and methods: 120 stock exchange investors with cognitive impairment were selected for the study, and the degree of cognitive impairment of 120 investors was evaluated by Mini-Mental State Examination (MMSE) and Mental Health (MH) of SF-36.

Research design: 120 investors with cognitive impairment were given an empirical analysis based on cognitive psychology. The intervention time was set at 4 months. Before and after the intervention, relevant survey data were collected to compare and analyze the improvement of cognitive impairment and the change of investment return of investors before and after the intervention.

Methods: Excel software and SPSS24.0 software, as the main data analysis tool, completes the statistics and analysis of relevant data.

Results: Before the intervention, the MMSE score of investors in stock exchanges was low, maintained at about 15.01. After the intervention, the MMSE score increased to about 25.03. The comparison results of MMSE scores before and after intervention showed that the difference was statistically significant ($P < 0.05$). See Figure 1 for details.

Figure 1. Comparison of MMSE scores of investors in stock exchanges before and after intervention

Conclusions: From the perspective of cognitive impairment, the empirical research and opening-up strategy of international comparison of China's securities market based on cognitive psychology has a good application effect, which can significantly improve investors' MMSE score and effectively eliminate investors' cognitive impairment. The opening strategy of international comparison of China's securities market from the perspective of cognitive impairment proposed by this study can enable investors to always maintain a high level of mental health and make reasonable investment judgments and decisions in the investment process.

PROTECTION TOURISM DEVELOPMENT OF INTANGIBLE CULTURAL HERITAGE UNDER THE TOURISM EXPERIENCE OF COGNITIVE IMPAIRMENT

Xiaojing Liu

Business School, Xuchang University, Xuchang 461000, China

Background: Cognitive impairment is a mental health disorder that has a negative impact on various cognitive abilities. It will lead to the impairment of individual basic cognitive function, which is mainly externalized into executive dysfunction, learning and memory impairment, sensory motor function limitation, complex attention decline, aphasia and agnosia. The memory ability and language ability of patients with cognitive impairment will be significantly reduced, accompanied by abnormal emotion or behavior, which is difficult to carry out normal social, work and life. Patients with cognitive impairment will show some functional impairment or decreased ability in all aspects, and even have great difficulty in leisure activities such as tourism experience. The intangible cultural heritage protection tourism development of tourism experience has great attraction and influence on normal tourists, and its influence on tourists with cognitive impairment is unknown. Intangible cultural heritage is a kind of precious cultural heritage. Its transmission mode is oral and heart-to-heart instruction from generation to generation. It is not only a single cultural heritage, but also a symbol of the cohesion and continuation of the spirit of all nations in the world. At present, most scholars believe that intangible cultural heritage has the basic characteristics of uniqueness, historicity, inheritance, nationality, regionality, intangibility and diversity. In addition, intangible cultural heritage should also have the characteristics of popularity and vulnerability. The popularity is reflected in the strong local flavor and popular color covered in the intangible cultural heritage. This is because the intangible cultural heritage is mainly produced and continuously spread among the people. Under the adaptation and innovation of folk artists in previous dynasties, it has been recognized by the public and inherited. Vulnerability is mainly reflected in the fact that intangible cultural heritage is very vulnerable to change and destruction. Due to the particularity of Intangible Cultural Heritage

Inheritance, it will be irreparable once it is destroyed. Therefore, intangible cultural heritage is often faced with the risk of extinction, which is also one of the manifestations of its vulnerability. Based on this, it is very important to develop the protective tourism of intangible cultural heritage.

There are some differences between tourism experience and traditional tourism model. The former focuses more on the physical and mental feelings of the noumenon, which is the embodiment of the internal spiritual pursuit. Tourism experience is a kind of value experience of certain significance to individuals or society. It is the result of the active participation of tourism subjects and the interaction with tourism objects. Tourism development under cognitive impairment can explore more diversified tourism experience from the perspective of cognitive psychology. On the basis of realizing the protective tourism development of intangible cultural heritage, we can also explore its impact on tourists with cognitive impairment.

Objective: Tourism experience is a way to compensate for physical and mental deficiency, which can make individuals establish contact when they travel with the external world, watch and imitate, so as to improve their psychological level and adjust their psychological structure. Explore the development model of intangible cultural heritage conservation tourism under the cognitive barrier of tourism experience, in order to dig out the best measures to study and protect intangible cultural heritage, and improve the cognitive impairment of tourists.

Research objects and methods: 108 tourists with cognitive impairment were randomly selected on the tourism website as the research object, and four tourism experience modes were constructed from the perspective of cognitive psychology, so that all subjects could choose and evaluate them. According to the evaluation results, we can analyze the attitudes of tourists with cognitive impairment towards different tourism experience modes and the changes of their own cognitive impairment symptoms.

Research design: From the perspective of cognitive impairment, the tourism experience model is divided into four types: compensatory tourism experience, reclusive tourism experience, extreme tourism experience and cognitive tourism experience. Using ant colony classification algorithm, count and analyze the number and proportion of various tourism experience choices.

Methods: Using Excel and SPSS24.0 to collect data and calculate the number of people who choose different tourism experience modes.

Results: Different tourism experience models have different characteristics of cognitive impairment, of which 41 and 37 choose extreme tourism experience and reclusive tourism experience respectively, which shows that most tourists with cognitive impairment have a good desire to escape from the secular world and return to nature.

Table 1. Description of different tourism experience modes and tourist selection

Different tourism experience modes	Specify	Select number of people	Proportion (%)
Compensatory tourism experience	Physical and psychological deprivation	5	0.05
Reclusive tourism experience	Escape from the real world of daily life	37	0.34
Extreme tourism experience	The pursuit of individualized contact	41	0.38
Cognitive tourism experience	Get to know the unknown world	25	0.23

Conclusions: The intangible cultural heritage protection tourism under the cognitive impairment can eliminate the cognitive impairment of tourists to a certain extent and restore them to the normal level of mental health. Under the positive influence of different tourism experience modes, they devote themselves to the research and protection of intangible cultural heritage in the process of tourism.

PSYCHOLOGICAL METHODS AND THEIR APPLICATION IN THE IDEOLOGICAL AND POLITICAL WORK OF EMPLOYEES IN STATE-OWNED ENTERPRISES

Dejie Ma & Huilan Jing

School of Marxism, Dalian University of Technology, Dalian 116024, China

Background: In the process of sustainable development and improvement of socialist market economy,

social competition is becoming more and more fierce, the process of state-owned enterprise system reform is also advancing, the economic benefits of state-owned enterprises have been greatly improved, and their asset scale has been innovated and expanded. In this context, the ideological and political work in state-owned enterprises should also carry out long-term and lasting reform and development. By strengthening the development of ideological and political work in state-owned enterprises and improving the management mechanism of ideological and political work, we should improve the effectiveness of employee management in state-owned enterprises, so as to improve the professional quality and moral level of employees in state-owned enterprises. Finally realize the establishment of excellent corporate culture of state-owned enterprises. In the actual process of the ideological and political work of employees in state-owned enterprises, the ideological and political educators in state-owned enterprises bear the important task of improving the overall quality of employees. To ensure the smooth development of ideological and political work to state-owned enterprises, which is the prerequisite for the stable development of state-owned enterprises. Some leaders of state-owned enterprises insist on the supremacy of interests and believe that the ideological and political work of employees is far less important than economic development. Therefore, it will usually promote the ideological and political work to give way to the production and operation of enterprises. The lack of ideological and political work of employees in state-owned enterprises is not conducive to the daily operation and sustainable development of enterprises. Based on this, we must deeply explore the problems existing in the current ideological and political work of state-owned enterprises, put forward corresponding solutions to the problems, and optimize the ideological and political construction scheme of enterprises. Moreover, the way of carrying out the ideological and political work of employees in state-owned enterprises also needs to be improved and optimized. The traditional ideological and political work has problems such as marginalization, singleness and lack of innovation, which makes it difficult for the ideological and political work of employees in state-owned enterprises to achieve remarkable results. The essence of ideological and political work of employees in state-owned enterprises is ideological and political education, so it is feasible to apply appropriate psychological methods in it. In the process of carrying out their daily work, employees of state-owned enterprises are faced with external diversified influencing factors, including social ideological trend, competitive employment system, social structure reform, etc., which leads to the ideological characteristics of employees of state-owned enterprises showing strong profit seeking, competitiveness and confusion. Based on the perspective of psychology, this paper observes the psychological changes and causes of employees in state-owned enterprises, and can take some targeted measures to ensure the effectiveness of ideological and political work of employees in state-owned enterprises.

Objective: In the reform of state-owned enterprises, many deep-seated relations and problems need to be adjusted to fully realize the reform of the system. As the spiritual driving force of enterprise development, the ideological and political education of employees in state-owned enterprises involves many problems such as interests, responsibilities and rights in the system reform of state-owned enterprises. In order to reasonably coordinate the relations among various parties and achieve the purpose of promoting the smooth development of the reform of state-owned enterprises, we must start with the ideological and political work. In the ideological and political work of employees in state-owned enterprises, it is necessary to adopt appropriate psychological methods and combine relevant systems to correctly guide, educate and motivate employees, cultivate employees' professional sentiment of loving their posts, dedication and pioneering spirit, and then help state-owned enterprises develop healthily under the mutual promotion of spiritual and material strength. It highlights the importance and necessity of ideological and political work.

Research objects and methods: 26 employees of state-owned enterprises were randomly selected from three state-owned enterprises, a total of 78. Analyze the performance of all employees during the intervention period, and give them ideological and political education from the perspective of psychology.

Research design: From the perspective of psychology, the traditional ideological and political education was improved and optimized, and then 78 employees of state-owned enterprises were educated from the perspective of psychology. At different time points before and after the intervention experiment, the employees were asked to evaluate their satisfaction with the ideological and political education.

Methods: The satisfaction of state-owned enterprise employees with different ideological and political education work was divided into three levels: dissatisfaction, general and satisfaction. Excel software and SPSS22.0 were used for statistics and analysis.

Results: After the intervention, the satisfaction evaluation results shown in Table 1 were obtained. According to Table 1, there are only 4 dissatisfied employees of state-owned enterprises, accounting for 5.13%. The proportion of employees who choose general and satisfied employees is 62.82% and 32.05% respectively, which is much greater than the former. The results of satisfaction evaluation show that the ideological and political work from the perspective of psychology has a good educational effect.

Table 1. Evaluation results of state-owned enterprise employees' satisfaction with ideological and political education [n (%)]

Degree of satisfaction	Dissatisfied (%)	Commonly (%)	Satisfied (%)
Before intervention	19 (24.36)	25 (32.05)	34 (43.59)
After intervention	4 (5.13)	49 (62.82)	25 (32.05)

Conclusions: The ideological and political education work provides the reform power and development path for state-owned enterprises. It is very important to pay attention to the development of the ideological and political work of the employees of state-owned enterprises. The integration of psychological theory into the ideological and political work can significantly improve the satisfaction and professional quality of the employees and ensure the effectiveness of the ideological and political work.

ON THE PROMOTING EFFECT OF COLLEGE PHYSICAL EDUCATION REFORM ON STUDENTS' MENTAL HEALTH FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Jiquan Ma

Sports Institute, Chengdu University of Technology, Chengdu 610059, China

Background: Educational psychology is one of the applied disciplines of psychology, and it is also an interdisciplinary discipline of psychology and pedagogy. Therefore, educational psychology has both the academic theoretical characteristics and practical application characteristics of psychology and pedagogy. The main research contents of educational psychology include human learning in educational context, the effect of educational intervention, teaching psychology, and the social psychology of school organization. The core idea of educational psychology is to apply the theory or research results of psychology to education. Educational psychology has a wide range of applications, including curriculum design, improvement of teaching methods, promotion of learning motivation and so on. It can even help students face various difficulties and challenges in the process of growth. Under the guidance of scientific teaching theory, educational psychology can study and discuss the basic laws and the interaction between teachers and students in the teaching process, which is helpful to improve the teaching quality and teaching effect, and play a significant role in the smooth development of teaching work. In diversified teaching scenarios, educational psychology can have different positive effects, and even speed up the reform and optimization of related courses. The current teaching mode and effect of physical education in colleges and universities are not optimistic, mainly in two aspects: students and teachers. At the level of students, it is mainly reflected in the unclear motivation of physical education learning, the difficulty of correctly choosing physical education learning items, the weak awareness of independent physical exercise and the lack of interest in physical education learning. At the level of teachers, there are two problems: the lack of rationality of physical education teaching methods and incomplete teaching equipment. From the perspective of educational psychology, a series of reforms on college physical education teaching can find the most appropriate physical education teaching mode from the perspective of students' psychology, so as to improve students' sports enthusiasm and enhance students' physical quality.

Objective: Physical education in colleges and universities is of great significance to comprehensively implement quality education and further promote the growth of students. From the perspective of educational psychology, college physical education teaching needs to undertake the important tasks of improving students' physical and mental health, helping students form good habits, guiding students to establish rule awareness and driving students to practice social morality. However, in the current process of college physical education, there are still many problems to be improved, including lack of teaching resources, lack of students' interest and so on. From the perspective of educational psychology, colleges and universities should continue to strengthen theoretical teaching, highlight the social value of teaching, pay attention to students' psychological needs by constructing a multi-dimensional resource system and reforming students' evaluation mechanism, so as to provide strong support for the reform and practice of college physical education teaching.

Research objects and methods: 322 non physical education majors in colleges and universities were randomly selected as the research object to receive targeted physical education teaching training from the perspective of educational psychology, and to explore their psychological and behavioral performance in the

process of physical education teaching.

Research design: At different time nodes before and after sports intervention, through the corresponding physical test and psychological test, obtain the corresponding data evaluation results, so as to complete the comparative analysis of the changes of college students' mental health and physical quality. Mental health mainly refers to the recognition of physical education, which is the same as the evaluation of physical quality. It is expressed at different levels from 1 to 5. The higher the number, the higher the recognition and the better the physical quality.

Methods: Before and after the exercise experiment, the psychological and physical quality data of college students were collected and analyzed by Excel and SPSS24.0.

Results: The evaluation results of college students' mental health and physical quality data before and after intervention are shown in Table 1. It can be seen from Table 1 that compared with before the intervention, the two index values of college students after the intervention showed a significant increase, indicating that the tested college students had a higher evaluation of physical education reform. After the targeted physical education training from the perspective of educational psychology, the physical quality of the tested college students has also been significantly improved.

Table 1. Evaluation of sports recognition and physical quality of college students

Recognition of physical education teaching		Physical fitness evaluation	
Before intervention	After intervention	Before intervention	After intervention
1	1	1	1
1	4	1	3

Conclusions: Targeted physical education teaching and training from the perspective of educational psychology can bring students' independent will into the teaching planning, effectively improve students' Sports initiative and interest in physical education learning, and finally successfully realize the reform and practice of physical education teaching in colleges and universities.

* * * * *

ON THE FIT AND EFFECTIVE INTEGRATION OF AESTHETIC EDUCATION AND IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaomin Wang

School of Media, Harbin Normal University, Harbin 150080, China

Background: Educational psychology is the product of the combination of educational activities and psychology. It is a science to explore the psychological law of middle school and teaching in the process of education. So far, educational psychology, as a science, has only a hundred years of history and is still a very young science. Educational psychology is a social psychology that studies human learning, the effect of educational intervention, teaching psychology and school organization under the educational situation. The focus of educational psychology is to apply the theory or research results of psychology to education. Educational psychology can be used to design courses, improve teaching methods, promote learning motivation, and help students face various difficulties and challenges in the process of growth. At the same time, the field of educational psychology is about the memory research of human learning process, cognitive process and individual differences (through cognitive psychology). The main task of this study is to reveal the basic psychological laws of students' learning and teachers' teaching, and use these laws to effectively promote students' learning. Students' learning is not only restricted by internal psychological factors such as their own learning ability, learning motivation and learning strategies, but also restricted by various external factors such as family, school, teaching materials and teachers' teaching. Educational psychology should study the psychological mechanism and law of these factors affecting learning. Specifically, educational psychology includes three aspects: first, the characteristics of educators. Educational psychology first needs to understand the characteristics of the executors of the educational process, that is, teachers, and the impact of these characteristics on the teaching process. Every educator has his own set of teaching ideas and methods, and the personality characteristics of educators will also affect the educational process. Second, the characteristics of educational objects. As the object of education, educators must understand the individual characteristics of the object of education and its

learning motivation, learning ability and learning habits. Only in this way can education be targeted and play a full role. Third, educational methods. The influence of different educational methods on different subjects and different teaching contents, and how educators cooperate with teaching methods to achieve good teaching results are also the research content of educational psychology.

Ideological and political courses and aesthetic education courses in colleges and universities are the key path and main position of modern college students' education, and the main channel to help higher vocational students establish correct three views. The teaching of college students' ideological and political course and aesthetic education course includes the content and requirements of mental health teaching. Basic courses also have relevant requirements for mental health teaching. Education should follow the law of internal acceptance of higher vocational students. It can be said that college students' healthy, positive and positive psychological state is the basis of good ideological and political morality and beautiful aesthetic education concept. Educational psychology is mainly committed to exploring people's internal happiness, optimism, gratitude, happiness and other positive and excellent qualities, advocating the appreciation of people's positive energy, and paying attention to people's survival and development and the perfect realization of life value. The idea of educational psychology runs through the whole process of the fit and effective integration of aesthetic education and ideological and political education in colleges and universities, creates a warm educational atmosphere, actively pays attention to the internal development needs of modern college students, and explores their own virtue and quality, which is conducive to guiding college students to improve their virtue and beauty, and then fully ensure the comprehensive and all-round development of modern college students.

Objective: This paper constructs a psychological intervention model based on the integration of aesthetic education and ideological and political education in colleges and universities, which aims to improve the positive personality of college students, so as to ensure the physical and mental health and all-round development of college students.

Research objects and methods: 600 college students were selected as the research objects and divided into three groups: pure aesthetic education group (200), pure ideological and political education group (200), and aesthetic education and ideological and political integration education group (200). The intervention lasted for 1 month. Then combined with the positive personality scale, the students' positive personality is measured. The scale has 88 items, including 24 dimensions. The higher the score, the more stable the corresponding positive personality is. Finally, the changes of positive personality of the three groups of students are analyzed and compared.

Methods: All data were statistically processed by SPSS22.0.

