As an art form, the ultimate purpose of art specialty teaching in higher vocational colleges is to further improve and even enhance students' psychological quality and ideological realm through the cultivation of aesthetic sentiment, so as to help individuals achieve comprehensive and all-round development. The integration of new media teaching methods in higher vocational art courses can improve the symptoms of cognitive impairment and help students improve their cognitive level. Under the background of cognitive impairment, there are very prominent problems in the reform of art major curriculum teaching in higher vocational colleges under the impact of new media, which are embodied in how to scientifically and effectively apply new media technology to the daily work and teaching of higher vocational colleges, and how to maximize the modern advantages of new media technology in teaching. Under the new situation of the development of new media, the demand for talents trained in the teaching of art courses will change greatly. Higher vocational colleges need to combine "creativity and practicality" and "theory and practice" and pay attention to the dual emotions of psychological experience, emotion, content diversification and form. The teaching method should make an orderly transition towards the goal of intellectualization and digitization, and realize the upgrading and updating of teaching software and practice site with the help of new media technology, so as to form a top-down professional consensus for the whole professional curriculum. In the context of improving cognitive impairment, the integration of new media teaching methods in higher vocational art courses should pay attention to the following points. First, diversified curriculum teaching. With the help of new ideas, new carriers, and new technologies, new media has diversified forms of expression. The course teaching of art majors needs to be combined with the recognition of art value and the resetting of corresponding professional course teaching through the thinking mode of new media art industry. Second, effectively integrate professional curriculum teaching and new media art. Digital media art should be effectively combined with the teaching of art professional courses, give full play to the role of new media technologies such as video editing, audio production, dynamic effect production, virtual reality technology and nonlinear editing and production, and provide a professional teaching mode for the teaching body of art professional courses. Third, improve teachers' teaching level. Regularly organize training and learning to improve teachers' teaching ability and quality, and help teachers cultivate students with high quality and strong comprehensive ability.

Objective: To explore the improvement effect of higher vocational art curriculum teaching mode on patients with cognitive impairment, in order to provide new research ideas and directions for improving the innovative development of art curriculum teaching under the background of cognitive impairment.

Research objects and methods: Students with mild cognitive impairment in two higher vocational colleges were selected as the research object. The total number of research objects was 100, and the experimental period was 6 months. Through the Density-Based Clustering (DENCLUE) algorithm based on density distribution function, this paper analyzes the improvement effect of the teaching mode of art

majors in higher vocational colleges on cognitive impairment. The improved content is evaluated through three aspects: memory, abstract thinking and attention. The evaluation results are accuracy and specificity. The higher the value of these two indicators, the better the effect of teaching reform.

Methods: Through the latest version of Minitab20 data statistics software, this paper analyzes the improvement effect of the teaching reform of art majors in higher vocational colleges on cognitive impairment.

Results: Table 1 refers to the improvement effect on cognitive impairment before and after the teaching reform of art majors in higher vocational colleges. It can be seen from Table 1 that the teaching reform of art majors in higher vocational colleges in China can greatly improve the memory, abstract thinking and attention of patients with cognitive impairment. After 6 months, the accuracy rate is as high as 95%.

Table 1. Improvement of cognitive impairment before and after the teaching reform of art majors in higher vocational colleges

Category	Before	After 1 month	After 3 months	After 6 months
Memory	89.68	91.21	94.26	97.25
Abstract thinking	86.34	91.23	92.32	96.35
Attention	88.66	89.65	92.30	95.36

Conclusions: The teaching reform model of higher vocational art majors integrating new media technology has a good effect on the treatment of patients with cognitive impairment. This model can be applied to other schools to increase the applicability of this teaching model.

ON THE CONTEXT RELATED TO CONTEMPORARY MINORITY MUSIC EDUCATION IN CHINA FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yun Peng

School of Art, Hunan City University, Yiyang 413000, China

Background: Different from psychology, educational psychology focuses on the psychological laws of student groups, and evaluates whether students can learn knowledge and master corresponding skills under normal teaching conditions. Educational psychology originated in the early 20th century. In recent years, educational psychology is closely related to psychiatry, medicine, sociology, anthropology, education and other fields. The main research content of educational psychology is the basic psychological laws of education and teaching in education and teaching situations. Based on psychology, the research involves teaching design, educational technology, special education and classroom management. Educational psychology is a subject that studies the law and essence of students' psychological activities. Its goal is to cultivate a sound personality and healthy psychology. Educational psychology can improve the level of teachers, improve the quality of education and teaching, and promote the reform of education and teaching. The characteristics of educational psychology include teachers' characteristics, students' characteristics and teaching methods. The future research trend of educational psychology is learners' subjective initiative, the action mechanism in the learning process, the influence of situational environment on learning results, teaching mode and so on. The practical significance of this discipline is to assist teachers to complete the problems in teaching work, provide scientific and reasonable theoretical guidance for teachers' teaching work, and assist teachers to analyze in practical teaching work.

The education and teaching of contemporary ethnic minority music in China is of great significance. In the process of learning ethnic music education, students can develop and carry forward traditional culture, which can make sufficient preparations for the inheritance and inheritance of Chinese culture. At present, there are various problems in minority music education and teaching. The context of minority music education and teaching combined with educational psychology includes philosophical context, anthropological context and pedagogical context. Minority music education is the product of the combination of practice and theory in the process of historical development. With the rapid development of the times, countries all over the world have entered a diversified era. Influenced by various objective factors, the objective fact of "Marginalization" of ethnic minority education really exists. Music plays an important role in the process of social construction. Music is a key part of social and cultural development, and its value and significance are worth studying. In the process of contemporary music development,

minority music education is the most important part of music development. In the context of pedagogy, minority music education is influenced by methodology, objectivism and epistemology. Minority music education needs to form a music view with Chinese national characteristics based on Chinese culture. Ethnic minorities are an indispensable part of Chinese national characteristics. The state needs to strengthen the exploration and education of ethnic minority music, so that ethnic minority can not only maintain their own national characteristics, but also promote the diversified development of ethnic minorities.

Objective: This paper analyzes the relevant context of contemporary minority music education in China under the background of educational psychology, in order to put forward new research ideas for the development of minority music education and lay the foundation for the improvement of students' comprehensive quality.

Research objects and methods: The students of five schools are selected as the research object. Through the Apriori association rule algorithm to analyze the correlation degree between the context of contemporary ethnic minority music education and students' related psychology, the number of students in each school is 100. Students' psychology is willpower, emotional function and cognitive ability. The evaluation results are determined by confidence and support. The minimum values set are 85% and 76%, respectively. In order to ensure the reliability of the results, the average value of all research object data is taken as the final result.

Methods: The results of association rules between the context related to minority music education and students' psychology combined with educational psychology are analyzed by NOSA data statistical analysis software.

Results: Table 1 refers to the results of the relevance between the context of contemporary ethnic minority music education and students' relevant psychology. The confidence of willpower, emotional function and cognitive ability of school students are all within the ideal value range. Combined with educational psychology, minority music education has a great relationship with students' willpower, emotional function and cognitive ability.

Table 1. The results of the relevance between the context of contemporary minority music education and students' related psychology

College	Willpower	Emotional function	Cognitive ability
College 1	87	86	91
College 2	89	88	92
College 3	90	89	89
College 4	91	90	87
College 5	87	91	88

Conclusions: Combined with educational psychology, the context related to minority music education has a high correlation with students' mental health. The subsequent analysis can focus on the relevant context of minority music education combined with educational psychology, so as to make corresponding contributions to the long-term development of minority music.

* * * * *

THE EFFECT OF MUSIC EDUCATION TEACHING MODE ON STUDENTS' PSYCHOLOGY UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY AND QUALITY EDUCATION

Fen Li & Heming Song

School of Art, Hunan City University, Yiyang 413000, China

Background: With the improvement of social requirements for students and the increase of parents' expectations, most students put forward higher requirements for their grades. However, limited by social experience and psychological endurance, the vast majority of students will be hit by cruel society when they step into society, which will lead to a series of psychological problems. Under the background of quality education, college education needs to pay attention to the all-round comprehensive development of students' morality, intelligence, physique, beauty and labor. Educational psychology is a subject that

studies the law and essence of students' psychological activities. Its goal is to cultivate a sound personality and healthy psychology. Educational psychology is an important branch of applied psychology. It is an interdisciplinary subject of pedagogy and psychology. The main research content is the basic psychological laws of education and teaching in the context of education and teaching. There is usually an intersection between school and psychology. The focus of educational psychology is to analyze theoretical work, and the focus of school education is to engage in school and related specific affairs. Educational psychology is based on psychology and involves teaching design, educational technology, special education and classroom management.

It is of great significance to combine the mode of music education in colleges and universities with the requirements of educational psychology and quality education. At this stage, the problems of the teaching mode of music education in colleges and universities are as follows: there is less communication and interaction between teachers and students, students' learning enthusiasm is low, and there is a lack of explanation and guidance of appreciation classes. In the process of music teaching, teachers' words and deeds are the main form of communication and interaction between teachers and students. In traditional teaching, teachers only pay attention to singing methods, and relatively less interpretation of works, and less exchange and interaction of ideas. The most important subjective factor for the improvement of students' comprehensive quality is the low learning initiative, which is mainly due to the low professional ability of students and the great influence of the external environment on students' values, outlook on life and world outlook. The teaching goal of music education is to improve students' comprehensive appreciation ability and their own cultural and professional quality. However, at present, most teachers only show the teaching-related content in the appreciation class, and do not provide students with the opportunity to communicate and show. In this context, it has a positive effect to put forward an innovative scheme of music education and teaching mode. The innovation and reform of the scheme is reflected in the basic theory of vocal music, singing teaching, personal characteristics, professional orientation and innovation ability.

Objective: This paper discusses the innovative mode of music education and teaching mode in colleges and universities under the background of educational psychology and quality education, in order to provide constructive suggestions for the reform of music education and teaching mode in colleges and universities.

Research objects and methods: The students of two schools are selected as the research object. The innovative mode of music education and teaching mode in colleges and universities under the background of educational psychology and quality education is evaluated by K-means II clustering analysis algorithm. The number of students in each school is 25. The evaluation content includes six parts: basic theory of vocal music, singing teaching, personal characteristics, professional orientation and innovation ability. The evaluation results are very satisfied, quite satisfied, satisfied, slightly satisfied and not very satisfied. In order to ensure the reliability of the results, the average value of the evaluation results of all research objects is taken as the final result.

Methods: Through the latest version of CHISS statistical analysis software, this paper analyzes the educational development and teaching innovation results of Journalism and communication specialty under educational psychology.

Table 1. Evaluation results of innovative teaching model of music education in colleges and universities under educational psychology and quality education

Type	Very satisfied	General satisfaction	Satisfied	Dissatisfied	Very dissatisfied
Basic theory of vocal music	12	7	6	4	2
Singing teaching	5	6	7	3	4
Personal characteristics	4	6	5	4	6
Career orientation	5	3	6	6	5
Innovation ability	5	4	5	5	6
Basic theory of vocal music	6	9	5	3	2

Results: Table 1 refers to the evaluation results of the innovative mode of music education and teaching in colleges and universities under the educational psychology and quality education of schools. It can be seen from Table 1 that the innovative mode of music education and teaching in colleges and universities has good satisfaction evaluation results in six aspects: basic vocal music theory, singing teaching, personal characteristics, professional positioning and innovative ability. Among them, the satisfaction of innovation ability is the highest, with a value of 80.0%. This shows that after the introduction of educational psychology, the innovative model of music education and teaching in colleges and universities can be widely recognized

by students, and the innovative model can be applied to the innovation of music education and teaching in colleges and universities in the future.

Conclusions: The proposed innovative mode of college music teaching combined with educational psychology and quality education has good satisfaction in the basic theory of vocal music, singing teaching, personal characteristics, professional positioning and innovative ability. This mode can significantly improve the students' cognitive, emotional and emotional levels, especially in the students' cognition. This model is of great significance in the innovation and development of music teaching in colleges and universities in the later stage.

THE EFFECT OF COLLEGE MUSIC EDUCATION MANAGEMENT REFORM MEASURES ON STUDENTS' PSYCHOLOGY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Lian Xiang¹ & Guangyu Yang^{2*}

¹*School of Drama and Dance, Russian National Normal University, St.Petersburg 190000, Russia*

²*College of Fashion and Art Design, Donghua University, Shanghai 200051, China*

Background: Educational psychology is a subject that studies the law and essence of students' psychological activities. Its goal is to cultivate a sound personality and healthy psychology. The characteristics of educational psychology include teachers' characteristics, students' characteristics and teaching methods. Different from psychology, educational psychology focuses on the psychological laws of student groups, and evaluates whether students can learn knowledge and master corresponding skills under normal teaching conditions. The teaching subject of educational psychology theory is the workers engaged in education, and the purpose is to guide teachers to complete teaching work. The future research trend of educational psychology is learners' subjective initiative, the action mechanism in the learning process, the influence of situational environment on learning results, teaching mode and so on. The practical significance of this discipline is to assist teachers to complete the problems in teaching work, provide scientific and reasonable theoretical guidance for teachers' teaching work, and assist teachers to analyze in practical teaching work. Due to the great differences in college students' life experience, growth environment and their own personality, most students feel more irritable and anxious. Therefore, college education should be combined with educational psychology for innovative development, which is not only conducive to the all-round development of students, but also conducive to improving the overall teaching quality of colleges and universities.

The teaching process of vocal music course in colleges and universities faces very big problems, which are embodied in that teachers do not pay attention to dance practice in the professional teaching process, the teaching resources prepared by teachers are limited, it is difficult to bring diversified learning contents to students, the teaching method of teachers in the teaching process is single, and there is no professional talent training plan. Specifically, there is no in-depth excavation of the connotation of teaching content and teaching content, and there is no preparation for the talent training plan. Students are in a boring learning atmosphere. In this case, understanding and mastering the content of music performance are not in place. In terms of teaching resources, teachers cannot help students' in-depth experience. In dance practice, students lack the perfection of practice. Stage practice plays a very important role in music education in colleges and universities. Students' technical skills can be effectively improved, and teachers can find problems in time in the teaching process. Dance practice can give students the opportunity to show themselves and test themselves in stage practice. Stage practice is the key point in teaching. It can not only exercise students' performance ability, but also improve students' good attitude. The reform measures of music education management in colleges and universities are as follows: improve the training scheme of professional talents, innovate the teaching strategy of music courses, integrate the teaching resources of music courses, and formulate the practice of stage performance.

Objective: This paper analyzes the reform and development countermeasures of music education management in colleges and universities under educational psychology, in order to improve the level of music education management in colleges and universities and ensure the cultivation of high-quality music talents.

Research objects and methods: The students of two schools are selected as the research object to evaluate the reform measures of music education management in colleges and universities through the constraint-based cluster analysis algorithm. The number of students in each school is 100. The evaluation

contents are to improve the training scheme of professional talents, innovate the teaching strategy of music course, integrate the teaching resources of music course, and formulate the practice of stage performance. The evaluation results are homogeneity, integrity and weighted average of the two. Among them, the value range of homogeneity and integrity is [0,1], and the weighted average value of both is [0,+∞]. In order to ensure the reliability of the results, the average value of all research objects is taken as the result.

Methods: Through the statistical analysis software of statistical, this paper analyzes the evaluation results of music education management reform in colleges and universities under the background of educational psychology.

Results: Table 1 refers to the evaluation results of school K's management reform of music education in colleges and universities under educational psychology. It can be seen from Table 1 that the uniformity and integrity of the four aspects of improving professional talent training scheme, innovating music course teaching strategy, integrating music course teaching resources and formulating stage performance practice are within the ideal value range, the value range of uniformity is 0.57-0.78, the value range of integrity is 0.62-0.68, and the weighted average value range of the two is 0.62-0.78. The management measures of music education in colleges and universities combined with educational psychology are of great significance.

Table 1. Evaluation results of school K's management reform of music education in colleges and universities under the educational psychology

Type	Homogeneity	Integrity	Weighted average of the two
Improve professional talent training program	0.57	0.62	0.62
Innovative music teaching strategies	0.68	0.63	0.68
Integrating teaching resources of music courses	0.72	0.68	0.78
Formulate stage performance practice	0.78	0.65	0.68

Conclusions: The reform measures of college music education management combined with educational psychology proposed by the research have ideal evaluation results. The follow-up reform measures of college music education management can learn from the research ideas, which can make corresponding contributions to the reform of college music education.

* * * * *

THE APPLICATION OF FILM AND TELEVISION TEACHING METHOD IN MARXIST TEACHING FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Menghui Yuan

Department of Architecture and Art Design, Jiangxi Vocational Technical College of Industry & Trade, Nanchang 330038, China

Background: With the continuous development of psychology, new psychological research has become a development trend, and cognitive psychology came into being under this background. Cognitive psychology is a subject that analyzes the law of human psychological activities. Its research object is the cognitive status of human body in psychology, including language, thinking, memory, perceptual learning, attention, perception and so on. Cognitive psychology can be divided into two types: broad sense and narrow sense. The narrow sense of cognitive psychology holds that it is a science of information processing; In a broad sense, cognitive psychology includes information processing psychology, psychologism school and structuralism psychology. Cognitive psychology theory attaches importance to the role of knowledge and points out that the main influencing factor of human behavior is knowledge. There is long-term memory in cognitive process. Long-term memory is determined by emotion and attention. It can also stimulate short-term memory and make it valuable. Marxism teaching combined with cognitive psychology has become a research hotspot of educators at this stage. Years of practical teaching results show that the traditional teaching model cannot achieve the ideal teaching effect. Film and television teaching has become a common teaching method in modern teaching by combining video and audio materials.

Film and television teaching is of great significance in Marxist teaching, which is embodied in the following points. First, change the curriculum model from static to dynamic to improve students' interest in learning. Traditional teaching methods are mostly static and plane teaching methods, which will cause students to lose the fun of learning. Film and television teaching can make the static theory move. Second,

create a good teaching situation and improve the timeliness of teaching. Image teaching shows the forms and social development hotspots at home and abroad to students through image materials and audio-visual, which will put students in a specific situation and improve the persuasion and appeal of teaching. Third, expand teaching time and space and improve students' exploration and creativity. Film and television works can reflect the outlook on life and values, which will enable students to improve their thinking ability and life consciousness in debate and discussion. At present, the problems of the application of film and television teaching method in Marxist teaching are mainly reflected in the following points. First, carefully select rich film and television teaching materials. In the process of selecting teaching materials, we should consider the fit with the purpose of theoretical teaching; The regularity of students' physical and mental growth; Knowledge and ideology of image materials; Pay attention to the timeliness and information of image data. Second, the correct application of image data. The content of image materials needs to be highly consistent with the teaching content. Students should change from passive acceptance of knowledge to active acquisition of knowledge. The teaching process needs to focus on theoretical teaching and supplemented by image teaching. Generally, the teaching time of film and television is 1/3 of the overall class hour. Film and television teaching courses need to be arranged in advance before the beginning, and students need to be driven to discuss together during the classroom. Third, correctly deal with the differences between image teaching methods and other teaching methods. In the case of developing image teaching methods, we should pay attention to its integration with traditional teaching methods, and pay attention to the joint application of interactive teaching, problem teaching, case teaching and other teaching methods.

Objective: This paper analyzes the application effect of film and television teaching in Marxism teaching under the background of cognitive psychology, in order to improve the quality of Marxism teaching in colleges and universities and help students accept professional knowledge in a more relaxed and pleasant situation.

Research objects and methods: 100 college students were selected to carry out the cluster analysis results of film and television teaching in Marx's teaching under the background of cognitive psychology. The evaluation contents include attention, thinking ability, memory function and speech expression ability. The analysis results used the accuracy and recall rate of cognitive process improvement, and the experimental period was 6 months.

Methods: Through the latest version of minitab20 data statistics software, this paper analyzes the application effect of film and television teaching in Marxism teaching under the background of cognitive psychology.

Results: Table 1 refers to the accuracy of Marxist teaching reform before and after the citation of cognitive psychology. On the whole, after applying the reformed Marxism teaching in colleges and universities, students show obvious improvement effects in four cognitive abilities: attention, thinking ability, memory function and speech expression ability.

Table 1. The accuracy of Marxist teaching reform before and after the citation of cognitive psychology

Category	Before	After 1 month	After 3 months	After 6 months
Attention	85.36	86.36	89.35	91.23
Thinking ability	87.56	89.36	91.25	93.28
Memory function	89.36	92.34	93.25	94.26
Speech expression ability	88.36	89.36	91.26	93.24

Conclusions: The effect of the Marxist teaching scheme proposed by the research institute shows that after the application of film and television teaching in Marxist teaching, students' cognitive ability has been generally improved. In the follow-up, this scheme can be applied to Marxist teaching in order to improve the teaching effect of Marxism.

* * * * *

DIVERSIFICATION OF HIGHER NATIONAL VOCAL MUSIC EDUCATION AND TEACHING UNDER THE OBSTACLE OF THINKING LOGIC

Chunlin Yang

School of Music and Dance, Nanning Normal University, Nanning 530000, China

Background: Thinking obstacle refers to the process that objective things act on the human brain. Due

to the confusion of the starting point of thinking, the fuzziness of thinking image, the deviation of thinking direction, the confusion of thinking logic and the interference of thinking, it is difficult for the human brain to show the normal thinking results of objective things. It can be divided into the abnormal thinking process and abnormal thinking content. The logical barrier of thinking is often manifested in the lack of proper logic in the connection of semantics, that is, when combing the language information organization, the thinking process is limited by relevant conditions or there are conflicts and differences with the original knowledge and ideas, which leads to symbolic thinking, new words, logical fallacious thinking and sophistication thinking. Thinking logic disorder will not only affect people's thinking ability and cognitive ability, lead to their easy to fall into the inherent thinking set, and then lack comprehensiveness and objectivity in the analysis and treatment of problems, but also affect the depth and breadth of people's views on things, resulting in certain physical and mental damage. Thinking logic barriers will limit people's artistic development and the formation of open thinking, reduce people's sensitivity to things and reduce their aesthetic ability. The value of vocal music courses, especially in many colleges and universities, is paid more attention to. However, vocal music teaching is a part of music education and has strong regularity. It needs a lot of practice under the guidance of teachers to strengthen students' music aesthetic experience in training. Due to the differences in individual personality, past learning background and their own endowment resources, vocal music majors show different learning abilities, learning initiative and learning effects. However, the current simplification and "model mechanization" of vocal music education make vocal music education a "tool of education". Learning in a unified model, ignoring the grasp of students' individuality and diversity, ignoring the differences of students' psychological quality and learning psychological problems, will make some students ashamed to show and express themselves. And it will produce self-doubt and negation due to the one-sided evaluation of the outside world, fall into thinking errors and emotional obstacles, produce thinking logic obstacles, and then affect its learning effect. From the perspective of thinking logic obstacles, promoting the diversified development of higher national vocal music education can effectively improve students' perception ability with the help of music carrier, improve the degree of thinking logic obstacles and improve their mental health level.

Objective: In order to improve the mental health level of students with thinking logic disorder, alleviate their symptoms, improve the teaching quality on the premise of meeting the needs of students, and promote the diversified development of vocal music education and teaching.

Research objects and methods: Firstly, the study screened the mental health of students majoring in national vocal music in a university, and took the students with thinking logic obstacles as the research object. Then, with the help of the analytic hierarchy process, it constructed the index level and target level to innovate the current vocal music teaching mode. The diversified teaching model is applied to the research object. The experimental time is four weeks to explore the diversified research and application effect of higher national vocal music education and teaching under the obstacle of thinking logic.

Method design: Bring the learning status and problems of students with thinking logic disorder into the teaching design process, optimize and improve the teaching means and teaching scheme, in order to design a diversified vocal music teaching mode, and collect and analyze the data of the thinking status and learning effect of the research object before and after the experiment, so as to draw the experimental conclusion.

Methods: The exploration of diversified vocal music teaching mode was realized by analytic hierarchy process, and SPSS21.0 statistical Fenix tool to process and analyze data.

Table 1. The classroom behavior and cognition of students with thinking logic disorder

Dimension	Mean	SD
Self-cognitive value	2.314	0.640
Learning enthusiasm	2.759	0.832
Memory impairment	4.287	0.549
Difficulty in understanding vocal music theory	4.251	0.658
Self-efficacy	2.322	0.613
Evaluation objectivity	2.958	0.521

Results: Vocal music teaching is a course aimed at cultivating and training students to master singing skills and skills, cultivating students' feeling, expression and creative ability of music art, constantly innovating classroom teaching methods and promoting the diversification of national vocal music teaching, which can help to meet the needs of students with ideological and logical obstacles, improve their obstacle symptoms and improve their learning quality. The results show that the innovation of vocal music teaching means and the diversity of programs greatly provide students with cognitive impairment with good learning

effect and enthusiasm, and improve the level of mental health. Table 1 shows the general situation of classroom behavior and cognition of students with thinking logic disorders.

Conclusions: Higher national vocal music education can improve students' understanding and creativity of art through the study of basic theoretical knowledge and the appreciation and practice of artistic ability. At the same time, it can meet the psychological needs of students with thinking logic disorder, promote the diversified development of education and teaching, effectively improve their mental health level, help students improve their professional quality and ability, and accelerate the development and progress of vocal music education.

MULTIMODAL LEARNING ANALYSIS OF THE APPLICATION OF DATA SCIENCE IN THE RESEARCH OF INVESTMENT PSYCHOLOGY AND BEHAVIOR UNDER COGNITIVE IMPAIRMENT

Yong Ma

School of Management and Economics, University of Electronic Science and Technology of China, Chengdu 610000, China

Background: Cognitive impairment is a state between normal aging and dementia. It is mainly characterized by mild memory and intellectual impairment, but it remains intact in life ability and cognitive function, which can be manifested in functional impairment such as understanding, judgment, calculation, execution, visual space, language and memory. Cognitive impairment can be divided into three types: perception impairment, memory impairment and thinking impairment. Perceptual disorders include perceptual synthesis disorder, hallucination and so on. Memory impairment includes memory error, memory defect and strong memory. Thinking obstacles include delusion, thinking logic obstacle, association process obstacle and abstract generalization process obstacle. The manifestations of cognitive impairment are emotion, spirit, creation, thinking, movement, language, memory, learning and so on. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further aggravation of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show decreased overall function and develop to dementia, which will lead to delusion, indifference, lack of self-care ability and so on. In the context of cognitive impairment, multimodal learning combined with data science investment psychology and behavior is facing great challenges.

Data science realizes big data investment data analysis by combining professional knowledge, computer and mathematical statistics. The licensing process of data science is to collect, clean, convert and operate data. Data modeling is realized through machine learning and exploratory analysis methods, and finally data visualization is realized. In the context of improving cognitive impairment, multimodal learning combined with investment psychology and behavior of data science needs to do the following. First, realize the integration of investment behavior and psychological business, programming and model in a real sense. Although modern quantitative technology can help investors analyze data to a certain extent, it is difficult for investors to realize real integration due to lack of understanding of data and lack of their own experience. Data science attaches importance to the role of professional knowledge, algorithms and data, which can be integrated with specific industry businesses through programming and models. Second, fully understand the potential value behind the data. Data science is data oriented and takes data as the basis of the whole process. For investors in the field of financial investment, the important basis of decision-making is news media, advertising, transaction data and financial data. The basis for judging whether the data understanding is comprehensive is the scale of the data, the business background of the data, and understanding the data through graphics. In addition, you need to pay attention to the details ignored and create the corresponding logic. Many researchers at home and abroad believe that the application of data science in multimodal learning of investment psychology and behavior research can reduce the symptoms of cognitive impairment, but the degree of improvement has not been verified.

Objective: To analyze the intervention effect of multimodal learning applied by data science to investment psychology and behavior research on cognitive impairment under the promotion of cognitive impairment, in order to improve the cognitive problems of cognitive impairment.

Research objects and methods: Patients with mild cognitive impairment in two regions were selected as

the research object, and the improvement degree of patients with cognitive impairment was analyzed by Iterative Dichotomiser 3 (ID3) algorithm. The evaluation content includes four aspects: language ability, attention, memory ability and memory ability. The evaluation results are no improvement, slight improvement and obvious improvement. The study period was 6 months. In order to facilitate the expression of the research results, the average value of all objects is selected as the final result.

Methods: The latest version of Minitab20 data statistics software is used to analyze the improvement of multimodal learning on cognitive impairment after data science is applied to the research of investment psychology and behavior.

Results: Table 1 refers to the improvement degree of multimodal learning applied by data science to investment psychology and behavior research on cognitive impairment. On the whole, the multimodal learning of applying data science to investment psychology and behavior research has significantly alleviated the cognitive impairment of patients with mild cognitive impairment after the intervention, especially in language ability and recall function. Therefore, applying data science to multimodal learning of investment psychology and behavior research can alleviate cognitive impairment and improve the individual accurate cognitive level.

Table 1. The improvement of multimodal learning of data science applied to investment psychology and behavior research on cognitive impairment

Category	Before	After 1 month	After 3 months	After 6 months
Language ability	89.62	91.23	94.26	96.35
Attention	87.66	88.69	91.20	94.56
Memory ability	86.35	89.36	92.31	94.26
Recall ability	87.36	89.36	92.32	95.36

Conclusions: The multimodal learning intervention program, which applies data science to investment psychology and behavior research, has a good effect on mild cognitive impairment, especially in language ability and recall function. The results provide a new idea for the clinical intervention of mild cognitive impairment.

THE EFFECT OF TEACHING REFORM PATH OF VOCAL MUSIC COURSE IN COLLEGES AND UNIVERSITIES ON STUDENTS' COGNITIVE ABILITY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaoyan Guo

Conservatory of Music, Henan University, Kaifeng 475001, China

Background: Educational psychology is an important branch of applied psychology. It is an interdisciplinary subject of pedagogy and psychology. The main research content is the basic psychological laws of education and teaching in the context of education and teaching. There is usually an intersection between school and psychology. The focus of educational psychology is to analyze theoretical work, and the focus of school education is to engage in school and related specific affairs. Educational psychology is based on psychology and involves teaching design, educational technology, special education and classroom management. The purpose of educational psychology is to guide teachers to complete teaching work. The future research trend is learners' subjective initiative, the action mechanism in the learning process, the influence of situational environment on learning results, teaching mode and so on. Educational psychology can be simply understood as all the sciences involved in the process of learning and teaching, including teaching methods, students' characteristics and teachers' characteristics. According to the type of subject, teachers can adopt different teaching schemes. For physics, chemistry and other highly operational disciplines, the teaching method should adopt a highly operational scheme. For drama and other art programs, the teaching method should adopt the teaching scheme of role-playing. At the same time, different teachers will have different teaching methods due to personality reasons. Serious teachers' teaching methods are relatively conservative and fixed, while cheerful and lively teachers may be more suitable for activity teaching method. At present, the relevant research of educational psychology mainly focuses on the active challenges faced by students in the process of growth, learning initiative, the change of teaching methods and the design of teaching courses.

At present, the teaching process of vocal music course in colleges and universities is facing very big problems, which are embodied in the weak professional foundation of students, the limited time of teachers in class, the single and conservative teaching methods, the lack of teachers' professional ability and the limited space for practical training. In the process of vocal music teaching, teachers usually carry out teaching work in the same way, which will lead to low learning enthusiasm of students. The learning time of vocal music courses set up by the school is relatively limited. Teachers focus on indoctrination teaching and theory teaching in the teaching process, which will lead to the lack of innovation in teaching work. Teaching methods are closely related to students' learning effect, which will limit students' interest and potential. In view of these problems, the teaching reform of vocal music course in colleges and universities combined with educational psychology has become a hot topic discussed by educators. The teaching reform of vocal music course in colleges and universities combined with educational psychology needs to improve students' music perception, diversify teaching methods, strengthen the construction of teachers' team, improve the course content system, and pay attention to practical training and expansion.

Objective: This paper analyzes the effect of the teaching reform path of vocal music course in colleges and universities under educational psychology, in order to improve the teaching quality of vocal music course in colleges and universities and do a good job in teaching guarantee for the artistic level of college students.

Research objects and methods: The students of two schools are selected as the research object, and the teaching reform path of vocal music course in colleges and universities is evaluated by a dichotomous K-means clustering analysis algorithm. The number of students in each school is 100. The evaluation contents are to improve students' music perception, diversify teaching methods, strengthen the construction of teachers' team, improve the curriculum content system, and pay attention to practical training and expansion. The evaluation results are rand index and adjusted rand index, in which the value range of rand index is [0,1], and the value range of adjusted Rand index is [-1,1]. In order to ensure the reliability of the results, the average value of the evaluation results of all research objects is taken as the result.

Methods: Through Minitab20 data statistical analysis software, this paper analyzes the evaluation results of vocal music teaching reform path in colleges and universities under the background of educational psychology.

Results: Table 1 refers to the evaluation results of the teaching reform path of vocal music courses in colleges and universities under the educational psychology of school. It can be seen from Table 1 that the rand index and adjusted rand index are high in five aspects: improving students' music perception, diversifying teaching methods, strengthening the construction of teachers' team, improving the curriculum content system, paying attention to practical training and expansion. The value range of rand index is 0.82-0.89, and the value range of adjusted rand index is 0.85-0.93.

Table 1. Evaluation results of the teaching reform path of vocal music course in colleges and universities under educational psychology

Type	Rand index	Adjusted Rand index
Improve students' music perception	0.88	0.91
Diversified teaching methods	0.82	0.93
Strengthen the construction of teachers' team	0.89	0.87
Improve the curriculum content system	0.82	0.86
Pay attention to practical training and development	0.83	0.85
Improve students' music perception	0.84	0.86

Conclusions: The teaching reform path of college vocal music course combined with educational psychology proposed by the research has ideal evaluation results. The follow-up teaching reform of college vocal music course can learn from the research ideas, which can make corresponding contributions to the improvement of the professional ability of college art students.

INFLUENCE OF COLLEGE COUNSELORS' IDEOLOGICAL AND POLITICAL EDUCATION ON ALLEVIATING COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY UNDER THE NEW MEDIA ENVIRONMENT

Huayu Chen

School of Foreign Languages, Xuchang University, Xuchang 461000, China

Background: After entering the new media environment, the development and application of various network technologies have promoted the change of college students' learning and life style. In the new media environment, digital technology and network technology interact. With the support of Internet, wireless communication network and other channels, a large amount of data information has been widely disseminated. The information transmission under the new media environment has strong richness, interactivity and immediacy, which has an important impact on college students' learning activities and daily life. The development of ideological and political education of college counselors determines the mental health level of college students. In order to carry out the ideological and political education of college counselors smoothly, we need to implement the teaching concept of Internet ideological and political course into the ideological understanding of all college counselors, make them fully understand and affirm the importance of ideological and political education in the new media environment, and then be able to formulate and implement scientific and feasible ideological and political teaching means. Ensure the effectiveness of Ideological and political education in colleges and universities. In the process of national sustainable development, the social demand for talents continues to increase. However, due to the negative effects of various influencing factors such as academic pressure, employment pressure and interpersonal pressure, it is very difficult for contemporary college students to maintain strong psychological quality and full mental state, and even produce certain psychological anxiety when the pressure is too high. College students' psychological anxiety is a common social phenomenon. Because college students are in the most critical stage of life, their physiological function has been mature, but their mind is not completely sound, and they are very vulnerable to external factors. In the process of entering society from school, college students often find it difficult to properly deal with the replacement of academic and employment, and cannot integrate theoretical knowledge and practical ability, so they show psychological anxiety in many aspects, such as learning activities, interpersonal communication, job hunting and employment. Excessive anxiety will lead college students into confusion and despair, making it difficult for them to maintain normal study or life. Therefore, it is necessary to carry out ideological and political education for college students. Under the new media environment, when carrying out ideological and political education, college counselors need to break through the traditional thinking and way, analyze the ideological and political situation and anxiety of college students, and carry out reasonable education and guidance accordingly, in order to alleviate the psychological anxiety of college students.

Objective: As the main place for the implementation and development of ideological work, colleges and universities should shoulder the responsibility of transmitting the content and meaning of ideological and political education. In the process of actually carrying out ideological and political education, college counselors need to carry out targeted ideological and political education for college students with the help of various advantages and characteristics under the new media environment, such as the timeliness and richness of information dissemination. Through the implementation of ideological and political work, college students can establish a correct ideological and political direction and effectively alleviate their psychological anxiety.

Research objects and methods: In the four grades of a university, 72 college students were randomly selected as the research objects, a total of 288. The psychological anxiety level of 288 college students was evaluated and analyzed by Hamilton Anxiety Scale (HAMA) and Self-rating Anxiety Scale (SAS). HAMA adopts a 5-level evaluation standard of 0-4. If its score is greater than 14, it shows that the college students are accompanied with anxiety symptoms.

Research design: Taking the ideological and political education of college counselors in the new media environment as an intervention measure, and the intervention duration is set to 4 months. Using the analytic hierarchy process to explore the psychological anxiety level of college students before and after the intervention, we can obtain the impact of the ideological and political education of college counselors on alleviating the psychological anxiety of college students.

Methods: The relevant data of college students' psychological anxiety were counted and analyzed by MATLAB 9.8 software.

Results: Before the intervention, the HAMA score and SAS score of college students were higher, indicating that the evaluation results of different scales were accompanied by serious psychological anxiety symptoms. After one month of intervention, the HAMA and SAS scores of college students decreased, but the decrease was small. From 2 months to 4 months after the intervention, the scores of HAMA and SAS decreased in varying degrees, which shows that the ideological and political education of college counselors can effectively alleviate the psychological anxiety of college students in the new media environment.

Table 1. Evaluation results of psychological anxiety of college students at different time nodes before and

after intervention

Evaluation time	HAMA score	SAS score
Before intervention	27.17	73.54
One month after intervention	23.35	65.77
After 2 months of intervention	14.69	52.15
After 3 months of intervention	9.14	43.26
After 4 months of intervention	5.23	36.65

Conclusions: Under the new media environment, the ways of Ideological and political education of college counselors have a certain diversity, which can significantly reduce the HAMA score and SAS score of college students, and play a vital role in alleviating the psychological anxiety of college students.