Table 1. Changes of positive personality of college students in the three groups after one month of intervention (n=600)

Dimensions of college students' positive personality	Pure aesthetic education group (n=200)	Simple ideological and political education group (n=200)	Aesthetic education + ideological and political group (n=200)
Creativity	3.34±0.76	3.78±0.69	5.12±0.77*#
Curiosity	3.65±0.81	3.15±0.67	6.38±0.77*#
Judgment	3.78±0.66	3.03±0.61	6.51±0.84*#
Studious	3.78±0.69	3.06±0.79	6.72±0.71*#
Insight	3.15±0.67	3.34±0.76	6.01±0.62*#
Brave	3.03±0.61	3.65±0.81	6.59±0.63*#
Insist	3.06±0.79	3.78±0.66	5.97±0.67*#
Sincere	3.34±0.76	3.78±0.69	5.12±0.77*#
Enthusiasm	3.65±0.81	3.15±0.67	6.38±0.77*#
Love	3.78±0.66	3.03±0.61	6.51±0.84*#
Kindhearted	4.00±0.59	3.06±0.79	6.72±0.71*#
Intelligence	3.09±0.65	3.34±0.76	5.95±0.70*#
Team	3.09±3.60	3.65±0.81	4.28±0.64*#
Fair	3.66±0.74	3.78±0.66	6.39±0.67*#
Leadership	3.56±0.68	4.00±0.59	6.97±0.64*#
Tolerant	3.77±0.73	3.09±0.65	5.97±0.67*#
Modest	3.78±0.69	3.09±3.60	5.12±0.77*#
Cautious	3.34±0.76	3.66±0.74	6.38±0.77*#

Autonomy	3.65±0.81	3.56±0.68	5.12±0.77*#
Appreciate	3.78±0.66	3.77±0.73	6.38±0.77*#
Gratitude	3.78±0.69	3.78±0.69	6.51±0.84*#
Hope	3.15±0.67	3.15±0.67	6.72±0.71*#
Humor	3.03±0.61	3.03±0.61	6.01±0.62*#
Faith	3.06±0.79	4.00±0.59	6.59±0.63*#

Note: * $P < 0.05$ compared with the pure aesthetic education group, # $P < 0.05$ compared with the pure ideological and political education group.

Results: Table 1 shows the changes of positive personality of college students in the three groups after one month of intervention. It can be seen from Table 1 that the students in the aesthetic education and ideological and political integration education group scored the highest in all dimensions of positive personality, with statistical difference ($P < 0.05$).

Conclusions: The effective integration teaching mode of aesthetic education and ideological and political education in colleges and universities based on educational psychology not only has a high degree of consistency, but also can fully improve the positive personality, and then has important value for the psychological development of students, which is worth popularizing and applying in the practice of teaching reform in colleges and universities.

ANALYSIS OF INNOVATIVE TEACHING REFORM IN COLLEGE FINANCIAL ACCOUNTING EDUCATION UNDER COGNITIVE IMPAIRMENT

Chunhui Yang

School of International Education, Guangxi University of Finance and Economics, Nanning 530007, China

Background: As a psychological disease, cognitive impairment develops from the perspective of psychological disease. In essence, cognitive impairment can be attributed to a kind of neurocognitive impairment, which is mainly manifested in many levels of psychological disorders, such as thinking, perception, memory, learning and so on. In the field of medicine, cognitive impairment mainly includes six kinds: social cognition, complex attention, language, perceptual motor function, learning and memory, and executive function. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further deterioration of cognitive ability. Patients are characterized by large emotional fluctuations, paranoia, anxiety, reduced ability of understanding and language expression, and reduced resolution of objective things such as time. Severe cognitive impairment developed further from moderate cognition. Patients show a decline in overall function and develop dementia, which will lead to delusion, indifference, lack of self-care ability and so on. This disease can be divided into congenital and postnatal. The main congenital factor is autism, such as growth retardation. Acquired factors mainly include HIV, prion disease, Parkinson’s disease, traumatic brain injury, Alzheimer’s disease and so on. According to the different types of psychological cognitive impairment, it can be divided into three types: mental disorder, mild neurocognitive impairment and severe neurocognitive impairment. However, as a mental disease, cognitive impairment does not have more significant external manifestations than the traditional psychological, emotional, behavioral and physical disorders. On the contrary, cognitive impairment is the concept of maladaptation caused by maladaptive cognition, and its clinical manifestations are more recessive. Moreover, because the function of the brain is complex, different types of cognitive impairment are interrelated, that is, cognitive problems in one aspect may lead to cognitive abnormalities in another or more aspects (for example, if the patient has defects in attention and memory, there will be obstacles to solving the problem). Therefore, cognitive impairment is one of the most difficult problems in the diagnosis and treatment of brain diseases. For patients with cognitive impairment with obvious mental and neurological symptoms, such as depression, anxiety and sleep disorders, symptomatic treatment can be carried out according to their condition. In

addition, according to the etiology and pathogenesis of cognitive impairment, different neuroprotective agents can be used, such as brain circulation improvers, energy metabolism activators, neurotransmitters and nerve growth factor protectors, calcium antagonists, glutamate receptor antagonists, antioxidants, glial cell regulators and non-steroidal anti-inflammatory agents. It is widely used to treat cognitive impairment caused by different diseases. In short, there is no unified diagnosis and treatment plan and method for patients with cognitive impairment at this stage. We should actively explore new ideas and directions for the treatment of patients with cognitive impairment.

At the same time, cognitive impairment also brings many challenges to the professional education of financial accounting in colleges and universities. It is mainly manifested in that students are difficult to learn activities due to their own cognitive impairment, and directly affect students' mental state and academic performance. In view of the negative impact of cognitive impairment on the learning of college students majoring in financial accounting, we should pay enough attention to it and take targeted solutions in the specific teaching practice of college financial accounting. For students with cognitive impairment, build an innovative teaching reform system to help students explore their way of thinking and problem-solving skills, so that students can correctly understand their own problems, and fundamentally grasp the relationship between the learning of financial accounting courses and their own psychological development, so as to reverse students' cognitive impairment by solving students' cognitive style. At the same time, ensure the innovative development of financial accounting education in colleges and universities.

Objective: This paper constructs a teaching model of innovative reform of accounting major in colleges and universities based on psychological intervention, which aims to help students form correct cognitive concepts by alleviating the cognitive obstacles of students majoring in financial accounting, so as to realize self-worth and social value.

Research objects and methods: 200 college students majoring in financial accounting were selected as the research object and divided into control group and experimental group, with 100 students in each group. The measurement of students' cognitive impairment is carried out in combination with Montreal Cognitive Assessment scale (MoCA). The scale includes 7 factors. The higher the score, the better the cognitive function. The students in the control group took the traditional education mode of financial accounting specialty, while the experimental group took the teaching mode of innovative reform of accounting specialty in colleges and universities based on psychological intervention. After the intervention for three months, the improvement of cognitive impairment of the two groups of students was compared.

Methods: Use Excel software to complete data analysis.

Results: Table 1 shows the improvement of cognitive impairment of the two groups of students after 3 months. It can be seen from Table 1 that compared with the control group, the experimental group of innovative and reformed teaching mode of accounting specialty in colleges and universities based on psychological intervention has a better effect on improving the psychological cognitive impairment of accounting students, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. Improvement of cognitive impairment of students in the two groups after march ($n=200$)

Factor	Control group ($n=100$)	Experience group ($n=100$)	<i>P</i>
Executive ability	2.47±0.43	4.66±0.61	0.00
Naming ability	2.54±0.55	4.52±0.60	0.00
Attention	2.36±0.41	4.39±0.43	0.00
Language ability	2.69±0.59	4.45±0.56	0.00
Abstract ability	2.47±0.43	4.66±0.61	0.00
Delayed recall	2.54±0.55	4.52±0.60	0.00
Orientation ability	2.36±0.41	4.39±0.43	0.00

Conclusions: The innovative teaching mode of accounting specialty in colleges and universities based on psychological intervention can significantly improve the cognitive impairment of accounting students, and then has important value and significance for students to form correct cognitive concepts.

ON THE CULTIVATION PATH OF RUSSIAN TO STUDENTS' LANGUAGE COGNITIVE IMPAIRMENT AND COMMUNICATION ABILITY

Mengyuan Liu

School of International Education (Department of Foreign Language Teaching), Yellow River Conservancy Technical Institute, Kaifeng 475000, China

Background: Cognitive impairment is developed from the perspective of psychological diseases. As a neurological cognitive impairment disease, in order to better understand cognitive impairment diseases, it is necessary to deepen the understanding of cognitive impairment from the perspective of cognitive type classification. Specifically, cognitive impairment includes two main types: perceptual cognitive impairment and thinking cognitive impairment. For perceptual cognitive impairment, it needs to be clear that perception belongs to the category of human perceptual cognition, which corresponds to the surface understanding of things. When people have perceptual cognitive impairment, they usually cannot understand the surface laws of things, and directly lead to doubts and fears about the common-sense world, which is reflected in the physiological level: the sensory threshold of the body is reduced, and they are extremely sensitive to their own breathing, blood pressure, heartbeat, gastrointestinal peristalsis, posture and posture. At the same time, they are highly sensitive to environmental stimuli, especially those regarded as threats by patients. In short, perceptual cognitive impairment only needs to trigger psychosomatic response according to the individual characteristics of its external image, without more contact with the thing itself. For thinking cognitive impairment, it needs to be clear that compared with perceptual cognition, thinking belongs to higher-level cognitive activities, including basic cognitive processes such as analysis, synthesis and comparison of things. Patients with thinking cognitive impairment can self-confirm that they have cognitive impairment because they have a stable conceptual basis. However, the negative effect is that patients will form a strong subjective bias because of their own concept cognition, resulting in patients falling into self-panic. Once there is a little physiological or psychological reaction, they will deny their treatment effect and think that their old disease is complex. In short, patients with thinking cognitive impairment often do not have a “sense of normality”, and always think that they are in the disease, which brings huge mental pressure to themselves, and brings great challenges to clinical treatment.

Language cognitive impairment is a typical manifestation of thinking cognitive impairment, which is mainly manifested in the lack of self-organization ability, the defect of language expression ability, the decline of communication ability, and has an important impact on the quality of life of patients. Relevant studies have pointed out that the main characteristics of Russian pronunciation include pronunciation, intonation, stress and rhythm, which makes Russian spelling simple, catchy, clear, smooth and powerful. When learners make progress in reading aloud and feel that they are reading correctly, they will have a sense of beauty, which plays an important role in enlightening people’s mood and soul. In view of this, this study designed a treatment model of language cognitive impairment based on Russian training, in order to alleviate the language communication disorder of cognitive impairment patients through Russian learning training, and then provide a perspective or a strategy for clinical treatment of cognitive impairment diseases.

Objective: Analyze the problems of language communication ability of patients with cognitive impairment, and design the treatment mode of language cognitive impairment based on Russian training, so as to help patients with language cognitive impairment build a good cognitive style and communication style, so that patients with language cognitive impairment can get rid of communication problems and have a normal dialogue with themselves, others and even society.

Research objects and methods: 100 patients with language cognitive impairment were selected as the research object and intervened in the treatment mode of language cognitive impairment under Russian training. The intervention period was 6 months. The scale has five factors: comprehensive verbal communication ability, oral reception function, oral expression function, written language reception function and written language expression function. The higher the score, the lower the symptoms of patients with language cognitive impairment.

Methods: All data were statistically processed by SPSS22.0.

Results: Table 1 shows the actual effect of the treatment mode of language cognitive impairment under Russian training after 6 months of intervention. On the whole, after the intervention of the treatment mode of language cognitive impairment under Russian training, the symptoms of patients with language cognitive impairment were significantly improved ($P < 0.05$).

Conclusions: The treatment mode of language cognitive impairment based on Russian training can effectively alleviate the language communication obstacles of patients, and then ensure that patients with language impairment can have normal dialogue with themselves, others and even society.

Table 1. The actual effect of the treatment mode of language cognitive impairment under Russian training after 6 months of intervention

Category	Before	After 3 months	After 6 months	P
Comprehensive verbal communication ability	1.39±0.43	2.75±0.61	4.38±0.47	0.00
Oral receiving function	1.45±0.56	2.69±0.59	4.64±0.59	0.00
Oral expression function	1.25±0.43	2.47±0.43	4.75±0.61	0.00
Written language receiving function	1.43±0.57	2.54±0.55	4.69±0.59	0.00
Written language expression function	1.28±0.43	2.36±0.41	4.47±0.43	0.00

COORDINATED DEVELOPMENT OF COLLEGE STUDENTS' PARTY AFFAIRS CONSTRUCTION AND IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Ruizhe Wang

School of Civil Engineering and Geomatics, Southwest Petroleum University, Chengdu 610500, China

Background: Educational psychology originated from the western classical naturalistic educational thought, which was formally put forward by Pestalozzi. He explored the relationship between human mental nature and educational activities, combined the educational process with the psychological activities of learning and communication, and made educational activities psychological from the law of human nature. Pestalozzi believes that we should pay attention to the change law of psychological activities of educational subjects in educational activities, understand the development mechanism of students' learning psychology, so as to carry out educational activities selectively, and adjust the teaching details such as the development method, teaching content and teaching principles of teaching activities accordingly. Under the guidance of educational psychology theory, the reform of ideological and political education teaching activities in colleges and universities can promote the coordinated development of party affairs construction and ideological and political education of college students, effectively utilize psychological elements, tap students' internal learning potential, and promote students' all-round development in psychological health and study.

The theoretical core of educational psychology has multiple consistency with the fundamental goal of ideological and political education in colleges and universities. Educational psychology and ideological and political education take the internal psychological needs of college students as the starting point and foothold, and emphasize the dominant position and role of students in teaching activities. And educational psychology and ideological and political education are based on students' psychological development path, from the perspective of psychology, committed to promoting students' all-round development. In terms of function, educational psychology and ideological and political education both emphasize the positive guiding role of teachers in the teaching process, and believe that teachers should be guided by students' psychological demands and value needs, and take students' psychological characteristics as the index of educational guidance. Therefore, carrying out the ideological and political education of college students under the guidance of educational psychology can promote the correct establishment of college students' outlook on life, world outlook and values, and lead the ideological concept of college students to develop in a correct and positive direction. College students are also the main body of party affairs construction. The party affairs construction of colleges and universities needs to take the characteristics of students as the starting point and foothold, organize and carry out ideological education activities related to party affairs, screen activists to join the party in a planned way, improve the ideological and political quality of the whole teachers and students, and strengthen the in-depth understanding of the party by all teachers and students. Under the guidance of educational psychology, adjusting and reforming the ideological and political education curriculum in colleges and universities and realizing the coordinated development with the party affairs construction can effectively promote the progress and development of students' ideas and avoid college students shaking their position due to external impact.

Objective: Integrate the theory of educational psychology into the ideological and political education in colleges and universities, establish a new educational model for the coordinated development of college students' Party affairs construction and ideological and political education, help colleges and universities improve the ideological and political height of talent training, and send a group of high-quality talents for

the development of the party's cause and the prosperity and progress of the country. Organically integrate the ideological and political education of college students with the construction of party affairs, promote the improvement of the quality of ideological and political education, and guide college students to develop positive life values and ideological character.

Research design: Aiming at the coordinated development of college students' party affairs construction and ideological and political education, based on the theory of educational psychology, deepen the application of educational psychology theory in college ideological and political education, and build a comprehensive index system for the coordinated development of college students' party affairs construction and ideological and political education. The principal component analysis method is used to evaluate the index system, explore the relationship between college students' party affairs construction and ideological and political education, and find the main factors affecting their collaborative innovation and development, so as to lay a foundation for putting forward a new model of collaborative development between college students' party affairs construction and ideological and political education. The principal component analysis method is used to mathematically transform and standardize the index variables, distinguish the amount of information according to the sample of the index, judge the importance of the index, and realize the comprehensive evaluation of the main influencing factors of the coordinated development of college students' party affairs construction and ideological and political education.

Results: The eigenvalues and contribution rate of principal components are shown in Table 1. The principal components of the coordinated development of party affairs construction and ideological and political education of college students are top-level design, organic correlation and practical connection, and the cumulative variance contribution rate of the three components is 93.97%.

Table 1. Principal component eigenvalues and contribution rate

Composition	Characteristic value	Variance contribution rate (%)	Cumulative contribution rate (%)
Top level design	3.284	37.53	37.53
Organic correlation	2.417	31.05	68.58
Realistic connection	2.063	25.39	93.97

Conclusions: Under the impact of western ideological trend, some college students' resistance is low, and their ideological position is easy to waver. Therefore, under the guidance of advanced and scientific educational psychology theory, the research combines educational psychology theory with ideological and political education in colleges and universities, adjusts and optimizes the teaching mode of ideological and political education in colleges and universities, and promotes the improvement of students' political consciousness and the promotion of party affairs in colleges and universities. Through the coordinated development of college students' ideological and political education and party affairs construction, correct college students' wrong ideas, guide college students to plan their own future development from a correct perspective, and improve college students' enthusiasm for learning and life. To optimize and reform the existing mode of ideological and political education, we need to first solve the problems existing in the curriculum of ideological and political education and the construction of party affairs, strengthen the correlation between them, and then promote the coordinated development and progress of them under the guidance of positive work ideas, so as to establish a new mode of ideological and political education in line with the situation of the new era.

THE RELATIONSHIP BETWEEN THE CHARACTERISTICS OF LITERARY WORKS AND THE AUTHOR'S PSYCHOLOGY IN CREATION

Peihua Sun¹ & Feiyue Li²

¹*School of Literature and Journalism, Sanjiang University, Nanjing 210012, China*

²*College of Liberal Arts, Shanghai University, Shanghai 200444, China*

Background: Social psychology analyzes the law of psychological activities of individuals and groups in the social environment, and explores the ideological, emotional and behavioral patterns of individuals under the constraints of others or groups. Social psychology analyzes the psychological characteristics of individuals such as interpersonal attraction, interpersonal perception and social promotion in the social

environment, and studies the unique psychological characteristics of social groups to understand the cohesion, group decision-making and psychological atmosphere of social groups. Social psychology focuses on the analysis of the relationship between individuals and groups in the social environment, which is closely related to personality psychology. Social psychology emphasizes the impact of the social situation on individuals and groups, and pays attention to the role of individuals and groups in the interpretation of the social situation they face. As a way of cultural and information communication, literary creation spreads individual emotion and information in the social environment through the form of literary works, and transmits the perception and experience of the author of literary works to other social individuals or groups, which has strong social-psychological characteristics.

The creation process of ancient Chinese literary works is a gradual cycle rising process, not a plane linear process. The creation process of ancient Chinese literary works transforms objective things and thoughts into words. After the author's internal processing, it contains strong personal characteristics of the author. Behind each ancient literary work, there is the organization and conception of the author's long-term ideas. This special writing feature of the author is produced by the interaction between personal style and social environment, and has a strong social-psychological attribute. Influenced by the social environment and group psychology, and combined with their own unique psychological characteristics and behavior patterns, the author has formed the unique style of the author of ancient Chinese literary works.

Objective: Based on the theory of social psychology, this study analyzes the creative process of ancient Chinese literary works, and explores the application of social psychology theory in the creation of ancient Chinese literary works. Through the analysis of the psychological meaning behind ancient Chinese literary works, this paper discusses the influence of social psychology theory on the creation of ancient Chinese literary works, hoping to make a new interpretation of ancient Chinese literary works from the perspective of social psychology and find a new entry point for the appreciation of ancient Chinese literary works.

Research design: Study the application of social psychology theory in the creation of ancient Chinese literary works in combination with historical documents, excavate the author's creative thinking and connotation behind typical ancient Chinese literary works through literary and artistic appreciation of typical ancient Chinese literary works, and interpret them from the perspective of social psychology. The expert scoring method is used to analyze the social-psychological factors in the process of Chinese ancient literary creation. 12 experts in social psychology and 13 experts in Chinese ancient literary works are invited to analyze and study the creative process of Chinese ancient literature and evaluate the relationship between Chinese ancient literary creation and social psychology.

Results: 25 experts rated the correlation between the creative process of ancient Chinese literary works and social psychology. The results are shown in Table 1. Both ancient Chinese literary works research experts and social psychology experts believe that the creation process of ancient Chinese literary works is strongly related to social psychology.

Table 1. 25 experts rated the correlation between the creative process of ancient Chinese literary works and social psychology

Competition duration	An expert in the study of ancient Chinese Literature	Social psychology expert
Individual characteristics	2	2
Social atmosphere	4	3
Thinking mode	3	3
Goal orientation	2	2

Conclusions: The formation of literary works is another form of speech output, and the author's speech output is its purposeful activity. The author creates literature to express his own thoughts, so as to influence others through literary works. The writing activity of ancient Chinese literary works is a highly comprehensive social practice, which requires the author's language operation ability. The author's emotional perception and expression in literary works are influenced by his personality psychology and social situation, which has strong characteristics of the times, and reflects the influence of social environment and groups on social individuals in the theory of social psychology. In the process of creating ancient Chinese literary works, the author is imperceptibly influenced by social psychology. The creative process of ancient Chinese literary works presents strong social psychological characteristics.

THE DEVELOPMENT OF RURAL PRESCHOOL EDUCATION LED BY HIGH-QUALITY STATE-RUN KINDERGARTENS UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Cuimei Yang^{1,2}

¹*Department of Philosophy, Nanjing University, Nanjing 210023, China*

²*Department of Physical Education, Nanjing Sport Institute, Nanjing 210014, China*

Background: Educational psychology analyzes the changes of educational subjects' psychological activities in educational activities, studies the psychological basis of people's teaching activities in educational environment, and discusses the learning and teaching intervention in teaching activities. Educational psychology is based on psychological theory and has strong practicality. It can help teachers and students solve difficulties and problems in teaching activities, and is of great positive significance to the development of students' mental health. Starting from educational psychology, teachers can analyze students' cognitive and learning characteristics, formulate corresponding systematic teaching methods and design scientific and reasonable teaching schemes according to students' learning characteristics, which is of great value to promote the steady improvement of students' comprehensive ability. Preschool children are young, their thinking development is immature, they do not have strong logical thinking and thinking ability, and their enthusiasm and self-discipline in learning are low, so they need teachers' intervention and assistance. On the other hand, preschool children have many psychological characteristics such as jumping thinking and strong curiosity. From the perspective of educational psychology, taking the psychological change characteristics of preschool children as the research center can effectively help preschool education teachers master the psychological laws and characteristics of preschool children and improve the quality and level of preschool education from the psychological level.

With the needs of social development, the state pays more and more attention to preschool education and rural education, and rural preschool education has been raised to an unprecedented height. The development speed of rural areas is slow and the development process is backward. The important role of preschool education of preschool children in promoting people's all-round development is often ignored. And the lag of rural economy also hinders the development of high-quality preschool education, which lacks a certain material foundation. Therefore, in recent years, the state has increased its policy support and fund preference for rural preschool education, established state-run kindergartens in rural areas, implemented the free preschool education system, promoted the improvement of the level of rural preschool education, and alleviated the problem of difficult and expensive admission in rural areas.

Objective: From the perspective of educational psychology, through the research and analysis of the psychological characteristics of preschool children, this paper discusses the role of high-quality state-run kindergartens in leading the development of rural preschool education, analyzes the development of new rural preschool education state-run kindergartens behind the policy inclination, and provides reference for the further development and development of rural preschool education. The research makes an in-depth analysis of the problems and situation of rural public preschool education parks, and puts forward reflections and suggestions, hoping to put forward reasonable suggestions for the development and improvement of rural public preschool education parks and promote the development of rural public preschool education.

Research design: The research aims at the development of rural preschool education, analyzes the problems existing in the construction of rural state-run kindergartens, deeply analyzes the role of rural state-run kindergartens in the development of rural preschool education, and understands the development needs of state-run kindergartens under the environment of rural preschool education. It also analyzes the psychological characteristics of preschool children, deeply integrates the psychological needs of preschool children in kindergarten education from the perspective of educational psychology, constructs the development system model of rural state-run kindergartens, and discusses the development strategies of high-quality state-run kindergartens under the needs of rural preschool education. The chain weighting method index system is used for scoring and weighting, combined with expert judgment, so as to realize the numerical analysis of the differences between the development indicators of rural state-run kindergartens. The research explores the internal conditions for the establishment of rural high-quality state-run kindergartens from the development status and problems of rural state-run kindergartens, and puts forward the improvement strategies and suggestions for the establishment of rural high-quality state-run kindergartens combined with the weight comparison of the development index system of rural state-run

kindergartens.

Results: The statistical results of the problems existing in the existing rural state-run kindergartens are shown in Table 1. Although some achievements have been made in rural preschool education, there are still many problems. At present, the utilization rate of hardware facilities in rural state-run kindergartens is low, the professional quality of teachers is uneven, and the knowledge of preschool education is backward. At present, the management of rural state-run kindergartens is chaotic, the system construction is imperfect, there is a lack of management, the randomness of teaching activities and plan design is strong, and the curriculum of preschool education is unreasonable.

Table 1. Statistical results of problems existing in existing rural state-run kindergartens

Survey object	Kindergarten principal	Teachers	Parents of students
School running philosophy	1	2	2
Hardware facilities	2	1	2
Teacher qualification	1	1	1
School management	1	2	2
Instructional design	2	1	2

Conclusions: Through the analysis of the psychological characteristics of preschool children and the law of changes in psychological activities, this study strengthens the teaching and education construction of high-quality state-run kindergartens in China and promotes the development and progress of rural preschool education. From the current teaching situation of the existing state-run kindergartens, under the policy support, the allocation of hardware facilities and other resources of rural state-run kindergartens is basically in place, but there is a problem of low utilization rate of hardware facilities, which requires rural state-run kindergartens to actively use local resources and improve the level of teaching quality. In addition, rural state-run kindergartens should strengthen the construction of relevant management systems, standardize the daily teaching management of state-run kindergartens, improve the access threshold of teachers in rural state-run kindergartens, and provide targeted and planned professional skills training and guidance for teachers in rural state-run kindergartens.

Acknowledgement: The research is supported by: Key project of The Ministry of Education of China: Research on the development of preschool education in rural areas led by public central parks. No. DHA200335.

METHODS OF ELABORATING THE DEATH THEME OF CHILDREN'S LITERATURE UNDER COGNITIVE PSYCHOLOGY

Xiaoyan Wang

Korean School, Eastern Liaoning University, Dandong 118001, China

Background: Death is the only way in human individual life, and death, as the precipitation of life, is also one of the eternal themes in literary works. Literary works usually describe death from various angles to show the author's exclamation about death or life. Children's literature is a special branch of literary works. Because of its different readers, it is quite different from conventional literary works. The potential readers of children's literature are young children, so the authors of children's literature have special writing techniques in content selection and elaboration. In the elaboration of the death theme of children's literary works, the author often chooses to avoid the intuitive description of death and sadness, and choose to take death as the theme and integrate the hope of life, so that children's readers can perceive death in the text and realize the value of life.

Based on psychological knowledge, the theory of cognitive psychology absorbs the essence of many advanced theoretical achievements, such as information theory and cybernetics, and analyzes the process of individual psychological change from the perspective of experiment and information processing. Cognitive psychology believes that human cognitive process is the process of responding to external stimuli. Human cognition of knowledge or information goes through individual processing and storage, and finally stimulates individual sensory organs and enters individual memory. Cognitive psychology also emphasizes the enthusiasm of individuals in information search and processing. Individuals use strategies to actively search for information, process, store and express it. From the perspective of cognitive psychology, to look

at the cognitive process of children's readers on children's literature, through the analysis of children's psychological activities in the cognitive process of things, and from the perspective of children's cognitive psychological characteristics, to analyze children's stimulation and perception of death, a special thing, can be effectively analyzed from the perspective of psychology. It provides a reference for the author of children's literature to elaborate the theme of death.

Objective: Under the guidance of cognitive psychology theory, taking children's cognitive psychological characteristics and change law as the starting point, the research analyzes the elaboration methods of death theme in children's literary works, studies the expression mode of death theme in children's literary works, and discusses the narrative characteristics and value of death theme in children's literary works. I hope to explore new ideas for the writing of death theme in children's literature and promote the effective and reasonable display of death theme in children's literature.

Research objects and methods: The research adopts the combination of questionnaire and interview, takes the author of children's literature and children's readers as the survey object, discusses the value of death theme in children's literature from the two perspectives of author and readers, and understands the interpretation methods of death theme in children's literature at present. Through one-on-one interviews, the research deeply excavates the death theme of children's literature from the perspective of children's literature writers, discusses the expression form and value of the death theme in children's literature, and excavates the new elaboration ideas of the death theme in children's literature.

Research design: The research analyzes the rationality and objectivity of the death theme in children's literature works in the form of questionnaire, discusses the significance of the death theme in children's literature works from the perspectives of children's literature authors and children's readers, understands the author's and reader's cognition of the death theme in children's literature works, and analyzes natural death The narrative way of accidental death and suicide in children's literature.

Results: The survey results of the respondents' narrative recognition of different types of death themes in children's literary works are shown in Table 1. The results of the survey on the narrative recognition of different types of death themes in children's literature are shown in Table 1. The recognition of children's literature writers and children's readers on the narrative of natural death, accidental death and suicide death themes is at a high level. It is believed that incorporating the theme of death into children's literature can effectively expand the depth and width of children's cognition of the world and life.

Table 1. The survey results of the respondents' narrative recognition of different types of death themes in children's literary works

Survey object	Author of children's literature	Children readers
Natural death	4	4
Accidental death	3	3
Commit suicide	4	3

Conclusions: Integrating the theme of death into children's literary works can guide children's growth from the spiritual level, reveal the relationship between death and life to children through the form and language of natural literary works, and help children find the truth of life in the simple literary kingdom. Children recognize death through literary works, perceive death through virtual story scenes and backgrounds, obtain the power of life and hope behind death, help children experience the confusion and confusion of death, and establish a more positive outlook on life and values. Death often makes people fear, and contacting death through the plain language of literary works can effectively help children avoid the violent impact of death, help children establish a hazy cognitive impression of death, and guide children to correctly recognize and treat death when they really face death.

INFLUENCE OF SPORTS GAME TEACHING METHOD ON THE PSYCHOTIC AND AESTHETIC FACTORS OF COLLEGE STUDENTS

Lihe Chen

Ministry of Sports and Military Education, Jingdezhen Ceramic University, Jingdezhen 333403, China

Background: Psychotic factor is an evaluation index of the severity of individual psychotic symptoms, which has wide applicability in the evaluation of psychotic symptoms. SCL-90 is a commonly used auxiliary

scale in the diagnosis of mental health in colleges and universities. It assists psychological counselors to evaluate the mental health level of college students through the self-evaluation of testers. The SCL-90 includes various types of psychiatric symptomatology. It analyzes the psychological health of the tester from 10 perspectives such as the tester's thinking, perception and interpersonal relationship, and the psychotic factor is the test factor for the tester's schizophrenic like symptoms, mainly on the tester's auditory hallucination, sense of control schizophrenic symptoms such as thought dissemination were evaluated. Schizophrenia is a serious brain disease. The psychological and behavioral characteristics of schizophrenic patients, such as thinking mode, emotional expression and behavior mode, are prone to distortion, which directly affects the social life, work and learning state of patients. Male aunts of schizophrenic patients distinguish the difference between illusion and reality in their self-imagination. Therefore, schizophrenic patients often have strange behavior, and their personality characteristics and behavior changes suddenly.

In recent years, with the advancement of social process, social competition is becoming increasingly fierce. The fast pace of life makes college students bear the pressure from society, family, campus and other aspects, which has a great negative impact on college students' mental health and daily quality of life. In recent years, the mental health problems of college students are worrying. There have been a large number of campus emergencies caused by the mental health problems of college students. Some college students have the symptoms of schizophrenia, which has aroused the attention of all sectors of society to the mental health status of college students. It is necessary to alleviate the schizophrenia of college students through various means. With the advancement of the reform of the educational system, the position of physical education in the teaching system of colleges and universities is gradually rising. Promoting the development of college students' mental health through physical education and exercise has become a new means of college students' mental health education. However, the traditional college physical education teaching mode is relatively backward, the teaching content is single and boring, and the teaching mode is stereotyped, which makes college students have low enthusiasm for physical education learning and training. Colleges and universities are required to actively adjust the physical education teaching mode, promote the reform of college physical education teaching system, and improve the quality of college physical education teaching. The sports game method combines physical education, exercise and games, enhances the entertainment and antagonism in traditional physical education, and can effectively improve the enthusiasm of college students for physical education courses.

Objective: To study and analyze the reform of college physical education teaching system, explore the influence of sports game teaching method on college students' psychotic factors, and explore the direction and path of college physical education teaching reform from the problems existing in the traditional physical education teaching mode, hoping to provide help for improving the quality of college physical education teaching and the mental health level of college students.

Research design: The research adopts the method of comparative experiment to analyze the impact of college sports game teaching method on college students' psychotic factors. 80 college students in four grades of colleges and universities are selected as the research objects by stratified cluster random sampling. The research objects are required to have a psychotic factor score of more than 30 and have obvious symptoms of schizophrenia. And no other mental illness. 80 subjects were divided into experimental group and control group. The students in the experimental group used the sports game teaching method for physical education teaching and exercise, and the control group used the traditional physical education teaching mode for teaching. The experiment lasted for three months. The experimental group and the control group conducted physical education teaching once a week for two hours.

Results: The statistical results of psychiatric factor scores of the subjects before the experiment are shown in Table 1. Before the experiment, there is no significant difference in psychiatric factor scores between the experimental group and the control group.

Table 1. Statistical results of psychosis factor scores of subjects before the experiment

Research object	Freshman	Sophomore	Junior	Senior
Experience group	37.62±1.35	39.51±1.22	40.68±2.06	38.49±1.65
Control group	37.55±1.46	39.32±1.39	40.89±1.95	38.52±1.48

Conclusions: The introduction of game physical education teaching method in the reform of physical education teaching mode in colleges and universities can further improve students' interpersonal communication and communication ability, strengthen communication and communication among students in game sports activities, eliminate wariness and estrangement among students, and promote students' cooperation and understanding in sports games. And the game physical education teaching method has strong competitiveness. Students can experience the feeling of physical confrontation in physical education teaching classroom, enhance students' self-confidence through antagonistic competition, reduce the

degree level of students' psychotic symptoms, and alleviate the schizophrenia of college students. Game physical education teaching method also has strong entertainment. Students can experience the happiness of physical exercise in teaching activities, enhance college students' enthusiasm for physical education courses, and help college students release their bad emotions in a happy and relaxed psychological state.

Acknowledgement: The research is supported by: Key Projects of the 13th Five-Year Plan of Jiangxi Province Education Science: Radical Reform-Study on the Value and Ways of Influence of Sports on the College Student's Aesthetic Education (Project Number: 19ZD060).

TEACHING OF LAWS AND REGULATIONS OF HOTEL MANAGEMENT SPECIALTY IN HIGHER VOCATIONAL COLLEGES BASED ON THE REALITY OF HOTEL OPERATION UNDER COGNITIVE IMPAIRMENT

Jie Huang

Hospitality Institute, Yangzhou Hospitality Institute, Yangzhou 215126, China

Background: Human cognitive function is the high-level activity of human cerebral cortex. Human cognition of things is the process of receiving, coding, extracting and using information, including human perception, recognition, memory, reasoning and other thinking activities. When the human cerebral cortex is damaged, it may lead to specific cognitive impairment. Patients with cognitive impairment are often involved in all aspects of cognitive impairment. Their condition covers attention, organization, memory, perception, understanding and other aspects. Only in rare cases, there is a single functional cognitive impairment. The range of dysfunction in patients with cognitive impairment is affected by the location of the lesion. Memory impairment and attention impairment are two common clinical manifestations of cognitive impairment. In severe cases, patients with cognitive impairment may also have agnosia, body conformational agnosia, spatial neglect and so on. When teaching students with cognitive impairment, teachers should timely adjust their teaching mode according to the situation of students with cognitive impairment, so as to help students with cognitive impairment master knowledge ability and efficiency.

The teaching of laws and regulations of hotel related majors is one of the core courses of hotel management majors in higher vocational colleges. Students are required to be familiar with and master the laws and regulations related to the hotel, and be able to directly apply the relevant laws and regulations in the actual process of hotel management, so as to ensure that students majoring in hotel management have high hotel management professional quality and legal skills. Moreover, the university stage is an important development period for the formation and maturity of students' outlook on life, values and world outlook. Integrating the teaching of relevant professional legal courses into the professional learning process of college students not only has important practical significance for the career development of hotel management students, but also improves the legal awareness of hotel management students. However, at present, there are many problems in the teaching of laws and regulations of hotel management specialty in higher vocational colleges, which is divorced from the reality of hotel operation and is difficult to meet the learning needs of hotel management students. Higher vocational colleges are required to reform the teaching of laws and regulations of hotel management specialty and improve the teaching quality of hotel management in higher vocational colleges.

Objective: Based on the actual situation of hotel operation, this paper discusses the teaching mode and current situation of relevant laws and regulations of hotel management major in higher vocational colleges, so as to provide theoretical and methodological reference for students with cognitive impairment to learn relevant laws and regulations of hotel management. The research analyzes the current situation of the teaching of laws and regulations related to hotel management in higher vocational colleges, deeply excavates the problems existing in the teaching system of hotel management in higher vocational colleges, and puts forward the optimization means and strategies of the teaching of laws and regulations related to hotel management in higher vocational colleges, hoping to provide new development ideas for the teaching reform of higher vocational colleges.