INNOVATIVE TEACHING REFORM OF VOCAL MUSIC COURSE IN NORMAL UNIVERSITIES FROM THE PERSPECTIVE OF PSYCHOLOGY

Ling Wang

College Conservatory of Music, Baotou Teachers' College, Baotou 014010, China

Background: As the core course of music major in normal universities, vocal music course occupies an important position. In the process of continuous promotion of education and teaching reform in China, schools and society have put forward higher requirements for vocal music curriculum in normal universities. The current teaching situation of vocal music course in normal universities is not optimistic. Under the influence of using the “one-to-one” teaching mode in professional music colleges, the effective development of the course is restricted by many factors, which is embodied in different levels such as curriculum, teaching methods and teaching structure, which forms a great obstacle to the cultivation of vocal music talents. Specifically, the vocal music curriculum in normal universities mainly has four disadvantages: inaccurate positioning of teaching objectives, lack of standardization of teaching curriculum, strong formalization of teaching mode, and mismatch between teaching theory and practice. As far as the orientation of teaching objectives is concerned, the current vocal music teaching in normal universities follows the teaching mode of professional colleges, ignoring its exemplary role, so that normal college students can only obtain a single vocal music knowledge. The lack of standardization in the setting of teaching courses mainly means that the vocal music course covers only two academic years, and the teaching of vocal music course is difficult to continue, which can easily lead to students’ loss of interest in vocal music course or difficulty in accurately mastering vocal music knowledge. The traditional “one-to-one” vocal music teaching mode can no longer meet the needs of the current music development, and there are certain differences in students’ qualifications and talents. Therefore, the solidified teaching mode is difficult to obtain excellent vocal music teaching effect. Most students do not fully grasp the basic music education knowledge in the study of vocal music course in normal universities. When they carry out the teaching of vocal music course, they can not apply what they have learned and effectively teach the relevant knowledge and skills of vocal music course in normal universities. From a psychological perspective, the problems faced by the current vocal music curriculum in normal universities can be abstracted into four psychological characteristics: blind confusion, lack of sense of responsibility, poor sense of innovation and timidity. Because the students majoring in vocal music course in normal universities are easy to produce these four psychological characteristics under the influence of external factors, it is very necessary to carry out innovative teaching reform of vocal music course in normal universities.

Objective: By observing the current teaching mode and teaching effect of vocal music course in normal universities, it can be seen that the teaching concept, curriculum system and teaching means of vocal music course in normal universities have changed to varying degrees, and achieved certain teaching effect. However, under the influence of many factors, the teaching of vocal music course in normal universities has been greatly hindered, and the integrity and operability of its teaching activities are relatively lack, which has a negative impact on the psychology of students majoring in vocal music course in normal universities. Based on this, the vocal music curriculum in normal universities needs to be innovated and reformed urgently, in order to explore the effectiveness of the innovative teaching reform of vocal music curriculum in normal universities and the psychological changes of students.

Research objects and methods: 125 students majoring in vocal music course in normal universities were

randomly selected as the research object, and the influence of innovative teaching reform of vocal music course in normal universities from the psychological perspective was analyzed by using fuzzy evaluation method and support vector machine.

Research design: From the psychological perspective, we can know that the students majoring in vocal music course in normal universities have four psychological characteristics under the negative influence of various factors, that is, blind confusion, lack of sense of responsibility, poor sense of innovation, timidity and fear of difficulties, which can be used as the evaluation index. Then set up three evaluation levels: very consistent, general and not at all. This paper compares and analyzes the psychological characteristics of students before and after the innovative teaching reform of vocal music course in normal universities.

Methods: The evaluation data were statistically analyzed by SCILAB software and Excel software.

Results: Before the innovation teaching reform of vocal music course in normal universities, the psychological characteristics of 125 students showed a certain negative situation. Among the four evaluation indexes of blind confusion, lack of sense of responsibility, poor sense of innovation and timidity, the evaluation results were very consistent, which showed that the students majoring in vocal music course in normal universities had a strong psychological burden. After the reform, the number of students whose evaluation results are very consistent has decreased, among which the innovation consciousness is poor. In this evaluation index, the number of students whose evaluation results are very consistent has decreased from 72 before the reform to 26, indicating that the innovative teaching reform of vocal music curriculum in normal universities has a good application effect, which can alleviate students' negative psychological emotions and improve their vocal music learning enthusiasm and learning effectiveness.

Table 1. Psychological characteristics and number distribution of students majoring in vocal music courses in normal universities before and after the reform (*n*)

Psychological feature	Before reform			After reform		
	Very consistent	Commonly	Not at all	Very consistent	Commonly	Not at all
Blind confusion	47	63	15	25	69	31
Lack of responsibility	51	60	14	19	61	45
Poor innovation consciousness	72	45	8	26	52	47
Timid and afraid of difficulties	43	58	24	11	47	67

Conclusions: The innovative teaching reform of vocal music course in normal universities has a positive impact, which can not only improve the teaching quality of vocal music course, but also effectively alleviate the negative psychological emotions of vocal music course students, and provide reliable support for training more vocal music teaching talents.

Acknowledgement: The research is supported by: Scientific Research Project of The Department of Education of Inner Mongolia Autonomous Region: Research on the Training Mode of Applied Talents of Music Major in Colleges and Universities in Inner Mongolia Based on OBE Concept, (Project No. njsy22033).

APPLICATION OF NEW MEDIA TECHNOLOGY IN THE COMMUNICATION AND EDUCATION OF CHINESE NATIONAL VOCAL MUSIC UNDER THINKING OBSTACLES

Shun Wang

Conservatory of Music, Guangxi normal University, Guilin 541006, China

Background: Thinking is the indirect and universal reflection of the human brain on objective things. In other words, the thinking process takes the known knowledge as the medium and does not depend on the actual object. At the same time, it also reflects the essence of things and the internal relationship between things. The functional state of human brain, individual psychological state (demand, motivation, emotion, personality, etc.) and social and cultural background will affect the thinking process. The normal thinking process is purposeful, coherent, logical and sustainable. When the ideological content is put into practice, it will produce certain results, accept the test of reality and correct mistakes by itself. In addition, people who think have corresponding introspective experience and know that their thinking activities belong to themselves and are controlled by themselves. If the thinking process and content are abnormal, the above normal thinking characteristics will often change, which is the thinking barrier. It is a group of important

symptoms of mental patients. There are many different categories of thinking disorders. Clinically, the current trend is divided into four categories: first, thinking speed obstacles, such as accelerating the thinking process (thought drift) or slowing down. Second, thinking form disorder, also known as association disorder, is mainly manifested in the relaxation of association structure. Lack of goal orientation, symbol abuse, illogical. For example, loose thinking. Pathological symbolic thinking, etc. Third, thinking control disorder refers to the experience that patients feel that thinking does not belong to themselves, that thinking activities lose autonomy, or that they feel controlled by external forces, such as thinking deprivation, thinking insertion, thinking communication, etc. Fourth, thinking content obstacles, such as delusion, paranoia, compulsion and so on. This classification is suitable for clinical diagnosis, but it focuses on the research of schizophrenic thinking disorder, and there is less research on organic encephalopathy or other mental thinking disorders. In short, the rapid development of new media technology has made great changes in modern life mode, and made the pace of life faster and faster, while the problem of thinking obstacles is becoming more and more serious, which should attract extensive attention from all walks of life.

China is an ancient oriental civilization with a long history, a vast territory and a large population. In the long history of thousands of years, the people of all ethnic groups have left rich and valuable cultural heritage, among which the art of national vocal music is one of the brilliant spiritual wealth of the Chinese nation. Chinese national vocal music is represented by national vocal music in Chinese music colleges and universities, which is different from the singing of folk songs, rap and opera. It is a scientific and national independent college formed on the basis of inheriting and developing the essence and characteristics of these traditional singing arts and drawing lessons from the singing theory and advantages of Bel Canto in Western Europe. A new national singing art with artistry and the spirit of the times. New media technology refers to the new media based on Internet technology. It has the inherent technical advantages and information service functions of media. It is the best choice for the connection between network economy and media industry. New media with dual social and economic attributes not only have the responsibility to spread advanced culture, but also need to make profits. With the rapid development of new media, Chinese national vocal music has achieved continuity and breakthrough, which is mainly reflected in the significant development of Chinese national vocal music communication and education. Relevant studies have pointed out that the singing skills and spiritual content contained in Chinese national vocal music have an important impact on people with thinking disabilities, that is, psychological intervention through the artistic means of Chinese national vocal music, so as to alleviate the symptoms of people with thinking disabilities. In view of this, this paper constructs the artistic psychological intervention mode of Chinese national vocal music based on new media technology, in order to provide an idea for the clinical treatment of people with thinking disorders, and give full play to the application value of Chinese national vocal music in communication and education.

Objective: Based on new media technology, this paper constructs the psychological intervention model of Chinese national vocal music art, which aims to provide ideas for the clinical treatment of patients with thinking disorders, and give full play to the application value of Chinese national vocal music in communication and education.

Research objects and methods: 100 patients with mental disorders were selected as the research object, and the mental disorders of patients were measured in combination with Montreal Cognitive Assessment scale (MoCA). The scale includes seven factors, namely executive ability, naming ability, attention, language ability, abstract ability, delayed recall and orientation ability. The higher the score, the better the cognitive function. Then, implement the artistic psychological model of Chinese national vocal music based on new media technology for intervention. The intervention cycle is June. Compare and analyze the improvement of patients' thinking obstacles before and after the intervention.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Table 1. Improvement of symptoms in patients with thinking disorder after 6 months of intervention

Factor	Before intervention	Intervention 3 months	Intervention 6 months	<i>P</i>
Executive ability	2.69±0.59	4.37±0.48	5.69±0.59	<0.05
Naming ability	2.47±0.43	4.62±0.58	5.47±0.43	<0.05
Attention	2.54±0.55	4.66±0.61	5.54±0.55	<0.05
Language ability	2.36±0.41	4.52±0.60	5.36±0.41	<0.05
Abstract ability	2.69±0.59	4.39±0.43	5.69±0.59	<0.05
Delayed recall	2.47±0.43	4.45±0.56	5.47±0.43	<0.05
Orientation ability	2.54±0.55	4.25±0.43	5.54±0.55	<0.05

Results: Table 1 shows the improvement of symptoms in patients with thinking disorders after 6 months of intervention. It can be seen from Table 1 that compared with before the intervention, after the intervention of the artistic psychological model of Chinese national vocal music based on new media technology, the symptoms of thinking disorders of patients were effectively improved, with statistical difference ($P < 0.05$).

Conclusions: The artistic psychological intervention mode of Chinese national vocal music based on new media technology can effectively improve the symptoms of patients with thinking disorder, and then it can be regarded as a strategy for the treatment of thinking disorder. At the same time, bringing Chinese national vocal music based on new media technology into psychotherapy or psychological education not only expands the dissemination of Chinese national vocal music, but also expands the application field of Chinese national vocal music.

* * * * *

RESEARCH ON THE APPLICATION OF TRADITIONAL CULTURAL ELEMENTS IN FASHION DESIGN FROM THE PERSPECTIVE OF AESTHETIC PSYCHOLOGY

Zeliang Wang

College of Art Design, Qilu University of Technology, Jinan 250353, China

Background: Aesthetic psychology is the marginal combination of aesthetics, literature and art, psychology, physiology and other related disciplines. A discipline that rose in China in the 1980s, namely aesthetic psychological structure and aesthetic psychological law. Aesthetic psychology took the lead in putting forward the proposition of “aesthetic psychological structure” in China, pointing out that aesthetic psychological structure is a multi-factor, multi-dimensional and multi-level dynamic structural system with organic unity of physiological function and psychological law. Psychological content and formal content, acceptance and creation function are the intermediate links of the aesthetic relationship between subject and object, and become the internal source of people’s aesthetic subject and creative subject. This proposition has been widely accepted and applied by academia for a long time. Using psychological principles, the researchers studied the complex aesthetic psychological phenomena, discussed the basic laws of aesthetic psychological movement, and put forward six principles, such as “opposition principle”, “harmony principle”, “balance principle”, “autonomy principle”, “compensation principle” and “self-realization principle”. Specifically, it mainly analyzes the difference psychology, innovation psychology, change psychology, common psychology, obedience psychology, conformity psychology, habit psychology, as well as the dynamic stereotype and thinking set in aesthetics. It demonstrates the significance of various forms of aesthetic psychological rhythm and self-realization needs to confirm their own aesthetic essential power and create beauty. The proposal and demonstration of the above six laws and principles is not only a combing and synthesis of the previous psychological research results, but also a summary of its development process. In short, aesthetic psychology is a branch of psychology, which studies and explains the law of human psychological activities in the aesthetic process. The so-called aesthetics mainly refers to the generation and experience of beauty, while psychological activities refer to people’s knowledge, emotion and meaning. Therefore, aesthetic psychology can also be said to be a discipline that studies and explains the activity process of knowledge, emotion and meaning in the generation and experience of people’s aesthetic emotion, as well as the law of personality tendency.

Fashion design directly designs products and indirectly designs personality and society. The imagination of fashion design quickly breaks through the shackles of ideology and is released in various forms. Novel, strange and abstract visual images form an amazing contrast with extreme colors, so we must start adjusting our eyes to adapt to the new landscape. Fashion art takes on more and more forms, sometimes more mysterious. How to treat clothing art and appreciate and feel the language of clothing itself has become the “eye war” in the “attention” economy in today’s network era. In addition, traditional culture is a kind of culture reflecting national characteristics and style, which is integrated with the evolution of civilization. It is a comprehensive expression of various ideological, cultural and conceptual forms in the history of all ethnic groups. Its content should be all kinds of material, institutional and spiritual cultural entities and cultural consciousness existing in previous dynasties. In other words, traditional culture contains a variety of cultural elements or cultural symbols, and incorporating these cultural elements into fashion design still becomes the inspiration of fashion design. However, how to organically incorporate traditional cultural elements into fashion design is undoubtedly a great challenge for fashion designers.

Objective: Combined with aesthetic psychology, aiming at the aesthetic cognitive obstacles of fashion

designers facing traditional cultural elements, this paper constructs a fashion design intervention model based on aesthetic psychology, so as to solve the aesthetic cognitive obstacles of fashion designers facing traditional cultural elements, so as to improve the taste and artistry of fashion design.

Research objects and methods: 100 fashion designers were randomly divided into control group and experimental group, with 50 in each group. Combined with the self-made aesthetic cognition scale, the aesthetic cognition of fashion designers is measured. The scale consists of 8 dimensions: learning ability, divergent thinking, perception ability, innovation ability, transformation ability, relevance ability, imagination ability and combination ability. The higher the score, the higher the aesthetic cognition. Among them, the control group adopts the conventional fashion design mode, and the experimental group adopts the fashion design mode based on aesthetic psychology. The intervention period is 1 month. The aesthetic cognition of the two groups of fashion designers is compared and analyzed.

Methods: Data through SPSS22.0 statistical analysis software is completed.

Results: Table 1 shows the aesthetic cognition of the two groups of fashion designers after one month of intervention. It can be seen from Table 1 that compared with the control group, the experimental group of fashion design mode based on aesthetic psychology has better aesthetic cognition, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. After one month of intervention the aesthetic cognition of two groups of fashion designers (n=100)

Factor	Control group (n=50)	Experience group (n=50)	P
Uncoordinated limbs	2.54±0.55	4.96±0.41	0.00
Unclear enunciation	2.99±0.69	4.84±0.46	0.00
Unnatural form	2.54±0.55	4.20±0.55	0.00
Inflexible expression	2.96±0.41	4.56±0.66	0.00
Mental disorder	2.84±0.46	4.78±0.75	0.00

Conclusions: The fashion design mode based on aesthetic psychology can effectively improve the aesthetic cognition of fashion designers. Therefore, it is worth popularizing and applying in the field of fashion design, so as to design modern clothing with strong traditional cultural charm.

APPLICATION OF CHINESE LANGUAGE AND LITERATURE KNOWLEDGE IN COLLEGE STUDENTS' EDUCATION UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Xiulian Zhao

The School of Humanities Education, Henan Vocational College of Agriculture, Zhengzhou 451450, China

Background: As a mental disease, cognitive impairment mainly refers to the disorder of learning and memory function caused by abnormal processing of human intelligent knowledge, and leads to pathological behaviors such as loss of line, recognition and use. The diagnostic criteria of cognitive impairment include normal overall cognitive function, main complaints of memory impairment and behavioral disorders inconsistent with age. The main causes of cognitive impairment are chronic brain injury, chronic systemic diseases and mental and psychological abnormalities, among which mental and psychological abnormalities are the most important. According to the latest research, the number of patients with cognitive impairment in China is increasing year by year, which has a serious negative impact on the patients themselves and their families. Timely intervention for patients with cognitive impairment can actively change their cognitive function, and then it is very important to reduce the quality of life of patients and their families. In recent years, many researchers at home and abroad have conducted intervention research on mild cognitive impairment. The intervention measures mainly include nutrition intervention, drug intervention, physical exercise, cognitive training, traditional Chinese medicine and acupuncture intervention. In short, cognition is an intelligent processing process of acquiring knowledge through a series of random, psychological and social behaviors such as learning, memory, language, thinking, spirit and emotion. Cognitive impairment refers to the abnormality of the brain's advanced intelligent processing process in all these processes, resulting in the changes of thinking, spirit, emotion and judgment. At present, the research of cognitive impairment mainly focuses on the field of medicine. However, matching the performance of medical cognitive impairment with the cognitive problems encountered by college students in the application of

Chinese language and literature knowledge, and exploring the strategies and methods to solve the problems are the ways to effectively solve the cognitive impairment of college students in learning Chinese language and literature knowledge. At the same time, it has theoretical and practical significance for the sustainable development of the application of college students' Chinese language and literature knowledge.

Chinese language and literature have a long history, broad and profound, which contains infinite mysteries, which is worthy of our continuous exploration. The knowledge of Chinese language and literature includes three parts: first, the basic knowledge of language, which systematically and comprehensively introduces the common language of modern Han nationality from the aspects of pronunciation, vocabulary and grammar. Second, Chinese application ability, which is divided into "oral expression" and "written expression", is very important to improve students' expression ability and communication skills. Third, the appreciation of literary works, as the core content of textbooks, through the appreciation of literary works, cannot improve students' cultural connotation, but also purify students' psychology, so as to help students form correct values, outlook on life and world outlook. The knowledge of Chinese language and literature, as the educational content in the university stage, is conducive to improving college students' cultural literacy, cognitive level and aesthetic ability. In short, it is also of great value and significance to set up Chinese language and literature knowledge courses in college education, especially psychological education and psychological training closely related to historical, cultural and spiritual development, which is of great significance in improving college students' cultural heritage and improving college students' cognitive impairment.

Objective: In order to effectively improve the widespread cognitive impairment of modern college students, this study constructs a psychological intervention model based on Chinese language and literature knowledge, which aims to promote the psychological development of modern college students and continuously output high-quality physically and mentally sound talents for the construction of the motherland.

Research objects and methods: 600 college students were randomly divided into control group and experimental group, with 300 students in each group. The measurement of students' cognitive impairment was carried out in combination with Montreal Cognitive Assessment scale (MoCA). The scale includes 7 factors: executive ability, naming ability, attention, language ability, abstract ability, delayed recall the higher the score of orientation ability, the better the cognitive function. Among them, the control group adopted the conventional psychological intervention mode, and the experimental group added the knowledge of Chinese language and literature on the basis of the conventional psychological intervention mode. The intervention period was 3 months. The improvement of cognitive impairment of college students in the two groups was compared and analyzed.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Results: Table 1 shows the improvement of cognitive impairment of college students in the two groups after 3 months of intervention. It can be seen from Table 1 that compared with the control group with routine psychological intervention, the experimental group based on Chinese language and literature knowledge has better effect on Improving college students' psychological cognitive impairment, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. The improvement of cognitive impairment of college students in the two groups after 3 months of intervention ($n=600$)

Factor	Control group ($n=300$)	Experience group ($n=300$)	<i>P</i>
Executive ability	2.69±0.59	4.37±0.48	0.00
Naming ability	2.47±0.43	4.62±0.58	0.00
Attention	2.54±0.55	4.66±0.61	0.00
Language ability	2.36±0.41	4.52±0.60	0.00
Abstract ability	2.69±0.59	4.39±0.43	0.00
Delayed recall	2.47±0.43	4.45±0.56	0.00
Orientation ability	2.54±0.55	4.25±0.43	0.00

Conclusions: Psychological intervention based on the application of Chinese language and literature knowledge can effectively improve the cognitive impairment of college students, and can significantly improve the cognitive function of college students. It is worth adding the content of Chinese language and literature knowledge to college students' psychological education, and better ensure the healthy psychological development of modern college students while expanding the application field of Chinese language and literature knowledge.

CONSTRUCTION OF NEW RETAIL SMART CIRCULATION SUPPLY CHAIN SYSTEM UNDER THE BACKGROUND OF COGNITIVE PSYCHOLOGY

Xu Xu

Comprehensive College, Shandong Vocational University of Foreign Affairs, Weihai 264504, China

Background: Cognitive psychology mainly studies people's cognitive process. It originated in the mid-1950s. At that time, behaviorism advocated the study of people's external behavior, while cognitive psychologists believed that we should pay attention to the study of psychological activities, not just superficial behavioral activities. Cognitive psychology became the mainstream school in the 1970s. At the specific level, cognitive psychologists study the internal mechanisms and processes that cannot be observed, such as memory processing, storage, retrieval and memory changes. From the perspective of information processing, the research on cognitive process is the mainstream of modern cognitive psychology. It can be said that cognitive psychology is equal to information processing psychology. It regards people as an information processing system, and holds that cognition is information processing, including the whole process of encoding, storing and extracting sensory input. According to this view, cognition can be divided into a series of stages, each stage is a unit that performs specific operations on the input information, and the reaction is the product of this series of stages and operations. The various components of the information processing system are interrelated to some extent. With the development of cognitive psychology, sequential processing is increasingly challenged by parallel processing theory and cognitive neuropsychology. It can be said that cognitive psychology is a psychology that studies the psychological process behind cognition and behavior (including thinking, decision-making, reasoning and the degree of some motivation and emotion). This science covers a wide range of research fields and aims to study the operation of memory, attention, perception, knowledge representation, reasoning, creativity and problem solving. Cognitive psychologists focus on the psychological mechanism as the basis of human behavior, and its core is the internal psychological process between input and output. However, people cannot directly observe the internal psychological process, but can only speculate by observing the input and output. Therefore, the method used by cognitive psychologists is to infer unobserved psychological processes from observable phenomena. Now, cognitive psychology research usually needs the joint support of experiment, cognitive neuroscience, cognitive neuropsychology and computer simulation. This multi-directional research is becoming more and more popular. By studying the brain, itself, cognitive psychologists hope to reveal the basic process of cognitive activity, not just speculate on its process. The most commonly used is to study the cognitive differences between patients with brain injury and normal people to prove the existence and specific patterns of cognitive processing. In short, both in theory and in practice, cognitive psychology has made important achievements. Therefore, it is worth continuing to expand the application scope of cognitive psychology.

In recent years, the information environment, technology environment and business environment of the new retail industry have undergone profound changes. The rise of big data, cloud computing, Internet of things, artificial intelligence and social media and their embedding in the new retail industry reflect these changes. In addition, the continuous maturity of 5G technology and the application of blockchain technology in the new retail industry have flattened the new retail industry. The data mining ability of the retail industry reflects the characteristics of digitization and ecology, the change and reorganization of supply chain structure, and consumers' consumption expectations in specific time and space, which are reflected in the business model of the new retail circulation supply chain. However, facing the changes of information environment, technology environment and business environment, the new retail circulation supply chain gradually presents the characteristics of flattening, digitization and ecology. However, the business model of the new retail smart circulation supply chain has not changed accordingly, which makes the overall operation of the new retail circulation supply chain poor. However, the business model innovation of the new retail smart circulation supply chain can solve the problems of long circulation time, complex circulation links and high circulation cost of the traditional retail industry, and improve the psychological experience of consumers through the reconstruction of the new retail circulation supply chain.

Objective: Based on cognitive psychology, this paper constructs a new retail smart circulation supply chain system, which aims to ensure the overall operation of the new retail circulation supply chain by improving consumers' psychological experience.

Research objects and methods: 100 consumers were randomly divided into control group and

experimental group, with 50 in each group. The control group adopts the conventional new retail smart circulation supply chain system, and the experimental group adopts the new retail smart circulation supply chain system based on cognitive psychology. Then, the psychological experience of the two groups of consumers is compared and analyzed. The evaluation indicators of consumers' psychological experience include: consumption expectation, consumption scene, business situation, service mode, community relationship and psychological demand. 0-3 points are dissatisfied, 4-6 points are satisfied, and 7-10 points are very satisfied.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the psychological experience of the two groups of consumers. It can be seen from Table 1 that compared with the control group, the experimental group of the new retail smart circulation supply chain system based on cognitive psychology has better psychological experience effect, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. Psychological experience of two groups of consumers ($n=100$)

Factor	Control group ($n=50$)	Experience group ($n=50$)	<i>P</i>
Consumption expectation	2	8	0.00
Consumption scenario	3	7	0.00
Business context	2	8	0.00
Service mode	1	8	0.00
Community relations	2	9	0.00
Psychological needs	3	8	0.00

Conclusions: The new retail smart circulation supply chain system based on cognitive psychology can effectively improve consumers' psychological experience, and then is of great significance to the overall operation of the new retail circulation supply chain.

INFLUENCE OF TRADITIONAL CLOTHING COLOR MATCHING ON PEOPLE WITH MEMORY IMPAIRMENT

Zhenzhen Chen

College of Humanities and Arts, Hainan College of Economics and Business, Haikou 571127, China

Background: Memory impairment is one of the main manifestations of mild cognitive impairment in the elderly. The prevalence of memory impairment among the elderly worldwide exceeds 3%. With the aging society in China, the incidence rate of memory impairment has increased year by year. This is a heavy burden on families and society. Memory impairment refers to the pathological state of functional decline or loss of any one or more links of memory, preservation, cognition and reproduction. It is a common symptom of neurological and mental illness. Memory impairment can be divided into long-term memory impairment, short-term memory impairment and short-term memory impairment. The disease can be improved by drug treatment, psychotherapy and other methods. At present, it cannot be completely cured. The etiology of memory impairment is complex. This is a syndrome that can occur in many diseases. It can come from brain and systemic diseases, including dementia, brain trauma, cerebrovascular diseases and so on. This disease often occurs in people with a family history of brain injury, cerebrovascular disease and degenerative diseases. It can be caused by infection and abnormal nutritional metabolism. At the level of dementia, it is an acquired and persistent intellectual impairment syndrome caused by brain dysfunction, including Alzheimer's disease, frontotemporal degeneration, vascular dementia and so on. The occurrence of dementia is slow and hidden, and memory loss is the main core symptom. In terms of brain injury, brain injury is caused by external forces. Damage to the brain parenchyma can lead to memory impairment, which may be temporary or permanent. At the level of cerebrovascular diseases, such as cerebral infarction and stroke, these diseases can lead to brain injury and memory impairment. When patients with memory impairment, severe memory impairment or diagnosed memory impairment have symptoms such as

depression and thinking retardation, they need to go to the psychiatric department or other corresponding departments in time to pass serological examination, memory test, EEG, cerebrospinal fluid examination, skull CT, MRI and other examinations. At the level of psychotherapy, when patients with memory impairment have symptoms of depression and anxiety, they should first seek psychotherapy to help them master their diseases, correctly understand the diseases, eliminate tension and anxiety, and accept the treatment measures proposed by doctors, which is conducive to the recovery of the diseases. Relevant studies have pointed out that with the increasing pressure of social competition and work pressure, memory disorders tend to be younger, which should attract extensive attention of the state and society.

The clothing of Han Dynasty embodies the aesthetic characteristics of “simplicity” from the aspects of shape, color and quality. The appearance of this aesthetic feature reflects the art’s grasp of the nature of heaven, earth and man in this period. Pursue simplicity and inaction, take “uselessness” and “selflessness” as values, achieve the realm of spiritual freedom and harmony of all things, blend the subject and object, and finally make the object of artistic creation reflect the beauty of pursuing essence and root. In addition, through the cultivation and education of art, we can complete the internalization of “goodness”, and finally form the personality cultivation of “benevolence”, so that art and morality can finally meet the requirements of internal integration and unity, which is also what art needs most today. Relevant studies have pointed out that the “neutralization gas” reflected in the color matching of traditional clothing has an important impact on alleviating the symptoms of people with memory impairment, because the color matching of traditional clothing grasps the essence of art from people’s mind and nature, pursues the free liberation of spirit, and highlights the grasp of mind from specific personality life. Therefore, it is a new strategy for the clinical treatment of people with memory impairment.

Objective: In view of the personality cultivation and spiritual freedom embodied in the color matching of traditional clothing, this study constructs a scheme for the treatment of memory impairment based on the color matching of traditional clothing, in order to provide a new idea for improving the clinical symptoms of patients with memory impairment.

Research objects and methods: 100 patients with memory impairment were selected as the research object, and the symptoms of memory impairment were measured in combination with the Self-rating Scale for memory impairment (AD8). The scale has seven dimensions, which are divided into judgment difficulty, decreased interest, repetitive behavior, learning difficulty, inability to deal with details, daily memory difficulty and decreased thinking ability. The higher the score, the more serious the memory impairment. Then, the psychotherapy model based on traditional clothing color matching was adopted to carry out the intervention. The intervention cycle was 6 months. The improvement of patients’ memory impairment symptoms before and after the intervention was compared and analyzed.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Results: Table 1 shows the improvement of memory impairment symptoms before and after the intervention. It can be seen from Table 1 that compared with before the intervention, after the implementation of the psychotherapy mode of traditional clothing color matching, the symptoms of memory impairment of patients have been effectively improved, with statistical difference ($P < 0.05$).

Table 1. Improvement of memory impairment symptoms before and after intervention

Factor	Before intervention	Intervention 3 months	Intervention 6 months	<i>P</i>
Judgment difficulty	4.37±0.48	3.52±0.60	2.69±0.59	0.00
Decreased interest	4.62±0.58	3.39±0.43	2.47±0.43	0.00
Thinking ability decline	4.66±0.61	3.45±0.56	2.54±0.55	0.00
Repetitive behavior	4.52±0.60	3.25±0.43	2.36±0.41	0.00
Learning difficulty	4.39±0.43	3.52±0.60	2.69±0.59	0.00
Inability to deal with details	4.45±0.56	3.39±0.43	2.47±0.43	0.00
Daily memory difficulty	4.25±0.43	3.45±0.56	2.54±0.55	0.00

Conclusions: The psychotherapy mode based on traditional clothing color matching can effectively improve the clinical symptoms of patients with memory impairment, and then it can be regarded as a new path and direction for clinical treatment of people with memory impairment.

CONSTRUCTION OF COLLEGE ENGLISH MICRO CURRICULUM RESOURCES BASED ON SOCIAL PSYCHOLOGY

Li Li

Department of Foreign Language Teaching, Hebei University of Economics and Business, Shijiazhuang 050061, China

Background: Social psychology is to explore interpersonal relationships from the level of individuals and social groups. It explores behavioral and psychological changes between individuals and groups. Man is the unity of physiology, psychology and society. People's mental health is affected by family environment and social life factors. Social psychology attaches importance to the analysis of individual psychological factors and emphasizes the interaction between individual and society. The most basic organizational form of social life is the family. The first cradle of personal growth after birth is also the family. Personal mental health problems are closely related to family environment. Parents' socio-economic status, family structure and family relations, family rearing style, childhood life experience and early education are important factors affecting individual mental health. Social life factors include social culture, knowledge, wealth, social competition, interpersonal relationships and so on. When individuals are in mental health, they can actively adapt to social life and natural environment through psychological activities and mental state. Mental health is easy to be affected by social life factors. The influence of social culture on individual mental health mainly has two ways: one is standardized social culture; the other is non standardized social culture. Standardized social culture is the objective compulsion of social culture and the consciousness of individual self-regulation. In the process of social survival, individuals will consciously restrict their behavior according to social norms and make individuals gradually socialized. However, due to the particularity of individuals, in the process of socialization, their social culture will collide with their emotions, resulting in individual mental health problems. Personality is the sum of people's psychological characteristics. Different time and place have different effects on people's thought, emotion and behavior. Personality tendency and psychological characteristics are two main aspects of personality, which have a great impact on people's mental health. Personality tendency is the driving force of personality. Research shows that personality tendency is the most active factor in personality. Personality tendency determines people's attitude towards reality and the tendency and choice of social cognitive objects. In short, mental health problems, also known as psychological imbalance, are a series of problems different from physiological diseases caused by the central nervous system. In recent years, China has paid more and more attention to mental health problems. Relevant scholars and experts continue to analyze the influencing factors of adult mental health problems from all aspects, and put forward corresponding solutions. Among them, personality and social psychology have a great impact on people's mental health. Through the study of it, we can find many ways to improve people's mental health level, so as to improve the mental health level of our people.

The traditional college English teaching model has been difficult to meet the social requirements for college students' English level. How to innovate college English learning mode and enable students to learn English anytime and anywhere is undoubtedly the key to the development of modern college English teaching. With the continuous innovation and development of education and teaching theory in the new era, colleges and universities have made major breakthroughs in teaching methods and means. Among them, colleges and universities can search and produce college English micro courses that meet the characteristics of students, enrich college English teaching resources and improve the informatization level of college teaching. Relevant studies have pointed out that college English micro curriculum learning can not only comprehensively improve college students' English level, but also be of great significance to the construction of modern college students' personality psychology. Therefore, from the perspective of social psychology, finding and making college English curriculum resources with rich psychological education content has important theoretical and practical value for improving college students' English level and positive personality.

Objective: In order to improve college students' positive personality, this paper constructs an intervention model of college English micro curriculum resources based on social psychology, which aims to promote college students' English level and help college students' mental health development.

Research objects and methods: 300 college students were randomly divided into control group and experimental group, with 150 students in each group. The control group implemented the traditional college English micro curriculum resource model, and the experimental group implemented the college English micro curriculum resource intervention model based on social psychology. The intervention cycle was 3 months. Then combined with the positive personality scale, the students' positive personality is measured. The scale has 88 items, including 24 dimensions. The higher the score, the more stable the corresponding positive personality is. Finally, the changes of positive personality of the two groups of students are analyzed and compared.

Methods: All data were statistically processed by SPSS22.0 software.

Results: Table 1 shows the changes of positive personality of college students in the two groups after 3 months of intervention. It can be seen from Table 1 that compared with the control group, the students in the experimental group scored higher in all dimensions of positive personality, with statistical difference ($P < 0.05$).

Table 1. Changes of positive personality of college students in the two groups after 3 months of intervention ($n=300$)

Dimension	Control group ($n=150$)	Experience group ($n=150$)	P
Creativity	3.34±0.76	5.12±0.77	<0.05
Curiosity	3.65±0.81	6.38±0.77	<0.05
Judgment	3.78±0.66	6.51±0.84	<0.05
Studious	3.78±0.69	6.72±0.71	<0.05
Insight	3.15±0.67	6.01±0.62	<0.05
Brave	3.03±0.61	6.59±0.63	<0.05
Insist	3.06±0.79	5.97±0.67	<0.05
Sincere	3.34±0.76	5.12±0.77	<0.05
Enthusiasm	3.65±0.81	6.38±0.77	<0.05
Love	3.78±0.66	6.51±0.84	<0.05
Kindhearted	4.00±0.59	6.72±0.71	<0.05
Intelligence	3.09±0.65	6.01±0.62	<0.05
Team	3.09±3.60	6.59±0.63	<0.05
Fair	3.66±0.74	5.97±0.67	<0.05
Leadership	3.56±0.68	5.12±0.77	<0.05
Tolerant	3.77±0.73	6.38±0.77	<0.05
Modest	3.78±0.69	6.01±0.62	<0.05
Cautious	3.34±0.76	6.59±0.63	<0.05
Autonomy	3.65±0.81	5.97±0.67	<0.05
Appreciate	3.78±0.66	5.12±0.77	<0.05
Gratitude	3.78±0.69	6.38±0.77	<0.05
Hope	3.15±0.67	6.01±0.62	<0.05
Humor	3.03±0.61	6.59±0.63	<0.05
Faith	3.06±0.79	5.97±0.67	<0.05

Conclusions: The intervention model of college English micro curriculum resources based on social psychology can effectively improve college students' positive personality, and then has important value for students' psychological development. It is worth popularizing and applying in the construction of college English micro curriculum resources.

ANALYSIS ON THE EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION REFORM IN HIGHER VOCATIONAL COLLEGES ON COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Xue Bai

School of Digital Construction, Shanghai Urban Construction Vocational College, Shanghai 200438, China

Background: Anxiety refers to the tension, uneasiness, worry, worry and other unpleasant complex emotional states caused by an individual's imminent and possible danger or threat. In other words, anxiety is people's emotional reflection of the serious deterioration trend of the value characteristics of real or future things. On the contrary, the emotional form is expectation, and immediate expectation is the

emotional reflection of people's obvious positive tendency to the value characteristics of reality or future things. Specifically, anxiety is a kind of irritability caused by excessive worry about the safety, future and fate of relatives or themselves. It contains worry, worry, sadness, tension, panic, uneasiness and other components. It is related to key situations and events that are difficult to predict and respond to. When the situation changes, anxiety may be relieved. Some people are in a state of anxiety for a long time without objective reasons. They are often afraid of major disasters for no reason, worried about incurable serious diseases, leading to symptoms such as agitation and panic. This abnormal anxiety is a manifestation of psychosis. In short, the clinical manifestations of anxiety disorder are chronic anxiety disorders such as tension, excitement of autonomic nerve function and excessive vigilance, accompanied by a series of symptoms such as muscle tension, autonomic nerve disorder and exercise anxiety, which last for a long time. It is generally believed that over compensation for negative emotions can lead to anxiety disorder. It should be pointed out that mild anxiety has a positive impact, which can stimulate spirit, improve attention and make talents think quickly. However, excessive anxiety can inhibit the brain and make people confused all day. The "Employment anxiety" of contemporary college students is closely related to "graduation anxiety". "Graduation anxiety" is a common psychological phenomenon among graduates. With the popularization of higher education, the pressure faced by college graduates is increasing day by day. This is not only due to the difficult choice of finding a job or taking the postgraduate entrance examination before graduation, but also due to the tense atmosphere of the school, the urging of parents, the competition among peers, and the hesitation and anxiety caused by lack of work. The anxiety of college students in the upcoming graduation, job hunting or other learning stages of the university is mainly caused by excessive employment pressure, which is called "Employment anxiety". Employment anxiety is a strong and lasting emotional experience accompanied by physiological changes. In psychology, mild Employment anxiety is everyone's normal psychological response. Moderate anxiety will make people feel pressure and urge graduates to seek work hard. However, excessive anxiety will not only affect college students' career choice, but also interfere with their normal life.