Research design: Research and use the 2021 academic year teaching quality evaluation and inspection report of a higher vocational college to obtain the evaluation data of the teaching quality level of the hotel management major in a higher vocational college. The evaluation and inspection report analyzes the teaching situation of the hotel management major from the two aspects of professional evaluation and student evaluation, and comprehensively evaluates the 2021 academic year teaching situation of the higher vocational college. Based on the evaluation results of hotel management specialty, this study analyzes the

teaching situation of hotel management specialty education in hotel management related laws and regulations, analyzes the existing problems of hotel management specialty in higher vocational colleges, and puts forward the teaching means and strategies of hotel management related laws and regulations for students with cognitive impairment. The research combined with the experimental method to verify the feasibility and effectiveness of the proposed teaching mode of laws and regulations of hotel management specialty. Taking 120 students majoring in hotel management in higher vocational colleges with cognitive impairment as the experimental objects, the experimental objects were divided into three groups, using the original traditional teaching mode, the targeted teaching mode of cognitive impairment based on the actual cognitive impairment of the hotel, the targeted teaching mode is used for teaching.

Results: The analysis and statistical results of the problems existing in the teaching mode of hotel management major in higher vocational colleges are shown in Table 1. Students majoring in hotel management generally believe that the current teaching mode of hotel management major in higher vocational colleges has the problem of unclear teaching objectives, and the teaching concept of the traditional teaching mode is relatively backward, which is difficult to meet the development needs of the new era.

Table 1. Analysis and statistical results of the problems existing in the teaching mode of hotel management major in higher vocational colleges

Survey object	Freshman	Sophomore	Junior	Senior
Teaching objectives	1	1	2	2
Textbook construction	1	2	2	1
Curriculum	1	2	1	2
Teaching model	2	1	2	2

Conclusions: The professional teaching mode of hotel management in traditional higher vocational colleges is relatively backward, and the teaching method is single, which is not conducive to cognitive impairment. Students learn the knowledge of laws and regulations related to hotel management. Therefore, starting from the reality of hotel operation, the research will reform the teaching mode of relevant laws and regulations of hotel management major in higher vocational colleges, optimize the existing teaching methods of hotel management major in higher vocational colleges in combination with the learning characteristics of students with cognitive impairment, and stimulate interest, confirm objectives, allocate resources and other ways, improve the learning efficiency of students with cognitive impairment on the knowledge of laws and regulations related to hotel management.

INFLUENCE OF COGNITIVE IMPAIRMENT ON THE LEARNING OF BRITISH AND AMERICAN LITERATURE AND ITS COUNTERMEASURES

Shuai Wu

Foreign Languages Department, Guangdong University of Science & Technology, Dongguan 523083, China

Background: Cognitive process refers to that the human brain recognizes and receives external things or information input, encodes and stores the received information through psychological processing and processing, and transforms it into its own recognized knowledge. The individual's cognitive ability is his ability to learn, acquire and apply knowledge. Through the processing and coding of external input information, the individual internalizes the received external information into self-knowledge, so as to realize the cognitive process of things. The damage of human cerebral cortex may lead to individual cognitive impairment, which may lead to individual cognitive impairment in memory, computing power, language ability, understanding ability and so on. And cognitive function is often accompanied by a variety of cognitive impairment, which has a negative impact on the daily life of patients with cognitive impairment, and seriously reduces the quality of life of patients with cognitive impairment.

Language is one of the important carriers of culture. The cultural characteristics of different national backgrounds are deeply imprinted in language expression, and learning English is inseparable from the cultural cognition under the English language background. The fundamental purpose of English learning is to have barrier free communication with people in Britain and the United States. In the past, English learning often paid little attention to cross-cultural knowledge learning, but with the advancement of globalization,

people have gradually realized the blending of cultural knowledge behind language learning. The study of British and American literature is an important part of the curriculum for English majors. It has certain learning difficulties and requires high cross-cultural learning ability for English majors. It belongs to the middle and high-level English learning curriculum. Therefore, from a cross-cultural perspective, the study analyzes the impact of cognitive impairment on the learning of British and American literature, and discusses the learning means of British and American Literature under cognitive impairment.

Objective: Based on the cross-cultural theory, this paper analyzes the impact of cognitive impairment on English majors' learning of British and American literature, understands the current situation of English majors' learning of British and American literature, discusses the learning methods and Strategies of British and American literature under the condition of cognitive impairment, and hopes to put forward some suggestions on the effectiveness of English and American literature learning for students with cognitive impairment, help students with cognitive impairment improve their learning ability and efficiency of British and American literature, and cultivate strong cross-cultural awareness and ability.

Research design: The study uses correlation analysis to understand the impact of cognitive impairment on students' learning of British and American literature, uses Spearman correlation coefficient to evaluate the impact of students' cognitive impairment on their learning of British and American literature, and analyzes the impact of cognitive impairment on the learning of British and American literature from three aspects: language expression, emotional connotation and literary meaning of British and American literature. The research analyzes the learning of British and American literature between students with cognitive impairment and ordinary students, understands the differences between students with cognitive impairment and ordinary students in learning style, learning efficiency and learning effect, and understands the impact of cognitive impairment on students' learning of British and American literature through comparative analysis.

Results: The comparison results of the learning effects of cognitive impairment students and ordinary students on British and American literature are shown in Table 1. The learning ability of cognitive impairment students on English and American literature in language expression, emotional connotation and literary meaning is lower than that of ordinary students. The cognitive impairment has seriously affected the learning effect of students on English and American literature.

Table 1. Comparison of learning effects of cognitive impairment students and ordinary students on British and American literature

Survey object	Students with cognitive impairment	Ordinary students
Language expression	1	3
Emotional connotation	2	3
Literary meaning	1	4

Conclusions: Behind language learning is the learning and accumulation of cross-cultural ability. The fundamental basis for the improvement of language learning skills lies in the individual's cross-cultural ability. The individual's learning ability in the dimensions of cross-cultural knowledge and consciousness is directly related to the individual's language learning effect. Therefore, in order to improve the learning ability of students with cognitive impairment to British and American literature, we need to start with the cross-cultural ability of students with cognitive impairment, bring the cross-cultural ability into the English and American literature learning classroom, help students with cognitive impairment perceive some vague or even non conceptual British and American literature knowledge, and strengthen the language learning ability and mastery skills of students with cognitive impairment. In the process of learning British and American literature, teachers should strengthen the cultivation of students' cross-cultural ability through various forms, carry out professional courses related to the cultivation of English majors' cross-cultural ability, and help students solve the negative impact of cognitive barriers on the learning of British and American literature.

* * * * *

THE INFLUENCE OF COMMUNICATION OBSTACLES IN THE INNOVATIVE REFORM OF FINANCIAL AND ACCOUNTING EDUCATION IN COLLEGES AND UNIVERSITIES IN THE NEW ERA

Nannan Sun^{1,2}

¹*Faculty of Education, Qufu Normal University, Qufu 273165, China*

²*Department of Accounting, Shandong Institute of Commerce and Technology, Jinan 250103, China*

Background: Communication disorders mostly occur in the childhood of social individuals, and will remain symptoms in adulthood without intervention. However, this does not mean that adult individuals will not have communication barriers. Compared with childhood communication barriers, the causes of adult individuals' communication barriers are often psychological factors. In psychological theory, the communication barrier of adult individuals is often not caused by a single self-cause, and its formation process must contain the dual influence of implicit and explicit factors. Implicit communication barriers are mainly caused by the concept, psychological state and other internal factors of the communication subject, including but not limited to the individual's psychological characteristics and psychological tendencies, that is, the individual's own personality, temperament and ability formed in the innate environment. Under the action of some environments, there will also be group communication barriers in this category, that is, when individuals are in a group with a certain trend of public opinion, individuals will be excessively oppressed by the group control, and then produce psychology such as fear of conflict and fear of group pressure, resulting in communication barriers. Explicit communication barriers are mainly caused by the pressure of social external factors such as social identity in the communication process. This situation is common in communication barriers between communicators of different ages, communication barriers between communicators of different social status, etc. In the financial and accounting education in colleges and universities, various types of communication barriers may arise. Students may have difficulties in actively asking questions about professional problems because of their own personality, resulting in communication barriers. It is also possible to conceal their own doubts when the group has no objection to the information transmitted by teachers, resulting in communication obstacles. It is more likely to be oppressed by teachers' social status in the process of communicating with teachers, so it is difficult to adopt normal communication methods, resulting in communication obstacles. Once there are obstacles in the communication of professional knowledge in the major of finance and accounting, it is likely to have a great impact on students' follow-up learning. Therefore, based on the characteristics of different types of communication obstacles, the analysis of communication obstacles in finance and accounting education is conducive to improving students' learning performance and cultivating students' communication ability, laying a foundation for students to show their normal social skills after entering the society.

Objective: By exploring the causes and types of communication barriers in the process of accounting education, this study helps students with communication barriers improve their communication skills in professional learning, and provides a guarantee for students' positive learning experience.

Subjects and methods: This study uses factor analysis and index weighted analysis to conduct quantitative analysis on various elements of financial and accounting communication in colleges and universities and provides a method sufficient to diagnose the source of communication obstacles by creating an index system that can quantitatively measure the way of communication.

Study design: In the research, students majoring in finance and accounting are selected as the research object. Through the intervention and quality detection of classroom and after-school communication for students majoring in finance and accounting, the elements in the communication process between teachers and students are quantitatively analyzed.

Methods: In this study, the weight coefficient calculation method is used to calculate and analyze the weight of different characteristic factors causing communication barriers.

Results: The score table after calculating the weight according to different communication paths and characteristics of different communication barriers is shown in Table 1.

Table 1. Weight calculation table

Features	Weight value (%)	Direct communication	Indirect communication	Mixed communication
Ambient pressure	10	4.4	1.6	3.8
Psychological characteristics	10	4.7	2	3.5
Peer pressure	20	7.8	3	3.2
Neurogenic factors	30	4.8	8.7	8.1
Communication style pressure	30	14.4	11.4	10.8
Total	100	36.1	26.7	29.4

The two features with higher weight in Table 1 are neural factors and communication style pressure. It can be seen from the table that direct communication often means that it is more difficult for people with communication disabilities, while the influence of external psychological pressure, personal-psychological

characteristics and peer psychological pressure is relatively weak, and indirect communication and mixed communication are relatively easier for students with communication disabilities.

Conclusions: In accounting teaching, college students often affect their professional knowledge learning due to communication barriers. Through the analysis of the types of communication barriers, we can find out the factors that affect the communication ability of college students in the process of financial and accounting education, and improve the communication methods according to the problem points. Establishing an efficient way of communication between teachers and students can greatly save college students' time and energy consumption in the process of communication and improve their learning efficiency. At the same time, a reasonable way of communication between students can also effectively improve the communication ability of college students in the group and provide help for their social life after entering society.

ON THE CONSTRUCTION STRATEGY OF CORPORATE PERFORMANCE MANAGEMENT AND PERFORMANCE APPRAISAL SYSTEM UNDER COGNITIVE IMPAIRMENT

Xianglan Dong

School of Management, Shijiazhuang Tiedao University, Shijiazhuang 050043, China

Background: Contemporary cognitive psychologists are used to classifying the information processed and mastered by human beings into two main types: procedural information and declarative information according to the difference of their representation. On this basis, procedural information can be further classified into descriptive information and strategic information. The three kinds of information are organically combined to form people's comprehensive cognition of the outside world. In this process, human individuals need to build the information system, constantly interact with new information, repeatedly predict and deduce the different variables within the existing information system, and search the whole cognitive system when necessary to find out the cognitive system that is most consistent with the current situation. This is the storage and extraction of human cognition, which can also be said to be the process of human learning feedback. In enterprise management, this ability is very important for both managers and managers, otherwise the whole management system will lose efficiency. But in fact, although there is reasonable performance management and evaluation system for people with normal cognition, there is a lack of a reasonable system for people with cognitive impairment. For people with cognitive impairment, some indicators in the original system are difficult to truly reflect their working state. Performance management and evaluation systems with different emphases should be established according to the characteristics of cognitive impairment.

Objective: This study provides a company performance management and performance appraisal method that is more suitable for the actual situation of employees with cognitive impairment through the parts that are prone to errors of employees with cognitive impairment under the company's performance management and performance appraisal system.

Subjects and methods: Based on the balanced scorecard, this study differentiates the key indicators of the company's performance management and evaluation system, selects the effective indicators that can best represent the performance of employees, and gives the indicator effectiveness weight according to the characteristics of employees with cognitive impairment, on this basis, using expert evaluation method and system analysis method, this paper makes a hierarchical and systematic analysis on the relationship between the company's performance management and assessment indicators and cognitive impairment, finds out the effective indicators that can actually fit the work status of employees with cognitive impairment, and improves the invalid indicators in combination with the characteristics of cognitive impairment.

Study design: Based on the balanced scorecard, this study selects the effective indicators that can best represent employee performance, and invites professionals in the field of cognitive impairment to form an expert evaluation group. The cognitive impairment expert group reviews the effectiveness of cognitive impairment evaluation for indicators at different levels, forms effective weights according to the audit results, and carries out detailed correlation analysis by relying on the system analysis method, retaining the effective part of the assessment for people with cognitive impairment, and improve the ineffective indicators to fit the characteristics of cognitive impairment.

Methods: According to the different susceptibility of cognitive impairment under different performance

management evaluation indicators, this study analyzes the importance of indicators by inviting professionals to form an evaluation team, and carries out quantitative weighting on this basis, so as to systematically analyze the company's performance management and evaluation system under cognitive impairment.

Results: The assessment weight results formed according to different types of cognitive impairment are shown in Table 1.

Table 1. Average score of basic layer index

Serial number	Basic layer index	Weight	Percentage (%)	Equal share
1	Descriptive cognitive impairment	0.12	12.00	1.71
2	Strategic information cognitive impairment	0.32	32.00	2.71
3	Declarative information cognitive impairment	0.26	26.00	2.34
4	Cognitive impairment behavior feedback	0.30	30.00	2.86

Table 1 clearly shows the different emphasis of the assessment system for employees with cognitive impairment on people with cognitive impairment. The average score on the far right represents the average score obtained by the professional evaluation team, and the weight represents the importance of this type of indicator to employees with cognitive impairment. It can be seen that the most important types of emphasis are strategic cognitive impairment assessment and cognitive impairment behavior feedback assessment. This is because the strategic cognition of employees with cognitive impairment is the most likely to cause consequences in their behavior. The behavior feedback assessment has the greatest correlation with strategic cognitive impairment, so the weight proportion of the two is the highest, other items are relatively less likely to cause consequences, so the proportion is relatively low.

Conclusions: Redistributing the company's performance management and assessment indicators from the financial level, customer level, process level and learning level can effectively change the focus of the indicator system. By focusing on the bias index system, we can effectively restructure the company's performance management and evaluation system for people with cognitive impairment, so as to promote the more comprehensive performance system of the company, better reflect the work status and work achievements of employees with cognitive impairment, and help employees with cognitive impairment correctly measure their own level at work, it also provides a way for the company to better understand employees with cognitive impairment and standardize the management of employees with cognitive impairment.

ANALYSIS ON INFLUENCING FACTORS AND INTEGRATED MANAGEMENT OF FORESTRY ECOLOGICAL CONSTRUCTION BASED ON COGNITIVE IMPAIRMENT

Chao Wang¹, Jiehua Lv¹ & Qiumin Zhao²

¹*College of Economics and Management Nefu, Northeast Forestry University, Harbin 150040, China*

²*Department of Fundamental Course Teaching and Research, East University of Heilongjiang, Harbin 150066, China*

Background: With the development of science and technology, on the basis of improving people's living standards, environmental problems are becoming more and more serious, which further restricts the environmental quality and economic development level. Forest is an important resource for human survival. As an important system to maintain ecological balance, it is of great significance in regulating climate and soil and water conservation. Paying attention to forestry ecological construction is the focus and foothold of modern forestry development. The effect of forestry ecological construction is closely related to relevant managers and employees. The imbalance between the forestry ecological construction process and management level has become an important factor restricting the level of forestry construction. The influencing factors of forestry ecological construction include controllable factors and uncontrollable

factors, which are mainly reflected in the low degree of science, the increase of diseases and pests and so on. In the process of modern forestry transformation, the traditional forestry construction concept and work mode cannot meet the new requirements of economic development, so that some relevant managers and staff with cognitive impairment cannot adjust their work concept and work ideas in time, which provides great resistance for the scientific management of forestry ecological construction.

Cognitive impairment refers to the impairment of one or more aspects of cognitive process, including memory, calculation, orientation, structural ability, executive ability, reduced efficiency or functional impairment of language understanding, expression and application process, resulting in learning impairment, memory impairment, visuospatial impairment and executive dysfunction. Cognition involves people's learning, memory, thinking and emotion. It is a scientific mechanism for cognition, acquisition and processing of information. Cognitive impairment will affect people's cognitive representation. When patients with cognitive impairment make informed decisions and judgments, due to the understanding deviation of the form and content of information, the sense of information and amount of information obtained by patients with cognitive impairment conflict with the original cognition, make judgments and behaviors inconsistent with the actual situation, and increase the difficulty of information extraction. Scientific forestry ecological construction mode is the mainstream trend of current forestry development, and forestry practitioners with cognitive impairment are difficult to realize the calculation and integration of data resources and quantitative and accurate analysis of pest control, resulting in obstacles to implementation ability. The cognitive barriers of forestry construction and management personnel will also affect the unreasonable allocation of ecological resources. Cognitive impairment will not only damage cognitive function, but also affect people's physical and mental health, work, life and learning. Accelerating the prevention and management of forestry ecological construction under cognitive impairment can effectively improve the cognitive level of people with cognitive impairment and promote the healthy development of forestry ecological construction.

Objective: On the basis of understanding the current development status and difficulties of forestry ecological construction, this paper analyzes the thinking differences and cognitive deviations of employees with cognitive impairment on the influencing factors and management ideas in forestry ecological construction, and constructs a forestry ecological construction system on this basis, so as to improve the cognitive level of employees with cognitive impairment and help them change their management ideas, improve the level of thinking and cognition of the dynamic development of things.

Research objects and methods: The research takes forestry practitioners and managers with cognitive impairment as the research object. Firstly, the cognitive status of the research object and the problems encountered in the current industry are collected, and then the forestry ecological construction system is constructed with the help of data information. The ecological construction system is used to adjust the cognitive standards of patients with cognitive impairment, so as to improve the cognitive level of the subjects.

Method design: On the premise of understanding the cognitive level and work status of patients with cognitive impairment, build a reasonable forestry ecological construction system from the application of information technology, resource management and data monitoring, and apply the system to the research object and practical application to explore the improvement and behavior mechanism changes of patients with cognitive impairment before and after the experiment.

Methods: The optimization system of forestry ecological construction was constructed with the help of the analytic hierarchy process, and the cognitive score and behavior mechanism of patients with cognitive impairment before and after the experiment were explored by model and comparative experiment.

Table 1. Statistics of impairment scores of cognitive impairment related personnel before the experiment

Dimension	Mean	S.D.
Learning disorder	2.314	0.640
Memory impairment	2.759	0.832
Executive dysfunction	4.287	0.549
Cognitive impairment	4.251	0.658

Results: The informatization and high efficiency of forestry ecological construction is the current development trend. In order to meet the needs of employees with cognitive impairment and promote their forestry system construction and management optimization, this paper studies the influencing factors and management analysis of forestry ecological construction from the perspective of cognitive impairment, with a view to improving the construction system and improving the objectivity and comprehensiveness of the evaluation standards of employees and managers, so as to improve their cognitive level and standard of ecological construction. The results show that the forestry construction system helps to improve the

symptoms of patients with cognitive impairment, improve their cognitive level and practical management ability, and greatly improve the conscientization and efficiency of forestry ecological construction. Table 1 shows the score statistics of cognitive impairment-related personnel before the experiment.

Conclusions: Forestry ecological construction is an important guarantee for China's forest resources. Exploring the influencing factors and development path of forestry ecological construction from the perspective of cognitive impairment can improve the management level and cognitive standard of relevant personnel with cognitive impairment on the premise of promoting the long-term benign development of resources and the application of modern science and technology, then put forward more innovative and practical suggestions and management schemes for China's ecological construction.

* * * * *

ANALYSIS OF BIG DATA AND INNOVATIVE TEACHING REFORM OF ACCOUNTING EDUCATION FROM A PSYCHOLOGICAL PERSPECTIVE

Dashan Wang & Shuijin Zheng

School of Economics and Management, Hainan College of Software Technology, Qionghai 571400, China

Background: With the rapid development of information technology and big data, the transmission of information is more efficient and stable, which not only changes people's production and lifestyle but also brings a great impact on the education mode of accounting major in higher vocational colleges. At present, accounting education focuses on theory rather than practice, and some teachers' teaching ideas still stay in the collection of traditional ideas. The solidified ideas and teaching methods with slow renewal speed are difficult to improve the teaching effect. Moreover, the unreasonable course setting will also be divorced from the actual needs of enterprises, making the course learning content match the responsibilities and posts, and increasing the management cost and operation cost of enterprises. For example, most colleges and universities still cultivate cash counting and abacus as a skill repeatedly, but under the environment of mobile payment and accounting informatization, the application value of this skill is not high. The teaching ideas of some accounting majors are still based on the traditional inherent mode, and the low level of informatization of their teaching courses, the low degree of combination of big data technology and single teaching methods will affect students' learning enthusiasm and the cultivation of professional skills. In order to accelerate the teaching reform of accounting specialty, we need to better grasp the teaching needs of students on the premise of increasing its integration with big data technology, and integrate psychological theory into teaching practice from its psychological law and cognitive structure, so as to further improve the teaching quality and realize the teaching objectives.

Psychology is a science that studies human behavior and psychological laws. Modern psychology mainly includes biological perspective, cognitive perspective, behaviorism perspective, whole-person perspective, development perspective and social and cultural perspective. The cognitive perspective emphasizes cognitive activities or psychological activities, and pays more attention to people's thinking, learning, memory and perception. The perspective of behaviorism is to study the influence conditions of behavior and its surrounding environment, and pay attention to the degree and quality of the influence of the environment. The whole person perspective includes psychodynamics and humanism, pays attention to people's spiritual core, believes that people have the internal needs of growth and goodness, and believes that self-concept, self-esteem and thinking have a great impact on emotion and behavior. The development perspective believes that at the same stage of growth, they will have different ideas and behaviors under the influence of environment and heredity. The combination of psychology and education is mainly reflected in educational psychology. Educational psychology pays attention to the behavior and needs of teaching subjects and objects in the teaching process. Exploring the law of behavior and psychological change can provide guiding theory in the teaching process, improve teaching quality and meet teaching objectives. The reform and innovation of accounting education from the perspective of psychology can effectively analyze students from the perspective of cognition, behaviorism and whole person, grasp students' learning needs and psychological laws in the teaching process, and improve their negative emotions and psychological problems for their own profession and learning caused by teaching quality, such as employment anxiety, social disorder and so on, further improve the teaching level and students' psychological status.

Objective: Further grasp the laws of the teaching process and students' psychological characteristics from the perspective of psychology, accelerate the integration of big data and accounting education, better apply computer, network technology and other carrier forms to the innovation of teaching content, teaching

resources and teaching means, and realize the renewal of accounting education concept and the reform of teaching structure, then improve the psychological problems of students in the accounting major and alleviate their anxiety caused by the difficulty of the course.

Research objects and methods: Taking the accounting students of a university as the research object, after evaluating their teaching status and curriculum satisfaction, the research integrates big data technology and psychological theory into the accounting education reform, and constructs a new teaching model to meet the development requirements of the times and the needs of students. The improved teaching model will intervene the research objects, explore the changes of students' psychological needs and the mitigation of psychological problems in the teaching process, and reduce the negative emotions caused by their professional problems.

Method design: With the help of principal component analysis, the factors affecting the teaching effect are extracted and analyzed, and then the accounting teaching classroom is innovated and optimized. The new model is constructed to collect the change data of the learning quality and learning effect of the experimental objects within three months, and the data on learning needs and psychological changes to obtain the experimental results.

Methods: Based on SPSS22.0 analysis tool to process the experimental data, extract the influencing factors and test the regression coefficient with principal component analysis, and test its intervention mechanism on students' psychological problems with the new accounting teaching classroom optimization model.

Results: The psychological perspective can effectively guide teachers to grasp the characteristics of the teaching process and the psychological laws of students, and then realize the integration of teaching resources and big data with the optimization of teaching courses, so as to make the accounting teaching more information-based, diversified, applied and personalized, and carry out targeted teaching according to students' psychological needs and problems, so as to improve their mental health level. Table 1 shows the statistics of accounting students' anxiety under different teaching effects.

Table 1. Statistics of accounting Employment Anxiety of students under different teaching effects

Timing	Employment Anxiety	Social anxiety	Academic anxiety	Social anxiety
Before teaching optimization	25.36±1.25	19.12±1.69	20.11±1.06	18.46±1.78
After teaching optimization	12.42±1.16	10.51±1.03	11.58±1.46	8.29±1.04

Conclusions: Psychological perspective can effectively improve teachers' intelligent thinking, promote their acceptance of information technology and their initiative to learn new things, further guide and help students solve their learning and life problems, and cultivate technical talents with solid theoretical knowledge and excellent technical ability. At the same time, psychology guides teaching reform, which can better take students' learning characteristics and psychological needs into account under the application of teaching means, teaching resources and teaching modes, deepen the integration depth of big data and accounting, improve students' psychological tolerance to social changes, and then improve their psychological quality and health level.

DESIGN OPTIMIZATION OF INTELLIGENT THEME AND STYLE REPRESENTATION SYSTEM FOR INTERIOR DECORATION OF CRUISE ATRIUM FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Bin Xi & Yanchi Chen

Jiangsu Maritime Institute, College of Arts and Humanities, Nanjing 211100, China

Background: As an important public space inside the cruise ship, the cruise ship atrium can not only

create a space place with wider perspective and more diverse functions, but also provide tourists with a sense of direction and internal environment. It is the symbolic space of the cruise brand and the key representation area of corporate culture. Cruise theme design refers to the design from two aspects of interior and exterior design under the guidance of a specific concept, so as to determine the cultural concept and artistic style of the cruise atrium, take this as the main tone of the design, and build a consistent spatial atmosphere and characteristic business model around the theme form, so as to improve the cultural feeling and spatial experience of tourists. Intelligent theme design is the overall design of intelligent technology and overall interior decoration, which is reflected in system configuration and network communication technology layout, and uses its theme to create an all-round cultural atmosphere and marketing mode, such as the application of information technology means and so on. At the same time, the style representation of the interior decoration of the atrium is based on the design theme, which is displayed and expressed on the ground, wall, ceiling, color, lamps, structures and other decorative elements, so as to coordinate the design style of some details with the overall design style, bring tourists an immersive experience and meet their consumption needs and psychological expectations. However, at present, there are few studies on the design style and representation of cruise atrium at home and abroad, and the correlation between theme design and detail elements in some cruise industry is not high, and the information level in intelligent design theme and style is low, and the connection between technology application and design is too rigid, which destroys the overall design characteristics of cruise atrium, It affects tourists' theme experience and demand satisfaction, and brings poor cruise experience and satisfaction to tourists with certain cognitive impairment.

Cognitive impairment refers to the impairment of one or more aspects of cognitive process, including memory, calculation, orientation, structural ability, executive ability, language understanding, expression and application process efficiency reduction or function impairment. Different degrees of cognitive impairment have different effects on people's overall function and survival function, which makes the brain advanced intelligent processing process related to learning, memory and thinking judgment abnormal, resulting in learning, memory impairment, visuospatial impairment and executive dysfunction. When patients with cognitive impairment perceive information, they have a deviation in understanding and perception of the form and content of information, which leads to the functional imbalance of neural information in the process of activity, resulting in the conflict between the information person's sense of information and the original cognition, making judgments and behaviors inconsistent with the reality, which increases the difficulty of information extraction. Mild cognitive impairment mainly refers to mild memory or other cognitive impairment beyond the allowable range of their age, with the normal ability of daily living. In the field of epidemiological research, it is found that the proportion of mild cognitive impairment is increasing year by year. Effective early intervention for cognitive impairment can improve the cognitive level of patients, improve their attention and understanding, and help them make better cognitive judgment and decision-making. The effect of the overall style and local design of the cruise atrium will affect the tourists' emotional experience of pheromone extraction, and then produce different psychological needs and expectations. Therefore, exploring the intelligent theme design and style representation of the interior decoration of the cruise atrium from the perspective of cognitive impairment can effectively meet the user needs of this group and improve the service quality and level of the cruise.

Objective: Based on the needs of people with cognitive impairment, optimize and adjust the problems existing in the intelligent theme design and style representation of cruise atrium, promote the independent design and improvement of the cruise, and continuously improve the service quality of cruise to meet the needs of different people and improve the cognitive level of patients with cognitive impairment.

Research objects and methods: The research takes some patients with cognitive impairment who have participated in the cruise experience as the research object, and collects their opinions and views on the cruise atrium experience. On this basis, the intelligent design of the atrium is systematically optimized to meet the cognitive needs of patients with cognitive impairment and improve the satisfaction of cruise service.

Method design: Improve the intelligent theme and style representation of the atrium, that is, consider the diversification of its functions from the aspects of technical design and selection, enhance information discrimination in the design detail style, and optimize the design system. The improved design system is applied to patients with cognitive impairment to collect the relief of cognitive impairment and the sense of cruise experience after the experiment, so as to promote the optimization of cruise atrium design.

Methods: The optimized model and comparative experiment were used to collect and sort out the data of cognitive improvement and cruise experience of patients with cognitive impairment before and after the experiment, and the experimental data were imported into statistical analysis tools for result analysis.

Results: At present, the intelligent design of cruise atrium is difficult to meet the service needs and psychological cognition of tourists to a certain extent, and the user needs of people with cognitive impairment are less met and reflected in the design. From the perspective of cognitive impairment,

realizing the intelligent theme design and style representation of cruise atrium will help to speed up the independent design of cruise ships, practice products and improve the cognitive level and mental health level of patients with cognitive impairment. Figure 1 shows the score results of cognitive impairment personnel on the rationality of cruise ship atrium design before and after the experiment. The score value represents their satisfaction with the system.

Figure 1. Score of cognitive impairment personnel on the rationality of cruise ship atrium design before and after the experiment

Conclusions: The theme design of cruise ship atrium is to build an infectious place. Its theme positioning, design concept, decoration style, cruise ship brand and designer's different aesthetic preferences will affect the overall design style of cruise ship, and the consumption experience is also different. Incorporating the needs of groups with cognitive impairment into the design optimization helps to better interpret the significance of the cruise theme, improve the cognitive level and satisfaction of this group, and speed up the process of cruise independent optimization design.

THE INFLUENCE OF THINKING LOGIC ON THE CULTIVATION OF CROSS-CULTURAL COMMUNICATIVE COMPETENCE IN COLLEGE ENGLISH EDUCATION

Hua Liu

School of Foreign Languages, Zhongyuan Institute of Science and Technology, Zhengzhou 450000, China

Background: Thinking logic refers to the ability of correct thinking and reasonable evaluation, that is, the ability to observe, compare, analyze, summarize, judge and reason things with scientific logical methods, and then accurately and orderly express our thinking process. It is an important tool for us to recognize and guide the objective world. Thinking cognition has the characteristics of abstraction and indirectness. Rational cognition is thinking. Different individuals have different thinking at different stages due to the influence of education level, age structure, reading experience and self-awareness level, which will lead to deviation in people's views and evaluation standards of things and lead to different behavior activities. As a cognitive process with mathematical characteristics, thinking logic emphasizes the logic between things. It is an important embodiment of the unity of external things and their own cognitive level. It has high requirements for people's language organization ability and thinking expression ability. When individuals carry out cognitive activities, they will be affected by the confusion of the starting point of thinking, the fuzziness of thinking image, the deviation of thinking direction, the confusion of thinking logic and so on, which makes it difficult for objective things to appear normally in the human brain, which can be manifested as the abnormality of thinking process and thinking content. English communication ability is a good embodiment of thinking logic. The quality of English communication ability can reflect the clarity of individual thinking logic and the strictness of language organization. "Cross-cultural communicative competence" is a comprehensive test of language application ability in language communication practice. It is an effective way to improve college students' cultural connotation and their professional ability. However,

in the current college English education, teachers' pay too much attention to the study of theoretical knowledge in curriculum design and ignore the cultivation of students' language expression ability and communication ability, which makes students only pay attention to the study of surface knowledge and ignore the importance of cross-cultural communication ability. It is difficult to understand the logical connotation of English culture, resulting in "language bias", which fall into "misunderstanding of thinking logic". Therefore, exploring the cultivation and influence mechanism of thinking logic on students' cross-cultural communication ability in college English education will help to cultivate students' better organizational ability, adaptability and speculative ability, improve their confidence in English understanding logic and language communication, and then improve their cross-cultural communication ability and professional level, which has important practical significance and guiding value.

Objective: Based on the characteristics of students' thinking logic and existing problems, this paper innovates the college English education model and strengthens the cultivation of students' cross-cultural communication ability, so as to continuously improve the professional ability and comprehensive quality of English majors.

Research objects and methods: The study takes 900 English Majors in three universities as the research object, collects and evaluates the information of their thinking logic level, thinking misunderstanding and English professional level, and then explores the correlation between thinking logic ability and English cross-cultural communication ability with the help of principal component analysis. According to the problems and needs of the research object in English teaching, the teaching mode is improved. At the same time, take various forms to mobilize students' interest and enthusiasm in classroom and English dialogue and communication, such as oral knowledge competition, scene simulation, online English communication, language logic training, etc., so as to improve students' cross-cultural communication ability and comprehensive quality.

Method design: Firstly, collect the basic information and sort out the problems of the research object's thinking logic level and English communication level ability, then explore the correlation between thinking logic ability and English cross-cultural communication ability with the help of principal component analysis, and innovate the educational means of cross-cultural communication according to the students' learning characteristics and needs, so as to realize the reform of teaching mode. The experiment lasted for one month. After the experiment, the students' thinking logic improvement and English expression level were processed and analyzed.

Methods: The correlation between thinking logic and English cross-cultural communicative competence was explored by principal component analysis, and the experimental research was carried out with the improved teaching model. The experimental data were collected and processed by statistical analysis tools, and the experimental results were obtained.

Results: To improve cross-cultural communication ability is to respect and understand the culture of others, which can enable students to strengthen their understanding of foreign language cultural background and values in the process of communication, so as to help them understand the core of language communication, and enhance their own cultural self-confidence to a certain extent. The results show that the reform of teaching mode can effectively help students with poor thinking logic ability better understand the cultural connotation of language, and then improve their cross-cultural communication ability and thinking ability. Table 1 shows the statistical difference of students' thinking logic scores before and after the experiment.

Table 1. Statistics on the difference of students' thinking logic scores before and after the experiment

Logical expression of thinking	Before the experiment	After the experiment
Analysis and synthesis	14.76±2.59	25.14±2.23
Comparison and classification	15.18±2.53	29.12±2.67
Abstraction and generalization	17.45±3.81	27.43±2.05
Induction and deduction	13.91±2.24	22.79±2.24

Conclusions: The ultimate goal of language learning is the application of language, and the communicative ability of language and culture not only refers to the improvement of language expression ability, but also requires students to master the corresponding basic cultural knowledge and cultural background. Strengthening college English education to cultivate students' cross-cultural communication ability can effectively improve students' thinking and logic ability, improve English teaching effect and students' comprehensive quality ability, and further give play to the guiding value and practical value of English.

* * * * *

RESEARCH ON COLLEGE VOCAL MUSIC TEACHING ON COLLEGE STUDENTS' COGNITIVE IMPAIRMENT

Weiling Li¹ & Ye Liu²

¹*School of Music and Dance, Xuchang University, Xuchang 461000, China*

²*School of Information Engineering, Xuchang University, Xuchang 461000, China*

Background: Cognition refers to the process of intelligent processing when individuals know things and acquire relevant knowledge. This process involves learning, thinking and other psychological and social behaviors. Cognitive impairment indicates that there are some abnormalities in the process of intelligent processing, which leads to memory impairment, accompanied by symptoms such as agnosia and anorexia. Cognitive impairment is divided into three main types: perception impairment, memory impairment and thinking impairment. Perceptual impairment may cause some perceptual abnormalities, such as sensory retardation, hallucinations, etc. In the memory disorder, the related memory function will become too strong and wrong, while the thinking logic disorder is manifested in the abnormalities of thinking and abstract generalization, such as delusion and abstract generalization disorder. At present, the cognitive impairment of college students is manifested in interpersonal communication, job selection and entrepreneurship. They have certain cognitive deviations from themselves, others and society. The cognitive impairment in interpersonal communication is manifested in the cognitive disorder of self-evaluation, over self-centered and the cognitive disorder of evaluating others. Some college students will evaluate themselves too high or too low, resulting in two extreme psychologies of pride or inferiority. He is too proud and handles interpersonal relationships as a leader, making others feel uncomfortable, such as being strongly ordered and driven. Being self-centered, not considering the feelings of others, and everything according to your own mood, this behavior will lead to interpersonal problems. In terms of entrepreneurship and career selection, there are many college students who want to start a business, but few actually take action. Being too picky about careers leads to the loss of employment opportunities. The reasons for this situation are college students' unreliable prejudice against entrepreneurship, high vision and low hand, lack of correct understanding of entrepreneurship and lack of clear self-awareness. Due to the emergence of these cognitive barriers, college students are prone to some negative emotions. As an important means of regulating and soothing emotions, music can be used in the treatment of college students' negative emotions. Therefore, music teaching in colleges and universities can be reformed appropriately to help college students know themselves in music learning, reduce negative emotions and learn to get along with others.