There is no doubt that China's higher vocational education has developed rapidly and the situation is gratifying in recent years, but behind the appearance of prosperity, the current higher vocational education is facing many difficulties, many problems and contradictions are becoming more and more acute. At the specific level, the recognition of higher vocational education is not high, which is also the mainstream thought of today's society. Various phenomena seem to show that, in terms of national society, higher vocational education is secondary education. For parents and students, higher vocational education is a helpless choice. For employers, the enrollment rate of higher vocational graduates is generally low. In this situation, the employment anxiety faced by higher vocational graduates is undoubtedly more serious. Ideological and political education is not only the primary content of China's spiritual civilization construction, but also one of the main ways to solve social contradictions and problems. Ideological and political education is both important and difficult to do. There are many reasons for the poor effect of ideological and political work, but one of the important reasons is the long-term neglect of psychological education and training. Psychological education and cultivation are the basis of ideological and political education. Without this basis, ideological and political education is difficult to go deep. It is undeniable that ideological and political education based on psychological intervention or training is very important to alleviate the employment anxiety of higher vocational college students. Therefore, exploring the reform of ideological and political education in higher vocational colleges and taking this as the basis to alleviate the employment anxiety of higher vocational college students is undoubtedly a new idea and direction of higher vocational college education reform.

Objective: In order to alleviate the employment anxiety of higher vocational college students, this paper constructs an ideological and political education reform model based on psychological intervention, which aims to dredge the employment anxiety of higher vocational college students, and then establish confidence in their easy employment.

Research objects and methods: 400 higher vocational college students were randomly divided into control group and experimental group, with 200 students in each group. The control group implemented traditional ideological and political education, and the experimental group implemented the reform mode of ideological and political education based on psychological training for 3 months. Then, combined with the Self-rating Anxiety Scale (SAS), the psychological measurement of employment anxiety of higher vocational college students is carried out. The higher the score, the more serious the anxiety psychology is. Finally, the improvement of anxiety psychology of the two groups of higher vocational college students is compared and analyzed.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the psychological improvement of employment anxiety of students in two groups of higher vocational colleges. As shown in Table 1, compared with the control group, the psychological improvement of employment anxiety of higher vocational college students in the experimental group is

more significant, with statistical difference ($P < 0.05$).

Table 1. The improvement of employment anxiety of two groups of higher vocational college students ($n=400$)

Factor	Control group ($n=200$)	Experience group ($n=200$)	P
Somatization	3.75±0.61	1.45±0.56	<0.05
Obsessive compulsive symptoms	3.69±0.59	1.25±0.43	<0.05
Interpersonal sensitivity	4.47±0.43	1.43±0.57	<0.05
Depressive status	3.54±0.55	1.28±0.43	<0.05
Anxiety state	2.36±0.41	1.66±0.61	<0.05
Hostile situation	3.44±0.56	1.52±0.60	<0.05
Psychological state of terror	4.29±0.42	1.45±0.56	<0.05
Paranoid mental state	3.75±0.61	1.25±0.43	<0.05
Psychotic	3.69±0.59	1.43±0.57	<0.05

Conclusions: The reform mode of ideological and political education based on psychological intervention can effectively alleviate the employment anxiety of higher vocational college students. Therefore, the content of psychological education should be added in the ideological and political teaching practice of higher vocational colleges, so as to help higher vocational college students establish the confidence of smooth graduation and easy employment.

DISCUSSION ON RURAL REVITALIZATION STRATEGY TO PROMOTE THE INTEGRATED DEVELOPMENT OF AGRICULTURAL INDUSTRY UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Guanqin Liu

School of Finance, Zhengzhou College of Finance and Economics, Zhengzhou 450000, China

Background: Cognitive impairment is a kind of mental disease. In psychiatry, cognitive impairment is identified as ideological cognitive impairment and perceptual deficit disorder. At the same time, from the perspective of psychology, cognitive impairment is a kind of psychological problem, which is obtained after the psychological impact of patients. In clinical medicine, it is considered that the generation of cognitive impairment is the brain injury caused by the stimulation or external environment. The brain is the part that controls human activities. The impairment of brain cognitive function will lead to people's inability to accurately judge the external information they receive. In psychiatric research, the treatment of cognitive impairment mainly depends on the long-term efficacy of drugs. The treatment brought by drugs is limited, which can only alleviate individual cognitive impairment to a certain extent, and drugs have side effects. Long-term use will bring all kinds of unpredictable consequences. However, some psychiatrists have suggested that cognitive impairment, as an ideological disorder, can effectively cultivate the cognitive ability of patients with cognitive impairment through thinking and cognitive reconstruction. Thinking and cognitive reconstruction is the use of psychological induction to educate and cultivate patients with cognitive impairment, including reshaping the world outlook of patients with cognitive impairment, re understanding things and events, etc. In the modern society with the continuous development of society, people are more likely to have cognitive impairment under the influence of the external environment. Therefore, how to effectively alleviate and treat patients with cognitive impairment in different fields is of great significance.

In the context of national economic development, rural revitalization is proposed as an important strategy for agricultural economic development. In the rural revitalization strategy, take the countryside as the strategic point and drive rural development by looking for the path of rural development. The main purpose of rural revitalization strategy is to help agricultural development and promote agricultural economic growth. At the same time, in rural revitalization, it advocates the integration of the three major industries in agriculture to achieve common development. However, in the modern society of economic development, rural residents are easy to breed cognitive impairment psychology in the changing modern

environment. The most common is that under the influence of cognitive impairment, rural residents have low cognition of the agricultural industry and cannot correctly understand the development prospect of the agricultural industry. At the same time, they have insufficient cognition of the rural revitalization strategy and cannot implement the strategic task. Therefore, under the rural revitalization strategy, the integrated development of agricultural industry needs to focus on the cognitive barriers of rural residents to ensure the normal implementation of the strategy. From the perspective of cognitive impairment, this paper analyzes the hindering role of residents' cognitive impairment in promoting the development of agricultural industry integration, and puts forward the improvement measures of cognitive impairment, in order to promote the development of agricultural industry integration and reduce the level of cognitive impairment of rural residents.

Objective: This paper discusses the promoting effect of rural revitalization strategy on the integrated development of agricultural industry, analyzes the hindering effect of rural residents' cognitive impairment on the implementation of rural revitalization strategy and the integrated development of agricultural industry, and puts forward the improvement strategy of rural residents' cognitive impairment, so as to provide guarantee for the integrated development of agricultural industry.

Study design: Taking a rural area in Southwest China as the research object, the number of residents with cognitive impairment is counted, and the development of rural agricultural industry integration in this area from 2016 to 2021 is counted. Spearman correlation coefficient is used to evaluate the correlation between cognitive impairment and the implementation of rural revitalization strategy and the development of agricultural industry integration.

Results: There are 137 rural residents with cognitive impairment in a rural area of Southwest China. The cognitive impairment level of residents with cognitive impairment is tested respectively, and the impact of the number of cognitive impairments on the development effect of agricultural industry integration under the rural revitalization strategy is compared. See Table 1. Table 1 shows that rural cognitive impairment has a negative impact on the implementation of rural revitalization strategy and the integration and development of agricultural industry, and the number of people with cognitive impairment has different degrees of impact.

Table 1. The impact of rural cognitive impairment on rural development

Index	Number	Implementation of rural revitalization strategy	Integrated development of agricultural industry
Rural 1	33	-0.421	-0.464
Rural 2	21	-0.316	-0.372
Rural 3	16	-0.264	-0.304
Rural 4	36	-0.433	-0.471
Rural 5	31	-0.417	-0.425

Conclusions: The integrated development of agricultural industry under rural revitalization is the main development policy in China. In the development of agricultural economy, the cognitive impairment of rural residents is the main factor affecting its development. Therefore, alleviating the cognitive impairment of residents will help to improve the development of agricultural economy. From the perspective of cognitive impairment, this paper analyzes the impact of residents' cognitive impairment on the integration and development of agricultural industry, and puts forward solutions. The results show that the cognitive impairment of rural residents seriously hinders the implementation of rural revitalization strategy and the integrated development of agricultural industry. Reducing the number of cognitive impairments will help to improve the role of rural revitalization strategy in promoting the integrated development of agricultural industry. Therefore, in the development of agricultural economy, on the premise of implementing the rural revitalization strategy, we need to always pay attention to the cognitive impairment of rural residents, and promote the development of agricultural economy by changing the level of residents' cognitive impairment.

Acknowledgement: The research is supported by: Study on the Development of Modern Agricultural Industrial System, Production System, and Management System in the View of Supply-side Structural Reform in Agriculture in Henan Province (No. 212400410386).

ANALYSIS ON THE INFLUENCE OF UNIVERSITY EDUCATION INFORMATIZATION TEACHING INNOVATION ON COLLEGE STUDENTS' ANXIETY UNDER THE BACKGROUND OF DIVERSIFICATION

Fangxia Zheng

Computer Teaching Department, Zhengzhou Preschool Education College, Zhengzhou 450000, China

Background: In psychology, it is believed that college students are just at the boundary between school and society. Many college students can't calmly deal with the pressure of learning, economy, communication and love, passively avoid, and can't actively explore and solve problems, which leads to negative emotions such as complaint, anxiety and fear of difficulties, which seriously affects their physical and mental health. With the acceleration of social development, the social pressure that college students need to face also begins to increase. Under this social pressure, the mental health status of college students has become the main topic of social concern. It is undeniable that in the psychological changes of college students, more psychological problems are anxiety disorders. The conventional psychological anxiety relief program is to carry out psychological courses, instill relevant psychological knowledge into students, and help students understand the serious impact of negative psychological emotions. However, in the development of psychological curriculum, students' interest in psychological curriculum is not high, which leads to little effect of psychological curriculum on students' psychological counseling. In order to alleviate the psychological anxiety of college students, colleges and universities gradually begin to start with daily course teaching. The continuous development of information technology provides a new environment for course teaching. How to use information technology to realize information-based teaching to improve the teaching quality in daily course teaching and help alleviate college students' anxiety is of great significance.

The main purpose of information-based teaching in university education is to improve students' comprehensive ability, help students establish correct values and reduce the incidence of students' anxiety. University education informatization teaching is to use Internet technology to realize online and offline teaching and help students consolidate their professional knowledge. In the teaching innovation of educational informatization, student-centered diversified teaching has been widely used in the teaching innovation of colleges and universities. The use of diversified teaching can evaluate the current situation of students, teachers, school leaders and society, use the evaluation results to improve the teaching mode and improve the teaching mode step by step. Using diversification to carry out innovative evaluation of information-based teaching and improve the teaching mode can formulate more appropriate teaching plans at the student level, increase the frequency of students attending classes, improve students' learning enthusiasm and reduce students' pressure in learning. At the same time, in online teaching, students can choose the right time to study, and students can also feel a sense of freedom in their daily life. Many studies have pointed out that in university education information-based teaching, diversified evaluation can alleviate students' anxiety, but it is still not deep enough. Therefore, the research takes diversified evaluation as the background to explore the mechanism of university education information-based teaching innovation affecting college students' anxiety, so as to provide theoretical support for college students' psychological counseling.

Objective: This paper analyzes the influence of diversified evaluation of middle school students on the construction of university education information-based teaching innovation model, and discusses the influence of university education information-based teaching innovation model on college students' anxiety.

Study design: Taking a university as the main research object, two classes were selected from freshmen to seniors in the university for test and analysis. The two classes were randomly divided into experimental class and control class. Make statistics on the current situation of middle school students' anxiety in all classes, take students as the main body, adopt diversified evaluation to formulate the innovative mode of university education information teaching, adopt the innovative mode for teaching in the experimental class, and adopt the conventional teaching mode for teaching in the control class. The teaching duration is 5 months. Finally, make statistics on the professional achievements and anxiety of middle school students in different classes. All data were collected by SPSS22.0, $P < 0.05$ was statistically significant.

Results: The comparison results of students in different classes in different grades are shown in Table 1. Table 1 shows that the anxiety scores of students in the experimental class in each grade are lower than those in the control class after teaching, and the improvement of professional scores of students in the experimental class is more obvious.

Conclusions: College students' anxiety is common in colleges and universities. Therefore, it is of great significance for colleges and universities to formulate innovative teaching models to alleviate students' psychological problems. Taking diversified evaluation as the starting point, the research formulates the innovative model of university education information teaching, and analyzes the changes of students'

anxiety under the innovative model. The results show that in college teaching, students of different grades can alleviate their anxiety under the new teaching mode, and compared with the conventional teaching mode, the innovative mode has a more significant effect on students' anxiety relief. Therefore, in college teaching, we should take students as the main body, formulate appropriate teaching models and formulate innovative plans to improve the efficiency of students' anxiety relief.

Table 1. Comparison of students' anxiety before and after teaching

Project		Professional achievement		Anxiety score	
		Before teaching	After teaching	Before teaching	After teaching
Freshman	Experimental class	61.2	80.7	69.57±2.31	35.45±1.26
	Control class	60.7	75.8	68.42±2.22	39.07±1.29
Sophomore	Experimental class	59.4	82.1	64.68±2.17	34.52±1.37
	Control class	60.3	77.5	66.12±2.06	39.52±1.66
Junior	Experimental class	57.8	80.9	59.52±2.33	36.37±1.21
	Control class	55.9	75.6	60.11±2.28	40.02±1.33
Senior	Experimental class	64.3	83.4	70.4±2.77	35.15±1.01
	Control class	63.7	79.7	70.1±2.69	42.06±1.25

TEACHING OF MODERN LITERARY WORKS IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Yuxuan Han

School of Humanities, Jiangnan University, Wuxi 214122, China

Background: College students will have different types of mental diseases due to the pressure of learning tasks, among which cognitive impairment is the most common. Psychiatry believes that cognitive impairment becomes unable to identify common sense information. From the evaluation of psychological characteristics, it can be found that people's cognition is the processing of social information, while mental patients with cognitive impairment have reduced cognitive ability and cannot accurately identify social information, resulting in negative emotions such as fear and anger. Cognitive impairment was classified as schizophrenia in the early research of psychiatry. With the deepening of research, psychiatrists believe that cognitive impairment is a primary symptom independent of schizophrenia. In the research and development of psychiatry, it is suggested that the generation of cognitive impairment has certain genetic factors, and patients with cognitive impairment are more vulnerable to the influence of their parents. At the same time, some studies have pointed out that most patients with cognitive impairment have prefrontal related executive function loss, which indicates that important areas of the brain of patients with cognitive impairment are damaged and have cognitive impairment. In the routine treatment of psychosis, surgery and drug quality are adopted for people with cognitive impairment. In the prognostic study of people with cognitive impairment, it has been confirmed that patients with severe cognitive impairment have social and professional abilities.

In college teaching, the literary ideas contained in modern literary works can significantly affect students' values, which leads to the cognitive impairment of students in literature teaching. However, it can be admitted that colleges and universities are gradually using the ideological impact of literature to solve the cognitive impairment of students in the face of cognitive impairment students in teaching. The main reason for the cognitive impairment of college students is that the learning pressure leads to the confusion of students' thinking logic, which eventually leads to cognitive impairment. The generation of students' thinking logic impairment often occurs in the teaching of literature courses. The core ideas contained in different literature are significantly different, which makes the students' logic confused. This kind of teaching mode of literature can not only lead to the deterioration of students' cognition, but also lead to the deterioration of students' cognition. Therefore, from the perspective of college students with cognitive impairment, this study uses the modern literary works course to carry out teaching innovation, and puts

forward the innovative teaching mode of college literary works teaching, in order to alleviate the cognitive impairment of college students.

Objective: This paper discusses the cognitive impairment of students in college teaching, analyzes the impact of college literary works teaching on students' cognitive impairment, and puts forward an innovative teaching model of modern literary works in colleges and universities based on alleviating cognitive impairment.

Study design: Taking the students of modern literature teaching course in a university as the research object, count the number of students with cognitive impairment, and evaluate the level of students' cognitive impairment. Cluster analysis is used to count the types of works that affect the reduction and improvement of students' cognitive impairment in the teaching of modern literary works in colleges and universities, so as to construct the teaching scheme of modern literary works in colleges and universities. Carry out innovative program teaching for students with cognitive impairment for one year, count the changes of students' cognitive impairment level during teaching, and finally compare the differences of students' cognitive impairment before and after teaching. All data were collected by SPSS24.0, $P < 0.05$ was statistically significant.

Results: According to the statistics of 22 students with cognitive impairment in the teaching of modern literary works in colleges and universities, the impact of the categories of modern literary works on students' cognitive impairment is shown in Table 1, in which "+" means aggravating patients' cognitive impairment, "-" means alleviating students' cognitive impairment, 0-3 means the degree of impact, 0 means no impact, and 3 means significant impact. Table 1 shows that different types of modern literary works have significant differences in the degree of influence on students' cognitive impairment.

Table 1. The influence of the types of literary works on students' cognitive impairment

Project	Prose	Sketch	Poetry	Novel
Cognitive impairment	-2	-2	+3	+2

Conclusions: College students' cognitive impairment is the main factor that hinders the improvement of students' academic performance. In college teaching, we need to focus on students' cognitive impairment. In the research, by analyzing the current situation of cognitive impairment in the teaching of modern literary works and the impact of the types of modern literary works on students' cognitive impairment, we can build a teaching scheme of modern literary works with the ability to alleviate students' cognitive impairment. The results show that different types of modern literary works will promote and alleviate students' cognitive impairment. Taking the types of literary works that can alleviate students' cognitive impairment as the main teaching type can alleviate students' cognitive impairment to a great extent. Therefore, we should start with the construction of students' mental and physical barriers in the teaching program of colleges and universities.

PRACTICE OF PHYSICAL EDUCATION TEACHING METHODS IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Shoumu Pu

College of Physical Education, Huanggang Normal University, Huanggang 438000, China

Background: In college teaching, students are prone to mental and mental health problems, among which cognitive impairment is the most common mental disorder among students. In the teaching of colleges and universities, the learning tasks and learning requirements have been greatly improved in the era of middle school. College students are difficult to adapt to the learning atmosphere of colleges and universities in a short time after they are separated from middle school life. They are more prone to cognitive impairment in the face of the learning environment of colleges and universities with the integration of different cultures. Cognitive impairment is considered as a kind of mental disorder in psychiatry. Many studies have shown that patients with cognitive impairment have obvious impairment of cognitive function. With the help of medical tools, it can be seen that the relevant brain regions of patients with cognitive impairment will be damaged, and then cognitive function will be damaged. However, from

the perspective of psychological research, the generation of cognitive impairment is affected by psychological activities, and people's explicit behavior activities are controlled by the brain, but people's implicit behavior mechanism is still not enough. Generally speaking, psychological behavior is a kind of subconscious psychological change. When people are impacted by external information, the psychological subconscious will affect the individual's internal environment. Psychology and some psychiatry believe that cognitive impairment is a kind of subconscious failure behavior of patients after being impacted by the outside world. In college teaching, the environment faced by students is complex, and people's subconscious will change to a certain extent, which will lead to the failure or lack of students' cognitive function.

In college teaching, in order to deal with the problem of students' cognitive impairment, colleges and universities have carried out a large number of teaching practices. Among them, physical education teaching, as a course teaching of physical exercise, can transfer students' attention from the external environment to their own performance to a certain extent. In college physical education courses, teachers will ask students to choose course items according to their own needs, such as football, basketball and other sports. In addition, college sports also include more relaxed items such as Taijiquan. For students with cognitive impairment, colleges and universities gradually take physical education as the main mitigation method. The purpose is to make students have a sufficient understanding of their physical performance with the help of physical exercise in physical education, and promote the recovery of students' cognitive function with the help of relaxation means of sports. Therefore, a number of studies have gradually carried out the research on the impact of college physical education on students' cognitive impairment, but from the research results, a large number of research results have failed to give an in-depth understanding of the specific impact of physical education teaching mode on students' cognitive impairment. In view of this, from the perspective of students' cognitive impairment, this study constructs a physical education teaching model that can significantly alleviate students' cognitive impairment, in order to provide theoretical support for the treatment of college students' cognitive impairment.

Objective: This paper discusses the current situation of college students' cognitive impairment, analyzes the impact of college physical education on students' cognitive impairment, and explores the effect of the new model of college physical education on students' cognitive impairment.

Study design: Taking a university as an example, this paper collects the situation of students with cognitive impairment in colleges and universities, groups students according to the sports items selected by students, and analyzes the mitigation of cognitive impairment of students with cognitive impairment in three-month physical education teaching. The fuzzy evaluation method is used to extract the teaching methods that have an impact on students' cognitive impairment from the initial teaching situation, so as to construct a new model of physical education teaching, apply it to college physical education teaching, carry out teaching intervention for students with cognitive impairment, the teaching time is 3 months, and finally count the cognitive impairment of all students. The changes of students' cognitive impairment in the two teaching modes were compared by SPSS22.0 for statistical analysis.

Results: The comparison of cognitive level changes of students with cognitive impairment in the two teaching modes is shown in Table 1. Using 0-5 respectively indicates that students' cognitive function is poor to very good. Table 1 shows that in different sports, the cognitive impairment mitigation ability of physical education teaching innovation scheme is greater than that of traditional teaching mode.

Table 1. The influence of physical education teaching plan on students' cognitive impairment

Project		1 month	2 months	3 months
Football	Traditional teaching	1	2	2
	Innovative teaching	1	3	3
Basketball	Traditional teaching	1	1	2
	Innovative teaching	1	3	3
Taiji boxing	Traditional teaching	1	2	2
	Innovative teaching	2	3	4

Conclusions: The cognitive impairment of college students has caused great obstacles to students' physical and mental development. Therefore, it is necessary to formulate corresponding teaching plans on the premise of alleviating students' cognitive impairment in college teaching. In the research, by analyzing the current situation of students' cognitive impairment, evaluating the correlation between students' cognitive impairment and physical education teaching, and constructing an innovative model of physical education teaching to alleviate students' cognitive impairment. The results show that students with cognitive impairment in different sports can be affected by sports innovative teaching programs, and show a

significant improvement in cognitive function. Therefore, in order to alleviate the cognitive impairment of college students, schools can take physical education teaching as the main treatment scheme, improve students' cognitive level and promote students' healthy growth through physical education innovation scheme.

INFLUENCE OF PHYSICAL TRAINING ON IMPROVING COLLEGE STUDENTS' PHYSICAL HEALTH LEVEL AND ALLEVIATING LEARNING ANXIETY

Kuilong Yu

College of Physical Education, Baoji University of Arts and Sciences, Baoji 721013, China

Background: The anxiety of college students is a common phenomenon in college learning. The main reason for students' anxiety is that students' psychology cannot adapt to the college environment. In students' learning anxiety, the ecological environment of colleges and universities is the main factor affecting students' learning mood. Learning tasks and learning requirements are the main factors affecting students' learning enthusiasm. Anxiety will occur when students cannot meet the learning tasks issued by teachers and the learning requirements required by teachers. In psychology, psychological anxiety is defined as a kind of negative emotion of Chang a Jin, which is easy to breed under the influence of the outside world. People with anxiety often have anxiety. It is difficult to express their true feelings in the face of real life. Under the influence of anxiety, individuals are more likely to have doubts and uneasiness about the unknown, resulting in serious mental damage. From the existing psychological research, students' learning anxiety is a manifestation of psychological pressure, and this growing pressure will lead to students not only psychological health problems, but also the decline of students' basic physical quality, and finally serious diseases. In order to deal with students' learning anxiety in college teaching, colleges and universities continue to try various mitigation schemes. In the existing research, the more effective way is physical training.

Physical training is a kind of teaching course based on sports. Compared with physical teaching course, teachers urge students to carry out physical activities and guide students to carry out scientific and effective physical exercise. Physical training is one of the indispensable teaching courses in college teaching. In the development of education in China, it has always been emphasized to improve students' comprehensive physical quality and ensure that students have good physical ability in the learning process to support huge learning activities. With the deepening of psychological research, it is found that physical training can not only improve students' basic physical quality, but also play a certain role in alleviating students' learning pressure. Some studies have directly pointed out that in the process of physical training, students' psychological anxiety in physical exercise will be significantly reduced, which is reflected in that students' anxiety and tension will be significantly relieved after physical training. However, there is little research on how physical training can alleviate the anxiety caused by students' learning pressure. Therefore, the research deeply analyzes the alleviating effect of physical training on students' learning anxiety while improving students' physical health level, in order to put forward innovative schemes for colleges and universities to alleviate students' anxiety.

Objective: Explore the current situation of learning anxiety caused by learning pressure of college students, analyze the impact of physical training on college students' physical health level, and analyze the specific role of physical training in alleviating students' learning anxiety.

Study design: Taking three universities in a city as the research object, the number of students' learning anxiety in the three universities is counted. Professional performance assessment was used to determine the physical health level of college students, and Self-rating Anxiety Scale was used to count the anxiety of students. Formulate the physical training plan and apply the plan to the physical training in three schools. The length of physical training is 4 months. Compare and analyze the differences of students' physical health level and students' learning anxiety before and after teaching, and analyze the impact of physical training on students' learning anxiety. Adopt SPSS24.0. The data difference before and after statistical

analysis was statistically significant ($P < 0.05$).

Results: The professional scores and learning anxiety of students in the three universities are shown in Table 1. Table 1 shows that after physical training and teaching, students' professional scores have increased significantly. Students' learning anxiety has decreased significantly after physical training. The differences of students' professional scores and learning anxiety scores before and after teaching are compared and analyzed. The results show that they are statistically significant.

Table 1. Comparison of students' performance and anxiety before and after physical training

Group	Before teaching	After teaching	P
Professional achievement	66.7	75.4	<0.05
Learning anxiety	63.44±2.09	37.28±1.36	<0.05

Conclusions: The anxiety of college students is the content that the school must pay attention to in the teaching development. What means to alleviate the anxiety of students in learning is the key problem to be solved in the teaching planning of colleges and universities. In the research, the purpose of alleviating students' learning anxiety is achieved through physical training. By analyzing the current situation of students' learning anxiety in school, appropriate physical training teaching mode is formulated to alleviate students' psychological anxiety on the premise of improving students' basic physical quality. The results show that physical training can completely affect students' learning anxiety, and can reduce students' anxiety score on the premise of helping students improve their physical quality, which is of great significance to the development of students' comprehensive quality. In college education, we need to focus on the impact of physical education teaching on students' anxiety, change the teaching mode in real time, improve students' mental health level, and provide talent guarantee for national development.

ROLE OF VOLUNTARY SERVICE ACTIVITIES IN IMPROVING COLLEGE STUDENTS' MENTAL HEALTH FROM THE PERSPECTIVE OF POSITIVE PSYCHOLOGY

Jun Zhao¹ & Jia Liu²

¹*School of Computer Science, Hulunbuir University, Hulunbuir 021008, China*

²*School of Foreign Language, Hulunbuir University, Hulunbuir 021008, China*

Background: In college education, alleviating the psychological problems of college students is the main work content. College students are in the stage of breaking away from the discipline of their parents. In college learning, college students are also gradually integrating into the society. Aiming at the psychological problems of college students, a large number of early scholars studied the psychological changes of college students, and analyzed that college students are prone to self-differentiation and anxiety in college learning. The self-differentiation of college students is an imperfect personality when balancing parental care and self-independence. Anxiety is a complex emotion of college students in the face of college learning tasks. In a word, college students' anxiety is a kind of positive and applied anxiety in college students' ideological and political education. Positive psychology is a kind of psychological research to tap human good morality and inherent potential. It aims to enhance people's optimism and promote the harmonious development of society at one time. Psychology emphasizes the help of students' negative emotions rather than the diffusion of negative emotions. In short, positive psychology is a way of psychological induction, which promotes the good development of students' psychology through speech encouragement, behavior induction and so on.

In college education, the comprehensive development of middle school students is becoming more and more important, which leads to the school paying more and more attention to the mental health of college students. From the perspective of positive psychology, the school should improve the existing positive psychology of students. Therefore, the school continues to carry out various extracurricular activities to cultivate students' correct values and guide students' positive physical and mental development. Among them, volunteer service activities, as a main activity to test students' social ability, have a great impact on students' physical and mental health. In volunteer service activities, students need to have basic social skills. General volunteer service activities are aimed at the elderly, weak, sick and disabled in society, which emphasizes that students have basic psychological qualities such as kindness and responsibility. Therefore, from the perspective of positive psychology, volunteer service activities can promote the mental

health of college students. However, some studies have not been able to understand the specific mechanism of the positive psychology in volunteer service activities in the improvement of college students' mental health. The research explores the positive means in volunteer service activities through positive psychology, and evaluates the effect of ability training in volunteer service activities on the improvement of students' mental health, in order to provide reference for the cultivation of college students' physical and mental health.

Objective: Explore the connotation of positive psychology in volunteer service activities, and analyze the role of volunteer service activities induced by positive psychology in promoting college students' mental health.

Study design: Taking a university as an example, this paper counts the main activities in the development of volunteer service activities in colleges and universities, classifies the connotation of positive psychology in various activities by cluster analysis, analyzes the impact of different positive psychology on students' anxiety, self-differentiation and emotional expression, and summarizes the comprehensive effect of volunteer service activities on the improvement of college students' mental health.

Results: The positive psychology in volunteer service activities obtained by cluster analysis includes persistence, enthusiasm, dedication, love and pride. The impact of positive psychology on students' anxiety, self-differentiation and emotional expression is shown in Table 1. 0-4 represents the degree of impact, 0 represents no impact, 1 represents weak impact, 2 represents general impact, 3 represents strong impact and 4 represents complete impact. Table 1 shows that the positive psychology such as persistence, enthusiasm, dedication, love and pride in volunteer service activities have a complete impact on students' anxiety, self-differentiation and emotional expression.

Table 1. The influence of volunteer service activities on students' psychological emotion

Psychological emotion	Persistent	Enthusiasm	Dedication	Love	Proud
Anxious	3	4	4	4	4
Self-differentiation	4	4	4	4	3
Emotional expression	4	4	4	4	3

Conclusions: The mental health of college students is the focus of all sectors of society. It is particularly important for colleges and universities to promote students' physical and mental growth in the teaching process. From the perspective of positive psychology, this paper analyzes the positive psychology in volunteer service activities, and evaluates the impact of positive psychology on students' psychological emotion. The results show that the positive psychology in volunteer service activities can completely affect students' psychological emotion, that is, volunteer service activities can significantly improve students' mental health. Therefore, in college teaching, schools should often organize volunteer service activities and use the positive psychology in the activities to promote the healthy growth of students' psychology.

* * * * *

PERFORMANCE AUDIT OF FINANCIAL SUBSIDIES FOR RURAL REVITALIZATION PROJECTS FROM THE PERSPECTIVE OF ECONOMIC PSYCHOLOGY

Zhengdi Gu

School of Government Audit, Nanjing Audit University, Nanjing 210000, China

Background: In recent years, China has put forward the rural revitalization strategy, vigorously developed the rural tourism industry and improved the income of farmers. In order to develop rural tourism industry, the government's financial subsidy funds are indispensable. In this process, the performance audit of financial subsidy funds is very important. The traditional performance audit method of financial subsidy funds is inefficient, time-consuming and heavy workload. The staff often cannot get accurate results within the specified time, so there is great psychological pressure. In addition, the performance audit of financial subsidy funds is relatively boring, and the staff often have negative emotions such as irritability and anxiety. Over time, if the negative emotions cannot be alleviated, the staff will suffer from psychological diseases such as anxiety and depression, which will not only affect the physical and mental health of the staff, but also affect their daily life and work, and have a negative and negative impact on individuals and rural revitalization. Therefore, we need to find a fast, efficient and convenient financial subsidy fund

performance audit method to improve work efficiency, alleviate the negative emotions of staff, and then treat the anxiety and depression of staff.

Economic psychology is a comprehensive discipline that combines the dimensions of psychology, economics and management. It mainly studies the psychological activity law of individual, collective, labor and interpersonal communication in economic activities, so as to improve production efficiency. The main research contents of economic psychology are: individual characteristics and the position of personality in the labor force structure, the law of individual psychological change when participating in economic activities, individual psychological problems and change filtering during labor achievement distribution and consumption, the cycle law of individual demand generation, development, sufficiency and reproduction, the quantitative and qualitative analysis of individual demand the relationship between individuals and various forms of ownership, the effectiveness of the operation of the economic system and the psychological conditions for the formulation and implementation of economic policies. The theory of economic psychology adopts the viewpoint of psychology to analyze the psychological factors of various roles in economic activities, that is, to analyze the psychological change law, decision-making change and decision-making behavior of consumers, entrepreneurs and political decision-makers under different circumstances. Based on economic psychology, this paper constructs the performance audit system of financial subsidy funds of rural revitalization projects, improves the work efficiency of financial subsidy funds' performance audit staff of rural revitalization projects, reduces the workload, alleviates the negative emotions of staff, and plays a role in treating the mental anxiety of staff, which is of positive significance to the cause of rural revitalization in China.

Objective: The performance audit of financial subsidy funds is relatively boring, and the staff are easy to suffer from psychological diseases such as anxiety and depression, which not only affects the physical and mental health of the staff, but also affects their daily life and work, and has a negative and negative impact on individuals and rural revitalization. Based on economic psychology, this paper constructs a performance audit system of financial subsidies for rural revitalization projects, improves work efficiency, reduces workload, alleviates the negative emotions of staff, and plays a role in treating the mental anxiety of staff, which is of positive significance to the cause of rural revitalization in China.

Research objects and methods: 40 staff with different degrees of anxiety and engaged in the performance audit of financial subsidies were selected as the research objects. The mental health status of the staff was evaluated by Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS).

Study design: 40 patients were randomly divided into study group and control group with 20 people in each group. Among them, the staff of the research group used the financial subsidy fund performance audit system of rural revitalization project based on economic psychology to carry out the audit work. The staff in the control group used the traditional financial subsidy fund performance audit method for audit work. After a period of time, the mental health status of the two groups was compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After working for a period of time, the SAS score, SDS score and HADS score of the staff in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). Among them, the HADS scores of the two groups of staff are shown in Figure 1.

Note: * $P < 0.05$ compared with control group.
Figure 1. HADS score of two groups of staff

Conclusions: The traditional financial subsidy fund performance audit method is inefficient, time-consuming, heavy workload, great psychological pressure on staff, and staff often have negative emotions such as irritability and anxiety. When negative emotions cannot be alleviated for a long time, it will lead to psychological diseases such as anxiety and depression, affect the physical and mental health of staff, affect daily life and work, and have a negative and negative impact on individuals and rural revitalization. Based on economic psychology, this paper constructs a performance audit system of financial subsidies for rural revitalization projects. The experimental results showed that after working for a period of time, the SAS score, SDS score and HADs score of the staff in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). The above results show that the rural revitalization project financial subsidy fund performance audit system can improve the work efficiency of the rural revitalization project financial subsidy fund performance audit staff, reduce the workload, alleviate the negative emotions of the staff, and play a role in treating the mental anxiety of the staff, which is of positive significance to the cause of rural revitalization in China.

INNOVATIVE APPLICATION OF ECOLOGICAL LANDSCAPE DESIGN IN RURAL REVITALIZATION FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Zhiyuan Wang

School of Art, Shandong Jianzhu University, Jinan 250101, China

Background: Since the reform and opening up, China's economic level has improved rapidly, the market economy has developed continuously, and the pace of life of urban residents is also accelerating. In the fast-paced life, urban residents bear a lot of pressure, such as work, emotion, communication, loan and so on, but they cannot be effectively released. Under the long-term accumulation of pressure, urban residents have physical and psychological problems, and then suffer from various psychological diseases, such as anxiety, depression and so on. If the degree of mental illness is too heavy and lasts too long, it will damage the patient's physical function and make the patient feel painful and depressed. In the long run, it will make the patient have the psychology of world weariness and suicide, and cause a huge burden on the patient's family and society, which is not conducive to the construction and development of a harmonious society. Therefore, finding a suitable way to alleviate the negative emotions of urban residents and then treat mental diseases is of positive significance to the personal development of patients with mental diseases, the reduction of the burden on patients' families and the development of a harmonious society.

Under the rural revitalization strategy, the rapid development of rural tourism industry has become an important way for many urban residents to relax and alleviate their negative emotions. The ecological landscape design in rural tourism can make tourists feel happy and have the effect of treating mental diseases. However, the homogenization of some ecological landscape designs is serious, which leads to aesthetic fatigue of tourists and has little effect on tourists' mood relaxation. Therefore, innovation and improvement are needed. Social psychology is a branch of psychology, which mainly studies the occurrence and change law of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. In social psychology, it is generally divided into three fields: individual process, interpersonal process and group process. Among them, individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. Interpersonal process is to explore the interpersonal relationship between individuals and the impact of interpersonal relationship on individual psychology. Group process studies individual psychology and behavior law from the perspective of macro environment, including the psychological impact of group and organization on individual and the psychological impact of surrounding environment on individual. The research analyzes the psychology of urban residents based on social psychology, and innovates the ecological landscape design in rural tourism according to the analysis results, so as to treat the anxiety and depression of urban residents.

Objective: In the fast-paced life, urban residents bear a lot of pressure. Under the long-term accumulation of pressure, urban residents have physical and psychological problems, and then suffer from various psychological diseases, such as anxiety, depression and so on. Based on social psychology, this study

innovates the ecological landscape design in rural tourism in order to treat the psychological diseases of urban residents, such as anxiety and depression.

Research objects and methods: 100 urban residents with anxiety disorder were selected as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the mental health status of urban residents.

Study design: 100 urban residents with anxiety disorder were randomly divided into study group and control group with 50 people in each group. Among them, urban residents in the research group choose to travel to the countryside with innovative ecological landscape design based on social psychology. The urban residents in the control group went to the countryside with traditional ecological landscape design for tourism. Before and after tourism, the mental health status of the two groups of urban residents was counted.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After the tour, the SAS score, SDS score and HADS score of patients in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). The SAS scores of the two groups of urban residents are shown in Table 1.

Table 1. SAS scores of two groups of urban residents

Timing	SAS scores		<i>t</i>	<i>P</i>
	Research group	Control group		
Before Tourism	73.5±12.3	72.7±13.1	0.304	0.653
After tourism	52.6±6.7	62.5±7.9	4.420	0.013
<i>t</i>	7.371	6.421	-	-
<i>P</i>	0.000	0.009	-	-

Conclusions: If the degree of mental illness is too heavy and lasts too long, it will damage the patient's physical function and make the patient feel painful and depressed. In the long run, it will make the patient have the psychology of world weariness and suicide, and cause a huge burden on the patient's family and society, which is not conducive to the construction and development of a harmonious society. Based on social psychology, this study innovates the ecological landscape design in rural tourism in order to treat the psychological diseases of urban residents, such as anxiety and depression. The results showed that the SAS score, SDS score and HADS score of patients in the study group were lower than those in the control group after the tour, and the difference was significant ($P < 0.05$).

LEADERSHIP MANAGEMENT ANXIETY CAUSED BY THE REFORM FROM MANAGEMENT TO GOVERNANCE IN COLLEGES AND UNIVERSITIES IN CHINA

Li Zhang^{1*}, Shuai Huang² & Hua Jiang³

¹*School of Foreign Languages, Dalian University of Technology, Dalian 116024, China*

²*School of Maritime Economics and Management, Dalian Maritime University, Dalian 116026, China*

³*Graduate School of Education, Dalian University of Technology, Dalian 116024, China*

Background: In the process of reform from management to governance in colleges and universities, due to the lack of experience and management level of the management, there are many problems in the reform from management to governance in colleges and universities, resulting in the reform is not thorough enough and the management of colleges and universities cannot achieve the expected effect. Therefore, some college leaders have anxiety in the management process. Anxiety is a kind of emotional and behavioral disorder that excessively worries about bad expected results, including generalized anxiety, social anxiety, panic disorder and so on. The objective purpose of anxiety is to guide people on how to quickly take various measures and urgently mobilize various value resources, so as to effectively prevent the serious deterioration of the value characteristics of real or future things and make them develop in a favorable direction. Therefore, short-term and moderate anxiety can help individuals establish goals and efforts, and help individuals establish positive beliefs. However, long-term and excessive anxiety will lead to the impairment of patients' physical and mental health, affect patients' normal life, increase the burden on patients' families, have a negative effect on patients' personal development and the construction of a harmonious society, and also have a negative impact on the normal operation of the school.

Educational psychology is a psychological theory put forward under the background of teaching reform. It has important theoretical and practical significance in promoting the reform of the education system. In addition, educational psychology is also of great significance to the improvement of educators' psychological quality and teaching methods. Educational psychology contains many related theories, including psychological content, the law of psychological changes of students in the learning process, teachers' analysis and cultivation of students' learning motivation, teachers' transfer and promotion of students' learning, teachers' analysis of the development of students' cognitive ability, teachers' cultivation of students' cognitive understanding, students' memory development, students' knowledge consolidation methods the formation of students' cognitive strategies, the cultivation of students' problem-solving ability and innovation ability, the cultivation of students' correct self-consciousness, students' group psychology and students' mental health education. The research is based on educational psychology to solve the problems existing in the reform from university management to governance, and deepen the reform, so as to alleviate the anxiety of university leaders and ensure the normal operation of the school.

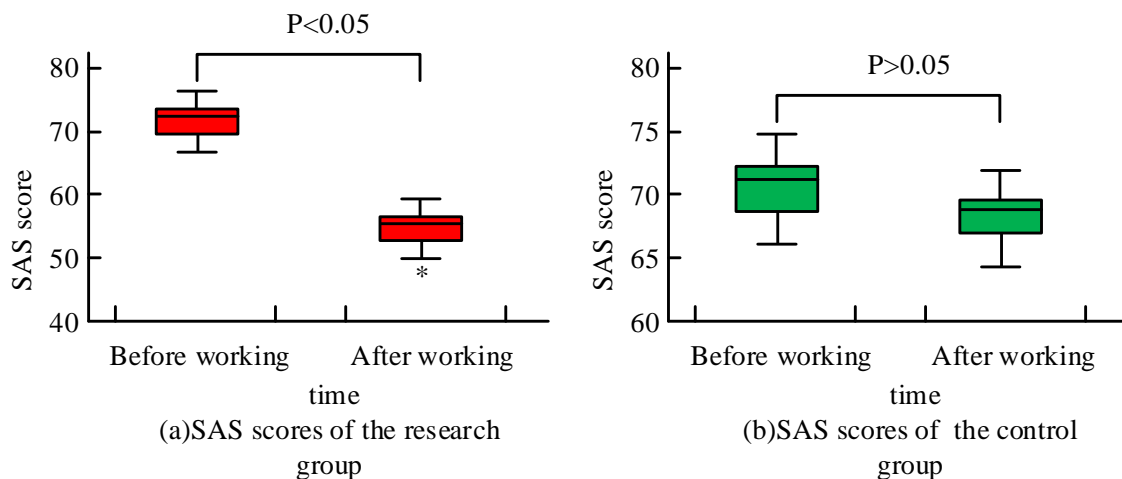

Objective: There are many problems in the reform from management to governance in colleges and universities. Some college leaders have anxiety in the process of management. The research is based on educational psychology to solve the problems existing in the reform from university management to governance, and deepen the reform, so as to alleviate the anxiety of university leaders and ensure the normal operation of the school.

Research objects and methods: 60 university leaders from 12 universities were selected as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the mental health status of the subjects.

Research design: 60 university leaders were randomly divided into research group and control group with 30 people in each group. Among them, the university leaders of the research group adopted the reform method based on educational psychology to carry out the reform of universities from management to governance. The college leaders in the control group adopted the traditional reform method to carry out the reform of colleges and universities from management to governance. After a period of time, the anxiety levels of the two groups of college leaders were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After working for a period of time, the SAS score, SDS score, and HADS the score of university leaders in the study group were significantly lower than those in the control group ($P < 0.05$). Among them, the SAS scores of the two groups of university leaders are shown in Figure 1.

Note: * $P < 0.05$ compared with the control group.

Figure 1. SAS scores of two groups

Conclusions: The traditional management mode of colleges and universities in China generally emphasizes top-down vertical supervision. Therefore, it is imperative for colleges and universities to transform from institutionalized management activities to institutionalized management activities. Due to the lack of experience and management level of the management, there are many problems in the reform from management to governance in colleges and universities, resulting in the reform is not thorough enough and the management of colleges and universities cannot achieve the expected effect. Therefore, some college leaders have anxiety in the management process. Research on solving the problems existing in the

reform from management to governance of colleges and universities based on educational psychology. The experimental results show that after working for a period of time, the SAS score, SDS score and HADS the score of university leaders in the research group are lower than those in the control group, and the difference is significant ($P < 0.05$). It shows that the application of educational psychology in the reform can deepen the reform, so as to alleviate the anxiety of college leaders and ensure the normal operation of the school.

TRY TO ANALYZE THE INFLUENCE OF MUSIC PERFORMERS' ANXIETY ON MUSIC PERFORMANCE

Zhiqiang Zheng

Academy of Music, Henan Vocational Institute of Arts, Zhengzhou 451464, China

Background: Stage anxiety is a common phenomenon of music performers in performance, which has a great impact on the live performance of music performers. Stage anxiety is stage tension, also known as performance anxiety. When performing in a strange environment and on a strange stage, each music performer will have varying degrees of anxiety. If the anxiety level is moderate and the music performers can make good use of their anxiety psychology, stage anxiety will become the driving force to promote the music performers to perform better. However, if the anxiety is too serious and the musical performer cannot control his anxiety well, it will affect the performance effect of the music performer on the stage and become an obstacle to the progress of the music performer. Stage anxiety will lead to faster heartbeat, heavier breathing, higher blood pressure, weaker control of muscles and vocal cords, forgetting words and scores, performance mistakes, and so on. Therefore, finding a way to alleviate the stage anxiety of music performers is of positive significance to the long-term development of music performers and the promotion of music in our country.

Behavioral psychology originated in the United States in the early 20th century. It is a branch of psychology. Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Therefore, based on behavioral psychology, this study analyzes the factors leading to the anxiety of music performers and the impact of music performers' anxiety on music performance, and puts forward strategies to reduce the stage anxiety of music performers.

Objective: Stage anxiety is a common phenomenon of music performers in performance, which has a great impact on the live performance of music performers. Based on behavioral psychology, this study analyzes the factors leading to the anxiety of music performers and the impact of the anxiety of music performers on music performance, and puts forward strategies to reduce the stage anxiety of music performers, which is of positive significance to the long-term development of music performers and the promotion of music in China.

Research objects and methods: In an art college, 80 students majoring in music performance were selected as the research objects. The subjects were investigated by Stage Anxiety Questionnaire (SAQ), Life Events Scale (LES), Symptom Checklist-90 (SCL-90) and Cattell's 16 Personality Questionnaire.

Research design: Using the random number table method, 80 students majoring in music performance were randomly divided into research group and control group, with 40 people in each group. The students in the research group used strategies based on behavioral psychology to alleviate stage anxiety, and then performed on stage, the students in the control group used traditional methods, such as deep breathing, to alleviate stage anxiety, and then performed. Record the anxiety level of the two groups of students before and after the performance.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: Before the performance, there was no significant difference in the anxiety degree between the two groups ($P > 0.05$). After the performance, the anxiety degree of the students in the study group was significantly lower than that of the students in the control group ($P < 0.05$). The stage anxiety questionnaire scores of the two groups of students are shown in Table 1.

Table 1. The stage anxiety questionnaire scores of the two groups of students

Timing	SAQ scores		<i>t</i>	<i>P</i>
	Research group	Control group		
Before the performance	11.5±2.3	10.7±3.1	0.304	0.653
After the performance	7.6±2.7	10.5±2.9	6.420	0.000
<i>t</i>	7.371	0.421	-	-
<i>P</i>	0.000	0.681	-	-

Conclusions: When performing in a strange environment and on a strange stage, each music performer will have varying degrees of anxiety. Stage anxiety will lead to faster heartbeat, heavier breathing, higher blood pressure, weaker control of muscles and vocal cords, forgetting words and scores, performance mistakes and so on. Based on behavioral psychology, this study analyzes the factors leading to the anxiety of music performers and the impact of the anxiety of music performers on music performance, and puts forward strategies to reduce the stage anxiety of music performers. The results showed that there was no significant difference in the anxiety level between the two groups before the performance ($P > 0.05$). After the performance, the anxiety level of the study group was significantly lower than that of the control group ($P < 0.05$).

RESEARCH ON THE SIGNIFICANCE OF COLLEGE MUSIC EDUCATION IN ALLEVIATING COLLEGE STUDENTS' COGNITIVE IMPAIRMENT

Wen Zhang

College of Educational Sciences, Xuzhou University of Technology, Xuzhou 221000, China

Background: Cognitive impairment is a very serious mental disorder. In psychiatry, the existing studies on cognitive impairment point out that there are great problems in the cognitive ability of patients with cognitive impairment, and it is difficult to be fully alleviated. However, in order to improve the physical and mental health of cognitive impairment and promote the harmonious development of society, there are also a large number of studies on the treatment of cognitive impairment. Many of them believe that music therapy can effectively alleviate the level of cognitive impairment of patients. As an emotional carrier, music contains rich thoughts and cultures. Psychiatry believes that rich cultural thoughts can not only directly affect the cognitive ability of patients with cognitive impairment, but also easier to implement treatment during this period. In the understanding of music, the perception of music by people with cognitive impairment will be quite different from that of ordinary people. In college education, in order to alleviate the cognitive obstacles of students and remove the traditional ideological and political teaching, colleges and universities began to take music teaching as an elective content to alleviate the serious obstacles of students. Music, as the carrier of a variety of ideas, contains extremely rich core cultural content. Therefore, the application of music education to the alleviation of cognitive impairment of college students is of great value. At the same time, it can promote the development of music on the basis of the alleviation of cognitive impairment of patients.

In college music education, the purpose is to increase students' extracurricular learning content and cultivate students' comprehensive quality on the basis of students' professional courses. Therefore, in the traditional teaching of colleges and universities, music education is mostly an elective course to assist students' growth. In the course teaching, teachers' pay less attention to students, so they know little about students' psychological and mental status. At the same time, some studies have pointed out that in college music teaching, due to the small psychological needs of students and the low classroom enthusiasm reflected in music teaching, it leads to the poor teaching effect in college students' music courses, and it also leads to the difficulty of alleviating students' cognitive impairment. In order to solve the above problems, the research puts forward the important practical significance of college music education, obtains the important correlation between college music education and students' growth, and aims to analyze the role of college music education in alleviating students' cognitive impairment, in order to provide theoretical support for the healthy development of college students.

Objective: This paper discusses the current situation of college music education, analyzes the impact of college music education on students' psychological activities, and analyzes the significance of college music education in the alleviation and treatment of college students' cognitive impairment.

Study design: Taking the students of a university as the object, the cognitive impairment of all the

students in the university is counted, so as to analyze the current situation of the students with cognitive impairment in the university. Taking the number of students in music education in colleges and universities as an example, count the number of students with cognitive impairment in recent years and the changes of cognitive ability of students with cognitive impairment, and evaluate the mitigation effect of students with cognitive impairment in music education.

Result: In college music teaching, the statistics of the number of students with cognitive impairment and the changes of cognitive ability are shown in Table 1. Table 1 shows that the number of students with cognitive impairment in music teaching shows a decreasing trend, and the number of patients with severe impairment also gradually decreases, while the number of students with mild cognitive impairment does not increase significantly. Comparing the differences between the results and data, it was found that the number of students with cognitive impairment after music education was significantly different from that before education ($P < 0.05$).

Table 1. Changes in music cognitive impairment of middle school students

Degree of cognitive impairment	Before teaching	After teaching	<i>P</i>
Total number	65	48	<0.05
Light	32	36	<0.05
Moderate	21	9	<0.05
Severe	12	3	<0.05

Conclusions: Alleviating college students' cognitive impairment is a key topic of social concern. Therefore, colleges and universities need to carry out relevant courses that can effectively alleviate students. In college education, music education is proposed to alleviate students' cognitive impairment. In order to explore the effect and significance of music education in the alleviation of college students' cognitive impairment, the students in college music education courses are taken as the research object. The application value of music education to the alleviation of students' cognitive impairment is judged by analyzing the change of the number of students with cognitive impairment and the change of students' cognitive ability. The results show that the number of college students with cognitive impairment is gradually decreasing in the process of receiving music teaching. At the same time, among the students with cognitive impairment, the number of students with severe cognitive impairment has decreased significantly. It can be learned that in higher education, in order to solve the problem of students' cognitive impairment, colleges and universities should carry out more perfect music teaching to expand students' knowledge level, guide students' subjective thoughts, improve students' cognitive impairment level, and also provide corresponding practical materials for the reform and innovation of higher education.

THE EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION BASED ON EDUCATIONAL PSYCHOLOGY ON THE CULTIVATION OF COLLEGE STUDENTS' SENSE OF SOCIAL RESPONSIBILITY

Wei He

School of Marxism, Hunan Polytechnic of Environment and Biology, Hengyang 421000, China

Background: Some students are influenced by some bad thoughts, their value orientation is distorted, their sense of social responsibility is missing, their ideals and beliefs are vague, their mental health level is low, and they are easy to fall into mental anxiety. Anxiety refers to the tension, anxiety, fear and other negative emotions caused by the threat of imminent threat of an individual to something. Many studies have shown that maintaining moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Therefore, it is necessary to find an appropriate method to help students alleviate anxiety.

In the education system of colleges and universities, ideological and political education plays a role in helping students shape positive, healthy and upward ideals and beliefs, establish a correct outlook on life and values, cultivate students' sense of social responsibility and improve their mental health level. Educational psychology is a psychological theory put forward for teaching reform. It has important

theoretical and practical significance in deepening the reform of education. Educational psychology theory is more complex, including learning theory, learning motivation, learning strategies, learning styles, learning transfer, network and learning, learning and teachers and so on. The main research content of educational psychology is the change and development law of students' psychological activities under the relief of education, including the psychological law of students' mastering knowledge and skills and the psychological law of students' personality formation. The application of educational psychology in teaching can help teachers analyze students' behavior psychology, help students dredge psychological problems, improve the pertinence and effectiveness of teaching work, optimize teaching ideas, and improve teaching methods and teaching modes. The research applies educational psychology to the teaching mode of ideological and political education in order to improve ideological and political education, so as to improve the teaching quality of ideological and political education in colleges and universities, better alleviate students' anxiety, cultivate students' sense of social responsibility, and transport high-quality, high-level and high-ability talents for the society.

Objective: Some students are affected by some bad thoughts, their value orientation is distorted, their sense of social responsibility is missing, their ideals and beliefs are vague, their mental health level is low, and they are easy to fall into mental anxiety. Based on educational psychology, the research improves the teaching mode of ideological and political education, so as to improve the teaching quality of ideological and political education in colleges and universities, better alleviate students' anxiety and cultivate students' sense of social responsibility.

Research objects and methods: 100 students were selected as the research objects in a university. Self-rating Anxiety Scale (SAS), Hospital Anxiety and Depression Scale (HADS) and SCL-90 are used to evaluate students' anxiety, and the examination results of ideological and political education courses in colleges and universities are used to evaluate the teaching effect.

Research design: Using the random number table method, 100 students were randomly divided into research group and control group, with 50 students in each group. Among them, the students in the research group used the improved college ideological and political teaching mode based on educational psychology to teach. The students in the control group used the traditional ideological and political teaching mode in colleges and universities. After teaching for a period of time, the anxiety levels of the two groups of students were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: Before teaching, there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). The changes in SAS scores of the two groups of students are shown in Figure 1.

Note: * $P < 0.05$ compared with that before teaching; # It means that compared with the control group at the same time, $P < 0.05$.

Figure 1. Changes in SAS scores of students in the two groups

Conclusions: Some students are affected by some bad thoughts, their value orientation is distorted, their sense of social responsibility is missing, their ideals and beliefs are vague, their mental health level is low, and they are easy to fall into mental anxiety. In the education system of colleges and universities,

ideological and political education plays a role in helping students shape positive, healthy and upward ideals and beliefs, establish a correct outlook on life and values, cultivate students' sense of social responsibility and improve their mental health level. The research applies educational psychology to the teaching mode of ideological and political education in order to improve the ideological and political education, so as to improve the teaching quality of ideological and political education in colleges and universities, better alleviate students' anxiety, cultivate students' sense of social responsibility, and transport high-quality, high-level and high-ability talents for the society. The results showed that there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups before teaching ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$).

* * * * *

THE INFLUENCE OF IMPROVING THE ABILITY OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS' SPIRITUAL AND EMOTIONAL ANXIETY UNDER THE MULTIMEDIA ENVIRONMENT

Yong Gao

Department of Student Affairs Management, Wuxi Vocational College of Science and Technology, Wuxi 214028, China

Background: In college education, we should not only pay attention to the cultivation of college students' academic level, but also pay attention to the cultivation of college students' own psychological quality. College students have high psychological pressure and poor psychological quality, so they are easy to fall into mental anxiety. Anxiety refers to the tension, anxiety, fear and other negative emotions caused by the threat of imminent threat of an individual to something. Many studies have shown that maintaining moderate anxiety can help students concentrate so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Clinically, researchers have divided anxiety disorders into two types: pathological anxiety and realistic anxiety. The mental anxiety of college students is generally realistic anxiety, which is caused by college students' worries about their studies, achievements, social and work. Finding a suitable way to solve the anxiety of students in the process of learning is of great significance to students' personal development.

Ideological and political education in colleges and universities is an important way to improve students' mental health and alleviate students' anxiety. However, the traditional teaching mode of ideological and political education in colleges and universities is solidified, the teaching content is vague and difficult for students to understand, which leads to its role in alleviating anxiety is not ideal. Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Through educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. Therefore, based on educational psychology, the research analyzes the psychological changes of students in ideological and political education courses, so as to improve the teaching mode of ideological and political education in colleges and universities, apply multimedia technology to ideological and political education, improve teaching quality and alleviate students' anxiety.

Objective: College students have high psychological pressure and poor psychological quality, so they are easy to fall into mental anxiety. When the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. The research is based on educational psychology to improve the teaching mode of ideological and political education in colleges and universities, improve the teaching quality and alleviate students' anxiety.

Research objects and methods: 80 students from a university were selected as the research objects,

and the mental health status of students was evaluated by Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Symptom Checklist-90 (SCL-90).

Study design: 80 students were randomly divided into study group and control group, with 40 students in each group. For the students in the research group, the teaching mode of ideological and political education in colleges and universities based on the improvement of educational psychology is adopted. For the students in the control group, the traditional teaching mode of ideological and political education in colleges and universities is adopted. After teaching for a period of time, the mental anxiety levels of the two groups of students were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After teaching, the degree of anxiety and depression of the students in the study group decreased significantly ($P < 0.05$). The anxiety and depression of the control group had no significant change ($P > 0.05$), and was significantly worse than that of the study group ($P < 0.05$). The anxiety of students is shown in Table 1.

Table 1. Anxiety of two groups of students

Timing	SAS Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	71.9±12.3	72.1±13.1	0.403	0.762
After teaching	52.4±9.6	71.7±13.4	8.452	0.001
<i>t</i>	8.943	0.147	-	-
<i>P</i>	0.001	0.652	-	-

Conclusions: In college education, we should not only pay attention to the cultivation of college students' academic level, but also pay attention to the cultivation of college students' own psychological quality. College students have high psychological pressure and poor psychological quality, so they are easy to fall into mental anxiety. When the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. based on educational psychology, this study analyzes the psychological changes of students in ideological and political education courses, so as to improve the teaching mode of ideological and political education in colleges and universities, improve the teaching quality and alleviate students' anxiety. The results showed that the anxiety and depression of the students in the study group decreased significantly after teaching ($P < 0.05$). The anxiety and depression of the control group had no significant change ($P > 0.05$), and was significantly worse than that of the study group ($P < 0.05$).

RESEARCH ON URBAN CULTURAL CONSTRUCTION STRATEGY OF PUBLIC MANAGEMENT UNDER COGNITIVE IMPAIRMENT

Yiran Wang

School of Public Policy and Management, Guangxi University, Nanning 530000, China

Background: Urban culture is the symbol of urban spiritual civilization. The public's evaluation of the city comes from the internal and external cognition of the city. Public management plays an important role in the construction of urban culture and is the basis of the construction of urban culture. In the process of urban cultural construction based on public management, due to many problems in public management, the process of urban cultural construction is slow, and the relevant staff have negative emotions, resulting in psychological diseases such as anxiety, depression and cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. In the process of cognition, it will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to patients themselves and social development. Therefore, many experts have carried out in-depth research on cognitive impairment.

Social psychology is a branch of psychology, which mainly studies the occurrence and change law of

psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. In social psychology, it is generally divided into three fields: individual process, interpersonal process and group process. Among them, individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. Interpersonal process is to explore the interpersonal relationship between individuals and the impact of interpersonal relationship on individual psychology. Group process studies individual psychology and behavior law from the perspective of macro environment, including the psychological impact of group and organization on individual and the psychological impact of surrounding environment on individual. Based on social psychology, the research analyzes the psychological change law of urban residents in public management, and then puts forward strategies for urban public management, completes urban cultural construction, and then alleviates the degree of cognitive impairment of staff, which is of great significance to the personal long-term development of staff with cognitive impairment and the construction of a civilized city.

Objective: Due to many problems in public management, the process of urban cultural construction is slow, and relevant staff have negative emotions, which leads to psychological diseases such as anxiety, depression and cognitive impairment. Based on social psychology, the research puts forward strategies for urban public management, completes urban cultural construction, and then alleviates the degree of cognitive impairment of staff, which is of great significance to the personal long-term development of staff with cognitive impairment and the construction of a civilized city.

Subjects and methods: 60 staff with cognitive impairment and engaged in public management were selected as the research subjects. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the emotional state of patients. The cognitive impairment of patients was evaluated by the Mini-mental State Examination (MMSE) and the Mental Health (MH) part of the 36-Item Short Form Survey (SF-36).

Study design: The patients were randomly divided into study group and control group, with 30 people in each group. Among them, the staff of the research group used the strategy based on social psychology to carry out public management. The staff in the control group used the original strategy for public management. After a period of time, the degree of cognitive impairment of the two groups was compared.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: Before treatment, there was no significant difference in MMSE score between the two groups ($P > 0.05$). The MMSE score of the study group was significantly higher than that of the control group ($P < 0.05$), as shown in Table 1.

Table 1. MMSE scores of patients in both groups

Timing	MMSE Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before working	15.1±4.9	15.3±5.2	0.157	0.721
After working	25.0±2.8	16.2±4.7	6.417	0.001
<i>t</i>	7.263	0.214	-	-
<i>P</i>	0.000	0.635	-	-

Conclusions: China is in a period of rapid social transformation, and people's lifestyle, values, thinking mode and behavior mode are also changing, resulting in the interweaving and intensification of various social problems and contradictions, and the breeding of a large number of social problems. As the fundamental means for the government to solve social problems, manage social contradictions and manage social public affairs, the importance of public management is becoming more and more prominent. In the process of urban cultural construction based on public management, due to many problems in public management, the process of urban cultural construction is slow, and the relevant staff have negative emotions, resulting in psychological diseases such as anxiety, depression and cognitive impairment. Based on social psychology, the research analyzes the psychological change law of urban residents in public management, and then puts forward strategies for urban public management, completes urban cultural construction, and then alleviates the degree of cognitive impairment of staff, which is of great significance to the personal long-term development of staff with cognitive impairment and the construction of a civilized city.

THE TRANSFORMATION OF LEISURE PHYSICAL EDUCATION TEACHING MODE IN COLLEGES AND UNIVERSITIES BASED ON PSYCHOLOGY

Xiaowei Li

Institute of Physical Education, Inner Mongolia Normal University, Hohhot 010022, China

Background: Leisure sports is a complex subject integrating physical education, leisure and pedagogy. The theoretical knowledge is complex and the learning difficulty is relatively high. The existing leisure physical education teaching mode in colleges and universities is more traditional and lacks corresponding equipment, which leads to unsatisfactory teaching quality and difficulty for students to master the knowledge points. In this case, out of anxiety about their studies and future employment, many students have negative emotions such as fear and worry. If the long-term backlog of negative emotions is not alleviated, students will suffer from psychological diseases such as anxiety and depression. Anxiety is a syndrome characterized by significant and lasting depression. When encountering negative life events such as frustration and stress, many people will have emotional depression and show anxiety symptoms. Moderate anxiety helps students set goals, study hard and have a positive impact. However, anxiety with a long duration and excessive degree will lead to the impairment of students' physical and mental health. In serious cases, it will produce a sense of near-death, loss of control and mental collapse, resulting in a significant decline in students' quality of life, loss of confidence in life, self-injury, suicide and other dangerous behaviors, which not only affect the normal life of students and their families, but also affect the harmony and stability of society. Therefore, we need to find a way to improve the teaching quality of leisure sports and alleviate students' anxiety.

Educational psychology is a psychological theory put forward under the background of teaching reform. It has important theoretical and practical significance in promoting the reform of the education system. In addition, educational psychology is also of great significance to the improvement of educators' psychological quality and teaching methods. Educational psychology contains many related theories, including psychological content, the law of psychological changes of students in the learning process, teachers' analysis and cultivation of students' learning motivation, teachers' transfer and promotion of students' learning, teachers' analysis of the development of students' cognitive ability, teachers' cultivation of students' cognitive understanding, students' memory development, students' knowledge consolidation methods, the formation of students' cognitive strategies, the cultivation of students' problem-solving ability and innovation ability, the cultivation of students' correct self-consciousness, students' group psychology and students' mental health education. Based on educational psychology, this paper analyzes the psychological changes of students in the teaching process, discusses the factors that easily lead to students' anxiety, and puts forward strategies to reform the teaching mode of leisure physical education in colleges and universities, so as to improve the teaching quality and alleviate students' anxiety, which is of positive significance to students' personal development and social harmony and stability.

Objective: The existing teaching mode of leisure physical education in colleges and universities is more traditional and lacks corresponding equipment, resulting in unsatisfactory teaching quality and difficult students' mastery of knowledge. Out of anxiety about their studies and future employment, many students suffer from psychological diseases such as anxiety and depression. This paper studies the reform of leisure physical education teaching mode in colleges and universities based on educational psychology in order to improve teaching quality and alleviate students' anxiety.

Research objects and methods: Two classes were randomly selected from the leisure sports major of a university as the research object. Self-rating Anxiety Scale (SAS), Hospital Anxiety and Depression Scale (HADS) and Symptom Checklist-90 (SCL-90) were used to evaluate students' anxiety, and the test results of leisure physical education courses were used to evaluate the teaching effect.

Research design: Randomly select a class to conduct a pilot experiment on the reform of leisure physical education teaching mode in colleges and universities based on educational psychology, and record it as the research group (42 people). The other class adopts the traditional college leisure physical education teaching mode, which is recorded as the control group (45 people). After teaching for a period of time, compare the anxiety level and course performance of the two groups of students.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: Before teaching, there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). The changes in SAS scores of the two groups of students are shown in Figure 1.

Note: * $P < 0.05$ compared with that before teaching; # It means that compared with the control group at the same time, $P < 0.05$.

Figure 1. Changes in SAS scores of students in the two groups

Conclusions: Leisure sports are a complex subject integrating physical education, leisure and pedagogy. The theoretical knowledge is complex and the learning difficulty is relatively high. It is also difficult for students to master the knowledge points. In this case, out of anxiety about their studies and future employment, many students have negative emotions such as fear and worry. If the long-term backlog of negative emotions is not alleviated, students will suffer from psychological diseases such as anxiety and depression. Based on educational psychology, this paper analyzes the psychological changes of students in the teaching process, discusses the factors that easily lead to students' anxiety, and puts forward strategies to reform the teaching mode of leisure physical education in colleges and universities. The results showed that there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups before teaching ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). It shows that the reform of leisure physical education teaching mode in colleges and universities can improve teaching quality, alleviate students' anxiety, and have positive significance for students' personal development and social harmony and stability.

RESEARCH AND PRACTICE ON THE EVALUATION AND FEEDBACK MECHANISM OF TEACHING QUALITY IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF APPLIED PSYCHOLOGY

Yu Shen^{1,2}

¹College of Economics and Management, Nanjing University of Aeronautics and Astronautics, Nanjing 210000, China

²Academic Affairs Office of Nanjing Forestry University, Nanjing 210000, China

Background: With the rapid development of Internet technology and computer technology, online and offline mixed teaching mode also began to rise, and gradually became one of the mainstream teaching modes. However, due to the virtual and abstract characteristics of online teaching mode, the evaluation of students' learning effect and teaching quality is not objective and accurate. In this case, teachers know about students' learning, and students don't know their learning progress. Out of concern about their studies, many students have anxiety. Anxiety is a kind of negative emotion caused by the inconsistency between expectation and reality, or fear and worry about the imminent threat. In the learning process, due to the fear of poor learning effect and students' self-denial, some students will have a sense of failure and frustration, resulting in students' emotions in a state of tension and fear for a long time, and finally, lead to students' symptoms such as anxiety and depression. Long term excessive anxiety will damage students' physical and mental health, and seriously lead to students' mental loss of control or collapse, personality disintegration, and other consequences, resulting in a significant decline in students' quality of life, loss of

confidence in life, self-injury, suicide and other dangerous behaviors, which not only affects the normal life of students and their families but also affects the harmony and stability of society. Therefore, it is of great significance for students' personal development to build a college teaching quality evaluation and feedback mechanism of online and offline mixed courses to alleviate students' academic anxiety.

Educational psychology is an important part of applied psychology. It is a psychological theory put forward under the background of teaching reform. It has important theoretical and practical significance in promoting the reform of education system. In addition, educational psychology is also of great significance to the improvement of educators' psychological quality and teaching methods. Educational psychology contains many related theories, including psychological content, the law of psychological changes of students in the learning process, teachers' analysis and cultivation of students' learning motivation, teachers' transfer and promotion of students' learning, teachers' analysis of the development of students' cognitive ability, teachers' cultivation of students' cognitive understanding, students' memory development, students' knowledge consolidation methods, the formation of students' cognitive strategies, the cultivation of students' problem-solving ability and innovation ability, the cultivation of students' correct self-consciousness, students' group psychology and students' mental health education. Based on the theory of educational psychology, the research analyzes the law of students' psychological changes in the teaching process, and then selects the evaluation indicators to construct the evaluation and feedback mechanism of college teaching quality of online and offline mixed courses, so as to provide real-time feedback on students' learning progress and learning effect, alleviate students' anxiety and promote the healthy development of students.

Objective: The evaluation of students' learning effect and teaching quality in the online and offline mixed teaching mode is not objective and accurate. Out of concern about their studies, many students have anxiety. Based on the theory of educational psychology, this paper constructs the evaluation and feedback mechanism of college teaching quality of online and offline mixed courses, so as to alleviate students' anxiety and promote students' healthy development.

Research objects and methods: Two classes were randomly selected as the research objects in a university. Self-rating Anxiety Scale (SAS), Hospital Anxiety and Depression Scale (HADS) and Symptom Checklist 90 (SCL-90) were used to evaluate students' anxiety, and the test results were used to evaluate the teaching effect.

Research design: Randomly select a class as the research group (42 people), and use the university teaching quality evaluation and feedback mechanism of online and offline mixed courses based on educational psychology to evaluate the learning effect and progress of students. The other class is recorded as the control group (45 people), which uses the traditional method to evaluate the students' learning effect and progress. After teaching for a period of time, compare the anxiety level and course performance of the two groups of students.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: Before teaching, there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). The changes of SDS scores of the two groups are shown in Table 1.

Table 1. Changes in SAS scores of students in the two groups

Timing	SDS score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	73.4±10.9	72.5±11.3	0.304	0.653
After teaching	46.7±6.2	67.1±10.9	6.420	0.000
<i>t</i>	6.371	0.421	-	-
<i>P</i>	0.000	0.649	-	-

Conclusions: With the rapid development of Internet technology and computer technology, online and offline mixed teaching mode also began to rise, and gradually became one of the mainstream teaching modes. The evaluation of students' learning effect and teaching quality of online and offline mixed teaching mode is not objective and accurate. Out of concern about their studies, many students have anxiety. Based on the theory of educational psychology, the research analyzes the law of students' psychological changes in the teaching process, and then selects the evaluation indicators to construct the evaluation and feedback mechanism of college teaching quality of online and offline mixed courses. The results showed that there was no significant difference in SAS score, HADS score and SCL-90 score between the two groups before

teaching ($P > 0.05$). After adopting different ideological and political teaching modes in colleges and universities, the SAS score, HADS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). It shows that the evaluation and feedback mechanism of college teaching quality of online and offline mixed courses can alleviate students' anxiety and promote students' healthy development.

CONSTRUCTION AND EXPLORATION OF PHYSICAL EDUCATION TEACHING MODEL BASED ON FLIPPED CLASSROOM FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Ying Ma

College of Physical Education, Central South University of Forestry and Technology, Changsha 410211, China

Background: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very prone to mental diseases, such as anxiety, depression and so on. Anxiety refers to the tension, anxiety, fear and other negative emotions caused by the threat of imminent threat of an individual to something. Many studies have shown that maintaining moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. The main way for college students to improve their physical and psychological quality is physical education. Through physical exercise, they can improve their psychological quality, so that they can vent their accumulated emotions, and then improve their physical and mental health. There are some defects in the traditional college physical education teaching mode, which affect the quality of physical education teaching, students' interest in learning is not high, and physical education curriculum cannot play its role in improving students' physical and psychological quality, so it needs to be improved.

Flipped classroom is a new teaching mode emerging in the era of big data, which can improve students' autonomy and interest in learning. Educational psychology is a psychological theory put forward under the background of teaching reform. It has important theoretical and practical significance in promoting the reform of education system. In addition, educational psychology is also of great significance to the improvement of educators' psychological quality and teaching methods. Educational psychology contains many related theories, including psychological content, the law of psychological changes of students in the learning process, teachers' analysis and cultivation of students' learning motivation, teachers' transfer and promotion of students' learning, teachers' analysis of the development of students' cognitive ability, teachers' cultivation of students' cognitive understanding, students' memory development, students' knowledge consolidation methods, the formation of students' cognitive strategies, the cultivation of students' problem-solving ability and innovation ability, the cultivation of students' correct self-consciousness, students' group psychology and students' mental health education. Based on the theory of educational psychology, this paper applies the flipped classroom teaching mode to the physical education curriculum teaching, and constructs the physical education curriculum teaching model based on the flipped classroom, so as to improve students' learning interest, improve students' physical and psychological quality, alleviate students' anxiety and enable students to develop in an all-round way.

Objective: There are some defects in the traditional college physical education teaching mode. Physical education curriculum cannot play its role in improving students' physical and psychological quality, so it needs to be improved. Based on the theory of educational psychology, this paper constructs a physical education curriculum teaching model based on the flipped classroom, so as to improve students' learning interest, improve students' physical and psychological quality, alleviate students' anxiety and enable students to develop in an all-round way.

Research objects and methods: 60 students with anxiety disorder were selected from different majors in a university as the research objects. Self-rating Anxiety Scale (SAS) and Hospital Anxiety and Depression

Scale (HADS) were used to evaluate students' anxiety, and the examination results of physical education courses were used to evaluate the teaching effect.

Study design: Students were randomly divided into study group and control group, with 30 people in each group. Among them, the students in the research group used the improved college physical education teaching model based on educational psychology to teach. The students in the control group used the traditional teaching mode of college physical education. After a period of time, the anxiety and test scores of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After two months of teaching, the SAS score and HADS score of students in the study group decreased significantly ($P < 0.05$), and were significantly lower than those in the control group ($P < 0.05$). The degree of anxiety relief in the study group was significantly higher than that in the control group ($P < 0.05$). The degree of anxiety relief of the two groups of students is shown in Table 1.

Table 1. The anxiety of the two groups of students improved

Group	Timing	Degree of anxiety			
		No	Mild	Moderate	Severe
Research group	Before intervention	0	12	10	8
	After intervention	15	10	5	0
Control group	Before intervention	0	13	11	6
	After intervention	2	11	10	7

Conclusions: There are some defects in the traditional college physical education teaching mode, which affect the quality of physical education teaching, students' interest in learning is not high, and physical education curriculum cannot play its role in improving students' physical and psychological quality. Based on the theory of educational psychology, this paper applies the flipped classroom teaching model to the physical education curriculum teaching, and constructs the physical education curriculum teaching model based on the flipped classroom, so as to improve students' learning interest. The results showed that after two months of teaching, the SAS score and HADS score of the students in the study group decreased significantly ($P < 0.05$), and were significantly lower than those in the control group ($P < 0.05$), the degree of anxiety relief in the study group was significantly higher than that in the control group ($P < 0.05$). It shows that the physical education teaching model based on flipped classrooms can improve students' learning interest, improve students' physical and psychological quality, alleviate students' anxiety and enable students to develop in an all-round way.

THE INFLUENCE OF THE INNOVATIVE DEVELOPMENT OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON ALLEVIATING STUDENTS' PSYCHOLOGICAL ANXIETY

Weigang Luo

School of Marxism, Hechi University, Hechi 546300, China

Background: Anxiety is a kind of negative emotion caused by the inconsistency between expectations and reality, or fear and worry about possible threats. In the learning process, due to the fear of poor learning effect and students' self-denial, some students will have a sense of failure and frustration, resulting in students' emotions in a state of tension and fear for a long time, and finally, lead to students' symptoms such as anxiety and depression. Moderate anxiety can help students concentrate so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Clinically, researchers have divided anxiety disorders into two types: pathological anxiety and realistic anxiety. The mental anxiety of college students is generally realistic anxiety, which is caused by college students' worries about their studies, achievements, social and work. Finding a suitable way to

solve the anxiety of students in the process of learning is of great significance to students' personal development.