Objective: Combined with the current situation of college students' cognitive impairment, to carry out targeted reform of music teaching in colleges and universities and gradually guide college students. Through soothing and relaxing music, the physical and mental health of college students can be relaxed, and the psychological burden of college students can be gradually reduced. Then slowly carry out the practice of music imagination from easy to difficult, so that college students can gradually eliminate and alleviate the negative emotions in their hearts in the gradual music imagination, and carefully feel the pleasure and positive guidance brought by music imagination. In addition, in rhythm practice and impromptu performance activities, further release emotions and re-recognize yourself, and learn to get along with others.

Research objects and methods: The research objects are college students with cognitive impairment. 46 college students in music public elective courses in a university were randomly selected. With the consent of the students, these students were gathered to have a unified class. The time of the experiment was 2 months. Before the experiment, understand the problems of these students and choose the musical instruments to play according to the students' hobbies. Establish a good trust relationship with students and choose appropriate music for different types of students. By playing soothing music, music imagination from easy to difficult, and other gradual music treatment schemes, students can slowly relax, experience positive music experience, and try to communicate and cooperate with others in performance and other activities. Relevant data were recorded during the experiment. Through fuzzy comprehensive evaluation, the influence of the reformed music teaching mode on college students with cognitive impairment was evaluated. The quantitative score of influencing factors was 1-5. The higher the score, the greater the impact. SPSS was used to process the relevant experimental data, and the results were averaged and rounded.

Results: The psychological growth of college students is not fully mature. There will be some deviations

and cognitive obstacles in self-cognition and positioning, resulting in psychological conflict, interpersonal communication, job selection and other problems, which will affect the quality of life and mental health of college students. Based on the emotional regulation of music, we should reform the music teaching mode in colleges and universities and intervene the cognitive impairment of college students. After the intervention, the psychological burden score of female college students is lower than that of male college students, and the psychological burden score of female college students is 3. See Table 1 for details.

Table 1. Cognitive impairment scores of college students before and after intervention

Gender	Time	Self-cognition	Psychological burden
Male	Before intervention	3	5
	After intervention	5	4
Female	Before intervention	3	5
	After intervention	4	3

Conclusions: In recent years, the psychological status of college students has been paid more and more attention. Employment anxiety, interpersonal anxiety and other problems are more prominent. The reason is that college students have cognitive obstacles on these problems. Through the reform of music teaching mode in colleges and universities, college students' cognitive obstacles are alleviated, their psychological burden is gradually reduced, they become positive and healthy in mentality, and learn to have a correct understanding of themselves.

* * * * *

A COMPARATIVE STUDY OF VISUAL EXPRESSION BETWEEN VR AND TRADITIONAL FILMS FROM THE PERSPECTIVE OF POSITIVE PSYCHOLOGY

Nannan Yang

Film Media Industry Discipline, Cheongju University, Cheongju 28453, South Korea

Background: Positive psychology is different from traditional psychology. The research angle of this psychology is a positive angle, through which the research of traditional psychology is studied. Positive psychology is a new research field. Its role is to study the individual's positive psychological quality and guide the individual to go up on the basis of scientific principles and methods. The individual's positive psychological quality includes integrity, courage, persistence, optimism and so on. In the process of applied therapy, positive psychology stimulates individual positive behavior through relevant environmental design, and promotes the improvement of individual quality of life under relevant behavior control methods. Or cultivate the individual's positive emotions. With the change of time, these positive emotions will imperceptibly change the individual and make the individual more positive. From the perspective of positive psychology, the ultimate target of VR and traditional films are human beings. The expression content of the two types of films will slowly affect human emotions. If we want to cultivate human positive psychological quality, we should play film and television works with various themes of positive psychological quality. Both types of films can cultivate human positive psychological quality, but due to different technologies, they have different visual expression effects. Compared with the visual expression of traditional films, VR films are interactive, immersive, and imaginative. The film can determine the plot by the audience, drive the audience to make positive associations, and promote the positive development of the audience's imagination. With the support of advanced technology, the audience's multiple perception organs are combined with the virtual picture mechanism to make the audience's perception very realistic. Panoramic viewing from a 360° perspective is stronger than the perception of traditional films and can stimulate the audiences' positive feelings more. In addition, VR film is more "playful" under the concept, and the audience can communicate with the characters of the film, so as to enhance the variability of the film and increase entertainment and novelty.

At present, the school pays more attention to the psychological status of students, hoping that students can have positive psychological quality and study actively and actively. Some students believe that high school life is boring, even depressing. It is easy for high school students to avoid the setbacks of the past and the future because of their high personality. Under the advocacy of "love education", teachers encourage students through various forms to mobilize students' learning initiative and enthusiasm. Watching inspirational films is one of them. Due to the different types of film application technology, the role of VR

film and traditional film is different. Therefore, compare the visual expression effects of VR and traditional films, and analyze the impact of VR films on the cultivation of positive psychological quality of senior high school students.

Objective: To compare VR with traditional film visual expression and analyze their effects on the cultivation of positive psychological quality of senior high school students. VR films are used to enrich the learning life of high school students. Through films with different themes, students can feel excellent positive psychological qualities such as responsibility and courage, mobilize their learning initiative, make them study more actively and persevere in learning.

Research object and method: Three classes were randomly selected from the senior one of a high school and divided into normal class (57), traditional film class (54), and VR class (56). There was no significant difference between the three classes. Before the experiment, understand the personality and learning of students in each class. At the beginning of the experiment, the normal class will have classes and study normally in a previous way. The traditional film class will watch traditional films on the Friday night self-study in the second and fifth weeks of each month, and the VR class will watch VR films on the Friday night self-study in the second and fifth weeks of each month. The themes of the two films are in line with the psychological characteristics of students. The story is wonderful and moving. They are inspirational films. The experimental period is one semester. The meta-analysis method is used to quantitatively analyze the relevant effects of the experiment. The higher the score, the higher the degree. The data processing software is SPSS software to study the impact of different film types on senior one student.

Results: After saying goodbye to junior middle school life, the learning pressure and learning tension of senior one student increased. In order to alleviate students' boredom of learning and mobilize their learning enthusiasm, students were arranged to watch inspirational traditional films or VR films at a fixed evening self-study time. After one semester, the learning enthusiasm score of students in VR class is 1 point higher than that of traditional film class. The relevant results are shown in Table 1.

Table 1. The learning status of three groups of senior one student after a semester

Class	Learning enthusiasm	Learning initiative	Learning autonomy
Normal shift	3	3	3
Traditional film class	4	5	4
VR class	5	5	4

Conclusions: Film has the function of educational influence. In the audio-visual process, the feelings and ideas to be conveyed by the film will be transmitted to high school students, while VR film will further amplify the audio-visual experience and drive the experience of other sensory organs. This immersive viewing will enlarge the viewing experience of high school students and make them feel deeper, so as to be more active and active in learning.

* * * * *

CREATIVE PRODUCT DEVELOPMENT AND DESIGN FROM THE PERSPECTIVE OF DESIGN PSYCHOLOGY

Hui Li & Feng Sun

Luxun School of the Arts, Yan'an University, Yan'an 716000, China

Background: Design psychology rose in the last century, and its application field is ergonomics. With the passage of time, design psychology has been accepted by more people and applied more widely in the ordinary design process. Psychology is the basis of design psychology. Design psychology combines psychology, design art, aesthetics and other disciplines. When designing, it will analyze consumers' attention, perception and memory from the perspective of consumers, and carry out targeted design according to the characteristics of these three aspects. Study the way consumers' brains process external information, find the factors that can attract consumers, and design with these factors, so as to resonate with consumers. The development and design of cultural and creative products cannot be separated from the application of design psychology. Taking cultural and creative products in colleges and universities as an example, cultural and creative products mainly include products and creativity. In foreign countries, cultural and creative products have developed mature and formed a complete industrial chain. Cultural and creative products are complete, most of which belong to original products. Many foreign countries are good

at developing the cultural value of cultural and creative products. As a means of publicizing campus spiritual culture, some even create brands and expand their publicity. Compared with foreign countries, domestic campus cultural and creative products started late, lack of strong national support and lack of relevant legal support. Moreover, the design of domestic campus cultural and creative products is single, the production of products is relatively rough, and the cultural connotation is shallow, which cannot represent the characteristics of colleges and universities. In addition, there are few stores selling campus cultural and creative products in China. The innovation of cultural and creative products is insufficient, and there are few original products. According to the shortcomings of domestic campus cultural and creative products, the use of design psychology for targeted development and design should first grasp the attention of consumers. The products must be novel, which can make consumers pay attention intentionally, urge them to actively pay attention to the products, and then screen out the information required for design. In addition, it is also necessary to study the processing methods of consumers' perception and memory of relevant information, it also analyzes the characteristics of campus culture in detail, and designs campus cultural and creative products on this basis.

Objective: Apply design psychology to the development and design of campus cultural and creative products, take attention, perception and memory as the new design entry point, integrate into the cultural characteristics of colleges and universities according to the needs of consumers, and reflect it in the overall shape, color and material of cultural and creative products, so as to resonate with consumers and make consumers have the desire to buy, so as to improve the sales volume of campus cultural and creative products and open the market of campus cultural and creative products. Adjust and improve the development and design of campus cultural and creative products according to the time-varying consumption aesthetics and demand, so that campus cultural and creative products can keep up with the changes of consumer demand and promote the sustainable development of campus cultural and creative products.

Research objects and methods: The research objects are college students. Five universities with obvious cultural characteristics were selected, and 500 college students were randomly selected from these universities. Invite them to participate in the activity of tasting campus cultural and creative products. The campus cultural and creative products in the activity come from five universities. The design of related products integrates design psychology. Relevant data were recorded during the activity and recorded through SPSS17.0 software to process the data, and use fuzzy synthesis to evaluate the impact of design psychology on-campus cultural and creative products. The evaluation adopts grades 1-5. The higher the score, the greater the impact.

Results: The creativity of campus cultural and creative products in domestic colleges and universities is insufficient, and the sales volume of products is not ideal, which cannot fully show the campus cultural characteristics of colleges and universities. From the perspective of design psychology, integrate campus culture into cultural and creative products, carry out design innovation in attention, perception and memory, promote the creativity of campus cultural and creative products, and meet the consumption needs of college students. Students majoring in language and literature score 5 points and 4 points respectively on the innovation and practicability of campus cultural and creative products. The relevant scoring results are shown in Table 1.

Table 1. Evaluation of campus cultural and creative products by college students of different majors

Major	Innovation	Practicability	Aesthetics
Language and culture major	5	4	5
Tourism English major	4	4	4
Bioengineering	4	4	4

Conclusions: The design of cultural and creative products on campus involves many disciplines, such as design psychology and aesthetic color composition. The ultimate purpose of campus cultural and creative products is to attract consumers to shop and reflect the spiritual culture of different colleges and universities. Through the research of design psychology, the perception, memory and attention of consumption are studied, and on this basis, novel and practical cultural and creative products in line with consumers' aesthetics are designed.

* * * * *

THE APPLICATION OF EDUCATIONAL PSYCHOLOGY IN IDEOLOGICAL AND POLITICAL TEACHING IN COLLEGES AND UNIVERSITIES

Jing Rong

Department of Applied Foreign Languages, Maanshan Technical College, Maanshan 243031, China

Background: Teaching psychology studies the psychological activities of education and the educated in education and teaching, as well as the related change laws. This psychology belongs to the category of psychology. In the 19th century, educational psychology developed into an independent discipline, and then it was continuously improved. Education includes school education, family education and social education. The formation of individual main knowledge and moral quality is mainly concentrated in the scope of schools. Educational psychology includes students' learning psychology, teachers' teaching psychology, teaching evaluation, teachers' psychology and so on. Educational psychology is closely related to educational and teaching practice and has strong applicability. Educational psychology plays a very important role in the ideological and political teaching of college courses. The application of educational psychology in the teaching of such courses can promote the expansion of teaching ideas. During the teaching period, we should pay attention to the psychological situation of students, understand their learning needs and personality differences, and carry out teaching around students. Educational psychology can also promote the innovation of ideological and political teaching methods. By strengthening the understanding of students' thoughts and emotions, it can carry out targeted teaching and increase the effect of ideological and political teaching. According to the knowledge of teaching psychology, the path of ideological and political teaching is innovated. Give full play to the leading role of teachers, update the teaching concept according to educational psychology, and get the favor of students. Using emotional teaching theory, increase the scientificity of teaching, pull in the relationship with students in the process of psychological counseling, promotes students' self-improvement, improves students' self-consciousness, cultivates students' learning enthusiasm, and improves learning efficiency in continuous learning and exploration. The specific path of ideological and political education curriculum reform in colleges and universities.

Objective: Through the characteristics of educational psychology, integrate it into the ideological and political teaching of college courses, understand the psychological status and emotional changes of students, and carry out corresponding education and teaching centered on students. Carry out the innovation of ideological and political teaching methods, strengthen the understanding of students' thoughts and emotions, carry out targeted teaching, and increase the effect of ideological and political teaching. Give full play to the leading role of teachers, update the teaching concept according to educational psychology, and get the favor of students. Using emotional teaching theory, increase the scientificity of teaching, pull in the relationship with students in the process of psychological counseling, promotes students' self-improvement, improves students' self-consciousness, improves students' learning enthusiasm, and lets students learn self-regulation.

Research objects and methods: The research objects are college students. Four colleges are randomly selected from a university, and then one class is selected from each of these colleges. Among them, the economic and trade class carries out normal ideological and political teaching, and the other three classes carry out ideological and political teaching integrated with educational psychology. Before the experiment, there was no statistical difference in the ideological and political situation of the students in these classes. The relevant situation of the students was recorded during the experiment, which lasted for one semester. Through SPSS18.0 software processing experimental data, using fuzzy evaluation method, using 1-5 grades to quantify the relevant influencing factors, to study the impact of the reformed ideological and political teaching on college students.

Table 1. The ideological and political situation of college students after the reform of ideological and political teaching

Group	Achieve mastery through a comprehensive study of the subject	Unity and cooperation	Overall situation
Economic and trade class	4.05±0.14	3.86±0.11	3.94±0.34
Humanities class	4.41±0.51	4.68±0.35	4.87±0.58
Chemistry class	4.64±0.83	4.70±0.42	4.32±0.45

Results: Educational psychology can study the psychological change law of educators and students, and apply it in teaching activities, which is conducive to the good development of teaching and improve the effect of teaching. According to the role of educational psychology, it is applied to the ideological and political teaching of college courses. Under student-centered teaching reform, it can promote the

improvement of students' self-consciousness and improve students' comprehensive quality in the process of active learning. After one semester of ideological and political teaching reform, students' knowledge and ability have been improved. The overall awareness score of humanities class is higher than that of chemistry class. The overall awareness score of the humanities class is (4.87 ± 0.58). The specific results are shown in Table 1.

Conclusions: With the continuous development of education, the state and colleges and universities attach great importance to students' ideological education and affirm the value and important role of educational psychology in education. Ideological and political teaching plays a very important role in the cultivation of students' three outlooks. Combine educational psychology with ideological and political teaching, realize the reform and innovation of ideological and political teaching methods, provide teaching effects, promote the improvement of students' self-efficacy and improve students' comprehensive quality under the guidance of teachers.

EXPLORING THE TRANSFORMATION TREND FROM COMPARATIVE LITERATURE TO COMPARATIVE CULTURE FROM THE PERSPECTIVE OF CROSS-CULTURAL PSYCHOLOGY

Yufang Xiao^{1,2}, Zhiqiang Tan³ & Xuexiang Zhang^{4*}

¹*School of Literature, Shandong University, Jinan 250100, China*

²*Scientific Research Office, Weifang University, Weifang 261061, China*

³*School of Literature & History, Weifang University, Weifang 261061, China*

⁴*School of Foreign Languages, Weifang University, Weifang 261061, China*

Background: Cross-cultural psychology is a branch of psychology. With reference to the data of multiple cultures, this paper analyzes the psychological differences between different cultures, explores their commonality, as well as the relevant social culture, and studies the impact of these cultural characteristics on psychology. Cross-cultural psychology comes from two disciplines: cultural anthropology and psychology. Cultural anthropology studies the psychological characteristics of different cultures and analyzes their differences, while psychology explores the causes of psychological differences. There is the cultural comparison in cross-cultural psychology. Analyzing the effects of different social environments on psychology, cross-cultural psychology provides new research ideas for psychology.

From the perspective of cross-cultural psychology, the fundamental attribute of comparative culture is cross-culture. Literature is the product of the joint action of multiple cultures, and neither Chinese nor Western culture can be pure. In the long history, the development of Chinese culture has also been affected by other cultures, while western culture will integrate some other cultures when conquering or communicating with other countries, and there is no clear boundary between Chinese and Western cultures. From the perspective of cross-cultural psychology, there is a situation of comparative culture transformation in higher education. In the process of teaching, learn advanced western knowledge and experience. In foreign language teaching, we should use the foreign language to tell and write about Chinese culture and customs. Chinese and Western cultures are merging with each other, and finally, realize the coordinated development of the two

Objective: Study the connotation of cross-cultural psychology and comparative literature, and on this basis, analyze the phenomenon of comparative literature in college education and teaching, study the law of its development and change, and find the trend of comparative culture transformation. This paper applies these comparative culture transformation trends to foreign language teaching in Colleges and universities, analyzes their impact on foreign language teaching, teachers and students, and the changes obtained by teachers and students in this comparative culture transformation.

Research objects and methods: The research objects are foreign language majors. A total of 200 foreign language majors were randomly selected from four universities to understand their learning situation, personal information, attitude towards foreign language teaching, understanding of comparative literature and other information, apply the trend of comparative culture transformation to foreign language teaching, and record the relevant experimental data. Through the fuzzy evaluation method to evaluate the impact of foreign language teaching on foreign language majors after the reform, the quantitative score of relevant influencing factors adopts grade 1-5, and 1-5 points respectively mean no impact, slight impact, general impact, obvious impact and complete impact. SPSS software is used for the statistical analysis of relevant data.