In the teaching system of colleges and universities, ideological and political education is the main way to improve students' psychological quality and alleviate students' anxiety. However, the traditional theoretical knowledge of ideological and political education in colleges and universities is more obscure and difficult to understand. Students have little interest in ideological and political education courses, so it is difficult to play its role in improving students' psychological quality. School psychology is a kind of applied psychology and the application of psychology in school education practice. The main research content of school psychology is to scientifically and reasonably evaluate the students' mental health level and the school's psychological education level, improve the teaching mode according to the evaluation results, and carry out psychological intervention on students. School psychology plays a good role in correcting and alleviating students' emotional disorders, personality disorders and other mental diseases. Therefore, the research applies the school psychology theory to the innovation of college ideological and political education curriculum, so as to improve students' learning interest and enthusiasm, so as to give better play to the role of college ideological and political education in alleviating students' anxiety and improving students' mental health level, which is of positive significance to the long-term development of students.

Objective: In the learning process, due to the long-term concern about their studies, students will eventually have symptoms such as anxiety and depression. Based on the theory of school psychology, the research innovates the teaching mode of ideological and political education course in colleges and universities, so as to alleviate students' anxiety and improve students' mental health level.

Research objects and methods: 80 students with different degrees of anxiety disorder were randomly selected as the research objects in a university. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Symptom Checklist-90 (SCL-90) were used to evaluate students' mental health. Use the examination results of students' ideological and political education courses to evaluate the teaching effect.

Research design: Using the random number table method, 80 students were randomly divided into research group and control group, with 40 people in each group. Among them, the students in the research group used the innovative college ideological and political teaching mode based on school psychology to teach. The students in the control group used the traditional ideological and political teaching mode in colleges and universities. After teaching for a period of time, the anxiety level of the two groups of students and the examination results of ideological and political education courses were compared.

Methods: The relevant data were processed and analyzed by software SPSS22.0.

Results: After teaching, the degree of anxiety and depression of the students in the study group decreased significantly ($P < 0.05$); The anxiety and depression of the control group had no significant change ($P > 0.05$), and was significantly worse than that of the study group ($P < 0.05$). The changes in depression in the two groups are shown in Table 1.

Table 1. Changes of depression in two groups of students

Timing	SDS Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	71.9±12.3	72.1±13.1	0.403	0.762
After teaching	52.4±9.6	71.7±13.4	8.452	0.001
<i>t</i>	8.943	0.147	-	-
<i>P</i>	0.001	0.652	-	-

Conclusions: In the learning process, due to the fear of poor learning effect and students' self-denial, some students will have a sense of failure and frustration, resulting in students' emotions in a state of tension and fear for a long time, and finally lead to students' symptoms such as anxiety and depression. This paper applies the theory of school psychology to the innovation of ideological and political education curriculum in colleges and universities, so as to improve students' learning interest and enthusiasm. The results showed that the degree of anxiety and depression of the students in the study group decreased significantly after teaching ($P < 0.05$). The anxiety and depression of the control group had no significant change ($P > 0.05$), and was significantly worse than that of the study group ($P < 0.05$). To sum up, the improvement of college ideological and political teaching mode based on school psychology can effectively improve students' learning interest and enthusiasm, so as to give better play to the role of college ideological and political education in alleviating students' anxiety and improving students' mental health level, which is of positive significance to the long-term development of students.

THE INFLUENCE OF RADIO, FILM AND TELEVISION EDITING AND DIRECTING MAJOR ON COLLEGE STUDENTS' THINKING, EMOTION AND COGNITIVE IMPAIRMENT UNDER THE MULTICULTURAL BACKGROUND

Biwei Jiang

Faculty of Media & Arts, Sichuan Vocational College of Culture & Communication, Chengdu 610000, China

Background: The individual's cognitive process of knowledge is to receive, process and use the external input information. The individual realizes the internal processing of the received information through the coding, operation and storage of external things or information, so as to complete the cognitive process of external things and knowledge. When the cerebral cortex of the human body is damaged, individuals may have cognitive impairment, such as memory, understanding, perception, reflecting profit and other cognitive functions. Thinking cognitive impairment is a manifestation of human cognitive impairment. When individuals have thinking emotional cognitive impairment, their shallow negative automatic thoughts and deep dysfunctional assumptions have obstacles, which affect the individual's cognitive function of emotion and thinking. The emergence of cognitive impairment of thinking and emotion breaks the cognitive schema and structure established by individuals from childhood, making it difficult for individuals to recall old information with the help of cognitive structure, so as to misjudge thinking and emotion.

With the advancement of globalization, the increasing complexity of human society and the acceleration of the development of information technology, the world culture presents the characteristics of diversification, and the renewal and transformation speed of world culture also shows an upward trend. In the new situation of the changing world, various national cultures are facing different opportunities and challenges, forming a multicultural world situation under the background of the complex social environment. Different national cultures have their own local national characteristics. The development of film and television communication under the multicultural background has important training significance for college students' aesthetic consciousness, and can improve students' sensitivity to multiple information and emotional culture. In the context of the multi-cultural world, the teaching of radio, film and television editing and directing for college students can effectively improve the aesthetic interest consciousness of professional students, and has important therapeutic value for students' thinking, emotion and cognitive impairment.

Objective: To study and analyze the background of multicultural development in the world, to explore the therapeutic effect of radio, film and television editing and directing teaching on college students with emotional thinking and cognitive impairment, and to analyze the aesthetic consciousness cultivation mechanism behind the radio, film and television editing and directing teaching by excavating the correlation between radio, film and television editing and directing teaching and the cultivation of students' aesthetic consciousness, to provide a reference for the thinking, emotion and cognitive impairment of therapeutic college students.

Research design: The research adopts the method of correlation analysis to explore the relationship between the teaching of radio, film and television editing and directing major and the treatment of college students with emotional thinking and cognitive impairment. The regression analysis is used to study the relationship between the teaching of radio, film and television editing and directing major and the aesthetic consciousness and emotional sensitivity of college students, so as to provide a reference for the treatment of college students' thinking and emotional cognitive impairment. The research makes regression analysis on the relationship between independent variables and dependent variables, estimates the conditional expectation of dependent variables by giving independent variables, and realizes the exploration of the correlation between independent variables and dependent variables. The study also used the experimental method to analyze the therapeutic effect of radio, film and television editing and directing professional teaching on college students' thinking and emotional cognitive impairment. 50 college students with thinking and emotional cognitive impairment were taught radio, film and television editing and directing professional teaching, twice a week, with two hours of professional knowledge and practice. This paper compares the cognitive impairment of thinking and emotion of the research objects before and after the experiment, and discusses the significance of the teaching of radio, film and television editing and directing specialty in colleges and universities in the treatment of college students' thinking and emotion disorder.

Results: The investigation results of the role of the teaching of radio, film and television editing and directing in colleges and universities on the cultivation of students' aesthetic consciousness are shown in Table 1. College students have a high degree of recognition for the teaching of radio, film and television editing and directing in colleges and universities on the cultivation of students' aesthetic consciousness. It is generally believed that the teaching of radio, film and television editing and directing in colleges and

universities can help students in art appreciation, product production the aesthetic consciousness of copywriting should be cultivated from three aspects.

Table 1. The effect of radio, film and television editing and directing teaching on the cultivation of students' aesthetic consciousness

Survey object	Freshman	Sophomore	Junior	Senior
Art appreciation	4	3	4	4
Product production	3	3	3	4
Copywriting	3	4	4	3

Conclusions: Taking the world's multiculturalism as the background, this paper analyzes the therapeutic effect of the teaching of radio, film and television editing and directing major in colleges and universities on the cognitive impairment of college students' thinking and emotion. The experimental results show that the teaching of radio, film and television editing and directing major in colleges and universities can cultivate college students' aesthetic consciousness and improve their perceptual sensitivity to a variety of thinking and emotions, it can effectively treat the thinking, emotion and cognitive impairment of college students. The teaching of radio, film and television editing and directing major in colleges and universities cultivate the aesthetic consciousness of students in audio-visual art appreciation, film and television work production and radio, film and television copywriting creation, improves the aesthetic interest and cultural connotation of college students, and has important practical significance for the treatment of college students' thinking, emotion and cognitive impairment.

* * * * *

THE INTEGRATION OF PSYCHOLOGY AND ART APPRECIATION IN AESTHETIC EDUCATION IN COLLEGES AND UNIVERSITIES

Han Liu^{1,2}

¹*College of Art, Jiangxi University of Finance and Economics, Nanchang 330013, China*

²*Performing Arts and Culture, The Catholic University of Korea, Bucheon 14662, Korea*

Background: With the advancement of social process, the social development situation puts forward higher requirements for college education, requiring college students to achieve all-round comprehensive development. Art appreciation is an important part of college students' quality education. Through the form of art appreciation, we can improve college students' aesthetic interest and consciousness, and help college students improve their artistic literacy and ability. Under the traditional teaching mode, college education pays less attention to art appreciation and the cultivation of students' aesthetic consciousness, and art appreciation plays an important role in the curriculum system of colleges and universities. The traditional teaching system structure of colleges and universities has been difficult to keep pace with the development of the times and cannot meet the needs of the all-round development of college students. Colleges and universities are required to optimize and adjust their curriculum system, realize the innovation and reform of efficient teaching mode, change the backward concept of knowledge uniqueness under the traditional teaching mode, and promote the all-round quality development of college students.

The theory of effective psychology is introduced into aesthetic education in colleges and universities, which organically integrates psychology and art appreciation, promotes the development of aesthetic education in colleges and universities, and improves the aesthetic consciousness of college students. Effectiveness psychology insists on effective teaching based on students' personality psychology to promote the formation and promotion of students' humanistic consciousness. In the course teaching of colleges and universities, through the form of art appreciation, college students can not only obtain the same aesthetic experience as others, but also produce their own personality psychology and establish an aesthetic mechanism with personal style. And effectiveness psychology emphasizes the guidance and understanding of students, and takes students' ability as the starting point to strengthen students' understanding and perception of the artistic visual image. Effectiveness psychology also pays attention to students' personal emotions, and requires teachers to create a good art learning atmosphere for students in the teaching process and keep students in a natural and harmonious state of pleasure.

Objective: To analyze the coordinated development of effective psychology and art appreciation, explore the integration path of psychological theory and art appreciation in the aesthetic education of

college students, and analyze the organic integration mode of psychology and art appreciation, so as to provide help for improving the aesthetic consciousness and interest of college students and the quality of aesthetic consciousness education of college students.

Research design: The research uses Delphi method to analyze the integration characteristics between psychological theory and college students' art appreciation, study the integration characteristics between effective psychology and college students' art appreciation through three rounds of expert consultation, and obtain experts' opinions on the basic connection between effective psychology and college students' art appreciation in the first round of consultation, on this basis, it constructs the integrated development system of effectiveness psychology theory and college students' art appreciation. And then through two rounds of consultation, the integrated development system is preliminarily revised and adjusted, and finally, the integrated development system is scored by experts. Starting from the four dimensions of college students' personality psychology, humanistic quality, appreciation ability and emotional perception, and based on the analysis of the integration characteristics of effectiveness psychology and college students' art appreciation, the research constructs the integration development system of effectiveness psychology theory and college students' art appreciation, and puts forward the organic integration strategy and path of psychology and art appreciation.

Results: The expert consultation results of the integration of effectiveness psychology and college students' art appreciation are shown in Table 1. The combination of effectiveness psychology and college students' art appreciation improves college students' aesthetic consciousness and interest and helps college students establish a good aesthetic mechanism from the perspective of students' personality psychology, humanistic quality, appreciation ability, and emotional perception.

Table 1. Expert consultation results on the integration of effectiveness psychology and college students' art appreciation

Survey object	Expert 1	Expert 2	Expert 3	Expert 4
Personality psychology	3	3	4	4
Humanistic quality	4	3	3	4
Appreciation ability	3	4	4	3
Emotional perception	2	3	3	2

Conclusions: In the aesthetic education of college students, we should organically integrate psychological theory and art appreciation, start from the students' personalized psychological performance, take into account the students' self-characteristic performance, give full play to the students' unique thinking and creative ability, and improve the students' humanistic quality. Combining effective psychology with art appreciation in colleges and universities, starting from students' observation ability and appreciation ability, this paper guides and understands students' art aesthetics, analyzes students' psychological change characteristics in art appreciation activities from the perspective of psychology, and helps students strengthen their perception ability and aesthetic understanding ability of art visual image. Based on the theory of effective psychology, art appreciation teaching is carried out for college students, so that college students can maintain a good mood in the learning process, promote the cultivation of college students' aesthetic consciousness and enhance their learning enthusiasm for art appreciation courses with the help of high learning efficiency in a pleasant state.

THE GUIDING ROLE OF MARXIST THEORY IN IDEOLOGICAL AND POLITICAL CURRICULUM UNDER THE OBSTACLE OF CONSCIOUSNESS

Jinping Chen

School of Marxism, Fuzhou University of International Studies and Trade, Fuzhou 350202, China

Background: The formation and development of self-consciousness is an important factor in individual psychological development. The growth of self-consciousness is of great significance to the mental health development of college students. The university stage is an important development stage for the formation and maturity of individual thinking and logical concepts. College students' self-consciousness has not been fully formed and are experiencing the struggle process before self-integration. The formation and

development process of individual self-consciousness has strong instability, so the university stage is a high-frequency period of individual mental health problems, and college students are prone to self-consciousness obstacles. College students' self-consciousness disorder is manifested in excessive self-acceptance and self-esteem. Students with self-consciousness disorder often show the characteristics of conceit or vanity. Students with self-awareness disorder also show excessive self-centeredness, focus too much on themselves, and show a selfish attitude in daily life and interpersonal communication. Excessive independence and obedience are also manifestations of college students' self-consciousness obstacles. Some college students have unclear self-awareness, excessive pursuit of personality development, and strong rebellious consciousness. Some college students are influenced by herd psychology, blindly pursue synchronization with the group, and completely ignore the importance of self-consciousness in personality development.

Marxist theory course is an important channel for college students to carry out ideological and political education. Marxist theory course teaches Marxist theoretical knowledge and promotes college students to establish a scientific and reasonable outlook on life, values, and world outlook through ideological and political education. Through the transmission of ideals and beliefs of socialism and communism, Marxist theory course internalizes Marxist theoretical knowledge into students' ideals and concepts, and trains qualified socialist successors for the development and construction of the country and the party. We should fully realize the guiding role of Marxist theory course on students' ideological and political quality, use Marxist theory teaching to improve college students' self-consciousness obstacles, and cultivate college students' noble personality and moral quality.

Objective: To analyze the content of Marxist theory course in ideological and political education in colleges and universities, explore the guiding role of Marxist theory course in ideological and political education in colleges and universities, and understand the important value of Marxist theory course to the mental health development of college students. The research analyzes and understands the ideological and political education function of Marxist theory curriculum, excavates the positive role of Marxist theory curriculum in college students' mental health intervention, and discusses the application effect of Marxist theory curriculum in the treatment of college students' self-consciousness disorder, hoping to provide help for improving college students' ideological and political consciousness, put forward a new treatment scheme for college students' self-consciousness disorder.

Research design: The research adopts the evaluation method of artificial neural network to explore the treatment effect of Marxist theory course on college students' self-consciousness disorder, constructs the teaching model of Marxist theory course combined with RBF neural network, and makes use of the advantages of artificial neural network in information mining and in-depth learning, solve the intervention and guidance effect of Marxist theory curriculum on students with different characteristics of consciousness obstacles, and analyze the role of Marxist theory curriculum on students' consciousness obstacles. This paper uses RBF neural network to analyze the psychological guidance effect of Marxist theory course on college students with the characteristics of conceit, excessive self-esteem, self-centered, excessive independence and excessive easygoing, and compares the degree of consciousness disorder of students with different characteristics of consciousness disorder after completing the learning of Marxist theory course, analyze the intervention and guidance effect of Marxist theory course on students with different characteristics of consciousness disorders. Based on the evaluation results of the neural network, this paper discusses the new treatment scheme for students with consciousness disorder, so as to provide help for alleviating the consciousness disorder of college students.

Results: The scoring results of the treatment effect of Marxist theory course on students' self-consciousness disorder are shown in Table 1. The treatment effect scores of Marxist theory courses on students' self-consciousness disorder at different levels are high.

Table 1. Scoring results of the therapeutic effect of Marxist theory course on students' self-consciousness disorder

Survey object	Freshman	Sophomore	Junior	Senior
Overweening	4	4	3	4
Excessive self-esteem	4	4	4	3
Self-centered	3	3	3	4
Excessive independence	3	4	3	3
Too easygoing	4	3	4	3

Conclusions: Based on the Marxist theory course, the ideological and political education for college students can effectively intervene the mental health problems of college students, guide college students

to establish a healthy and positive outlook on life, values and world outlook, and treat the obstacles of college students' self-consciousness.

Acknowledgement: The research is supported by: 2021 Year Project "Teaching and Research Team of Ideological and Political Course "4S" (No. TD2021005).

THE PATH OF INTEGRATING IDEOLOGICAL AND POLITICAL EDUCATION INTO TEACHING REFORM PRACTICE IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Xianggang Kong

School of Marxism, Yunnan Technology and Business University, Kunming 651700, China

Background: Individual cognition involves many abilities, such as memory ability, judgment ability, thinking ability, perception ability and so on. Individual cognitive process is to encode, extract and utilize external things and input information. Individual cognitive function is a high-level activity of the cerebral cortex. When the human cerebral cortex is damaged, it may lead to specific cognitive impairment. The emergence of cognitive impairment often involves a variety of cognitive impairment. Patients with cognitive impairment have obstacles in many aspects, such as attention, memory, abstraction, computing power and so on. Generally, there is rarely a single state of impaired ability. When students have a cognitive impairment, their learning ability will inevitably decline. Teachers are required to reform the teaching model to adapt to the learning characteristics and laws of students with cognitive impairment.

Guided by the goal of all-round education, the ideological and political concept of the curriculum combines the teaching of professional knowledge and value guidance in colleges and universities. By combining the ideological and political education in colleges and universities with the curriculum, it enhances students' political identity and cultural self-confidence, and helps students establish a good civic personality. In recent years, the government and colleges and universities have paid more and more attention to the ideological and political education of college students. Many colleges and universities have introduced the curriculum ideological and political concept into professional teaching, integrated the ideological and political education into the teaching of professional courses, and formed a benign development track of ideological and political education and professional knowledge learning. The introduction of the ideological and political concept of the curriculum solves the problem that the traditional teaching mode takes professional knowledge as the only learning goal, puts the ideological and political education and professional knowledge of college students at the same height, and promotes the all-round development of college students.

Objective: To study the integration of ideological and political ideas of college courses and professional courses, promote the development of professional teaching reform practice in colleges and universities, excavate the ideological and political education resources of college students contained in professional courses and teaching modes through the coordinated development of explicit education and implicit education, and promote the establishment of the education mode of all-round development of college students' comprehensive quality. The research analyzes the ideological and political ideas of college curriculum at different levels, and integrates the ideological and political ideas of college curriculum with the practice of teaching reform, hoping to provide reference for solving the cognitive impairment of college students and improve the mental health level and cognitive learning ability of college students.

Research design: Based on the evaluation report on the implementation of college teaching reform in a city in 2021, the research obtains the statistical data of college teaching reform evaluation from the evaluation report, understands the implementation of college curriculum ideological and political ideas, and discusses the effect of the combination of college curriculum ideological and political ideas and college professional teaching. Combined with the data of the evaluation report, this paper analyzes the development status of the reform of professional teaching mode in colleges and universities, collects the problems existing in the integration of ideological and political education into teaching reform practice, and puts forward the implementation path of the integration of ideological and political education into teaching reform practice. The study also used the way of comparative experiment to understand the effect of the combination of college curriculum ideological and political ideas and professional teaching on the treatment of college students' cognitive impairment. Fifty college students with cognitive impairment were divided into experimental group, traditional teaching group and preliminary integration group. The students in the experimental group were taught by a new teaching mode combining college curriculum ideological

and political ideas with professional teaching, while the students in the traditional teaching group were taught by the traditional teaching mode, The preliminary integration group uses the existing ideological and political concept of the curriculum and the preliminary integration mode of professional teaching in colleges and universities to teach. The implementation time of the experiment is one semester. In the process of the experiment, the research object has six professional learning hours per week, and both of them study two professional knowledge courses. By comparing the mental health level and curriculum professional achievements of students in the experimental group and the control group, this paper discusses the therapeutic effect of the combination of college curriculum ideological and political ideas and professional teaching on college students with cognitive impairment.

Results: The evaluation statistical results of the students in the experimental group on the new professional teaching mode after the experiment are shown in Table 1. The students in the experimental group have high satisfaction scores on the teaching concept, teaching method, teaching content and teaching evaluation of the new professional teaching mode.

Table 1. The evaluation and statistical results of the students in the experimental group on the new professional teaching model after the experiment

Survey object	Experience group
Teaching philosophy	3
Teaching methods	4
Content of courses	3
Teaching evaluation	4

Conclusions: Apply the curriculum ideological and political concept to the teaching reform of professional courses in colleges and universities, integrate the ideological and political education of college students on the basis of following the characteristics of professional courses, cultivate college students' professional knowledge and skills through different teaching methods, guide college students to improve their ideological and political consciousness, and promote the all-round development of college students' psychology and professional skills. Using the organic integration of college curriculum ideological and political ideas and professional teaching reform to promote the improvement of college education quality can effectively help college students with cognitive impairment improve their mental health quality and professional level, which has important practical significance to alleviate the problem of college students' cognitive impairment.

* * * * *

THE INFLUENCE OF THE INNOVATIVE DEVELOPMENT OF COLLEGE STUDENTS' IDEOLOGICAL AND POLITICAL EDUCATION ON ALLEVIATING STUDENTS' ANXIETY

Cheng Su

School of Marxism, Northwestern Polytechnical University, Xi'an 710000, China

Background: Psychological anxiety refers to a kind of fear and anxiety when an individual faces unsolvable difficulties or insurmountable obstacles. With the advancement of social process, social competition is becoming increasingly fierce, and people's life pressure is gradually increasing. In such a fast-paced life, college students bear the pressure from academic burden, interpersonal communication and other aspects, and are easy to fall into tension and anxiety. Appropriate anxiety can promote the study and life of college students, but some college students do not know enough about their mental health problems and do not take corresponding countermeasures in time, which makes them in a high state of anxiety for a long time and seriously reduces the quality of life. Therefore, it is necessary to strengthen the ideological and political education of college students, through the means of ideological and political education and psychological intervention, help college students eliminate psychological crisis and promote the comprehensive development of college students' physical and mental health.

Ideological and political education helps college students improve their ideological and political awareness by intervening in their ideological concepts, and promotes college students to learn to look at things in life from a dialectical perspective. Under the guidance of Marxist philosophy theory, ideological and political education adjusts their own pace of study and life, and improves the ideological level of college students. With the advent of the new media era, the development of networked information

technology has opened up a new development path for the ideological and political education of college students. Colleges and universities are required to establish a new innovative teaching mode of ideological and political education of college students, break the tradition, and deeply excavate the value significance of ideological and political education of college students to improve the level of mental health of college students. College students' enthusiasm and enthusiasm for ideological and political education.

Objective: To analyze the current situation of college students' ideological and political education under the new social situation, understand the problems existing in the traditional mode of college students' ideological and political education, and explore the innovative development path of college students' ideological and political education. Starting from the development mode of college students' ideological and political education under the new media environment, this study analyzes the impact of the innovative development of college students' ideological and political education on alleviating college students' anxiety, and analyzes the application value of college students' ideological and political education on improving college students' mental health level, hoping to provide reference for alleviating college students' anxiety.

Research design: Based on the general survey of college students' mental health level in 2021, this study obtains the relevant statistical data of college students' mental health quality, analyzes the current situation of college students' psychological anxiety, and understands the source and degree of college students' psychological anxiety. This study uses the artificial neural network evaluation method to analyze the impact of the innovative development of college students' ideological and political education on alleviating college students' anxiety, uses BP neural network to construct the innovative development model of college students' ideological and political education, and takes the psychological anxiety data of college students in the census data as the input variable of the model, to analyze the therapeutic effect of the innovative development of college students' ideological and political education in alleviating college students' psychological anxiety.

Results: The statistical analysis results of the sources of anxiety of contemporary college students are shown in Table 1. The psychological anxiety of contemporary college students mainly comes from the nervous state of college students on academic performance, interpersonal communication and employment development. Some college students are difficult to adapt to the university learning mode and have poor initiative and enthusiasm for learning, resulting in academic performance anxiety. Some college students are afraid of interpersonal communication in daily life and future employment development, afraid of contact with people and confused about future development.

Table 1. Statistical analysis of the sources of anxiety of contemporary college students

Survey object	Freshman	Sophomore	Junior	Senior
Academic	4	3	3	4
Social	3	4	3	3
Obtain employment	3	3	4	4

Conclusions: To carry out the ideological and political education of college students, we should take the reality of college students' life and study as the basis, have an in-depth conversation with college students with psychological problems, help college students with psychological anxiety solve their mental health problems, deal with specific things in life, and improve their mental health level. Mental health education is an important part of college students' ideological and political education. Colleges and universities should pay attention to the mental health education of college students, analyze the laws and characteristics of college students' physical and mental development, establish the training mechanism of college students' mental health development on this basis, and formulate a scientific and reasonable mental health education plan for college students. Moreover, colleges and universities should establish a sound ideological and political education system and mental health education mechanism, and do a good job in the allocation of resources for ideological and political education and mental health education, so as to provide a good environmental atmosphere for alleviating college students' anxiety.

THE INFLUENCE OF COLOR APPLICATION ON PSYCHOLOGY IN CHINESE ANTIQUE INTERIOR DESIGN

Jing Song

School of Arts Design, Wuchang University of Technology, Wuhan 430000, China

Background: Color psychology is an interdisciplinary subject of art and psychology that studies the various elements of color and their impact on human psychology when combined with objective objects. Because in the evolution of human species, various types of colors in the environment often represent different things and meanings. For example, the main color at night is black, which is the main rest time of human beings and will make human beings feel calm. The relationship between color and the psychology of objective things is abstracted, engraved into the human brain, and preserved through heredity, which still affects us today.

Interior design is to serve people. In the design process, we should comprehensively consider the impact of relevant factors on people's psychology, and color is an element that will significantly affect residents' psychology. Color is an objective thing. It affects people's psychology by combining with the walls, furniture and other parts of the indoor space. For example, the restaurant takes warm colors such as orange as the main color, which can increase the appetite of diners and speed up their dining speed. The swimming pool takes blue as the main color, which is easy to produce a quiet and pleasant psychological feeling. The coffee shop decorates the environment with brown as the background color, which can make people feel comfortable. The ancient-style interior design schools in China have played an irreplaceable role in inheriting and protecting Chinese architectural culture. However, the color selection of ancient style interior design in China is mostly red and black, and the spatial layout is relatively rigid, which is easy to cause aesthetic fatigue, which is not conducive to its promotion. Therefore, this study attempts to apply the principles and methods of color psychology to Chinese antique interior design, hoping to improve the attraction of this design style to modern residents.

Objective: To analyze the types and characteristics of Chinese antique interior design, and then design experiments to verify the impact of integrating the knowledge of color psychology into Chinese antique interior design on the psychology of residents.

Objects and methods: Collect a large number of literatures on color psychology and Chinese antique interior design published in recent years, and put forward some methods that may help to improve the effect of Chinese antique interior design. Then a decoration experiment is designed. The experimental subjects are 20 heads of households with their own houses randomly selected from China. They are divided into experimental group and control group, with 10 families in each group. The permanent rooms of the two groups are decorated with Chinese antique interior design, but the decoration of the experimental group is integrated with the above-mentioned color psychology method, adjust and combine the colors of room elements, while the decoration process of the control group does not need to consider color psychology. In addition, before and after the experiment, SCL-90 (Symptom Checklist-90) survey should be conducted for all heads of households to understand the psychological changes of heads of households before and after decoration. After the experiment, one-on-one interviews were conducted with the heads of households in the experimental group in order to understand their psychological feelings about decoration.

Results: The characteristics of all measurement types in the study were displayed by means of mean \pm standard deviation, and *t*-test was conducted. The significance level of difference was set to 0.05. After the experiment, the SCL-90 score data of the two groups of heads of households were counted to get Table 1.

Table 1. Statistical results of SCL-90 scores of two groups of household heads after the experiment

Project	Experimental group (n=10)	Control group (n=10)	<i>t</i>	<i>P</i>
Somatization	1.31 \pm 0.62	1.32 \pm 0.76	1.145	2.843
Obsession	1.27 \pm 0.55	1.45 \pm 0.58	0.515	0.024
Susceptibility	1.26 \pm 0.58	1.24 \pm 0.49	0.641	1.142
Depressed	1.32 \pm 0.80	1.62 \pm 0.65	0.362	0.008
Anxious	1.24 \pm 0.41	1.53 \pm 0.43	0.569	0.027
Hostile	1.45 \pm 0.46	1.44 \pm 0.62	3.121	0.447
Terror	1.48 \pm 0.48	1.46 \pm 0.54	0.914	3.850
Paranoid	1.49 \pm 0.61	1.48 \pm 0.74	1.028	1.841
Psychotic	1.33 \pm 0.43	1.31 \pm 0.45	0.328	5.233

It can be seen from Table 1 that after the experiment, the *t*-test *p* value of the average score data of the two groups of heads of households on the six symptom factors of somatization, sensitivity, terror, hostility, paranoia and psychosis of SCL-90 is greater than the significance level of 0.05, so it is considered that the data difference is not significant. The average scores of obsessive-compulsive disorder, depression and anxiety in the experimental group were 1.27, 1.32 and 1.24 respectively, while those in the control group were 1.45, 1.62 and 1.53 respectively. The former was significantly lower than the latter, and the data

difference was significant.

Conclusions: With the rapid development of China's economy, the people's aesthetic demand for the living environment is higher and higher. The Chinese ancient style interior design integrates the elements of China's ancient architectural culture and can meet the psychological needs of some residents for the aesthetic of the living environment to a certain extent. However, modern aesthetic psychology is not considered enough in Chinese antique interior design. In particular, red, brown and black are widely used as the main colors in Chinese antique interior design, which greatly limits the development and promotion of this genre. Therefore, this study designs a decoration experiment of Chinese antique interior design. The experimental results show that, some negative psychological performances of residents in the experimental group considering the psychological impact of color on residents were improved. The experiment shows that in the process of Chinese ancient style interior design, considering the color psychology to reasonably match the environmental color is helpful to improve the mental health level of residents.

THE INFLUENCE OF CUSTOMER FIT OF AFFECTIVE DISORDER CONSUMERS ON VALUE CO CREATION BEHAVIOR IN SOCIAL NETWORK

Qiang Li¹, Di Xiang¹ & Yingji Li^{2*}

¹*School of Economics and Management, Shanghai Technical Institute of Electronics & Information, Shanghai 201411, China*

²*School of Management, Chongqing Institute of Engineering, Chongqing 400056, China*

Background: Affective disorder refers to a psychological disease that cannot control one's emotional expression by virtue of self-consciousness. Its main causes include family heredity, negative personality and social experience. The main symptoms of the affective disorder include running away, slow thinking, psychomotor excitement or inhibition, manic state and depression. The manifestations of these symptoms are abnormal high mood and abnormal low mood.

Customer fit refers to a psychological state in which the cognition, emotion and behavior of the brand will be driven by some motivation and change with the situation in the interaction between customers and product brands. From the perspective of behavior, customer fit can also be understood as the non-transactional behavior or performance of customers towards the enterprise or brand driven by some motivation (these behaviors mainly include word-of-mouth, recommendation, helping others, comments, etc.). Value co-creation is the theory that the value of goods and services is created by the providers and consumers of goods or services. With the development of China's market economy, the competition among enterprises is becoming more and more fierce. Making more customers in a state of value fit and carrying out value co-creation for the company will help to improve the long-term profitability and customer loyalty of enterprises. However, for consumers with emotional disorders, their value co-creation in social networks and the effect of enterprise product marketing behavior may be restrained or even become negative due to inappropriate emotional expression in communication. Therefore, it is necessary to study the customer fit state and value co-creation behavior of affective disorder consumers in social networks.

Objective: To explore the impact of the characteristics, types and value co-creation behavior of emotional barrier consumers on enterprises in social networks, so as to provide some references for improving the level of relationship marketing, word-of-mouth marketing and customer value co-creation of Chinese enterprises.

Objects and methods: To study the academic literature and books published in China in recent years on emotional disorders, customer fit and consumer business value co-creation, and put forward some main clinical manifestations of emotional disorders in the current population and typical behaviors of enterprise value co-creation and customer fit in the background of social network. 47 experts and scholars from affective disorder and marketing, enterprise management and other fields were invited to form an expert group in China to send the sorted information to them and ask them to give the impact of these affective disorder symptoms of consumers with affective disorder on various listed typical behaviors. The impact degree is divided into five levels: no impact, slight impact, general impact, obvious impact and full impact. In order to facilitate quantitative statistics, the five impact degree levels are given the numbers 1, 2, 3, 4 and 5 in turn.

Results: After the expert group reached an agreement, they sorted out and counted their views on the research problems, as shown in Table 1, the quantitative score of impact grade is quantitative data, which is described in the form of mean ± standard deviation.

Table 1. Expert group’s evaluation on the impact of symptoms on typical behaviors of consumers with affective disorder

Affective disorder symptoms	Participate in product design	Product recommendation	Product usage review	Online marketing
Thinking run	3.20±2.15	2.21±0.18	1.36±0.24	1.73±0.42
Slow thinking	4.62±0.33	4.25±0.15	2.14±0.46	1.87±0.53
Manic	4.75±0.16	4.80±0.67	3.74±0.25	3.09±0.74
Depressed	3.86±0.24	4.31±0.37	3.63±0.58	2.89±0.38

It can be seen from Table 1 that the expert group believes that the impact of various affective disorder symptoms on consumer value co-creation and marketing behavior is different. Specifically, the impact of thinking retardation and manic symptoms on consumer value co-creation and marketing behavior is relatively similar, both of which have an overall impact on “participating in product design” and “product recommendation” that exceeds the level of “significant impact”. Thinking Bentley has the greatest impact on the behavior of “participating in product design”, and depressive symptoms have the greatest impact on the behavior of “product recommendation”.

Conclusions: In order to analyze the impact of emotional barrier consumers on value co-creation and customer fit behavior in social networks, this study analyzes the characteristics, types and typical value co-creation behavior of emotional barrier consumers in current social networks, and then solicits the opinions of the expert group on this basis. Analyzing the final opinion of the expert group, it is found that the expert group believes that the impact of thinking retardation and manic symptoms on consumer value co-creation and marketing behavior is relatively similar, both of which have an overall impact on “participating in product design” and “product recommendation” that exceeds the level of “significant impact”. Thinking Bentley has the greatest impact on the behavior of “participating in product design”, and depressive symptoms have the greatest impact on the behavior of “product recommendation”. The expert consultation results show that consumer affective disorder will have a certain negative impact on customer fit behavior and value co-creation behavior. It is suggested that enterprises avoid using such customers to carry out relevant marketing work.

IMPORTANT EXPOSITION OF MARX AND ENGELS’ LETTERS ON IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Yuefeng Ding

Party School of Gansu Provincial Committee of C.P.C (Gansu Academy of Governance), Teaching and Research Section of Scientific Socialism, Lanzhou 730010, China

Background: Social psychology is a subject that studies the psychological and behavioral conditions of individuals and organizations in the social environment, and summarizes the laws used to solve the corresponding social problems. Social psychology is an interdisciplinary subject of sociology and psychology. Compared with traditional psychology, it focuses on language, friends, family, living environment while the learning environment has an impact on itself, it also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. Because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to improve the reliability and accuracy of research results.

There is a close relationship between the content of Marx and Engels’ classic letters and the current ideological and political teaching in colleges and universities. In theory, letters reflect the criticality of ideological and political education. In practice, letters are helpful to enhance students’ interest in ideological and political courses. However, it will be particularly stiff and unnatural to directly combine letters with ideological and political courses. Therefore, it is necessary to consider using the theoretical methods of social psychology to analyze students’ learning psychology, so as to organically and flexibly integrate Marx and Engels’ letters into ideological and political education in colleges and universities.

Objective: To use the theoretical method of social psychology to analyze the psychological status and psychological needs of college students in learning ideological and political courses, and take this as the starting point to integrate the contents of Marx and Engels’ classic letters and social psychology knowledge

into college ideological and political courses, so as to enable students to have the ability to analyze their own and social problems from the perspective of social psychology, so as to improve students' self-psychological adjustment ability and pressure resistance ability.

Participants and methods: A representative school in terms of student source distribution, educational environment and teaching staff was selected from two ordinary colleges and universities in China. 226 non-ideological, political and non-philosophy students who were willing to participate in the research were selected as the research objects. The two groups of students were divided into experimental group and control group, with 113 students in each group, first, make statistics on the difference of basic information between the two groups. If there is a significant difference in some information, it needs to be regrouped. If there is no significant difference in basic information, the follow-up experiment can be carried out. The two groups of students were given ideological and political education. The control group only received traditional ideological and political education. On this basis, the experimental group organically integrated the contents of classic letters of Marx and Engels in the course, taught students to analyze the principle and essence of teaching content from the perspective and method of social psychology, and encouraged students to apply this method to analyze and adjust their own psychology emotional aspect. Teaching students the experiment lasts for a semester. Before and after the experiment, teachers were asked to provide information on the degree of students' positive psychology and depression. Teachers can obtain this information through interviews, special examinations and other ways, but the test methods of the two groups must be the same.

Results: After the completion of the teaching experiment, the data of students' positive psychology and depression psychology were obtained from the teachers of ideological and political courses of the two groups of students. It was found that the teachers scored the performance of students' two kinds of psychology according to the percentage system. The higher the score, the stronger the students' psychological tendency. The statistical results are shown in Table 1.

Table 1. Statistics of positive and depressive psychological performance of the two groups of students after the experiment

Comparison index	Experience group	Control group	<i>t</i>	<i>P</i>
Positive psychological intensity	83.6±5.2	74.3±5.8	0.483	0.007
Psychological intensity of depression	61.7±4.6	78.5±5.4	0.516	0.003

It can be seen from Table 1 that after the teaching experiment, the score data of positive psychological intensity and depression psychological intensity in the experimental group are significantly different from those in the control group. Specifically, the average scores of positive psychological intensity and depression psychological intensity in the experimental group were 83.6 and 61.7, which were 12.5% and -21.4% respectively compared with the control group.

Conclusions: With the increasing attention paid to the ideological education of college students in China, the voice of adding the content of Marx and Engels's classic letters to ideological and political education is rising day by day. However, the content of these letters is difficult to understand, and the direct integration of courses may lead to difficulties in students' learning and understanding. Therefore, this study designed a teaching experiment, in which teachers are required to try to analyze the principle and essence of teaching content from the perspective of social psychology, and encourage students to apply this method to analyze and adjust their own psychology and emotions. The experimental results showed that after the experiment, the score data of positive psychological intensity and depression psychological intensity in the experimental group were significantly different from those in the control group. Specifically, the average scores of positive psychological intensity and depression psychological intensity in the experimental group were 83.6 and 61.7, which were 12.5% and -21.4% respectively compared with the control group. The results show that integrating the contents of Marx and Engels' letters into the teaching mode of ideological and political education in colleges and universities and using social psychology-assisted teaching can help to improve students' positive psychology and improve their psychological performance of depression.

* * * * *

THE COMBINATION OF CREATIVE THINKING ABILITY OF ART DESIGN UNDER COGNITIVE IMPAIRMENT

Mingqi Yao

School of Arts, Anhui Polytechnic University, Wuhu 241000, China

Background: The main manifestation of cognitive impairment is that the advanced functions of human brain such as memory, logic and thinking cannot operate abnormally, and the cognitive impairment of patients in one aspect is likely to cause cognitive impairment in other aspects. The main clinical manifestations of cognitive impairment are divided into perceptual impairment (such as hypersensitivity or retardation, sensory deterioration and internal discomfort), memory impairment (such as strong memory and memory defect), and thinking disorder (thinking logic disorder and association process disorder). Most of the causes are the abnormal activity of the human cerebral cortex. Because cognitive impairment will have a great impact on patients' ability to understand the world and surrounding environment, it is very harmful in the field of education. The teaching of art major aims to cultivate students' ability of subjective thinking to create and change objective things. If students don't have strong innovative thinking and ability, they can't design unique and excellent works, let alone make their works recognized and favored by the public. Therefore, in the teaching of art majors in colleges and universities, it is particularly important to cultivate students' innovative thinking. However, for students with cognitive impairment, their innovative ability must be greatly affected. Therefore, this study attempts to find methods that can make art design majors improve their cognitive impairment in the teaching process.

Objective: To understand the current situation of cognitive impairment of art design students in colleges and universities in China and various reasons for their cognitive impairment. Then try to design a method that can improve the severity of students' cognitive impairment symptoms in the teaching process without using drug treatment and professional psychological guidance, so as to provide some help for improving the mental health level of Chinese college students and improving the employment quality of art and design students.

Objects and methods: Collect the research data of cognitive impairment and art design major, analyze the causes of cognitive impairment of art design major college students in China, and then put forward some non-drug treatment methods to help cognitive impairment art design major college students alleviate their symptoms in the process of education. A teaching experiment is designed to verify the reliability of these methods. Four universities with roughly the same teaching quality, school type and teaching team strength were randomly selected from China, and then 50 college students majoring in art and design with cognitive impairment and 12 normal college students were selected as the research objects. They were divided into cognitive impairment group and normal group. After the statistical difference of their basic information was passed, the course teaching of the art design and innovative thinking training was carried out for the two groups of students, but the teachers in the cognitive impairment group were required to observe and understand the incidence of students' cognitive impairment as much as possible in the teaching process, and adjust, add and delete the teaching content and teaching speed according to the students' psychological state. The teaching experiment lasted for 3 months. Before and after the experiment, students were asked to fill in MMSE (Mini-Mental State Examination) to measure the severity of cognitive impairment.

Results: After the experiment, the students were divided into two groups according to the total MMSE scores before the experiment. The students with scores of [0,9], [10,20], [21,26] and [27,30] were classified into severe cognitive impairment, moderate cognitive impairment, mild cognitive impairment and no cognitive impairment group (i.e., the original normal group). After the experiment, the symptoms of cognitive impairment of students in each group are counted, as shown in Table 1.

Table 1. MMSE scores of students with cognitive impairment before and after teaching

Statistical time	Severe cognitive impairment	Moderate cognitive impairment	Mild cognitive impairment	No cognitive impairment
Before experiment	8.5±1.3	16.3±2.4	25.3±1.8	29.1±2.0
After the experiment	19.2±2.0	24.7±2.1	27.4±1.5	29.1±1.7

It can be seen from Table 1 that the cognitive impairment of art and design students with different degrees of cognitive impairment before the experiment has been improved as a whole after the experiment. The specific analysis is as follows: the mean MMSE scores of students with severe, moderate and mild cognitive impairment before the experiment are 8.5, 16.3 and 25.3 respectively, after the experiment, it became 19.2, 24.7 and 27.4 respectively, and the overall level of cognitive impairment in each group was decreasing.

Conclusions: Aiming at the problem that the cognitive impairment of college students majoring in art and design affects the cultivation of their innovative thinking ability, this study designed a comparative teaching experiment after investigating the current situation and causes of cognitive impairment of college students majoring in art and design in China. The experimental results show that the art and design students

with different degrees of cognitive impairment before the experiment, after the experiment, the overall situation of cognitive impairment has been improved. The specific analysis is as follows: before the experiment, the mean MMSE scores of students with severe, moderate and mild cognitive impairment were 8.5, 16.3 and 25.3 respectively, and changed to 19.2, 24.7 and 27.4 respectively after the experiment. The overall level of cognitive impairment in each group is decreasing. The experimental results show that requiring teachers to pay attention to students' cognitive impairment and adjust the teaching content in time is helpful to improve students' cognitive impairment symptoms.

THE CURRENT SITUATION OF UNDERGRADUATE EDUCATION OF TOURISM MANAGEMENT SPECIALTY FROM THE PERSPECTIVE OF PSYCHOLOGY

Man Liu

School of Economics and Management, Tongren University, Tongren 554300, China

Background: The research object of educational psychology is the psychological changes and laws of learners and teachers in the teaching environment. It is a collection of accumulated knowledge, wisdom and intuitive ideas of psychological methods and theories in the field of education. Teachers should master this discipline to effectively solve the problems in daily teaching. Its most intuitive application occurs in the typical two-way interaction between teachers and students in the teaching process. It requires teachers to carefully study all aspects including teaching content, teaching methods, teaching cases, teaching means and teaching environment. In addition, educational psychology also requires teachers to have a necessary understanding of students' psychological state and activities, so as to further improve the effectiveness of teaching. Educational psychology holds that students, as independent individuals, have different thinking abilities and are indifferent psychological environments. The rapid development of China's tourism industry has provided a large number of professionals for the industry. However, the extensive teaching of tourism management specialty for a long time also has a lot of problems: at the school level, there are some problems, such as the decline of enrollment, low interest in learning and low professional employment rate. At the enterprise level, however, there are problems of failing to recruit and retain high-level talents. These problems have brought great pressure to professional students, and some students even have employment anxiety. Tourism management departments and experts and scholars in the industry have conducted a lot of research on the psychological problems of professional students' employment anxiety, but it has little effect. This is because previous studies have focused too much on tourism education itself and paid insufficient attention to students in the major. Therefore, this study attempts to use the method of educational psychology, focusing on finding ways to alleviate students' employment anxiety from the perspective of students.

Objective: To understand the current employment situation and professional teaching content of tourism management students in China, analyze the main causes of students' employment demand and psychological anxiety combined with the theoretical knowledge of educational psychology, and put forward effective strategies to improve the employment quality of professional students and alleviate their employment anxiety.

Objects and methods: Collect the research data of employment analysis and educational psychology of undergraduate education in tourism management published in China in recent years, try to summarize the main causes of employment anxiety of students majoring in tourism management, and use Delphi method to verify the reliability of these causes and their impact on the employment anxiety of students majoring in tourism management. 49 key teachers of educational psychology and tourism management and senior executives of tourism companies were selected from China to form an expert group, which sent the identified reasons to the expert group, asked them to respond to whether the reasons were selected accurately and whether there were omissions, and made an evaluation of the impact of each reason on students' job anxiety. The impact level was selected, no impact, slight impact general impact, obvious impact and full impact. After sorting out the opinions of the expert group, feedback the results to the experts again until the experts reach an agreement.

Results: The final opinions of statistical experts after completing the steps of Delphi method are shown in Table 1.

The figures in each cell in Table 1 represent the number of people who believe that the impact of this reason on the employment anxiety of students majoring in tourism management is the corresponding level. It can be seen from Table 1 that the expert group believes that "the quality of tourists is uneven" and

“professional social prejudice” are the biggest reasons for students’ employment anxiety, followed by “non-standard industry management” and “insufficient industry demand”, and “the personality of the new generation of students” has the least impact on the psychology of employment anxiety, the cumulative number of people who choose these reasons to have an impact level greater than “general impact” is 27, 29, 11, 10 and 4 respectively.

Table 1. Statistical results of the final opinions of the expert group

Reason	No effect	Slight impact	General impact	Obvious influence	Full impact
Professional social prejudice	0	6	14	25	4
Personality of the new generation of students	7	27	11	3	1
Insufficient industry demand	6	18	15	7	3
The quality of tourists is mixed	0	5	17	20	7
Industry management is not standardized	2	10	26	6	5

Conclusions: In view of the employment anxiety of tourism majors in China, based on the understanding of the employment status and professional teaching contents of tourism management majors in China, combined with the theoretical knowledge of educational psychology, this study analyzes the main reasons for students’ psychological anxiety, and uses Delphi method to verify and adjust these reasons. The survey results of the expert group show that the expert group believes that “the quality of tourists is uneven” and “professional social prejudice” are the biggest reasons for students’ employment anxiety, followed by “non-standard industry management” and “insufficient industry demand”, and “the personality of the new generation of students” has the least impact on the psychology of employment anxiety. Delphi consultation results show that in order to fundamentally deal with the psychological problems of employment anxiety of college students majoring in tourism management, the government needs to standardize the development of the industry, expand the demand of the industry and positively guide the behavior of tourists and tourism psychology by social media.

COLLEGE STUDENTS’ ENGLISH TRANSLATION AND INFORMATION-BASED TEACHING INNOVATION BASED ON COGNITIVE IMPAIRMENT

Tao Zhang

The Business Foreign Languages Department, Shandong Foreign Trade Vocational College, Qingdao 266100, China

Background: The high-frequency symptoms of cognitive impairment are the abnormalities of human brain advanced functions such as emotion, memory, logic and thinking, and the cognitive impairment of patients in one aspect is likely to cause cognitive impairment in other aspects. The causes of cognitive impairment diseases are mostly the abnormal activity of the human cerebral cortex, which is generally treated with antioxidants Glutamate receptor antagonists and other drugs or surgical treatment. At present, with the development and popularization of computer technology, its application in the field of education is becoming more and more extensive. More and more schools use various Internet tools for auxiliary teaching, especially in the field of college English teaching. Due to the wide range of humanistic knowledge involved in teaching courses, it is necessary to use Internet tools to display more relevant contents for students, however, for college students with cognitive impairment, their ability to learn and understand things is poor. After integrating internet teaching tools into the classroom, the amount of information they receive increases greatly, which may further reduce their learning effect on English translation courses. This study was conducted to explore the learning performance of students with cognitive impairment in the English translation course under the Internet reform.

Objective: To explore the impact of adding internet teaching aids and internet teaching thinking to college English translation courses on the learning of students with cognitive impairment, and to find countermeasures that may reduce the degree of this impact, so as to provide some ideas for improving the overall English translation ability of Chinese college students.

Participants and methods: 42 full-time college students who are studying English translation courses and have varying degrees of cognitive impairment were selected from a foreign studies university in a city

to understand their impact on themselves by integrating internet teaching tools into the course in the form of semi-structured interviews. Then the information obtained from the interview is combined with the academic literature of college English translation Internet reform, and the main reasons and factors affecting students' cognitive impairment are summarized. 50 excellent college English teachers, pedagogical experts and psychological experts were selected from China to form an expert group, which sent the sorted materials to the members of the expert group, asked them to give feedback on the content, identify the unreasonable reasons and note the reasons for the lack, and evaluated the impact degree of each reason. The impact degree was subdivided into no impact, slight impact, the impact is general and obvious. Sort out the feedback results of the expert group and return them to the expert group for evaluation again until the expert group reaches an agreement.

Results: After the termination condition of the expert group consultation cycle is triggered, the statistical consultation results are shown in Table 1.

Table 1. Statistics of expert group consultation results

Reason	No effect (%)	Slight impact (%)	General impact (%)	Obvious influence (%)	Full impact (%)
Online courses are difficult to answer	4	14	28	42	12
Too much information	2	20	32	36	10
Internet tools are difficult to use	18	24	26	20	12
The way of integration is stiff	22	30	26	14	8

The values in each cell in Table 1 represent the proportion of the number of people who believe that this reason has an impact on students' cognitive impairment at the corresponding level. It can be seen from Table 1 that the expert group believes that "difficult to answer questions in online courses" is the reason that has the greatest impact on students' cognitive impairment, followed by "too much information", and "rigid integration mode" has the least impact on students' cognitive impairment. The cumulative number of people who choose the impact level of these reasons not lower than the "obvious impact" level accounts for 54%, 46% and 22% respectively.

Conclusions: With the promotion of China's reform and opening-up strategy, the country's demand for high-quality English translation talents is increasing, which puts forward higher talent training requirements for English translation teaching in higher education in China. For the purpose of improving teaching quality, experts and managers in the industry began to apply Internet technology and information tools to college English translation teaching. However, this reform model is a double-edged sword. For college students with cognitive impairment, the reformed teaching model may reduce their learning effect and aggravate the symptoms of cognitive impairment. Through semi-structured interviews with college students and expert investigation and consultation, this study learned that the college English translation teaching model combined with information means is indeed not conducive to the learning and recovery of students with cognitive impairment. Moreover, the expert survey results show that "it is difficult to answer questions in online courses" is the reason that has the greatest impact on students' cognitive impairment, followed by "too much information", and "rigid integration mode" has the least impact on students' cognitive impairment. The cumulative number of people who choose these reasons whose impact level is not lower than that of obvious impact accounts for 54%, 46% and 22% respectively. Because it is difficult to answer questions in online courses, it is difficult for teachers to give timely encouragement and answer questions when students are anxious and nervous because they cannot understand the course due to cognitive impairment, which will generally worsen the symptoms of students' cognitive impairment. After the integration of information tools, the information density of the classroom is significantly increased, and the understanding difficulty of students with cognitive impairment is also significantly greater.

THE DIRECTION OF CAPITAL ECONOMIC FLOW FROM THE PERSPECTIVE OF PSYCHOLOGY

Jiebao Sun

School of Economics and Management, Jiangsu College of Engineering and Technology, Nantong 226000,

China

Background: Social psychology is mainly used to study the psychology of individuals and groups in the social environment, and summarize the laws to solve the corresponding social problems. Social psychology is an interdisciplinary subject of sociology and psychology. Compared with traditional psychology, it not only pays attention to the impact of language, friends, family, living environment and learning environment on itself in the process of individual socialization, but also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level, such as stereotypes in society first cause-effect, halo effect, etc. In the process of case study related to social psychology, we need to strictly abide by the principle of value neutrality, systematic principle and ethical principle, so as to avoid introducing irrelevant variables into the experiment and reduce the credibility of the results. Since the birth of the first capitalist country, there have actually been no less than 10 financial crises. The direct causes of each financial crisis are different, but they are closely related to capital flows. Therefore, in order to ensure the stability and prosperity of the national economy, it is necessary to analyze the flow direction of the capitalist economy. The essence of capital flow is that the individuals and organizations behind capital trigger specific psychology and decision-making in the social context. Therefore, using the theoretical method of social psychology to study the economic flow of capital has certain theoretical feasibility.

Objective: From the perspective of social psychology, to analyze which psychological factors affect the capital flow of independent economies and the importance of each factor. So as to put forward some suggestions that are conducive to improving the direction of China's scientific control of capital flow, and reducing the possibility of people's loss caused by the disorderly and negative capital flow caused by the irrational psychological activities and emotions of the controller behind the capital.

Objects and methods: By mean of Python crawler, the capital flow data and sociological data of multiple independent economies in the world in more than 70 years after World War II can be obtained from the publicly available macro-financial database and social humanities data. The data sets are cleaned and processed, the invalid data are removed, the high correlation characteristics are combined, and the samples containing blank data are deleted, taking the information of the overall national personality bias, cultural type, psychological expression degree, social openness, group communication mode, the severity of racial prejudice, the popularity of religious psychological habits and other information of the economies in the data set as the input characteristics, and taking the national average annual net capital inflow after World War II (excluding inflation) as the label, it is input into the random forest regression model. When the model parameters are adjusted many times to further optimize the regression effect, the importance coefficient of the characteristics is output to judge the social-psychological factors that affect the capital flow.

Results: After the model training, the statistical results of the characteristic importance coefficient of the model are output, as shown in Table 1 note that the statistical significance level is taken as 0.05.

Table 1. Statistics of characteristic importance of Stochastic Forest regression model of capital flow in independent economies

Number	Features	Characteristic value	Regression coefficient <i>B</i>	Standard deviation	<i>P</i>	OR	95% CI
1	Overall national character	Positive and optimistic	-1.882	0.262	0.007	0.520	0.098-1.204
2	Social openness	Medium open	-1.461	0.682	0.005	0.702	0.123-2.459
3	Racial prejudice severity	Unbiased	-1.127	0.434	0.003	0.149	0.029-1.533
4	Cultural type	Confucianism	-0.264	0.512	0.085	0.775	0.052-2.362
5	Popularity of religious psychological habits	No religion	-0.183	0.128	0.174	0.348	0.081-5.115
6	Group communication mode	Altruism	-0.135	0.248	1.514	0.541	0.047-1.344

Note: The data listed in Table 1 are the data of the corresponding characteristic value with the largest absolute value of the importance coefficient in the input characteristics.

It can be seen from Table 1 that the most effective protective factors for increasing the net capital inflow of the economy are positive and optimistic national overall personality bias, moderate openness to social interaction, and no racial bias, and their *P* values are less than the significance level.

Conclusions: In view of the economic and social problems caused by the disorderly flow of capital, this

study analyzes the psychological characteristics and decision-making mode of people and organizations behind the working capital from the perspective of social psychology, looks for relevant data sets and establishes a regression model to analyze the social-psychological factors that will affect the local capital flow. The results of regression analysis show that the most effective protective factors to increase the net capital inflow of the economy are positive and optimistic national overall personality bias, moderate social openness and non-racial bias. This is because a positive and optimistic national overall character will bring higher production efficiency, and the incidence of social-psychological crimes is lower. A medium degree of social openness can achieve a high cost-effective balance between protecting national spiritual independence and obtaining external resources. Non-racial bias can enable citizens to carry out production activities under the condition of lower psychological burden and negative emotions.

ON THE INFLUENCE OF MARKETING EFFICIENCY FROM THE PERSPECTIVE OF CONSUMER PSYCHOLOGY

Hua Yang

School of Economics and Management, Yunnan Technology and Business University, Kunming 651700, China

Background: Consumer psychology is an emerging discipline that studies various psychological changes and the law of psychological activities produced by consumers in consumer activities. It also belongs to the interdisciplinary discipline composed of consumer economics and psychology. The main research objects of consumer psychology are the psychological activity process and personality psychological characteristics of consumers, the psychological factors affecting consumer behavior, the impact of social environment on consumer psychology, consumer psychology and consumption habits, marketing methods and consumption psychology of consumer groups, and so on. Consumer psychology is of great significance to improve product sales revenue and expand product popularity. Consumers' purchase motivation is affected by various realistic and potential factors. It seems to be accidental. In fact, it has its profound reasons for consumer psychology, that is, a series of seemingly "accidental" consumer behaviors actually mainly depend on the influence of consumer psychological factors. Specifically, consumers' consumption psychology is mainly affected by advertising, past consumption experience and lifestyle, which is also the key point to improve marketing efficiency. Therefore, this study attempts to use consumer psychology to analyze the effective measures to improve marketing efficiency from the perspective of consumer psychology.

Objective: To analyze the consumer psychological factors affecting the marketing efficiency of enterprises, and put forward some suggestions to improve the marketing efficiency of enterprises, so as to contribute some ideas from different perspectives to improve the marketing ability and product competitiveness of domestic enterprises.

Objects and methods: Collect classic marketing and consumer psychology papers and books published at home and abroad, carefully study these materials, and summarize some consumer psychology that will affect enterprises to improve marketing efficiency from the perspective of consumer psychology according to the contents of these materials. Then a set of questionnaires is designed and carried out. The survey content is the influencing factors of consumers on enterprise marketing efficiency and the influence level of each factor. The influence degree is divided into five categories: no influence, slight influence, general influence, obvious influence and full influence, and assigned 1, 2, 3, 4 and 5 respectively. The questionnaire incorporates the consumer psychology proposed in this study for the respondents to choose. The reliability and validity of the questionnaire shall be tested. If one of the reliability or validity does not meet the requirements, the corresponding part of the questionnaire shall be adjusted and redesigned, and the reliability and validity shall be tested again until the reliability and validity of the questionnaire are qualified. The subjects of the questionnaire were 232 adults of different ages, occupations and genders, who were obtained by publishing the information of the convening of experimental volunteers in the administrative center of a commercially developed municipal administrative unit in China.

Results: After the questionnaire survey, the invalid questionnaire was collected and removed, the valid questionnaire was entered into the computer, and SPSS23.0 and Excel software has been used for statistical analysis, and the analysis results are shown in Table 1.

Compared with the average of the four psychological phenomena, the psychological degree of scarcity and the pursuit of market efficiency is more obvious. That is, the surveyed consumers believe that the impact of this two-consumer psychology on marketing efficiency is higher than the "obvious impact" on the whole level.

Table 1. Display of questionnaire survey results

Consumer psychological reasons	Explain	Mean score of influence degree	Standard deviation of influence score
Group psychology	Consumer behavior is influenced by other consumers	4.06	0.31
Conservative psychology	Once consumers get used to a product, their interest in other similar products will decrease	3.28	0.28
Comparative psychology	Consumers' perception of the value of products depends on the selected reference object	3.67	0.19
Pursuit of scarcity	Consumers are more interested in scarce products	4.25	0.25

Conclusions: In view of the marketing problems of some enterprises in China, such as low marketing efficiency and marketing content that cannot be recognized by consumers, after collecting and analyzing the classic marketing and consumer psychology papers and books published at home and abroad, this study summarizes some consumer psychological factors that will affect enterprises to improve marketing efficiency from the perspective of consumer psychology, and carry out a set of questionnaires to cross verify the rationality of these factors. The survey results show that consumers believe that the four psychological phenomena of conformity, conservatism, contrast and the pursuit of scarcity have an obvious impact on the marketing efficiency of enterprises, among which the pursuit of scarcity and conformity have the greatest impact. The analysis shows that this is because consumers are naturally more interested in scarce products, and consumers' consumption psychology will tend to be consistent due to the interference of other consumers to a large extent. Therefore, the reasonable use of marketing teams of hunger marketing, word-of-mouth publicity and community publicity in the market can usually achieve better marketing results.

RURAL TOURISM DEVELOPMENT AND ECO-TOURISM INNOVATION PATH FROM THE PERSPECTIVE OF TOURISM PSYCHOLOGY

Yu Fu & Jian Wang

School of Geographical Sciences, China West Normal University, Nanchong 637009, China

Background: There are two logical starting points of tourism psychology, which are also closely related to the diversity and development of their own definitions. Firstly, tourism psychology is a subject with tourism psychology as the main research object and core concept. Secondly, it takes tourism as the research object and psychology as the research perspective. No matter which logical way, the final relationship between human tourism behavior and tourism psychology is the main starting point. From the perspective of tourism psychology, the psychological and behavioral phenomena of tourists, tourism workers and local residents have a significant impact on the whole set of social tourism behavior. Tourists' tourism psychology includes both static and dynamic psychological factors. Static psychological factors include tourists' inherent tourism emotion, tourism concept, tourism interest and other almost attribute factors. These factors will not change due to the dynamic changes in tourism behavior. It is the main psychological motivation for tourists to choose tourism destination and tourism behavior. Dynamic tourism psychological factors are caused by the dynamic psychological phenomena in the process of tourism behavior, such as tourism traffic psychology, tourism accommodation psychology, tourism psychology, tourism diet psychology and so on. In the process of developing rural ecotourism, both static tourism psychological factors and dynamic tourism psychological factors of tourists need to be taken into account. These innovative designs around tourists' psychological factors can be shown through rural ecotourism construction, and rural ecotourism construction with different emphases can be favored by different tourism groups. Therefore, through the innovation of rural ecotourism construction path, we can effectively grasp the psychology of tourists, accurately divide tourism groups according to the existing rural characteristics, and lay the foundation for further marketing and publicity means, so as to achieve the effect of revitalizing rural tourism and developing rural economy.

Objective: This study starts from the perspective of tourism psychology, by grasping the static tourism psychological factors and dynamic tourism psychological factors of tourists' psychology, provides path

innovation for the development and construction of rural ecotourism, and then promotes the development of the rural economy.

Subjects and methods: This study combines structural equation method and social network analysis method to analyze rural society, economy and tourism from the perspective of tourism psychology. Structural equation model is used to model and evaluate rural ecotourism, social network analysis is helpful to confirm the action position and individual role of a single actor in the overall social and psychological motivation network.

Study design: This study uses the structural equation method to establish the attribute data model through the social action and psychological motivation of stakeholders. This part of the attribute data includes the quantitative values of individual psychological motivation, psychological attitude and actual behavior. These elements will be analyzed as individual attributes. In the process of model analysis, the social network analysis method is used to analyze the action principle and psychological motivation of individuals in the overall model network, so as to analyze the relationship and function of individuals in the network more specifically.

Methods: Amos software is used as the main analysis software in this study. The software can analyze multiple variables simultaneously in the process of processing structural equation model, and its function is consistent with the purpose of this study.

Results: The evaluation of multi-functional rural ecotourism is shown in Table 1.

Table 1. Multifunctional rural tourism evaluation

Type of function	Normalized priority	Limit matrix value
Economic function	0.6113	0.1082
Residential function	0.1146	0.0203
Environmental function	0.1117	0.0198
Psychological function	0.1624	0.0287

Table 1 evaluates the four main functions of multi-functional rural ecotourism: economic function, residential function, environmental function and psychological function. The results show that strong economic function is the most important factor in multi-functional rural ecotourism and the main support for ecotourism innovation. In addition, the good psychological function can also provide tourists with choice motivation. On the whole, economic function and psychological function are the two main functions of the development of multi-functional rural ecotourism. The economic function can expand the customer group of rural tourism to a greater extent and improve the basic customer experience, while psychological function can add cultural characteristics to the rural tourism base and enhance the tourism attraction of local villages on the basis of infrastructure construction, provide tourists with greater psychological motivation.

Conclusions: In the development and construction of rural ecotourism, the psychological factors of tourists are very important. By using tourism psychology to grasp the static and dynamic psychological factors of tourists, we can provide behavioral cues for tourists from the level of psychological motivation, and then help tourists complete their psychological choices. The application of tourists' psychological factors can be reflected through the construction of economic function, residential function, environmental function and psychological function in the construction of rural ecotourism. Through the innovation of rural ecotourism construction path, it can promote the development of rural tourism, provide jobs and promote the development of rural economy.

THE ROLE OF URBAN ENVIRONMENTAL PLANNING IN ALLEVIATING CITIZENS' PSYCHOLOGICAL PRESSURE UNDER THE PSYCHOLOGY OF ART AND DESIGN

Zhiyong Wen

School of the Arts, Hunan University of Arts and Science, Changde 415000, China

Background: In the process of social and economic development, people's pace of life is faster and faster,

and their psychological pressure is greater and greater. Many people have serious psychological problems, such as anxiety, depression and so on. When these psychological problems are not solved for a long time, it will lead to psychological diseases, damage the patient's body function, and even damage the patient's cerebral cortex, which will lead to the damage of cerebral cortex, the decline of cognitive function, and finally suffer from communication adaptability disorder.

Communication adaptability disorder is that in the process of communication, patients have language cognitive impairment due to defects in one or more cognitive functions such as working memory, self-management or executive function, which leads to the decline of patients' language communication ability, unable to accurately express their thoughts and normal communication with people. The learning, memory and life of patients with communication adaptability disorder will be affected, which reduces the quality of life of patients, increases the family economic burden of patients, and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to the patients themselves, their families and the harmonious development of society.

Urban environmental planning can provide urban residents with space for leisure, communication, entertainment, sports and other activities. At the same time, it is also a place for residents to rest and watch the scenery. It can make residents feel relaxed, physically and mentally happy, and then alleviate the negative emotions of residents. Art design psychology can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Design psychology contains many contents, including visual design, color psychology, consumer psychology, product design, environmental design, personality tendency, hierarchical demand, etc. it also involves perceptual texture and psychological effect. Based on design psychology, the study makes reasonable planning for the urban environment, alleviates the negative emotions of urban residents, achieves the effect of treating residents' communication adaptability obstacles, reduces the economic burden of patients' families, and promotes harmonious development of society.

Objective: People's pace of life is faster and faster, and their psychological pressure is greater and greater. Many urban residents suffer from communication adaptability barriers. Based on design psychology, the study makes reasonable planning for the urban environment, alleviates the negative emotions of urban residents, achieves the effect of treating residents' communication adaptability obstacles, reduces the economic burden of patients' families, and promotes harmonious development of society.

Research objects and methods: 80 patients with communication adaptability disorder were selected as the research objects in a hospital. The China Rehabilitation Research Center Aphasia Examination (CRRCAE) of China Rehabilitation Research Center was used to evaluate the degree of communication adaptation disorder, and the Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the mental health status of patients.

Study design: 80 patients were randomly divided into study group and control group with 40 people in each group. In addition to routine treatment, the patients in the study group walked for half an hour in the urban environment planned by art and design psychology every day. The control group was only treated with routine treatment. Three months later, the degree of communication adaptability disorder and mental health status of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: Before the intervention, there was no significant difference in the CRRCAE score between the two groups ($P > 0.05$). After the intervention, the CRRCAE score of the study group was significantly higher than that of the control group ($P < 0.05$), as shown in Figure 1.

Conclusions: In the process of social and economic development, people's pace of life is faster and faster, and their psychological pressure is greater and greater. Many people have serious psychological problems, such as anxiety and depression, which lead to communication adaptability disorder. Based on design psychology, the study makes reasonable planning for the urban environment, alleviates the negative emotions of urban residents, achieves the effect of treating residents' communication adaptability obstacles, reduces the economic burden of patients' families, and promotes harmonious development of society. The results showed that there was no significant difference in CRRCAE score between the two groups before the intervention ($P > 0.05$). After the intervention, the CRRCAE score of the study group was significantly higher than that of the control group ($P < 0.05$).

Figure 1. The degree of communication adaptability disorder between the two groups

GOVERNANCE LOGIC ANALYSIS OF GRASS-ROOTS SUPERVISION OF “FENGQIAO EXPERIENCE” UNDER THE BACKGROUND OF SOCIAL GOVERNANCE PSYCHOLOGY

Zhengdong Shi^{1,2} & Xuejin Hu²

¹*Institute of Education, Xiamen University, Xiamen 361005, China*

²*Business School, Shaoxing University, Shaoxing 312000, China*

Background: Social governance psychology is one of the most significant manifestations of the times when psychology undertakes social responsibility. In the process of social-psychological governance, the gap between the people’s yearning for a better life at the psychological level and the experience in actual social life, the bad psychological experience brought by unbalanced development and the bad social mentality caused by social injustice are all-important research contents of social governance psychology. Social behavior is the derivative of social psychology, and social environment is the collection of social behavior. Social psychology has a great impact on the social environment all the time. For the solution of social problems, only behavioral solutions are not enough, because social group psychology is often the guiding factor of social groups. Only managing behavioral factors without psychological factors cannot eradicate bad social phenomena. From the perspective of psychology, social governance psychology explores the psychological reaction and action law of social individuals and social groups under specific social governance policies. The governance process of social governance, a multi subject oriented decision-making process, must also take “governance from the heart” as the main governance means. “Fengqiao Experience” emphasizes the crime prevention mode of people-oriented, social participation and common promotion of social harmony, and this kind of social collective behavior must be supported by social collective psychology. Therefore, in the process of grass-roots supervision and governance, social-psychological governance should be taken as the main governance direction through institutionalization. The systematic psychological governance strategy promotes the formation of social stability and development factors, and provides an effective path for psychological governance and humanistic governance.

Objective: This study takes “Fengqiao Experience” as the guiding concept, starts with social governance psychology, actively uses the psychological development law of grass-roots people in grass-roots supervision and governance, reduces the burden of behavior governance through psychological governance, and looks for a more scientific, reasonable and integrated governance way for grass-roots supervision and governance.

Subjects and methods: This study combines analytic hierarchy process with empirical research method, starts from social governance psychology, takes “Fengqiao Experience” as the guiding ideology of grass-roots psychological governance, and sorts out a set of psychological supervision suitable for grass-roots people by analyzing the importance and focus of different governance strategies. The governance logic and strategy of grass-roots people’s psychological governance, and verify its feasibility and effectiveness through empirical analysis.

Study design: Based on the psychology of social governance, this study analyzes the psychological

supervision and psychological governance scheme of the grass-roots people around the “Fengqiao Experience”, and uses the analytic hierarchy process to give weight to the items in the scheme, so as to finally form a set of grass-roots psychological governance and supervision strategies focusing on the psychological state and psychological development route of the grass-roots people. And take the community scale as the experimental scale for empirical research to verify the effectiveness of grass-roots people’s psychological governance and supervision strategies.

Methods: In this study, excel was used to record and sort out the phenomena and problems in the experimental process.

Results: The index weights established according to social governance psychology and “Fengqiao Experience” are shown in Table 1.

Table 1. Index weight table

First level elements	First level weight	Second level elements	Second level weight
Take psychological concept management as the core of management	0.432	Take the wrong psychological concept as the main body of prevention	0.401
		Reconstruct the psychological law model of grass-roots people	0.452
		Mobilize the social and public psychology of the grass-roots people	0.371
		Grassroots psychological autonomy organization	0.284
Modularization of psychological supervision and governance	0.293	Take the psychological state of the grass-roots people as the object of intervention	0.207
		Establish a good psychological concept of grass-roots groups	0.175
		Popularize social psychological service institutions	0.363
Socialized psychological service	0.371	Set a psychological example of social responsibility	0.236
		Establish a psychological supervision mechanism for the masses	0.357

The three main levels in Table 1 are taking psychological concept management as the management core, psychological supervision and governance modularization, and socialized psychological service. These three parts basically cover the governance dimension from social psychological concept guidance to social psychological oriented behavior supervision. Among them, the transformation of psychological supervision and governance concept, as the most basic transformation means of the governance layer, has a slightly higher weight level than other dimensions.

Conclusions: This study starts from the psychology of social governance and absorbs the conceptual change brought by the “Fengqiao Experience”. On this basis, it takes the social-psychological governance and supervision of the grass-roots people as the main governance logic to build the grass-roots governance strategy system. Through the governance means from the perspective of social psychology, we can guide the social masses to standardize their own ideas and form autonomous psychology, so as to achieve the effect of crime prevention from the perspective of psychological motivation.

PATH OF IDEOLOGICAL AND POLITICAL TEACHING REFORM OF COLLEGE ENGLISH CURRICULUM UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Ping Chen

Humanity and Sociology Faculty, Taizhou Vocational & Technical College, Taizhou 318000, China

Background: Educational psychology is a branch of human learning science. It is research on the human learning process from the perspective of psychology and cognition. Through educational psychology, we can understand the individual differences and development laws of individual intellectual development,

cognitive development, behavioral motivation and behavioral emotion in the learning process. In the theory of educational psychology, learning is essentially a process in which an organism responds to external stimuli. The connection between stimulation and response is learning itself, and the tool of connection is individual psychology. In the process of responding to external stimuli, psychology adopts the way of continuous trial and error to make gradual attempts. With the progress of the attempt, the wrong response will continue to decrease, and finally the correct response will be left. In the process of students' learning, the psychological "reaction process" includes not only the learning of knowledge structure and specific skills, but also the cultivation of psychological creativity, the psychological transfer of existing knowledge, the cultivation of learning motivation and learning bias, and the cultivation of psychological morality. In the process of learning, students can not only acquire knowledge and skills, but also develop psychological morality with personalized psychological laws and personal characteristics. Therefore, we only pay attention to the traditional psychological education of students, and only pay attention to the psychological education of students. This study starts with the cultivation of students' psychological morality in learning behavior in educational psychology, combines professional English courses with psychological ideological and political education, guides students' psychological state in students' learning behavior, and helps students form positive ideological morality while forming good learning habits. Then improve students' academic performance and cultivate students' comprehensive psychological quality.

Objective: This study starts with the cultivation of psychological morality of middle school students in learning behavior in educational psychology. By combining professional English education with psychological and ideological and political education, it can not only improve students' learning effect, but also promote students to form good ideological morality.

Subjects and methods: This study combines BP neural network with importance analysis, uses BP neural network to classify the influencing factors between them, and judges its mitigation effect on college students' communication barriers by measuring the importance of factors in the implementation of ideological and political therapy.

Study design: This study uses educational psychology to explore the elements that have an important impact on the combination of the college English curriculum and ideological and political education. On this basis, it uses the characteristics of BP neural network to give connection weights to different contacts to analyze the importance of the influencing elements. Then it analyzes the factors that have a great impact on students' learning psychology and learning effect in college English course ideological and political teaching.

Methods: In this study, excel was used to count and sort out the student data.

Results: According to the differences in students' psychological gains in ideological and political teaching of college English courses, the statistical results are shown in Figure 1.

Figure 1. Harvest of English ideological and political teaching

In Figure 1, the number of students who have established the correct three concepts has reached 42, the number of students who have improved their ideological and theoretical level has reached 74, the number of students who have improved their moral cultivation has reached 71, and the number of students who have increased their ideological and political knowledge reserve has reached 57. It can be seen from the results that more students have improved their ideological and theoretical level and moral cultivation,

which is due to the role of psychological and ideological guidance in the process of English learning, while less students have established the correct three outlooks, which is due to the wide coverage of the three outlooks. The combination of English major learning and ideological and political education alone is not enough to support the overall formation of the three outlooks, It is a normal phenomenon that fewer students have obtained professional knowledge of ideological and political education, because in the combination of English major and ideological and political education, the focus of education is to provide psychological guidance to students from daily English learning, and there are few teaching contents directly facing the theory of Ideological and political education.

Conclusions: In the process of students' learning behavior, students will not only develop learning habits with personal characteristics, but also develop personal psychological morality. This study uses the theory of educational psychology, follows the students' learning psychological law, guides the students' psychological state and cultivates the students' psychological morality in the process of professional English teaching. In this way, while improving the students' academic performance, it helps the students form good behavior habits and improve the students' comprehensive ideological and political quality.