Results: It has been 30 years since the beginning of Chinese comparative literature. After the accumulation of this time, Chinese comparative literature has reflected on the system and theory, and rationalized the system. From the perspective of cross-cultural psychology, comparative culture has undergone great changes and has been applied more widely. In foreign language teaching, we should reform foreign language teaching with the help of the trend of comparative culture transformation. In terms of listening, speaking, reading and writing, we have integrated Chinese and Western cultures, used foreign languages to teach Chinese and Western cultural knowledge, and compared the cultural differences between China and the West. Foreign language majors have more sense of identity and familiarity with foreign language teaching. In the research on the impact of foreign language teaching reform, sophomores believe that reformed foreign language teaching can significantly improve students' writing ability, and the impact score is 5. The specific results are shown in Table 1.

Table 1. The influence of foreign language teaching on foreign language majors after the reform

Grade	Listening ability	Oral ability	Writing ability	Reading ability
Freshman	4	5	4	4
Sophomore	4	4	5	3
Junior	5	4	5	4

Conclusions: Cross-cultural psychology is the study of people in multiple cultures, analyzing the commonality of these people's psychological characteristics, and studying the impact of social culture on human psychology. Using cross-cultural psychology, this paper analyzes the current situation and transformation trend of comparative literature, and finds that comparative literature has been transformed from literariness to symbolism, from cross-cultural to interdisciplinary, and the scope of comparative literature research has been continuously expanded to meet the needs of the development of the times. The interpretation of different cultures is more profound. Using the idea of transforming comparative literature into the comparative culture, we will reform the foreign language teaching that used to teach foreign language knowledge only, and use Chinese culture. Foreign language has become a means to express Chinese culture, customs and other knowledge. Through this means, we will expand the scope of the spread of Chinese culture and enable foreign students to understand China more truly. In addition, for foreign language majors, this way can increase their acceptance of foreign language learning and make foreign language majors feel a sense of national pride and achievement in the process of foreign language learning.

* * * * *

INFLUENCE OF VOCAL MUSIC TEACHING REFORM IN COLLEGES AND UNIVERSITIES ON THE IMPROVEMENT OF CONTEMPORARY STUDENTS' ANXIETY PSYCHOLOGY

Yanghua Huang & Houbiao Wei

Conservatory of Music and Dance, Institute of Education, Nanchang Vocational University, Nanchang 330500, China

Background: Anxiety is the anxiety caused by facing unsolvable problems in life, and there will also be negative emotions such as tension and anxiety. There are also some typical anxieties in anxiety psychology, such as floating anxiety, which can also be called nameless anxiety, that is, anxiety of unknown cause. For students, anxiety psychology is a double-edged sword. An appropriate amount of anxiety psychology can maintain their learning enthusiasm and promote the improvement of students' initiative. When anxiety is beyond the scope of students' psychological tolerance, it will have a negative impact on students' physical and mental health, resulting in physiological phenomena such as mental tension, sweaty palms, headache and so on. Anxiety psychology is affected by environment and personal characteristics, and can be divided into state anxiety and trait anxiety. The former has timeliness and will reduce or disappear according to the change of anxiety environment. The latter is long-term and difficult to eliminate. According to the causes of anxiety psychology, it can be divided into realistic anxiety and pathological anxiety. Realistic anxiety comes from the real potential challenges and threats, and the anxiety emotional response in the face of these potential challenges and dangers. Realistic anxiety is a common anxiety. The pathological anxiety will appear the continuous anxiety of unknown reason, feel the inexplicable sense of threat, and the patient's autonomic nerve function will be disordered, resulting in subjective pain, such as mental anxiety in generalized anxiety disorder.

Contemporary college students have great learning pressure. Due to the lack of timely and effective elimination of these pressures, students have psychological problems, such as anxiety, anxiety and anxiety, which affect the normal development of students' learning and life. For example, college vocal music students have singing anxiety and stage performance anxiety in the process of vocal music learning. They are afraid to sing in front of others, and they are afraid that the teacher will criticize themselves because of their poor singing, and they may also be ridiculed by the students. Because the expectation of their singing effect is too high, resulting in anxiety. Before the relevant stage performance, due to lack of self-confidence, they have fear, feel that their stage performance ability is not good, and have anxiety. According to the anxiety psychology of college vocal music students, this paper reforms the vocal music teaching in colleges and universities, and studies its influence on the improvement of students' anxiety psychology.

Objective: To reform vocal music teaching in colleges and universities by comprehensively mastering the anxiety psychology of vocal music students in colleges and universities. Through stage performance psychological training and regulation, vocal music students' anxiety can be controlled and alleviated, and students' self-confidence can be improved. Students can appropriately use some small skills to alleviate their tension, such as drinking some warm boiled water before the performance to alleviate dry mouth and tongue. By asking vocal music students to summarize their stage experience, analyze their shortcomings, and check and make up for deficiencies, so as to avoid anxiety caused by high expectations.

Research objects and methods: The research objects are students majoring in vocal music in school. 200 students majoring in vocal music are randomly selected from three universities. These students come from different schools and grades, their personality characteristics are different, there is a gap in family economic situation, and their vocal music learning level is different. Understand their views on vocal stage performance and vocal singing and relevant teaching suggestions. The principal component analysis method is used to analyze the relevant factors to study the influence of the reformed vocal music teaching mode on the anxiety psychology of vocal music students. The relevant influencing factors are quantified by grade 0-4. The higher the score, the greater the impact. The relevant data are processed and analyzed by Excel software and SAS software.

Results: The anxiety of college students is a common psychological problem. Affected by the environment and students' personality characteristics, the degree of anxiety of students is different. For students majoring in vocal music, their anxiety psychology is mainly manifested in singing anxiety and stage performance anxiety. Due to the lack of self-confidence, excessive pursuit of perfection and insufficient stage preparation, vocal music students have anxiety, which seriously affects their learning enthusiasm and initiative, and has a certain negative impact on their physical and mental health. After the reform of vocal music teaching mode, the self-confidence of vocal music major has been improved, the self-awareness is more accurate, and the learning level has been significantly improved. Among the effects of the reformed vocal music teaching mode on the anxiety psychology of vocal music majors, stage performance psychological training and regulation have the greatest impact on the anxiety psychology of freshmen majoring in vocal music, with a score of 4 points. See Table 1 for the specific results.

Table 1. The influence of the reformed vocal music teaching mode on the anxiety psychology of vocal music majors

Grade	Stage performance psychological training and regulation	Stage experience summary	Teachers' emotional regulation	Strengthen music sense training
Freshman	4	4	3	3
Sophomore	3	4	3	4
Junior	4	3	3	4

Conclusions: Through the reform of vocal music teaching mode in colleges and universities, the learning efficiency of vocal music students is greatly improved, the anxiety psychology of students is significantly improved, and the music sense of students is continuously enhanced.

* * * * *

THE IMPROVEMENT EFFECT OF TRACK AND FIELD TRAINING INTENSITY AND TRAINING AMOUNT ON STUDENTS' COGNITIVE IMPAIRMENT IN COLLEGE PHYSICAL EDUCATION

Dacheng Xu

Sports institute, Inner Mongolia Minzu University, Tongliao 028000, China

Background: Cognition is the brain's comprehensive perception of external things, mainly including psychological processes such as execution, perception, thinking, attention, memory and judgment. Cognitive function is mainly reflected in executive function, attention and memory. Memory refers to the neural process of storing and extracting information or experience in the brain. It is the first aspect of cognitive decline, and memory decline is the main symptom of patients with cognitive impairment. Mild cognitive impairment is a precursor of dementia. It is an intermediate state between dementia and healthy aging. It is one of the main health problems caused by the aging of the world population. At present, the incidence rate of global cognitive impairment is increasing year by year, and is becoming younger and younger. The prevalence of cognitive impairment in European and American developed countries ranges from 1% to 6%, and in China, the prevalence among people over 60 years old ranges from 8.3% to 35.9%. Research shows that the proportion of cognitive impairment transformed into dementia within three years is about 39%, while the proportion of normal people is less than 1%. The average treatment cost of dementia patients in China accounts for about 40% of family income, which is far greater than that of non-dementia patients. Therefore, patients with cognitive impairment will cause a serious economic burden on their families, and then evolve into a major global social problem. In addition, the mental and behavioral symptoms caused by cognitive impairment will also lead to the impairment of patients' social ability and life ability, which will seriously affect the lives of patients and their families. Some studies have pointed out that mild cognitive impairment can return to normal under certain conditions, and once it turns into dementia, the damage to the nerve will not be reversed. Strengthening the early intervention of patients with cognitive impairment is of great significance to prevent the further deterioration of the disease.

Research shows that sports track and field training can effectively improve students' cognitive impairment symptoms. In the past track and field teaching, the teachers' usual training principle is high training amount and low training intensity. However, in the actual results, the traditional training mode has not achieved good results, and cannot effectively improve the symptoms of students' cognitive impairment. Students' long-term experience of such training will lead to students' muscle injury, which cannot really give full play to their own characteristics. In serious cases, it will lead to extreme fatigue of the nervous system, and even affect the students' motor nervous system, resulting in serious psychological trauma and even confusion of consciousness and consciousness, which is very dangerous for students.

Objective: In the physical education of colleges and universities in China, track and field sports are of great significance to improve the sports level and physical and mental health development of college students, and can promote the overall improvement of college students' physical and mental quality. At the same time, in track and field teaching in colleges and universities, training quantity and training intensity are two important factors, which directly affect students' training effect and psychological quality. This study mainly analyzes the relationship between the intensity of track and field training and the amount of training in colleges and universities, and provides suggestions for improving students' track and field training effect and mental health.

Research objects and methods: 300 college students with cognitive impairment were selected as the research object. The teaching mode was optimized after the training intensity and training amount. The teaching time lasted for 3 months. After the teaching was completed, the relief of cognitive impairment symptoms of college students before and after teaching was analyzed.

Study design: After optimizing the teaching mode of training intensity and amount, evaluate the improvement of cognitive impairment symptoms of subjects. The evaluation methods mainly include invalid, effective and obvious effect. The invalid is that the students' mental state is not improved, and the effective cognition, emotion and will are improved. The obvious effect is that cognition, emotional behavior and will are significantly improved. Total effective rate = (effective + effective) / total number of people × 100%.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After teaching and test, the improvement rate of symptoms reached 89.0%, which has a high effect and application value.

Table 1. Statistics of improvement effect after teaching

Time	Invalid	Effective	Remarkable effect	Total effective
After teaching	33	105	162	267 (89.0%)

Conclusions: Track and field training can not only effectively promote students' physical and mental development, but also develop students' thinking ability. In order to better strengthen the intensity and

training amount of students' track and field sports, teachers need to formulate a scientific and reasonable teaching plan, and cannot blindly strengthen the training of students and increase the training amount. Therefore, teachers should understand the physical condition of each student, formulate appropriate training plans according to the actual situation of students, reasonably grasp the training intensity and amount, and arrange students to train in a planned way. In addition, teachers should make corresponding improvements to the problems in the teaching process, so as to improve the teaching quality and promote the healthy and all-round development of students' bodies and minds.

* * * * *

PROMOTING EFFECT OF COPING STRATEGIES OF COAL MINE SAFETY STANDARDIZATION MANAGEMENT ON THE IMPROVEMENT OF EMPLOYEES' COGNITIVE IMPAIRMENT

Meng Li

*Department of Safety Supervision and Management, Chongqing Vocational Institute of Safety & Technology,
Chongqing 404000, China*

Background: Cognitive impairment is a common clinical symptom in psychosis. It is a key entry point for the early diagnosis of dementia and can provide a key basis for the early prevention of dementia. Mild cognitive impairment mainly refers to mild memory or other cognitive impairment beyond the allowable range of their age, but it does not meet the diagnostic criteria of dementia. Patients with cognitive impairment have normal activities of daily living, but the etiology cannot be explained by known neurological and mental diseases. They are in an intermediate transition state between aging and early dementia. At present, cognitive impairment has attracted more and more scholars' attention at home and abroad. Research shows that mild cognitive impairment can be divided into four subtypes: forgetting type, multi cognitive domain forgetting type, single non-memory type and multi cognitive domain non-forgetting type. In the field of epidemiology, 40% of the patients with cognitive dysfunction develop dementia, and the incidence rate is 10 times that of normal people. It indicates that patients with cognitive impairment are the high-risk group of dementia. The conversion rate of cognitive impairment into dementia will increase significantly with the extension of time. The conversion rate within 1 year of initial diagnosis will be 10%-15%, and will reach more than 55% within 4-5 years. Therefore, the early prevention of cognitive impairment is particularly critical. Some scholars pointed out that cognitive impairment is divided into seven clinical stages from normal cognition to very severe dementia, and pointed out that the diagnosis of dementia should be extended to preclinical and cognitive impairment. In addition, cognitive impairment is also associated with dementia, indicating that the early diagnosis and treatment of dementia is beginning to become promising. Research shows that the standardized management of enterprises is conducive to improving the symptoms of cognitive impairment. At present, the safety and quality standardization management of domestic coal mining enterprises must comply with laws, regulations, rules and regulations, including coal mining, excavation, electromechanical, transportation, ventilation, water prevention and other production links of the mine, as well as the safety and quality work of relevant posts, so as to keep the coal mine in a good state of safety production, to ensure the safety of miners' lives and the modernization of coal industry. Focusing on the basic work of coal mine safety, relevant national safety departments have introduced a series of laws, regulations and rules, which provide a legal basis for in-depth coal mine quality standardization, effectively curb illegal mining and illegal production, and provide a basis for coal mine quality standardization.

Objective: The nature of coal mine safety quality standardization mainly includes scientific, mandatory, operable, comprehensive and developable. Therefore, it must be formulated according to the psychology of staff. This study mainly discusses the impact of coal mine safety standardization management on patients with cognitive impairment in enterprises, in order to provide suggestions for improving the symptoms of cognitive impairment.

Research objects and methods: 120 employees with cognitive impairment in 6 coal mining enterprises were selected as the research objects. The research objects were subject to coal mine safety standardized management. After 2 months, the relief of cognitive impairment symptoms of the subjects was observed.

Research design: Before and after the standardized management of coal mine safety, the Mini-Mental State Examination (MMSE) was used to evaluate the improvement of cognitive impairment symptoms, including memory, attention, understanding and time orientation. The total score was 0-30. The higher the score, the stronger the ability.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The MMSE score after the application of coal mine safety standardization management was significantly higher than that before the management ($P < 0.001$), indicating that the coal mine safety standardization management has a high effect and application value.

Table 1. Statistics of improvement effect before and after management

Scoring method	Before management	After management	<i>t</i>	<i>P</i>
MMSE Score	12.42±2.69	20.57±4.74	8.323	0.000

Conclusions: Coal mine safety quality standardization is the basis for coal enterprises to ensure safety in the production process, and it is important content and fundamental way to establish coal mine safety mechanism. Coal mine safety and quality standardization have been comprehensively promoted in China's coal industry and achieved great results. However, due to the production characteristics of the coal industry and the continuous progress of science and technology, safety and quality standardization needs to be revised and improved continuously. This is a long-term, basic, and daily work. It is necessary to summarize mistakes and find out deficiencies in the process of construction and development. It is also necessary to constantly learn from the advanced management experience of excellent enterprises and constantly improve the content of quality standardization management. So as to improve the standardized management level of coal mine safety and quality as a whole, create a civilized and harmonious safety production environment for miners, ensure the life safety of miners and the benign operation of the mine, and build an intrinsically safe mine.

ON THE CONSTRUCTION OF DESIGN INDUSTRY COLLEGE FROM THE PERSPECTIVE OF ART DESIGN PSYCHOLOGY

Dong Wang

College of Art and Design, Henan Institute of Technology, Xinxiang 453000, China

Background: Art design psychology is a theoretical course for design majors. It is a subject that designers must master. It is based on psychology. It is a knowledge that applies people's psychological state, especially people's psychology for needs, to design through consciousness. At the same time, it studies people's mentality in the process of design creation and the psychological response of the design to society and social individuals. In turn, it plays a role in making the design more able to reflect and meet people's psychology. Art design runs through the whole process of humans changing the world. In order to design products that meet the needs of generations, designers should think from the perspective of art design psychology and innovate the design concept of modern art. With the continuous development of society, people's requirements for art design are becoming higher and higher, which makes innovative thinking become the main development trend of modern design. As an interdisciplinary subject of industrial design and consumer psychology, art design psychology is a branch of applied psychology. Design psychology is a psychology that studies the interaction between people and things. It studies how to grasp consumer psychology, follow the law of consumer behavior, design marketable products and finally improve consumer satisfaction in design activities. It can be seen that design psychology studies the relationship between environment, people and things, and the relationship between psychological phenomena and emotional factors of designers and audiences.

For the College of design industry in colleges and universities, it needs to meet the dual needs of students' psychology and physiology, and emphasize that design takes students as the starting point, so as to finally achieve the purpose of being used by students. As the main body of learning, students are both natural and social people. Therefore, the humanized design of courseware should be fully considered in these two aspects. For example, we should consider the students' perception characteristics, reaction characteristics, physiological characteristics and psychological characteristics. The purpose of students' social behavior, values and humanistic environment are to attract their attention and improve their learning effect. In order to better build the art industry, colleges and universities should be based on art design psychology in order to design innovative products that meet the requirements of the times and consumer psychology, so as to promote the development of the art industry. Because the psychological needs of consumers will change constantly, designers also need to update their design works, and the application of art design psychology has become an important link between consumers and designers. Therefore, college

students should have the ability to innovate and creation and apply the new potential to design.

Objective: With the improvement of people's living standards and the development of the market economy, the art industry in relevant colleges and universities continues to rise and plays a certain role in the socialist market economy. If the art industry in colleges and universities wants to develop rapidly, the key lies in cultivating innovative talents from the perspective of art design psychology. Therefore, this study aims to explore the scheme of building a design industry college from the perspective of art and design psychology, so as to improve the ability of college students in art and design psychology.

Research objects and methods: 200 college students from the college of the design industry in a university were selected as the research object to teach students' art design from the perspective of art design psychology. The teaching time was one semester. After the teaching was completed, the ability of art design psychology of college students before and after teaching was evaluated.

Research design: Before and after the art design teaching of students based on the psychology of art design, evaluate the scores of students' design works and professional courses based on the psychology, and the full score is 100.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After one semester of teaching, the scores of all students' works and examination scores were significantly higher than those before teaching ($P < 0.05$), as shown in Table 1.

Table 1. Comparison of work scores and examination scores before and after teaching

Score	Before teaching	After teaching	<i>t</i>	<i>P</i>
Professional course score	71.69±7.66	76.27±8.11	4.886	<0.001
Work score	71.54±7.58	78.62±7.94	6.517	<0.001

Conclusions: Innovation is the core element of the art design and the standard for evaluating design works. Design psychology is more like the benchmark of the art design, which guides designers to design works that are more in line with the psychology of consumers and closely follow the social and cultural trends in order to meet the different needs of consumers. The future development of the art industry in colleges and universities must be based on the organic combination of people-oriented and innovative design. First, innovation is the soul support of the whole art design industry, which requires designers to carry forward the tradition, go beyond the inertia, actively cultivate innovative thinking and expand innovative technology, so as to continuously improve the value of their artworks. Let college students actively participate in the innovation of art industry, integrate new ideas and new trends into future art and design works in combination with design psychology, enrich campus culture and drive the organic development of art industry at the same time.