Acknowledgement: The research is supported by: Vocational and Technical Education Branch of Chinese Association for Higher Education (2021): The Reform and Practice of EPA Ideological and Political Construction in Vocational English Curriculum from Perspective of PAD Model. Grant No:21ZSGZYJYB040.

RESEARCH ON THE IMPORTANCE OF PSYCHOLOGICAL ANALYSIS TO VOCAL MUSIC SINGING TEACHING

Hongqiang Shi

Department of Opera, College of Vocal Opera, Sichuan Conservatory of Music, Chengdu 610021, China

Background: Psychology is a science that studies human behavior and psychological laws. Modern psychology believes that psychological perspectives include six aspects: biological perspective, cognitive perspective, behaviorism perspective, whole-person perspective, development perspective and social and cultural perspective. Its theoretical content involves connection theory, behaviorism theory and humanistic theory. Psychology focuses on people's cognitive activities, psychological activities, individual spiritual core and influencing factors, and guides people's behavior mechanism and psychological changes from the perspective of long-term development. Connectionist theory holds that the essence of learning is the process of "trial and error", that is, to deepen learners' understanding and mastery of learning content through the reciprocating process of "try error try again". Behaviorism theory emphasizes the key role of reinforcement in individual behavior conditions. Humanistic theory emphasizes the values within the individual and advocates respecting and caring for students. Apply psychology to the field of education, that is, in a specific educational situation, with the help of psychological theory, carry out conscious intervention and guidance according to the psychological laws and change characteristics of both teaching subjects and objects, and then carry out design improvement in curriculum design, teaching method improvement and teaching motivation guidance. Vocal music is a performing art with the human body as the "musical instrument", which needs a lot of practice under the guidance of teachers. However, due to the individual differences of students in this major and their different levels of learning ability, students have different psychological feelings and learning effects in the teaching process. Moreover, the simplification and "mode mechanization" of vocal music singing education make vocal music education ignore the grasp of students' individual and diversity characteristics, the differences of students' psychological quality and learning psychological problems, which makes it very easy to have psychological problems in the teaching process, and then affect its learning efficiency. Therefore, analyzing its importance to vocal music singing teaching with the help of psychological theory will help teachers to further understand teaching activities on the basis of grasping the interaction between both sides of teaching, carry out targeted education according to students' individual differences and psychological change characteristics, pay attention to their main characteristics, and then achieve the teaching goal of improving their psychological problems and teaching quality.

Objective: The teaching process of vocal music singing is to constantly understand and learn on the basis of vocal simulation practice, so as to master the internal mechanism and law of singing skills. However, due to the differences in learning ability and learning process, vocal music students will unconsciously produce negative emotions and psychological problems such as self-doubt, negation and anxiety. In order to improve the psychological and emotional problems of vocal music students and improve their learning quality and

effect, this paper analyzes the vocal music singing teaching process with the help of psychological theory and actively intervenes it.

Research objects and methods: The research takes the students with learning and psychological barriers in the major of vocal music singing in a university as the research object. Firstly, the data of students' learning status and psychological problems are collected, and then the vocal music singing teaching mode is innovated and reformed, that is, the theory of psychology is used to promote teachers' attention to students' learning motivation and psychological problems in the teaching process guide and intervene, and test the teaching effect and students' psychological changes with the improved teaching model.

Method design: Firstly, the information collection and grade evaluation of students' learning psychological obstacles and psychological problems are carried out, and then the influencing factors of students' psychological problems are analyzed with the help of principal component analysis. On this basis, targeted teaching reform is carried out. The optimized vocal music singing teaching mode is applied to classroom practice. The experimental time is three months. After the experiment, the experimental data are statistically processed by statistical analysis tools.

Methods: Principal component analysis was used to analyze the classroom influencing factors affecting students' psychological problems, and the innovative vocal music singing teaching mode was used to analyze the improvement of classroom teaching under the guidance of psychological theory on students' learning status and psychological problems.

Results: The psychological perspective can effectively guide teachers to grasp the characteristics of the teaching process and the psychological law of students, pay attention to the behavior characteristics of students, and improve the teaching quality with the help of multi-means and multi-way teaching methods, so as to improve students' psychological problems and improve their mental health level and professional ability. Table 1 shows the score statistics of students in different performance dimensions before the improvement of classroom teaching mode.

Table 1. Statistics of students' scores in different performance dimensions before the improvement of classroom teaching mode

Dimension	Mean	SD
Learning negative mentality	4.315	0.639
Memory loss	3.761	0.831
Self cognitive efficacy	2.288	0.539
Anxiety Psychology	4.253	0.678

Conclusions: The application of psychological theory to vocal music singing teaching can enable teachers to carry out different degrees of intervention according to different learners' professional conditions and psychological change characteristics, so as to improve their learning motivation and learning enthusiasm and strengthen humanistic care for students. The integration of psychology and education helps to deepen teachers' cognition of teaching activities and teaching subjects, improve students' psychological problems and improve teaching quality.

ON THE TEACHING REFORM METHODS OF VOCAL MUSIC PERFORMANCE UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Yuzhu Lian

Chinese Opera Academy, Henan Vocational Institute of Arts, Zhengzhou 450000, China

Background: Educational psychology is a branch discipline combining psychological theory with the field of education, that is, in the teaching process and teaching situation, it actively intervenes in the teaching process, teaching subject and object, educational psychology, and effectively guides and intervenes on the premise of meeting students' learning needs. Educational psychology can develop many special fields to study educational problems, which can be applied to curriculum design, teaching method improvement and teaching motivation guidance, help students deal with difficulties and challenges in life and learning, and emphasize students' subjective status and teaching laws. Educational psychology provides a psychological scientific basis for the setting of diversified courses. It can effectively guide teachers to innovate and

improve teaching methods, teaching means and teaching schemes, including the relationship between students' personality development and educational environment, ability development and knowledge learning. Research on the relationship between social development and standardized learning, as well as the regularity between the effectiveness of teaching and talent training. Each school of pedagogy in history has established its own theoretical system directly based on the corresponding psychological views. Teaching is a process of interaction between teachers and students, and its essence is the choice of methods. On the basis of analyzing the psychological characteristics of teachers and students, choosing different teaching methods can achieve different teaching effects, and different psychological characteristics and goal orientation will lead to students' different attitudes and enthusiasm towards learning. Under the current background of vocal music teaching reform, due to the lack of clear goal orientation, single and backward talent training mode and the neglect of the attention to the practical ability of students majoring in vocal music performance, students are prone to psychological burden and psychological problems under the influence of many factors, which will affect the improvement of their learning quality and professional ability. In the teaching process, teachers do not take into account the differences between individual students, but only use the "standardized" training mode for teaching, which makes the teaching effect deviate from the students' psychological needs, resulting in negative emotions and psychological problems, affecting their learning and living standards. Therefore, from the perspective of educational psychology, we should improve the teaching quality from the aspects of the design of teaching content, the selection of teaching resources and the evaluation of teaching mode, in order to pay full attention to the needs and psychological change characteristics of students and realize the all-round and healthy development of students.

Objective: With the help of educational psychology, this paper analyzes the problems existing in the current course teaching of vocal music performance specialty and the psychological characteristics of students, applies multi-channel and multi-means to the innovation of teaching content, teaching resources and teaching means, realizes the renewal of teaching concept and the reform of teaching structure of vocal music performance specialty, and then realizes the personalized teaching of vocal music specialty students. Pay attention to their psychological problems and emotional difficulties in the teaching process, and alleviate their negative emotions.

Research objects and methods: The research takes the students majoring in vocal music performance in a university as the research object, evaluates their teaching status and psychological status, integrates the psychological theory into the teaching classroom, realizes the innovation and improvement of the original vocal music performance teaching classroom, and intervenes the improved teaching model to the research object. Explore the changes of students' psychological needs and the mitigation of psychological problems in the teaching process, so as to reduce their negative emotions caused by professional problems.

Method design: With the help of principal component analysis, the factors affecting the teaching effect are analyzed, and then the vocal music performance teaching classroom is innovated and optimized. The new model is constructed to collect the learning needs, psychological laws and changes of psychological problems of the experimental subjects within three months, and make statistical analysis of the data to obtain the experimental results.

Methods: SPSS23.0 analysis tool to process the experimental data, extract the influencing factors with principal component analysis, and test its intervention mechanism on students' psychological problems with the new vocal music performance teaching classroom optimization model.

Figure 1. Statistics of scores of students' psychological and emotional changes before and after the experiment

Results: Educational psychology can effectively grasp the teaching needs and psychological characteristics of both sides in the teaching process, guide teachers to optimize teaching courses according to students' psychological needs and problems, and then improve students' professional quality and ability and help them solve psychological problems, make them learn with a more positive attitude.

Conclusions: Educational psychology can provide theoretical basis for classroom teaching, enable teachers to teach students according to their aptitude, teach without category, and fully mobilize students' enthusiasm and initiative to participate in the classroom on the basis of grasping the psychological law and teaching law of teaching subject and object. At the same time, integrating teaching psychology into curriculum teaching reform can pay more attention to students' psychological changes and needs, and then enlighten students' negative emotions with the help of teaching means. Make it look at the changes of itself and surrounding things more objectively and comprehensively, and improve the level of mental health.

THE INFLUENCE OF LANGUAGE ART EXPRESSION ON ALLEVIATING AUDIENCE MENTAL ANXIETY IN NEWS COMMUNICATION

Yuanyuan Sun

Office of Academic Affairs, Shangqiu Polytechnic, Shangqiu 476000, China

Background: The main feature of mental anxiety is anxiety, which will produce anxiety without basis and origin, and there is no clear objective object and specific content. In addition to anxiety, individuals with mental anxiety will also have fear and anxiety, muscle tension, autonomic nerve symptoms and other physiological reactions. According to different classification methods, the types of mental anxiety are different. According to the time of symptom onset, it can be divided into acute anxiety and chronic anxiety. Acute anxiety often occurs at night, with panic attacks. Individuals will have physiological symptoms such as tachycardia and dyspnea. In severe cases, there will be limb weights, numbness around the mouth and so on. Chronic anxiety usually appears panic, fatigue and neuroticism, sometimes accompanied by physiological symptoms such as cold sweat, nausea and urgent urination. This kind of anxiety is similar to neurasthenia and needs careful judgment. In addition, according to the characteristics of symptoms, mental anxiety can be divided into two types: generalized anxiety and panic attack. In generalized anxiety, individuals will be nervous without certain objects, and show excessive worry or worry about some problems in real life, and this anxiety has the characteristics of regularity and persistence. Terrorist attacks are repeated strong panic, and you will feel out of control.

In the fast-paced life, people's pressure gradually increases. For a long time, under various pressure environments, many people have mental anxiety, especially generalized anxiety. People are only in a state of anxiety, but they can't tell why they are anxious. The news has changed from a humorous language to a more entertaining language, which has attracted the audience's attention and increased the artistic expression of the news. Let the audience feel a lot of fun when watching some social news, make people laugh unconsciously, feel relaxed, forget the troubles in real life, and deepen people's memory of those social news. According to the characteristics of language art expression in news communication, this paper studies the influence of language art expression in news communication on alleviating audience mental anxiety.

Objective: To analyze and study the characteristics of language art expression in news communication, study its specific impact on the audience's mental anxiety, and on this basis, put forward relevant suggestions on news communication, increase the diversity and novelty of language art expression in news communication, attract the audience's attention and alleviate the audience's mental anxiety. Increasing the interaction between the program and the audience, improve the enthusiasm of the audience to watch relevant news programs, so as to further alleviate the mental anxiety of the audience.

Research objects and methods: The research object is college students. Using data mining technology, 200 college students with mental anxiety are mined from the mental health database of a university. The 200 students were divided into normal group (66), traditional news group (67) and new news group (67). During the experiment, the normal group conducted general teaching. The traditional news group and the new news group watched 45 minutes of news on the basis of general teaching. The news of the traditional news group and the reform news group adopted the traditional news communication mode and the innovative news communication mode respectively, and watched once a week for 3 months. During the experiment, relevant data were recorded and analyzed by SAS software. The influence of specific factors was quantified by 1-5 grades. The higher the score, the greater the impact. The impact of language art

expression in news communication on alleviating audience mental anxiety was studied.

Results: People are in an environment full of all kinds of pressure. Mental anxiety is a psychological problem in the process of life and work, which will seriously attack people's curiosity and enthusiasm for things. In order to attract the attention of more viewers and stimulate their desire to continue watching, the language of news communication has changed, and the artistic expression characteristics of diversity, novelty and readability have emerged. In the process of watching news, people can temporarily forget the troubles in life, feel the joy brought by the new news, and alleviate their mental anxiety imperceptibly. In the new newsgroup, freshmen believe that the impact of the novelty of language art expression on mental anxiety is 5 points, and the relevant impact scores are shown in Table 1.

Table 1. The influence of language art expression on mental anxiety of college students in different grades in news communication

Grade	Diversity	Novelty	Readability
Freshman	4	5	4
Sophomore	4	4	5
Junior	5	4	5

Conclusions: By increasing the diversity, novelty and readability of language art expression in news communication, the audience can relax their body and mind, obtain joy and laughter, and imperceptibly alleviate the audience's mental anxiety.

ANALYSIS OF IDEOLOGICAL AND POLITICAL PSYCHOLOGICAL QUALITY OF POOR COLLEGE STUDENTS AND RESEARCH ON EDUCATIONAL COUNTERMEASURES

Hui Deng

Principal's Office, Hezhou University, Hezhou 542899, China

Background: The state carries out continuous educational system reform, attaches importance to the family economic status of poor students, and implements economic assistance measures. In this assistance process, colleges and universities ignore the ideological, political and psychological quality education of poor students. Their ideological, political and psychological quality has appeared in varying degrees, affecting the life of poor students and the healthy development of their body and mind. Poor students in colleges and universities are those who enjoy state subsidies from families with financial difficulties. Due to the influence of family economic environment, poor college students have difficulties in maintaining their life and learning. In this environment, poor college students are prone to different degrees of psychological and ideological and political problems. Without corresponding intervention, poor college students will even have extreme thoughts. The psychological and ideological and political problems of poor college students are manifested in seven aspects: ideological and political trend, lack of sense of responsibility, lack of self-confidence, lack of healthy psychology and so on. In the ideological and political trend, some poor students have a vague understanding of the relationship between the state, nationality and individual. Some poor students lack group consciousness and pay more attention to their own interests. Some poor students are unwilling to assume their responsibilities, afraid of hard work, do not want to engage in some work study work, and are perfunctory in their work attitude. When facing difficulties, some poor students will lack self-confidence and courage to solve problems. Dare not show their own advantages on the relevant self-display platform, and have the psychology of timidity and inferiority. Use the Internet, alcoholism and other negative ways to escape the outside world and indulge in it.

Objective: To understand the current system implementation of poor students in colleges and universities, study the psychological and ideological and political problems of poor students in colleges and universities, and put forward relevant educational countermeasures according to the existing problems. The government should play a leading role in the education of poor students. While adhering to the subsidy policy, it also needs to adjust the investment in combination with the actual situation of different regions. Create a good social atmosphere so that poor students can have fair employment opportunities in an unbiased society. The school has a comprehensive understanding of the family situation and learning situation of different poor students, carries out targeted education, improves the effect of education, and timely and effectively helps those poor students in active ideological and political education. In the process

of education, we should pay attention to the combination of education and education, strengthen the mental health education of poor students, and take relevant countermeasures such as strengthening the construction of educational environment. Through a series of countermeasures, we can improve the physical and mental health level of poor college students, improve their ideological and political quality, and cultivate and exercise the spirit of self-improvement and self-reliance.

Research objects and methods: The research objects are poor students in colleges and universities. 320 poor students are randomly selected from five colleges and universities. These poor students come from different grades, majors and nationalities, and their family economic situation is different. Carry out the ideological and political education for these poor students after the reform for one semester, record the relevant data during the experiment, and analyze the impact of these ideological and political education countermeasures on the ideological and political psychological quality of poor students in colleges and universities through the principal component analysis method. The quantitative score of the relevant impact adopts grade 1-5 and SPSS21.0 software to process the relevant experimental data.

Results: When providing financial assistance to poor students, colleges and universities ignored the importance of ideological and political education to poor students, resulting in different problems in their ideological and political quality, did not promote their own development, and the effect of financial assistance did not reach the expected effect. Carry out targeted education according to the ideological, political and psychological quality problems of poor students. In the score of the impact of relevant educational countermeasures on the ideological, political and psychological quality of poor students, the impact score of freshman poor students on the combination of helping the poor and educating people is 5, which is the same as that on strengthening mental health education. The relevant results are shown in Table 1.

Table 1. The influence of ideological and political education countermeasures on the ideological and political psychological quality of poor college students

Grade	Combination of poverty relief and education	Strengthen mental health education	Give full play to the dominant position of poor students
Freshman	5	5	4
Sophomore	4	5	4
Junior	5	4	5

Conclusions: There are some ideological and political psychological problems in poverty-stricken colleges and universities, such as lack of self-confidence, lack of sense of responsibility, lack of gratitude and so on. The improvement of ideological and political education is carried out from the five aspects of government, society, schools, families and poor students. Among them, the school ideological and political education occupies an important position. After the implementation of various improvement measures of ideological and political education, the ideological and political psychological quality of poor students is significantly improved, and they become confident and know how to be grateful.

PSYCHOLOGICAL COUNSELING EFFECT OF IDEOLOGICAL AND POLITICAL COURSE EDUCATION ON STUDENTS WITH WILL DISORDER IN COLLEGES AND UNIVERSITIES

Jian Shen

Guangdong Innovative Technical College, Dongguan 523960, China

Background: Will disorder indicates that there is an abnormality in will. Will disorder includes six kinds of will disorder: will enhancement, will weakening, will lack, intention reversal, compulsive intention and contradictory intention. Will enhancement mean that an individual has morbid self-confidence and is very stubborn to do something. The relevant will activities increase, the willpower of the individual is significantly enhanced, and the relevant pathological symptoms are the manic state of the individual. On the contrary to the symptoms of will enhancement, the individual has significantly less relevant will activities, is not interested in the surrounding things, and the individual shows a significant decline in will power, such as depression. The meaning of will deficiency is similar to that of will weakening, but the symptoms of will deficiency are more serious than that of will weakening. Individuals are not interested in the things around them, have no motivation to live, and lack of will, showing a state of no desire.

Individuals with wrong will act contrary to ordinary people. It is difficult for ordinary people to understand their way of thinking and related ideas. The symptoms of wrong will include hurting themselves, eating feces and so on. In forced will, individuals will have some inner impulse to do something beyond their own heart. This impulse is very strong, such as the impulse to self-mutilate. Contradictory intention means that individuals produce two different, contradictory and opposite will activities for one thing at the same time. For example, patients with schizophrenia will show contradictory will.

In colleges and universities, some students will suffer from will disorder, in which their will is weakened, they are not interested in learning, life and other things, they have exclusion psychology for interpersonal communication, their mood will be relatively low, their will activities will be significantly reduced, the relevant will power is significantly weakened, and they have exclusion psychology for the acceptance of things. For example, in the teaching of boring and single courses, the symptoms of students' weakening of will are more obvious, and the education methods without new ideas are difficult to arouse their interest in learning. The ideological and political course education in colleges and universities pays attention to students' emotion and will, which can regulate students' emotion and dredge students' psychological problems. According to the role of ideological and political education in colleges and universities, it is applied to the students with will disorder to study its psychological counseling effect on the students with will disorder.

Objective: To understand and analyze the performance of will disorder of college students, analyze the application of ideological and political course education in mental health, and adjust the ideological and political course education according to the characteristics of will disorder students. In the course of ideological and political education in colleges and universities, through a comprehensive understanding of the cognition, will, thinking and emotion of students with will disorder, treat them with an equal attitude, pay attention to their relevant needs, understand them, talk with a friendly tone, stimulate their positive emotional experience and enhance their will power. Through relevant social practice activities, let the students with will disorder have an in-depth understanding of the actual situation of the society, enhance their moral emotion, promote the increase of their will activities and will power, and produce the idea of slowly integrating into the collective and socializing. Carry out ideological and political course education in combination with professional ideals, stimulate their learning motivation and further enhance students' willpower. Through the combination of excellent culture and education, practice and theory, cultivate students' correct values, improve their psychological quality and alleviate students' will obstacles.

Research objects and methods: The research objects were college students with willpower disorder. 240 students with willpower disorder were randomly selected from a university to understand their learning and living conditions, personal information, attitude towards college education and ideological and political course education, and record the relevant data. Through the principal component analysis, this paper studies the psychological counseling effect of college ideological and political course education on students with will disorder, analyzes the impact of college ideological and political course education on students with will disorder, quantifies the relevant factors, adopts grades 0-4, and uses SAS software to process the relevant data.

Results: Some students in colleges and universities have the symptoms of weakened will, cannot be interested in things, have weak willpower in the face of difficulties, it is difficult to stick to it, and the whole person is relatively depressed. After ideological and political education, students' will obstacles are alleviated, their learning enthusiasm is significantly improved, their will power is enhanced, and they don't shrink back in the face of difficulties. In the evaluation of the impact of ideological and political education on students will disorder in colleges and universities, social practice activities have the greatest impact on mathematics majors will disorder, with a score of 4 points. See Table 1 for the specific results.

Table 1. The influence of ideological and political curriculum obstacles on students' will education in colleges and universities

Major	Social practice activities	Enrich the spare time life of college students	Combination of theory and practice
Mathematics major	4	3	4
Chinese literature major	4	4	4
Business English major	3	4	3

Conclusions: Through the ideological and political course education in colleges and universities, the psychological counseling for the students with will disorder can significantly alleviate the students will disorder and improve the students' learning enthusiasm.

* * * * *

THE PROMOTING AND GUIDING ROLE OF IDEOLOGICAL AND POLITICAL TEACHING IN COLLEGES AND UNIVERSITIES IN CULTIVATING STUDENTS' MENTAL HEALTH

Xinjuan Ma & Aikui Tian

School of Computer Science and Technology, Shandong University of Technology, Zibo 255049, China

Background: With the rapid development of economy, people's pace of life is getting faster and faster. Various pressures such as life and study are coming, which has a certain impact on the physical and mental health of college students. The negative emotions such as anxiety, depression, tension and anxiety are sometimes accompanied by physiological symptoms such as palpitation, dizziness and headache, which affect the study and life of college students, reduce their quality of life. In addition to the external environment will have an impact on college students' physical and mental health, college students' personal personality characteristics will also affect the development of college students' physical and mental health. For example, people with sensitive personality are more likely to be disturbed by the external environment, resulting in emotional fluctuations and psychological emotions such as anxiety and uneasiness. In addition, college students are in a special stage of physical and mental development, their physiological and psychological conditions are not fully mature, and their three views have not been fully finalized. If the outside world has a negative impact on college students, it will be detrimental to the good development of college students' physical and mental health.

Ideological and political teaching in colleges and universities can guide college students' three outlooks and help them establish a correct outlook on life and world outlook. It is an important means of college students' three outlooks education and occupies an important position in the development of college students' physical and mental health. The important content of ideological and political teaching in colleges and universities is psychological counseling for college students. In the psychological guidance of physical and mental health, psychological counseling is used to strengthen students' psychological pressure resistance. In the process of psychological guidance, teachers should respect students' privacy, not force students to say something they don't want to say, and reduce students' psychological defense in a relaxed and pleasant atmosphere, so as to open students' hearts and express themselves. In the process of psychological guidance of ideological and political teaching, the form of traditional language indoctrination should be changed. Enrich the class mode and language expression, let students accept psychological guidance services in the process of philosophical and political language expression, reduce their psychological preparedness, actively accept the psychological guidance of ideological and political teaching, and cultivate students' healthy psychology.

Objective: To understand the current physical and mental health status of college students and analyze the specific application contents of psychological guiding factors of ideological and political education in colleges and universities. On this basis, this psychological guidance of ideological and political teaching is applied to the psychological cultivation of students' physical and mental health. According to the situation of students, corresponding psychological guidance is provided, and relevant courses are taught to create a good psychological education atmosphere, let students actively participate in relevant psychological guidance activities, and promote the cultivation of students' physical and mental health. Improve the accuracy of effective ideological and political education evaluation, and conduct a questionnaire survey on college students' mental health. According to the students' answers, analyze the students' psychological situation and make an accurate evaluation. Strengthen the construction of psychological guidance teachers, improve the teaching quality of teachers, increase the richness of their teaching experience, and ensure the overall quality of teachers through regular professional training. Increase the diversity of psychological education activities and let students choose extracurricular activities, so as to improve students' active participation. In psychological education activities, change their wrong views and adjust their psychological state, so as to promote students' physical and mental health and psychological development.

Research objects and methods: The research objects were college students. 100 college students were randomly selected from a university to understand their physical and mental health, learning status, interpersonal relationship, attitude towards ideological and political education and psychological education activities, and record relevant data. Through cluster analysis, this paper studies the promoting and guiding role of ideological and political teaching in colleges and universities in cultivating students' physical and mental health. The higher the score, the greater the degree. The data processing software adopts SAS software.

Results: College students' physical and mental health and psychological development are the focus of school education. Influenced by the external environment and individual characteristics, college students' physical and mental health has different problems, and different types of negative emotions have appeared in learning, interpersonal relationship, employment and so on. In order to cultivate college students' mental and physical health, we should make use of the psychological guidance and promotion of ideological

and political education in colleges and universities to provide psychological guidance services for college students' new life, encourage college students to actively participate in relevant psychological education activities, improve their stress resistance and improve their psychological status. In the promotion and guidance of ideological and political teaching in colleges and universities on cultivating students' mental and physical health, the promotion score of psychological guidance service on the cultivation of sophomore students' mental and physical health is 4 points. See Table 1 for the specific results.

Table 1. The promoting and guiding role of ideological and political teaching in colleges and universities in cultivating students' mental health

Grade	Psychological guidance service	Strengthen the construction of psychological guidance teachers	Psychological education activities
Freshman	4	4	3
Sophomore	4	3	3
Junior	3	4	4

Conclusions: The cultivation of college students' mental health is inseparable from the psychological guidance of ideological and political education in colleges and universities. Teachers should pay attention to the role of psychological guidance in effective ideological and political teaching. Teach students according to their aptitude, respect and understand students, and promote the cultivation and development of students' physical and mental health.

REFLECTIONS ON THE MODE OF INTEGRATING MENTAL HEALTH EDUCATION INTO COLLEGE STUDENT MANAGEMENT

Yibin Huang, Anran Zhang & Qingyue Yang

Institute of Marxism, Jiangxi University of Chinese Medicine, Nanchang 330004, China

Background: College teachers pay more attention to college students' mental health problems. Through the analysis of the root causes of college students' mental health problems, it is found that there are three reasons for mental health problems, namely environmental changes, interpersonal imbalance and excessive pressure on learning and employment. For freshmen, especially those only child college students, after entering colleges and universities, they are separated from the care of their parents. Due to their poor self-care ability and weak adaptability to the new environment, they feel it is difficult to adapt to the changing learning environment, which has brought a lot of impact to their psychology. And the one-child college students are spoiled by their parents since childhood. They have a strong sense of self-awareness and lack relevant skills and experience in interpersonal communication. Facing students with different living habits, they will conflict because of differences in living habits, so they feel pain and depression in the process of communication, which affects their mental health development. In addition, the great pressure brought by learning and employment makes them mentally tense and have psychological abnormalities, resulting in mental health problems.

Popularize relevant mental health knowledge through mental health education, help students establish mental health awareness, understand their own psychological abnormalities, let students adjust their emotions in the process of using psychological adjustment methods, promote the normal development of students' learning and interpersonal communication, and improve their social adaptability. However, although college mental health education has a full understanding of students' mental health problems, formulated relevant educational action plans and carried out the teaching of mental health education courses, the practical effect of mental health education is not satisfactory. In the process of mental health education, there is a lack of teachers specialized in mental health education, which is usually taught by political teachers or counselors. Psychological counseling and treatment are different from general ideological and political education. This difference will affect the effect of students' psychological counseling and is not conducive to the development of students' mental health. From this point of view, mental health education has not been fully incorporated into the curriculum system of colleges and universities, the relevant teaching modes are relatively backward and not innovative, and the effect of counseling students' psychological problems is not good. The contents of the teaching courses are boring, and the teachers' teaching attitude is perfunctory, which cannot stimulate the students' interest in

learning.

Objective: To analyze the causes of college students' mental health, study the current situation of college mental health education, explore the mode of integrating mental health education into college students' management, reform the mode of college students' management, adhere to the people-oriented management concept, and look at students' management from the perspective of development. On the basis of paying attention to the individual needs of students, guide students' self-exploration and self-regulation, so as to help college students understand themselves, understand their mental health problems and self-regulation. Carry out hierarchical management according to the characteristics of students, and improve the working effect of college student management through service-oriented management mode. By deepening the level of management and project-based management, we can promote the effective development of college students' management, reduce college students' mental health problems and improve college students' mental health level.

Research objects and methods: The research objects were college students, and 400 students were randomly selected from a university. These students come from different majors, have different mental health problems, and the children of their families are different. To understand the mental health status of college students, students' current student management and mental health education

Through the fuzzy evaluation method, the impact of the mode of college student management on college students' mental health problems after the reform is evaluated. The relevant influencing factors are quantified by 1-5 grades. The higher the score, the greater the impact. The SAS software is used for data processing and analysis.

Results: Influenced by three main factors: environmental change, interpersonal imbalance and excessive pressure on learning and employment, college students have different mental health problems, especially those with only child are more likely to have mental health problems. In order to solve the mental health problems of college students, integrate mental health education into the management mode of college students, reform the previous management mode of service-oriented management, deep-level management and project-based management, respect the individual needs of students, and carry out hierarchical management according to the characteristics of students, so as to make college students aware of their own psychological problems, Improve the level of mental health in self-regulation. In the evaluation of the impact of the management mode of college students on the mental health problems of college students after the reform, the score of the impact of service-oriented management on the mental health problems of freshmen is 4 points. The relevant results are shown in Table 1.

Table 1. The influence of college students' management mode on college students' mental health after reform

Grade	Service management	Deep management	Project management
Freshman	4	5	4
Sophomore	5	4	5
Junior	4	5	5

Conclusions: In view of the mental health problems of different college students, mental health education should be integrated into the mode of college student management. Under the people-oriented management concept, we should carry out targeted and hierarchical comprehensive management for college students, so as to reduce their mental health problems and improve their adaptability.

* * * * *

ON THE CHANGE OF GENDER CONCEPT OF MEN AND WOMEN IN ETHNIC MINORITIES FROM THE PERSPECTIVE OF NATIONAL TRADITIONAL CULTURAL PSYCHOLOGY

Yingfeng Deng

College of Foreign Languages, Guangxi Normal University for Nationalities, Chongzuo 532200, China

Background: National psychology is the sum of personality, emotion, hobbies, habits and other psychological characteristics formed by a nation in the long-term historical development. This is one of the characteristics of human society. The psychological state of national cultural characteristics is condensed in the formation and development of all nationalities. Through the national material and cultural

characteristics, such as architecture, clothing, language art and so on. Some are formed on the basis of national common region, common economic life and historical development. They are closely related to religious beliefs and become important factors to maintain all ethnic groups. With the changes of material living conditions and social environment, national character, emotion and hobbies have also changed. Mainly in the following aspects: first, national consciousness. It refers to people's identification with their own nation, that is, the understanding and understanding of their own nation's social status, national interests and the relationship with other nations. It resonates with members of the country in emotion, attitude and intention. Second, national feelings. It refers to a person's emotional response to the actual situation of his own country and the relationship between countries, expressed as love and hate for his own country or other countries. Third, ethnocentrism. It refers to measuring and assessing the tendencies of other nationalities according to their nationality. Fourth, national character. It is a concentrated reflection of the typical characteristics of a nation. Fifth, national stereotypes. It refers to a fixed view of a country, which is often biased and negative towards other countries. Therefore, it often becomes an obstacle to mutual understanding between countries or the root of ethnic disputes. In short, national psychology always changes with the changes of social environment and national relations. National psychology is closely related to the national economic life, cultural life, cultural level and the understanding of the external environment. As a reflection of the national spirit, the common psychological quality in the national psychology unites a nation and makes all kinds of thoughts and behaviors of the society composed of this nation consistent. National psychology is one of the most stable factors in national composition. In the contact and collision of different types of national cultures, national psychology is like an invisible barrier and psychological fortress, which plays the role of filtering and isolation. Due to the historical differences between Chinese Han and ethnic minorities in politics, economy, culture and education level, the relationship between national psychological problems in China is more profound. The psychological identity and emotional experience of ethnic minorities are significantly different from those of Han nationality. When human society still exists and develops in the form of nationality, it is difficult for different nationalities to have the same value scale, concept, emotional tendency, temperament and personality.

In the long history of development, the Chinese nation has accumulated and formed its own unique and great national character and spirit. The basic spirit of Chinese culture is characterized by constant self-improvement, noble morality, vigilance in times of peace, happiness and contentment, and advocating etiquette. The core and essence of Chinese culture lies in "harmony". In addition, China is a multi-ethnic country. Each nation not only has different levels of social development and socio-economic structure, but also has significant differences in values, religious beliefs, customs and psychological characteristics. Nowadays, China has basically achieved equality between men and women. Women are no longer the appendage of men. They have the opportunity to fully develop their personal talents and personal freedom. However, the phenomenon of preference for boys over girls still exists in ethnic minority areas, forming a thinking stereotype: men have the natural advantage of sociality. Even in some ethnic minority areas, in order to have a boy, they continue to have children regardless of their affordability until they have a boy. It can be said that for ethnic minority areas, forming a correct gender concept of men and women and completely changing this idea still face great challenges.

Objective: In order to get rid of the patriarchal phenomenon in China's ethnic minority areas, this paper constructs an intervention model based on national traditional cultural psychology, which aims to promote the formation of correct gender concepts in China's ethnic minority areas through the infiltration and integration of excellent national traditional cultural psychology.

Research objects and methods: 100 residents in ethnic minority areas were selected as the research object. Through questionnaire survey, the problem of preference for boys and girls among residents in ethnic minority areas was obtained. 0-3 points were not preference for boys, 4-6 points were preference for boys, and 7-10 points were very preference for boys and girls. Then carry out intervention based on national traditional cultural psychology for half a year. The improvement of son preference among residents in ethnic minority areas before and after the intervention was compared and analyzed.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the improvement of son preference among residents in ethnic minority areas before and after the intervention. It can be seen from Table 1 that compared with before the intervention, after the psychological intervention based on national traditional culture, the problem of preference for boys among residents in ethnic minority areas has been improved, with statistical difference ($P < 0.05$).

Table 1. Improvement of patriarchal preference of residents in ethnic minority areas before and after the intervention ($n=100$)

Factor	Before intervention	After intervention	<i>P</i>
Value the male child only	7	2	0.00

Conclusions: With the process of urbanization, the preference of men over women has gradually withdrawn from the mainstream. However, there is still the problem of emphasizing men over women in some ethnic minority areas. In order to completely change this concept, we still need to actively realize the infiltration and integration of excellent national traditional culture, so as to promote the formation of correct gender concepts in ethnic minority areas of our country.

GUIDING EFFECT OF SOCIAL PSYCHOLOGY ON COLLEGE STUDENTS’ IDEOLOGICAL AND POLITICAL EDUCATION

Nan Wang

Office of Student Affairs, Chifeng University, Chifeng 024000, China

Background: Social psychology is committed to understanding and explaining how individual thoughts, emotions and behaviors are affected by reality, imagination and implicit social existence. Social psychology is an experimental study on social promotion or social encouragement. Only by introducing the experimental process into the research of human social psychology and social behavior can it mark the formal birth of modern social psychology. The core topic of social psychology is the relationship between attitude and behavior. The main variables of its theoretical framework include: behavior attitude, subjective norms, perceived behavior control and behavior intention. According to the theory of planned behavior, the more positive attitude and subjective norms are, the stronger perceived behavior control is, and the stronger the individual’s intention to consider executive behavior is. Social psychology mainly studies people’s social support and personality traits. It is a discipline that emphasizes research to make life more valuable and meaningful. As a compound concept, social support is a multi-dimensional concept that includes both individual internal cognitive factors and environmental factors. The research on social support mainly focuses on three aspects: one is the material support that individual feel and given by others. The second is the cognitive support in the subjective sense, mainly the emotional resonance and other support felt by the individual. The third is the individual’s cognition and evaluation of the social support they receive, which tends to the degree of acceptance and subjective understanding of the individual’s inner support for others. In the study of the influencing factors of social support, it is found that mental health is a broad factor affecting social support, and the two affect each other. Social support has a certain impact on individual physical and mental health. The good social support received by individuals is conducive to the development of individual physical and mental health, while the existence of adverse social relations damages individual physical and mental health. In short, social psychology is a subject that studies the psychological and behavioral development of individuals and groups in social communication. Social psychology is a main branch of psychology, which aims to study the psychological problems related to society.

The opinions on further strengthening and improving college students’ ideological and political education issued by the CPC Central Committee and the State Council pointed out that we should pay attention to mental health education. According to the characteristics of college students’ physical and mental development and the law of education, we should pay attention to cultivating college students’ good psychological quality and the fine qualities of self-esteem, self-love, self-discipline and self-improvement, so as to improve their ability to overcome difficulties. Therefore, colleges and universities should strengthen the exploration and research on the management system of college students’ mental health education in order to promote the all-round development of college students’ quality. At present, foreign countries have basically formed a relatively perfect mental health education system, with highly specialized talents, which has been incorporated into school education. The development of mental health education in China is in the ascendant. Experts and scholars have explored new ways and methods of college students’ mental health education from different angles. China should learn from foreign advanced experience, explore a mental health education management system suitable for China’s national conditions and the characteristics of college students, and realize the development from psychological medical system to

psychological education management system. In view of this, this paper explores the guiding role of social psychology in college students' ideological and political education, and expands the educational object from students with psychological barriers to all students, so as to promote the development of college students' mental health education and ensure the scientization, standardization and systematization of modern ideological and political education.

Objective: To explore the guiding role of social psychology in modern ideological and political education, in order to solve the common mental health problems of modern college students, so as to ensure the scientization, standardization and systematization of modern ideological and political education.

Research objects and methods: 500 ideological and political students in our school were randomly divided into control group and experimental group, with 250 students in each group. The mental health problems of college students were measured with the mental health Self-Rating Scale (SCL-90), which includes 10 factors such as somatization, interpersonal sensitivity, depression, paranoia and anxiety. Each factor item is evaluated with a five-level scoring standard of 1-5 points. Among them, the control group adopted the conventional ideological and political teaching mode, and the experimental group implemented the ideological and political teaching mode based on social psychology for 6 months. The changes of mental health of college students in the two groups were compared and analyzed.

Methods: SPSS22.0 statistical software was used to analyze the data.