* * * * *

THE INFLUENCE OF STUDENTS' THINKING LOGIC OBSTACLES ON IDEOLOGICAL AND POLITICAL MANAGEMENT IN COLLEGES AND UNIVERSITIES

Xiaoyan Yu

School of Transportation and Civil Engineering, Nantong University, Nantong 226019, China

Background: No matter in any work, the ability of thinking and logic is one of the necessary abilities for work. Thinking logic can be mainly divided into three categories: formal logic, that is, the logical mode with thinking form and law as the main thinking object. Mathematical logic is a logical category applied to mathematical language or methods. Dialectical logic focuses on the internal contradictions and mutual transformation of things. These three logical forms provide a basic guarantee for human thinking, social and educational functions. In the process of understanding the objective world and external society, any logical way is essential. As an important part of education, ideological and political management in colleges and universities, both the manager and the managed party need certain thinking logic ability. The thinking logic obstacles generated by students are likely to lead to their misunderstanding of Ideological and political management information, and then lead to the failure of Ideological and political management. Thinking logic barrier refers to the phenomenon that people use reasoning, judgment and other logical methods to deduce the external information, which is contrary to the conventional thinking and logical methods, including different forms of expression such as unable to accurately judge the connotation of information, misjudge the logical premise and rules, misinterpret the causal relationship and so on. Because the essence

of Ideological and political management in colleges and universities in the management of students' psychological status, and the management of behavior is only one of the external manifestations of psychological management, the most common way in the process of management is the transmission and understanding of Ideological and political information. Once the process of thinking and politics is influenced by logic, it is very difficult for the students to convey information effectively, that is, the process of thinking and politics is affected by the logic, and then it is very difficult for the managers of colleges and universities to have an effective communication of information. According to the different types of management work, students' obstacles in any aspect of formal logic, mathematical logic and dialectical logic may lead to the failure of Ideological and political management in colleges and universities. Therefore, analyzing the characteristics of students' thinking logic obstacles in college ideological and political management can effectively prevent the negative impact of thinking obstacles on Ideological and political management, so as to ensure the normal progress of Ideological and political management and improve management efficiency.

Objective: This study analyzes the negative impact of thinking logic barriers on Ideological and political management in colleges and universities, so as to help colleges and universities establish a system to prevent and manage students' thinking logic barriers in Ideological and political management.

Subjects and methods: This study mainly uses the way of the field test to detect the thinking logic obstacles of middle school students in Ideological and political management. Through the statistics of the types of obstacles that students show in the field test, this paper analyzes the impact of students' thinking logic obstacles and ideological and political management in colleges and universities.

Study design: This study selects freshmen majoring in English in a university as the experimental object. The experiment is mainly carried out in the form of a field test. The test includes two parts: paper problems and practical problems. Through the statistics of the test results and the observation of the practical test process, the characteristics of students' thinking obstacles in Ideological and political management are collected.

Methods: According to the difference between the results of paper problems and practical problems, this study adopts the methods of observation and computer background statistics to collect the students' field test results.

Results: The proportion of thinking logic obstacles caused by paper problems and practical problems in field inspection is as shown in Figure 1.

Figure 1. The proportion of practical operation and paper logic obstacle

In Figure 1, the thinking logic obstacles caused by practical problems account for 68% of the whole, while the thinking logic obstacles caused by paper problems account for 32% of the whole. It can be seen that due to the complexity of the problems generated in the practical operation of ideological and political management, students also have more thinking logic obstacles, which has a great impact on Ideological and political management.

Conclusions: In the process of Ideological and political management in colleges and universities, the transmission and understanding of information is often an important part of guiding students' actions in management. Once students have thinking logic obstacles in the process of receiving and understanding information, it will affect students' understanding of Ideological and political management information, and then lead to the obstruction of Ideological and political management. Analyzing the characteristics of students' thinking logic obstacles can ensure that students, as managers, receive wrong information in the process of management, and effectively improve the efficiency of Ideological and political management in colleges and universities.

* * * * *

THE APPLICATION OF PROJECT COST IN CONSTRUCTION PROJECT MANAGEMENT UNDER COGNITIVE IMPAIRMENT

Jinbao Cao

School of Construction Engineering, Nanchang Institute of Engineering, Nanchang 330044, China

Background: Mild cognitive impairment mainly refers to mild memory or other cognitive impairment beyond the allowable range of their age, but it does not meet the diagnostic criteria of dementia. Cognition is the brain's comprehensive perception of external things, mainly including psychological processes such as execution, perception, thinking, attention, memory and judgment. Cognitive function is mainly reflected in executive function, attention and memory. Memory refers to the neural process of storing and extracting information or experience in the brain. It is the first aspect of cognitive decline, and memory decline is the main symptom of patients with cognitive impairment. At present, the incidence rate of global cognitive impairment is increasing year by year, and is becoming younger and younger. Some studies have pointed out that mild cognitive impairment can return to normal under certain conditions, and once it turns into dementia, the damage to the nerve will not be reversed. Strengthening the early intervention of patients with cognitive impairment is of great significance to prevent the further deterioration of the disease. The research shows that the scientific and effective application of project cost in construction project management can improve the symptoms of employees' cognitive impairment. Scientific cost control can reduce the occurrence of changes and reconstruction caused by unreasonable cost control in project construction, and effectively improve employees' mental health problems, especially cognitive impairment. Because patients with cognitive impairment have poor understanding and learning ability, poor ability to master new things and new knowledge, and relatively blocked information, they can't know what happened, let alone understand the severity of the problem. Patients' cognitive abilities such as memory, judgment and execution decline. They don't know when and how to do a good job in work control and management, how to do a good job in protection, and it's difficult to remember the things repeatedly instructed. Moreover, patients have poor self-control ability, sometimes stubborn personalities, and may have stereotyped behavior. Patients are prone to anxiety and depression, emotional fluctuations, more obvious sense of insecurity, more prone to psychological stress response, and even the risk of inducing and aggravating mental and behavioral symptoms.

Objective: By analyzing various factors affecting the construction project cost, and aiming at the cognitive impairment of employees, scientifically and effectively put forward the application scheme of the project cost in construction project management technology, so as to improve the cognitive impairment of employees while improving the efficiency of construction project management.

Research objects and methods: 150 employees with cognitive impairment in a regional construction enterprise were selected as the research object. The project cost construction project management scheme based on cognitive impairment was used for 4-month management, and the effects of enterprises before and after management and the improvement of employees' cognitive impairment were evaluated.

Research design: The intervention time of this experiment is 4 months, and the construction enterprise employees are given the project cost and construction project management scheme management mode based on cognitive impairment. After the experiment, the improvement of cognitive impairment was evaluated by a Neuropsychiatric Inventory questionnaire (NPI), and the scores before and after the experiment were compared and analyzed.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After management, the NPI score of employees in the second and fourth months was significantly lower than the baseline level ($P < 0.05$), and the NPI score in the fourth month was significantly lower than that in the second month ($P < 0.05$).

Table 1. Comparison of NPI scores of employees in different periods

Score	Baseline	2 months	4 months
NPI	3.41±4.09	2.36±2.72*	1.74±2.42*#

Note: Compared with baseline, * $P < 0.05$; Compared with the second month, # $P < 0.05$.

Conclusions: Through the preliminary training of construction personnel, the construction personnel can carry out efficient construction, reduce mistakes in construction, and then improve the construction efficiency. In the early training of construction personnel, we should focus on the training of construction

technology. In the training, we should first clarify the contents of the construction project to the construction personnel, and then clarify the construction techniques involved. Whether the construction personnel have mastered the corresponding technology or not, we should re-emphasize the corresponding construction methods, and carry out construction simulation if necessary. Ensure that the construction personnel can fully master the corresponding construction skills. In construction engineering, cost management and control are of great significance. From the current situation, a variety of factors will have a certain impact on the construction engineering cost, such as design factors, material and equipment factors, decision-making factors, construction personnel factors and so on. Therefore, construction companies should have a comprehensive understanding of the influencing factors of construction project cost, and deal with them from multiple levels, so as to continuously improve the effectiveness of construction project cost management and control.

RESEARCH ON FINANCIAL AUDIT AND THE CONSTRUCTION OF MODERN FINANCIAL SYSTEM FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Hongwei Zhao

Research Center for Accounting and Auditing, Henan Finance University, Zhengzhou 451464, China

Background: Research on financial audit and the construction of modern financial system from the perspective of social psychology social psychology is an important science related to people's daily life. It can not only cover the advantages of all disciplines, but also add vitality to the long-term development of various disciplines. Irving's social interaction and habit analysis are the earliest disciplines proposed by psychologists. As a new category of language marginalization, sociopsycholinguistics follows the guiding principle of human standard, and the research object is people in society. Social psychology plays a very important role in the process of social development and interpersonal communication. If the national society wants to realize the people-oriented sustainable development, it needs the help of the relevant research of social psychology. With the rapid development of national economy, financial audit and modern financial system are also facing new reforms, which is an important requirement for promoting the modernization of national governance. It is of great significance to improve the financial audit and modern financial system. The Third Plenary Session of the 18th CPC National Congress clearly pointed out that finance is an important and basic pillar of national governance, and promoted the role of finance to the national level for the first time. At the Fourth Plenary Session of the 19th CPC Central Committee, it was proposed to divide the financial power and administrative power among governments, build local and financial relations with regional balance, financial coordination and clear rights and responsibilities, and form a system corresponding to the financial power, expenditure responsibility and administrative power of governments at all levels.

At present, the national economic development model has basically realized the transition to the stage of high growth and high quality, but there are still very prominent problems in the financial audit and modern financial system, which can be reflected in the unsatisfactory effect of the reform of the financial and tax system and the obvious problems in the tax system model; The investment and financing mechanism is relatively backward, the flexibility and scientificity are relatively lacking, and the market operation cost is high; Budget management is weak and budget execution is lacking. In view of these outstanding problems, building a modern fiscal and taxation system and promoting the internationalization of national governance are urgent problems to be solved at this stage. To achieve this goal, we should pay attention to the following points: establishing a sound fiscal and tax system, clarifying the fiscal relationship between the local and central governments, adjusting the fiscal and tax expenditure structure, and training professionals. With the continuous improvement of financial audit and modern financial system, it has become an inevitable demand to have high-quality, comprehensive and professional fiscal and tax talents. Government departments need to regularly organize fiscal and taxation personnel to participate in professional learning and training, so as to improve their understanding of the basic characteristics, development trend and key role of financial audit and modern financial system, and help them establish a rich fiscal and taxation professional knowledge system.

Objective: This paper analyzes the construction effect of financial audit and modern financial system under the background of social psychology, in order to improve the quality of national financial service and the quality of employees.

Research objects and methods: Select two enterprise financial related personnel to evaluate the

constructed financial audit and modern financial system through the fuzzy comprehensive evaluation method. The evaluation number of each enterprise is 50 and the cycle is 6 months. The evaluation content includes individual social psychology and social behavior, interpersonal psychology and behavior, and mass social psychology. Individual's social psychology and social behavior include social motivation, social attitude, social cognition, etc.; The psychology and behavior of interpersonal communication include interpersonal influence, interpersonal communication and interpersonal relationship; Mass social psychology includes national psychology and mass psychology. The evaluation results are evaluated by the five-grade scoring standard of 1-5 points. The higher the score, the healthier the psychology. In order to facilitate the expression of the research results, the average value of all objects is selected as the final result.

Methods: Analyze the construction effect of financial audit and modern financial system through the latest version of minitab20 data statistics software.

Results: Table 1 refers to the evaluation results of financial audit and modern financial system by the relevant financial personnel of enterprise B. It can be seen from Table 1 that in the three aspects of individual social psychology and social behavior (Q1), interpersonal psychology and behavior (Q2) and mass social psychology (Q3), financial audit and modern financial system have high mental health scores with the increase of duration. Therefore, the constructed financial audit and modern financial system can meet the development requirements of social psychology.

Table 1. Evaluation results of financial audit and modern financial system by relevant financial personnel of enterprise B

Category	Before	After 1 month	After 3 months	After 6 months
Q1	1	2	2	4
Q2	2	2	3	4
Q3	2	3	3	4

Conclusions: The constructed financial audit and modern financial system can meet the development requirements of social psychology. The research plays a role in promoting the efficient, standardized and scientific development of the fiscal and tax system. The constructed fiscal and tax system has certain popularization value and practical application significance.

Acknowledgement: The research is supported by: Sponsored by Program for Science & Technology Innovation Talents in Universities of Henan Province (No. 2020-cx-029).

APPLICATION OF REFINED MANAGEMENT IN PREFABRICATED BUILDING CONSTRUCTION PROJECT MANAGEMENT UNDER COGNITIVE IMPAIRMENT

Yongfu He* & Junjie Wang

School of Civil and Ocean Engineering, Jiangsu Ocean University, Lianyungang 222005, China

Background: Cognitive impairment refers to the abnormal processing of advanced intelligent knowledge in the process of thinking, judgment and learning. In most cases, it will produce dysfunction such as memory function and learning, and even pathological behaviors such as loss of line, recognition and use. At present, the medical field generally believes that the main causes of cognitive impairment are chronic brain injury, chronic systemic diseases and mental and psychological abnormalities, among which mental and psychological abnormalities are the most important. Cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment according to different performance types. The clinical manifestations of thinking disorder include delusion, thinking logic disorder, association process disorder, abstract generalization stage disorder and so on. In clinical practice, memory impairment mainly includes memory error, memory fragment loss, memory enhancement and so on. The perceptual disorder can be manifested as a perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. Under the background of cognitive impairment, assembled construction managers will have a series of problems, mainly manifested in the inadequate management of assembled construction projects, the inadequate implementation of construction engineering management system, the insufficient attention to construction engineering management, the insufficient preparation in the construction preparation stage, and the lack of a perfectly fine management mechanism.

The prefabricated construction project management scheme combined with fine management can

reduce the symptoms of patients with cognitive impairment, which is reflected in many studies at home and abroad. At present, there are still many loopholes in the supervision of construction engineering. Most enterprises rely too much on government functional departments because of their imperfect project management, which leads to the poor effect of management. For the problem that the construction project management system is not in place, although the competent departments at all levels have formulated the supervision and management norms of the construction industry, they still cannot achieve the effect of satisfaction in the specific implementation process. In view of the importance of construction project management, at this stage, the construction units advocate the principle of putting interests first. There are deficiencies in the implementation of many projects management work, the quality of the project cannot be effectively guaranteed, and the construction enterprises cannot get good development. Aiming at the problem of the insufficient construction preparation stage, it is mainly reflected in the low rationality of prefabrication construction and the low professional technical level and ability of construction enterprises. For the lack of a fine management mechanism, it is difficult to quantify the work standards. It is analyzed that the main reasons affecting the realization of high efficiency of construction engineering are the essential difference between the management mode of prefabricated building and the traditional management mode, the work mistakes of managers and so on. In view of these problems existing in prefabricated buildings, the development of prefabricated buildings in the future needs to be improved from the following aspects: strengthening construction technology management, improving management system, innovating construction engineering, optimizing construction management process and saving economic cost.

Objective: In order to analyze the impact of prefabricated construction project management combined with fine management on patients with cognitive impairment in the construction industry, this paper aims to provide new ideas and research directions for the future prefabricated construction project management and the mitigation of cognitive impairment.

Research objects and methods: Patients with mild cognitive impairment in two regions were selected as the research object. The improvement of patients with cognitive impairment before and after refined management of prefabricated building construction project management scheme was evaluated by fuzzy comprehensive evaluation method. The duration of the experiment was 6 months. Patients' cognitive impairment was measured with the help of Montreal Cognitive Assessment (MoCA), which includes seven dimensions: calculation and orientation, abstract thinking, visual structure skills, language, memory, executive function, attention and concentration. The full score is 30. The higher the score, the better the cognitive function. In order to avoid the influence of personal subjective factors on the research results, the lowest score and the highest score are omitted in the experiment, and the average scores of other research objects are taken as the final results.

Methods: Through SPSS23.0 data statistical analysis software to obtain the effect of assembly construction project management scheme on patients with cognitive impairment before and after fine management.

Results: Table 1 refers to the effect of the Q area prefabricated building construction project management scheme on patients with cognitive impairment before and after fine management. Before and after the refined management of the prefabricated construction project management scheme, the cognitive impairment of patients has been greatly improved, especially in abstract thinking and language.

Table 1. Effect of refined management of Q area prefabricated building construction project management scheme on patients with cognitive impairment

Factor	Before intervention	Intervention 6 months
Calculation and directional force	2.12±0.59	3.25±0.59
Abstract thinking	2.21±0.43	3.56±0.43
Visual structure skills	2.21±0.55	3.34±0.55
Language	2.06±0.41	3.53±0.41
Memory	2.31±0.59	3.21±0.59
Performing function	2.02±0.43	3.22±0.43
Attention and concentration	2.12±0.55	3.21±0.55

Conclusions: The prefabricated construction project management scheme after fine management can greatly improve the symptoms of patients with cognitive impairment. This scheme is an effective strategy for the treatment of thinking disorder. At the same time, the proposed project management scheme can be applied to the management of other prefabricated construction projects, so as to improve the management ability of prefabricated construction projects.

RESEARCH ON TEACHING REFORM OF ART MAJORS IN HIGHER VOCATIONAL COLLEGES UNDER COGNITIVE IMPAIRMENT

Chuan Xue

School for Creative Studies, Yiwu Industrial & commercial College, Yiwu 322000, China

Background: The behavioral characteristics of cognitive function are mainly manifested in the changes of executive ability, attention, language ability and social cognition. For social cognitive ability, it is mainly manifested in anxiety in social communication, weakening of emotional control ability, decline of resonance ability and reduction of recognition of social clues. For attention, it is mainly manifested in the reduction of information processing speed, selectivity and other types of attention changes. For the executive ability, it is mainly manifested in the decline of organization and decision-making ability and the inability to complete complex tasks. For language ability, it is mainly manifested in grammatical errors, ignoring social etiquette, the phenomenon of words failing to express their meaning in communication with people, and problems in abstract language expression and understanding. Clinically, cognitive impairment is a transitional state between normal people and early Alzheimer's disease. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further aggravation of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show decreased overall function and develop dementia, which will lead to delusion, indifference, lack of self-care ability, and so on.