Results: Table 1 shows the changes of mental health of college students in the two groups after the implementation of the ideological and political teaching mode of social psychology. As shown in Table 1, compared with the control group adopting the conventional teaching mode, after the implementation of the social psychology ideological and political teaching mode, the improvement of students' mental health in the experimental group is more significant, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. Changes of mental health status of college students in the two groups after 6 months of intervention ($n=500$)

Project	Control group ($n=250$)	Experience group ($n=250$)	<i>P</i>
Somatization	2.35	1.28	0.00
Obsession	2.03	1.85	0.00
Sensitive	2.85	1.70	0.00
Depressed	2.65	1.51	0.00
Anxious	2.55	1.40	0.00
Hostile	2.51	1.45	0.00
Fear	2.43	1.32	0.00
Paranoid	2.61	1.53	0.00
Psychotic	2.56	1.44	0.00
Ad-items	2.55	1.47	0.00
Total score	138.12	125.23	0.00

Conclusions: College ideological and political education based on social psychology can not only significantly improve the mental health of modern college students, but also effectively improve the psychological development of modern college students, and then play a positive guiding role in college students' ideological and political education.

* * * * *

A STUDY ON THE APPLICATION OF MULTIPLE INTERACTIVE ENGLISH TEACHING IN STUDENTS' COGNITIVE PSYCHOLOGY AND ENGLISH WRITING

Min Guo

School of Foreign Languages, Xinyang Normal University, Xinyang 464000, China

Background: Cognitive psychology mainly refers to the study of human advanced psychological processes, mainly cognitive processes, such as attention, perception, representation, memory, creativity, problem solving, speech and thinking. In a narrow sense, it is equivalent to contemporary information-processing

psychology, that is, to study cognitive process from the perspective of information processing. Educational psychology points out that only by understanding the psychological law of students' learning and exploring the different types of learning and the process and conditions of different types of learning, can teaching design to be effectively carried out. The real teaching design should conform to the students' learning psychology and depend on the students' active participation. The design of classroom questioning is the key to how to transform the idea that students are the main body of learning into teaching behavior. Therefore, only by studying students' cognitive psychology and thinking characteristics, combined with the professional characteristics of history course, and carefully designing the strategies of classroom questioning and its implementation process, can we stimulate students' interest in learning, inspire them to think actively, and make students truly become the main body of learning, so as to effectively improve the effect of history teaching.

The fundamental purpose of college English teaching is to cultivate college students' comprehensive application ability of English. However, in real life, most students' English level is high score and low ability, and teaching is in an embarrassing situation of time-consuming and low efficiency. Since the ministry of education officially launched the "teaching quality and teaching reform project in colleges and universities" in 2003, the exploration and research of Chinese scholars on the reform of college English teaching model has also been carried out in an all-round way. What kind of teaching model to build and implement is the key? However, cultivating college students' good psychological quality is the premise of college English teaching. If college students' self-awareness is correct, other psychological problems are relatively easy to solve. On the contrary, it will induce many other psychological problems. Multiple interactive English teaching is multi-element interaction. These elements include various English teaching factors related to learning and can interact with each other, such as teachers' and students' situation, teaching conditions and environmental factors. Interaction is a teaching and learning activity in which teachers use various teaching elements to stimulate students' interest in learning, so as to achieve efficient teaching effect. Therefore, analyzing the current cognitive psychological status of college students, discovering the psychological problems of college students in time and taking appropriate measures to solve them are the focus of the current work of colleges and universities. The proposal of multiple interactive English teaching model in colleges and universities makes a detailed and comprehensive exposition of the multiple interactive college English teaching model from the aspects of its meaning, characteristics, operation process, and how to implement and construct it in practice, and constructs a framework in line with the reality of English teaching in China.

Research objects and methods: 200 college students with cognitive and psychological problems in many colleges and universities in a city were selected. 200 questionnaires were distributed and 200 were recovered, with a recovery rate of 100%. The average age of the subjects was 19.9 ± 1.7 years old. All the subjects were equally divided into experimental group and control group, with 100 in each group. The experimental group was given multiple interactive English teaching mode and the control group was given routine English teaching mode. Compare and analyze the English teaching effects of the two groups of students.

Study design: The experimental intervention time of all subjects was 16 weeks. At the three-time points before, 8 weeks after and after the experiment, the cognitive psychological status of the two groups of college students was investigated by the Neuropsychiatric Inventory questionnaire (NPI), and the scores before and after the experiment were compared and analyzed.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Table 1. Comparison of NPI scores between the two groups in different periods

Group	Experience group	Control group	<i>t</i>	<i>P</i>	
NPI	Before experiment	3.46±4.26	3.41±3.68	3.374	0.746
	Week 8	2.34±2.70*	2.68±3.36*	4.946	0.037
	Week 16	1.76±2.48*#	2.32±2.92*	6.359	0.028

Note: Compared with the NPI score before the experiment, * indicates $P < 0.05$; Compared with the NPI score at week 8, # indicates $P < 0.05$.

Results: The NPI scores of the experimental group and the control group at the 8th and 16th weeks were significantly lower than those before the experiment ($P < 0.05$), and the NPI scores of the experimental group at the 16th week were significantly lower than those at the 8th week ($P < 0.05$). Before the experiment, there was no significant difference in NPI scores between the two groups ($P > 0.05$). The NPI score of the observation group at 8 and 16 weeks was significantly lower than that of the control group ($P < 0.05$). As shown in Table 1.

Conclusions: This paper deeply studies the multiple interactive English teaching model, and establishes

a framework in line with the reality of English teaching in China from the meaning, characteristics and operation process of the multiple interactive teaching model, combined with the mental health problems of college students. The multiple interactive English teaching model is an open multiple models, which provides English teachers with an open concept and makes them not stick to one pattern in teaching methods, so as to give full play to the advantages of various English teaching methods and optimize teaching resources. Cultivate students' English application ability in learning, work, and society, be able to communicate effectively in English, improve students' autonomous learning ability in English learning and improve comprehensive cultural literacy.

Acknowledgement: The research is supported by: 2019 High Education Backbone Teacher Training Program of Henan Province "Corpus based English Classroom Teaching Model Research" (No. 2019GGJS160); 2021 Graduate Teaching Case Project of Henan Province "A Study on the Effectiveness of English Classroom Teaching" (No. HNYJS2021AL082).

EFFECT OF NATIONAL INSTRUMENTAL MUSIC TEACHING ON REHABILITATION TREATMENT OF PATIENTS WITH COGNITIVE IMPAIRMENT

Mo Ma

Academy of Music, Henan Vocational Institute of Arts, Zhengzhou 450000, China

Background: Cognitive impairment is a very serious mental disorder. In psychiatry, the existing studies on cognitive impairment point out that there are great problems in the cognitive ability of patients with cognitive impairment, and it is difficult to be fully alleviated. However, in order to improve the physical and mental health of cognitive impairment and promote the harmonious development of society, there are also a large number of studies on the treatment of cognitive impairment. Many of them believe that music therapy can effectively alleviate the level of cognitive impairment of patients. As an emotional carrier, music contains rich thoughts and cultures. Psychiatry believes that rich cultural thoughts can not only directly affect the cognitive ability of patients with cognitive impairment, but also easier to implement treatment during this period. In the understanding of music, the perception of music by people with cognitive impairment will be quite different from that of ordinary people. China's national music is the product of Millennium inheritance, which contains extremely rich core ideas. Therefore, we can try to use national music to treat patients with cognitive impairment, and treat patients with cognitive impairment with the help of the core ideas of national music and the special texture and melody brought by millennium inheritance. On the basis of alleviating patients' cognitive impairment, it can also promote the development of music and the inheritance of traditional national music.

In traditional music, traditional national instrumental music is the main medium for the external transmission of traditional music. Therefore, the main way of its transmission is to use traditional instrumental music to perform national music. In college teaching, in order to realize cultural inheritance, colleges and universities pay more and more attention to national music, so the teaching curriculum of national instrumental music also began to be paid attention to. In the conventional teaching of national instrumental music, teachers first guide students to use national instrumental music. There are significant differences between national instrumental music and modern instrumental music. China's national instrumental music has strong national characteristics, and the instrumental structure and use methods of different nationalities are different. In addition, in the teaching of national instrumental music, the focus is to guide students to use national instrumental music for the performance of national music. According to relevant research, national instrumental music performance can effectively alleviate the cognitive level of patients with cognitive impairment. Therefore, in the teaching of national instrumental music, it has gradually evolved from traditional single teaching to applied teaching. Therefore, the research puts forward the national instrumental music teaching for the purpose of rehabilitation treatment of patients with cognitive impairment. By innovating and constructing the national instrumental music teaching mode, on the one hand, it can alleviate the level of cognitive impairment of patients with cognitive impairment, on the other hand, it is the effective inheritance of national instrumental music.

Objective: This paper discusses the current situation of national instrumental music teaching in colleges and universities, analyzes the situation of students' cognitive impairment in college teaching, and discusses the effect of national instrumental music teaching in the rehabilitation of students' cognitive impairment.

Study design: Taking the students majoring in ethnic instrumental music in a university as the main research object and the teachers in the teaching course as the secondary research object, the cognitive

impairment status of all students is counted, and the basic cognition of teachers on the treatment of cognitive impairment is analyzed. Build a national instrumental music teaching model for the treatment of cognitive impairment, carry out national instrumental music teaching for all students, analyze the changes of students with cognitive impairment and normal students after teaching, and evaluate the rehabilitation effect of patients with cognitive impairment in national instrumental music teaching.

Results: The changes of national instrumental application ability and cognitive ability of students with cognitive impairment and normal students are shown in Table 1. The patient's ability is graded according to 0-4. 0 indicates poor ability and 4 indicates very good ability. Table 1 shows that the application ability of national instrumental music of students with cognitive impairment is gradually improved, and their cognitive ability is gradually close to that of normal students.

Table 1. Changes of students' ability before and after teaching

Project		Before teaching	After teaching	P
Application ability	Cognitive impairment	1	3	<0.05
	Normal students	3	4	
Cognitive ability	Cognitive impairment	0	2	<0.05
	Normal students	3	4	

Conclusions: Students' cognitive impairment is an urgent problem to be solved in college teaching. In college teaching, Chinese traditional cultural ideas are gradually used for the rehabilitation treatment of students with cognitive impairment. In the study, national instrumental music teaching is used to treat students with cognitive impairment, hoping to use the national cultural thought contained in national instrumental music to realize the Ideological Reconstruction of patients with cognitive impairment. The results show that the basic cognitive ability of students with cognitive impairment under the innovative teaching of national instrumental music has been significantly improved. At the same time, it can not only improve students' cognitive ability, but also improve students' application ability of national instrumental music. The above results show that in the teaching of national instrumental music in colleges and universities, the formulation of students' national instrumental music teaching mode from the perspective of cognitive impairment can effectively improve the teaching coverage, drive the improvement of more students' application ability, effectively treat patients with cognitive impairment and promote students' growth and development.

* * * * *

ANALYSIS ON THE TEACHING REFORM OF FINANCE MAJOR IN HIGHER VOCATIONAL COLLEGES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Jie Deng¹ & Xin Zhao²

¹*College of Economy and Finance, Shaanxi Technical College of Finance & Economics, Xianyang 712000, China*

²*Department of Artificial Intelligence, Shaanxi Institute of Technology, Xi'an 710300, China*

Background: In educational psychology, the learning motivation and self-efficacy of students in the learning process are the key to the learning process. Learning motivation, together with individual IQ and ability, is regarded as one of the key factors affecting the final learning effect. In Dodson's law, the level of learning motivation can effectively improve the learning effect to a certain extent, but after exceeding a certain extent, the learning effect will become worse. Therefore, the theory believes that the medium level is the most beneficial to the learning effect. As the most intuitive embodiment of learning motivation in effect, learning investment is often taken into account by scholars. Learning investment refers to the degree of students' behavioral and psychological investment in the process of learning activities, which is generally directly reflected in the invested time and energy. At the same time, there are also investments in psychological, emotional or cognitive aspects. However, this part of the investment is difficult to quantify. As one of the most effective indicators to measure learning effect and learning satisfaction, quantifiable input factors are still the main evaluation means of this indicator. In the process of students' learning, the influence of self-efficacy on the final learning effect cannot be ignored. Especially for the students majoring in finance in higher vocational colleges, due to the professionalism and difficulty of finance itself, a good level of self-efficacy can fundamentally solve the problem of insufficient learning succession.

Self-efficacy is students' subjective judgment of their own ability, but it can also negatively affect students' psychology and behavior. Some studies have shown that self-efficacy is one of the important predictors of learning investment. Individuals will have a positive attitude when performing tasks with high self-efficacy, and then promote behavior progress. In contrast, individuals will have a negative attitude when performing tasks with low self-efficacy, which will lead to behavioral slack or avoidance. By integrating the three theories of learning motivation, learning investment and self-efficacy into the reform of Financial Teaching in higher vocational colleges, we can effectively improve students' autonomy in the learning process and improve the teaching effect.

Objective: Based on the theory of educational psychology, this study analyzes the learning status of higher vocational finance students from the perspectives of learning motivation, learning investment and self-efficacy. Through the analysis of the learning characteristics of finance students, this study provides reform suggestions for higher vocational finance teaching in line with the actual situation of students, and improves the teaching system and methods of higher vocational finance.

Subjects and methods: This study takes variable interaction model method and structural model path analysis method as the main analysis methods, and analyzes the impact of teaching reform elements of finance major in higher vocational colleges on students' learning state by calculating the level of influencing factors between variables.

Study design: This time, the learning data of students majoring in finance are collected through the higher vocational teaching background system. On this basis, the variable interaction effect model is established by combining the variables of educational psychology and the elements of educational reform, and the path parameters of the variable interaction effect model are analyzed by using the maximum likelihood method.

Methods: This study uses SPSS software and Amos software to analyze the research data.

Results: The structural equation hypothesis path includes five types: teaching method reform, textbook arrangement reform, exceptional teaching reform, information-based auxiliary reform and practical curriculum reform. The test results are shown in Table 1.

Table 1. Structural equation test results

Model serial number	Hypothetical path relationship	Standardized path coefficient	C.R.	Test conclusion
1	Reform of teaching methods	0.562	12.731**	Accept assumptions
2	Reform of textbook arrangement	0.014	8.1534*	Accept assumptions
3	Exceptional teaching reform	0.018	0.294	Reject hypothesis
4	Information aided reform	0.004	14.217**	Accept assumptions
5	Practical curriculum reform	0.312	7.864*	Accept assumptions

Note: where * means $P < 0.05$ and ** means $P < 0.01$.

Table 1 shows the final test conclusions of different reform investment methods. It can be seen that the four path conclusions of teaching method reform, textbook arrangement reform, information-based auxiliary reform and practical curriculum reform are acceptance hypothesis, and the conclusion of teaching reform is rejection hypothesis with only exceptions. This is because the exceptional teaching for students with cognitive impairment may lead to the imbalance of students' inner state, increase the educational burden of students and teachers, and the negative effect is greater than the positive effect.

Conclusions: By analyzing the learning status of higher vocational finance students, this paper disassembles the factors driving students' active learning and learning effect from the perspectives of learning motivation, learning investment and self-efficacy, and takes this as the starting point to provide theoretical support for the reform of higher vocational finance education. By using educational psychology to intervene students' learning status and driving factors, we can effectively promote students' initiative and enthusiasm in the learning process, ensure learning sustainability, and then help students achieve better learning results.

THE PROCESS OF RITUAL STUDY OF POETRY IN THE PRE QIN AND HAN DYNASTIES FROM THE PERSPECTIVE OF PSYCHOLOGY

Guoqin Si

Center for Teaching Quality Management and Evaluation (Teaching Supervision Office), Yancheng Kindergarten Teachers College, Yancheng 224005, China

Background: Psychology is a science that studies human behavior and psychological laws. Modern psychology mainly includes biological perspective, cognitive perspective, behaviorism perspective, whole person perspective, development perspective and social and cultural perspective. The cognitive perspective emphasizes cognitive activities or psychological activities, the behaviorism perspective focuses on the degree and quality of the impact of the environment on individuals, and the whole person perspective focuses on people's spiritual core, believing that people have the internal demand for growth and goodness. The combination of psychology and education is mainly embodied in educational psychology, that is, in a specific educational situation, carry out conscious and phased practical application according to the psychological laws and change characteristics of both teaching subjects and objects. Educational psychology can be applied to curriculum design, teaching method improvement and teaching motivation guidance to help students deal with difficulties and challenges in life and learning. From the perspective of psychology, excavating the important value and teaching enlightenment of the ritual process of the study of poetry in the Pre-Qin and Han dynasties, and teaching integration and design of the development of the study of poetry can effectively improve students' grasp and learning of the ritual process of the study of poetry in the Pre-Qin and Han dynasties. From the perspective of psychology, analyzing the ritual process of "poetry" learning in the Pre-Qin and Han dynasties, constantly enriching the teaching of "poetry" and innovating teaching methods and modes can effectively promote students to grasp the essence of learning, improve their negative learning emotions caused by the dryness of ancient literature learning, and improve the quality of teaching. The so-called ritual of the study of poetry means that the scholars of poetry use ritual meaning to say poetry, so that poetry becomes the carrier of ritual meaning. The process of the ritual study of "poetry" in the pre Qin and Han dynasties is from the breeding of "poetry" in the ritual music of the Western Zhou dynasty, to Confucius emphasizing ritual and creating opportunities for the ritual study of "poetry", then to the contribution of Han Confucianism to the Ritual Study of "poetry" and the construction of the ritual system of "poetry" with elegant songs, to the final "preface to Mao poetry" becoming the great achievement of the Ritual Study of "poetry". The study of poetry can help us improve our aesthetic quality and cultural connotation, enhance cultural self-confidence, and stimulate our learning and inheritance of excellent culture. However, in the current university education, students are not interested in the study of ancient literature, and in the study of poetry, they show learning fatigue, fatigue and other learning states, showing negative emotions and manifestations such as anxiety, irritability and evasion, which further affects the quality of learning. Therefore, from the perspective of psychology, by enriching and innovating teaching means and helping them understand the literary connotation through the ritual learning process of poetry in the Pre-Qin and Han dynasties, we can effectively improve students' learning enthusiasm and learning efficiency.

Objective: To further grasp the law of teaching process and students' psychological characteristics from the perspective of psychology, analyze the cultural value and teaching enlightenment in the process of ritual learning of poetry in the Pre-Qin and Han dynasties, use multimedia and other teaching tools to realize the innovation of teaching content, teaching scheme and teaching means, improve students' learning ability of ancient Chinese literature, and then improve the teaching level and quality.

Research objects and methods: The research takes the students with learning and psychological barriers in the literature major of a university as the research object. Firstly, it collects the data of the students' learning status and the basic situation of curriculum teaching, and then integrates the ritual process of the study of poetry in the Pre-Qin and Han dynasties into the teaching process to innovate and change the teaching mode. And the intervention research on the research object is carried out with this teaching mode.

Method design: First, grade the students' learning disabilities and classroom learning, and then analyze the influencing factors of teaching methods and teaching effects with the help of meta-analysis and principal component analysis. Then, the teaching mode is innovated and applied in practice. The experimental time is 2 months. After the experiment, the change data of students are collected, and the experimental data are processed by statistical analysis tools.

Methods: Principal component analysis was used to extract and analyze the factors affecting the teaching effect, and the innovative teaching model was used to analyze the improvement of students in the process of learning ritual of poetry in the Pre-Qin and Han dynasties.

Results: The psychological perspective can effectively guide teachers to grasp the characteristics of the teaching process and the psychological law of students, so as to improve the teaching effect of the ritual process of learning poetry in the Pre-Qin and Han dynasties, and mobilize students' interest and initiative in learning ancient literature. Table 1 shows the statistics of teaching effect scores under different classroom teaching modes.

Table 1. Statistics of teaching effect scores under different classroom teaching modes

Evaluation dimension	Richness of teaching content	Literary depth understanding	Learning enthusiasm	Relief of psychological disorders
New mode	21.49±4.53	15.17±3.34	21.15±7.13	23.76±3.37
Old mode	19.69±3.15	25.37±1.06	12.44±5.13	18.24±4.10

Conclusions: With its rich cultural core and internal logic, the study of poetry provides an important ideological weapon for people's treatment of people and affairs, and the ritual process of the study of poetry shows the ancient people's affirmation of the cultural value. Analyzing the value and ritual process of "poetry" from the perspective of psychology can better extract the classics of "poetry" on the basis of grasping students' psychological laws and learning characteristics, so as to improve their learning initiative, improve learning obstacles and improve teaching quality.

RESEARCH ON THE INFLUENCE OF COMPUTER SOFTWARE TALENT TRAINING MODEL INNOVATION ON ALLEVIATING COLLEGE STUDENTS' ANXIETY

Jun Ma

School of Information Engineering, Changsha Medical University, Changsha 410219, China

Background: The psychological status of college students has not been fully developed, and they are very vulnerable to the influence of the surrounding environment and others. Research has shown that about 20%-47% of college students have varying degrees of psychological discomfort, and anxiety is the psychological problem with the highest incidence. When dealing with the relationship between the external environment and their own psychology, students are prone to conflict, and the handling of interpersonal relations and the worry about employment prospects will cause students' anxiety. The anxiety psychology of college students includes social anxiety, examination anxiety, employment anxiety and so on. Anxiety disorder is a very complex psychological and emotional disorder. It is usually manifested in motor agitation and sympathetic hyperactivity, often accompanied by negative emotions such as anxiety, shame, disappointment, anxiety, fear and so on. Appropriate anxiety can make students in a more active learning state and have a more active attitude towards themselves and the environment. However, excessive anxiety will cause students' resistance and affect the quality of learning and daily life. As the main body of the teaching mode, the enthusiasm and learning efficiency of students participating in the classroom will affect the teaching quality and the completion of teaching objectives. At the same time, the quality of curriculum teaching effect and the focus of teaching training plan will also affect the enthusiasm and initiative of students participating in the classroom and the difference of their professional ability and practical ability. The students' mood and employment value will be changed. With the acceleration of the process of global integration, network computer and its related majors have attracted more and more attention. However, with the increase of the number of graduates of computer and its related majors over the years, the employment situation has been further exacerbated, resulting in graduates unable to find jobs and employers unable to recruit people. At present, the cultivation of computer professionals in colleges and universities mainly focuses on the study of their theoretical knowledge, but less on the cultivation of their practical ability and professional skills. The industrial market of professional education content is seriously disjointed, which makes the theoretical knowledge and exercise ability of students become "empty talk", and the employment problem has gradually become an important factor affecting students' psychological problems. At the same time, students are facing more complex interpersonal and academic problems in college social life, which is easy to produce impetuous psychology, and then ignore the cultivation of their own professional scientific literacy. Various pressures and problems make college students have negative emotions such as anxiety, worry and depression. Therefore, understanding the psychological development characteristics of computer majors in colleges and universities, paying attention to the anxiety expressed by the problems they encounter in education and learning, and properly intervening them, promoting the innovation of talent training mode and strengthening the application ability of students to technical software can greatly improve students' anxiety and improve their mental health level.

Objective: In order to improve the anxiety psychology of college students, alleviate their anxiety symptoms and help them improve their mental health level, this paper studies the innovation of computer software talent training mode, that is, accelerating the reform of teaching methods, teaching methods and teaching objectives, so as to realize the intervention of college students' psychological anxiety.

Research objects and methods: This study takes 400 college students majoring in computer science and suffering from different degrees of anxiety in a university as the research object, innovates the training mode of computer software talents, and explores its alleviation of college students' anxiety.

Method design: Firstly, the data of computer teaching methods and effects, students' learning and psychological anxiety symptoms were collected and sorted out. Through the reform of computer teaching mode to speed up the innovation of talent training scheme, and with the help of Self-rating Anxiety Scale (SAS), this paper analyzes the changes of psychological anxiety of computer majors in the three-month experimental time, and explores the intervention mechanism of computer software talent training mode innovation to alleviate the anxiety of college students.

Methods: With the help of social statistical analysis tool SPSS20.0. This paper makes a statistical analysis on the anxiety relief of students after the innovation of computer software talent training mode and teaching mode.

Results: On the premise of analyzing the current situation of computer teaching and the influencing factors of students' anxiety psychology, after innovating and improving the computer teaching mode and training scheme, it was found that students' professional skills and literacy had been significantly improved, which effectively alleviated students' anxiety psychology. Table 1 shows the scores of the psychological anxiety scale of the two groups of students after the experiment.

Table 1. The scores of psychological anxiety scale of the two groups of students after the experiment

Anxiety dimension	Before the experiment		After the experiment	
	Average value	Standard deviation	Average value	Standard deviation
Interpersonal relationship	2.15	1.96	3.74	2.32
Learning state	2.76	1.19	3.04	1.41
Employment prospects	3.15	1.98	4.59	2.06
Life emotion	2.75	1.47	3.97	1.65

Conclusions: The innovation of talent training mode for information and computer science majors is of great significance. We must promote the continuous innovation of professional teaching in order to lead the progress of the industry. Colleges and universities should pay attention to the targeted training and post adaptability of computer students, speed up the innovation of training mode, and ensure the teaching quality and efficiency of information computer specialty. At the same time, the transformation of teaching mode can effectively improve students' anxiety and mental health.

* * * * *

FORMATION SURROUND TRACKING CONTROL OF MULTI-AGENT SYSTEMS WITH COMMUNICATION DELAY IN THE CONTEXT OF COGNITIVE IMPAIRMENT

Xiaolong Qi

College of Electrical Engineering, Longdong University, Qingyang 745000, China

Background: Cognitive impairment refers to the impairment of memory, time and space orientation function, executive ability and language understanding. It can be divided into dysfunction and clinical disorder, and dysfunction is the main factor affecting its network use. Dysfunctions include memory disorder, problem solving disorder, attention disorder, language understanding and expression disorder, calculation disorder and visual reading disorder. Research at home and abroad shows that people with cognitive impairment can effectively improve their daily life and cognitive activities by using personal digital assistant and computer-assisted learning. Effective early intervention for cognitive impairment can improve the cognitive level of patients, improve their attention and understanding, and help them make better cognitive judgment and decision-making. However, due to the difference of their own cognitive level, there is a certain gap between patients with cognitive impairment and ordinary people in judgment and decision-making, and there is also a certain difficulty in the use of technical products. The design concept of some technical products is less, covering the cognitive characteristics and behavioral needs of this group, reducing their product experience and satisfaction. For example, multi-agent system pays attention to the connection between part and the whole and the coordination and order of information interaction, but there is a deviation in understanding and perception of the form and content of information when patients with cognitive impairment perceive information, which is very easy to make their sense of information

conflict with the original cognition, increasing the difficulty of information extraction. At the same time, the formation surrounding tracking control of multi-agent system involves the formation control, task allocation and coordination and tracking methods in the theory of multi-agent cooperative control system. Its essence is to explore the consistency of the system and pay more attention to the grasp of the integrity of the system. However, due to the differences in network speed and resource status among agents, the overall communication timeliness and performance stability of the system are affected, affecting its operation accuracy. At the same time, under the influence of communication delay, the application effect of multi-agent system control algorithm is difficult to meet the needs of some patients with cognitive impairment, which affects the improvement of its application effect. Therefore, from the perspective of cognitive impairment, the time-delay technology of multi-agent system control algorithm under communication delay is improved to speed up the optimization and improvement of tracking and inclusion system, which can effectively meet the needs of patients with cognitive impairment and optimize system technology.

Objective: To optimize and improve the multi-agent control system with the help of the background of cognitive impairment, improve the cognitive bias of some users with cognitive impairment, improve their cognitive level, and promote the further improvement of the multi-agent system under the communication delay.

Research objects and methods: The study selected some patients with cognitive impairment as the research object, collected their views on multi-agent system and related product experience, and then established the fault and saturation model of agent formation, taking the data information fed back by the research object as the constraints of the model and adaptive fault-tolerant control law. Then the model can effectively meet the cognitive needs of patients with cognitive impairment and promote the optimization of the model.

Method design: The collected use information related to cognitive impairment is introduced into the agent formation saturation model, and the gain method to solve the controller is obtained by the construction method, so that the follower can track the leader according to the expected formation. Then, the improved control optimization model is used to intervene patients with cognitive impairment, collect the remission of cognitive impairment and the application effect of formation surrounding tracking control of multi-agent system, and obtain the experimental results.

Methods: The construction method was used to improve the model controller, and the formation surrounding tracking control model before and after the improvement was used to compare the improvement mechanism of cognitive impairment, and the data were analyzed with the help of statistical analysis tools.

Results: Different degrees of cognitive impairment will interfere with people's information judgment and extraction, and affect their cognitive evaluation and consumption experience. The improvement of multi-agent control system based on the background of cognitive impairment can greatly improve the accuracy of formation surrounding tracking model and improve the cognitive level and practical ability of patients with cognitive impairment. Table 1 shows the score improvement statistics of patients with cognitive impairment before and after the experiment.

Table 1. Statistical improvement of scores of patients with cognitive impairment before and after the experiment

Dimension	Problem solving obstacles	Attention disorder	Computational barrier	Visual dyslexia
Before the experiment	26.51±1.25	21.34±0.52	19.47±1.16	18.59±0.68
After the experiment	15.23±1.01	14.26±0.11	13.26±1.22	11.20±0.26

Conclusions: The development of science and technology has greatly improved our living standards and quality, and made the agent gradually move towards our life. Due to its good robustness and reliability, multi-agent system is widely used to solve practical application problems. With the help of cognitive impairment background, the formation surrounding tracking control system of multi-agent system is optimized, which greatly improves the learning and reasoning ability of the algorithm, improves the cognitive level of patients with cognitive impairment, and has good application value and practicality.

Acknowledgement: The research is supported by Gansu Youth Science and Technology Fund Project: Theory and Application of Output Time-Varying Formation Tracking Control of Heterogeneous Multi-Agent System Based on Output Regulation, Project No.: 21JR7RM192.

APPLICATION OF FLIPPED CLASSROOM TEACHING MODEL IN COLLEGE ENGLISH TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Shujun Chang

School of Foreign Languages, Anyang Normal University, Anyang 455000, China

Background: Educational psychology is the use of psychological theories or research results to carry out educational intervention. It refers to the conscious and phased practical application according to the psychological laws and change characteristics of both teaching subjects and objects in a specific educational situation. Educational psychology can be applied to curriculum design, teaching method improvement and teaching motivation guidance to help students deal with difficulties and challenges in life and learning. Based on psychology, educational psychology constructs the relationship between the two disciplines, including the relationship between students' personality development and educational environment, the relationship between ability development and knowledge learning, social development and standardized learning, and the regularity between the effectiveness of teaching and talent training. Educational psychology can develop many special fields to study educational problems. It pays attention to the cultivation concept of people-oriented and student-centered, which provides a psychological scientific basis for the setting of diversified courses. Teaching method is the link between teachers' teaching plan and students' actual learning effect. As far as foreign language education is concerned, various schools of pedagogy in history have directly established their own theoretical system based on the corresponding psychological point of view. Teaching is a process of interaction with students. The essence of teaching is the choice of methods. On the basis of analyzing the psychological characteristics of teachers and students, choosing appropriate teaching methods according to relevant language materials can achieve different teaching effects. Different psychological characteristics and goal orientation will lead to students' different attitudes and enthusiasm towards English learning, and there is a large gap between students' English level and ability. Therefore, students only study with the mentality of coping with exams and blindly pursuing grades, ignoring the improvement of English ability. Flipped classroom teaching makes teaching more targeted, and displays the teaching content in various forms of teaching methods, which gives students more autonomy and practicality to a certain extent. However, the flipped English teaching model still has some deficiencies in improving students' enthusiasm and initiative to participate in the classroom, and it is difficult to grasp the law of students' psychological changes in the teaching process. Therefore, in order to strengthen the interaction between teachers and students and realize efficient classroom, the current English teaching should pay attention to the innovation and reform of flipped classroom teaching mode, and pay full attention to the needs and psychological changes of students from the aspects of the design of teaching content, the selection of teaching resources and the evaluation of teaching mode from the perspective of educational psychology, so as to improve their psychological status.

Objective: To analyze the law and characteristics of students' psychological changes in the teaching process with the help of educational psychology, so as to improve the teaching quality and teaching effect of college English teaching application flipped classroom, cultivate students' comprehensive English ability, and explore a model suitable for the characteristics of college English teaching.

Research objects and methods: The research takes English majors in a university as the research object. Firstly, it collects the basic information about the learning problems and needs of college students and the current situation of English teaching, and then innovates and optimizes the college English flipping classroom teaching mode, so as to build a new flipping mode that meets the psychological needs of students and the characteristics of English teaching, different classroom teaching schemes were randomly adopted to test the intervention mechanism and optimization effect of educational psychology on the psychological status of students.

Method design: With the help of principal component analysis, this paper makes a factor analysis on the students' psychological factors affecting the teaching effect, and then innovates and optimizes the flipped classroom of English teaching, analyzes the changes of learning quality and learning effect of the experimental subjects in three months with the new model, and makes a statistical comparison of the students' data under different teaching schemes before and after the experiment. To explore the model of flipped classroom in college English teaching from the perspective of educational psychology.

Methods: SPSS22.0 analysis tool to process the experimental data, factor extraction and regression coefficient test the influencing factors with principal component analysis, and analyze the changes of teaching situation before and after the experiment with the new flipped classroom optimization model.

Results: From the perspective of educational psychology, examining the psychological characteristics of teachers and students in the teaching process and finding out the measures of teaching improvement can cultivate practical talents with high comprehensive quality and adapt to the development of the times. From the perspective of psychological research, it has greatly improved students' mental health. Table 1

shows the statistics of teaching effect scores under different classroom teaching modes.

Table 1. Statistics of teaching effect scores under different classroom teaching modes

Evaluation dimension	Richness of teaching content	The burden of homework	Learning enthusiasm	Innovation of learning
New mode	21.35±4.52	14.16±3.34	19.25±7.13	23.86±3.47
Old mode	19.78±3.14	25.37±1.25	12.44±5.11	18.24±4.13

Conclusions: Educational psychology can provide a theoretical basis for classroom teaching and lay a psychological scientific foundation for the study of China's teaching reform. It is committed to serving practical education. On the basis of grasping the psychological law and teaching law of the subject and object of teaching, it can teach students according to their aptitude, teach without category, and greatly improve the teaching level and quality, fully mobilize the enthusiasm and initiative of students to participate in the classroom, and improve the level of mental health.

AN EMPIRICAL ANALYSIS OF THE EFFECT OF MUSIC EDUCATION IN COLLEGES AND UNIVERSITIES INTEGRATING MUSIC CULTURE IN DIFFERENT REGIONS ON STUDENTS WITH AFFECTIVE DISORDER

Yinying Cai¹ & Maizi Fang²

¹*College of Music, Zhejiang Normal University, Jinhua 321000, China*

²*School of Health and Biomedical Science, Royal Melbourne Institute of Technology, Melbourne 3000, Australia*

Background: With the rapid development of the times, people's pace of life is accelerating, and all kinds of pressure are pouring in. College students in colleges and universities will inevitably feel different degrees of pressure. Academic anxiety, emotional anxiety, interpersonal anxiety and Employment anxiety are the sources of college students' affective disorder. College students' affective disorder is a psychological burden for them, and some intervention measures need to be taken to alleviate this affective disorder. Relevant studies have found that music can weaken people's negative emotions and make individuals grow emotionally and psychologically. China's regional music culture is rich and diverse, with strong local characteristics. Being able to feel the local people's love for life and people's simple feelings from local music will have a strong impact on the listener's psychology, so as to bring the listener into the music atmosphere with strong local characteristics, then affect the listener's mood and weaken the listener's negative mood. Therefore, in order to improve the mental health of college students, colleges and universities should reform the previous music education, change the previous way of music indoctrination teaching, pay attention to the importance of college students' emotion in music education, integrate music culture from different regions into college music education, let college students feel the charm of music culture from different regions, and improve the mental outlook of college students, continue to inherit the regional music culture that has been increasingly ignored by people, and bring new vitality to the regional music culture.

Objective: Through the reform of music education in colleges and universities, integrate the music culture of different regions into music education in colleges and universities, so that college students can understand people's lives in different regions through regional music culture, feel the cultural characteristics of different regions, understand the thoughts and feelings that those music should convey, and stimulate the burst of college students' emotions through emotional resonance, and taste the charm of music culture in different regions, so as to get emotional sublimation and alleviate emotional barriers. In this process, we should improve the teaching quality of music teachers, make good use of multimedia and network technology, and increase the music atmosphere for classroom teaching.

Research objects and methods: The research objects are college students. Through stratified cluster random sampling, 60 college students from different majors, grades and regions are selected in the public elective course of music education in a university. After the beginning of the experiment, they were given music education to integrate into the music culture of different regions. The experimental time was 2 months, with one class per week and one class for 90 minutes. Before and after the experiment, the relevant data were collected in the form of questionnaire, and the emotional changes of college students

were collected by Symptom Checklist-90 (SCL-90). The influence of specific factors was quantified by 0-4 scoring system. 0 indicates irrelevant, 1 indicates slight influence, 2 indicates general influence, 3 indicates obvious influence, and 4 indicates complete influence. The 1-5 grade scoring system is used to quantify the psychological status of college students. The higher the score, the more serious the symptoms are. SPSS software is selected as the processing software of relevant data. The average value of the obtained results shall be calculated, and the number after the decimal point shall be rounded. This data processing method can reduce the influence of subjective factors. This paper analyzes the results and discusses the effect of college music education integrated into music culture in different regions on college students' emotional disorder.

Results: After the experimental data were processed by SPSS software, we can see the impact of college music education integrated into music culture in different regions on college students' affective disorder. The scoring results are shown in Table 1.

Table 1. The influence of college music education integrated into music culture in different regions on college students' emotional disorder

Grade	Music type	Emotional atmosphere	Situational teaching
Freshman	3	4	3
Sophomore	4	3	4
Junior	4	4	4

In Table 1, in the college music education integrated into the music culture of different regions, different educational measures have different effects on college students' affective disorders. From different grades, freshmen feel that music education can have the greatest impact on the emotional atmosphere, with a score of 4 points, followed by music types and situational teaching. The impact of these two measures is the same, with a score of 3 points. Junior students believe that music type, emotional atmosphere and situational teaching are very important.

Conclusions: Through the college music education integrated into the music culture of different regions, college students feel the characteristics of different regions and the emotions expressed in the music. They are quite touched. They have a deep understanding of the saying of "moving people with beauty and making people with beauty", and their emotions become positive. After this music education, college students feel that the regional music culture should continue to be inherited, keep pace with the times and innovate constantly.

* * * * *

INFLUENCE OF MUSIC TEACHING REFORM AND INNOVATION ON STUDENTS WITH COGNITIVE IMPAIRMENT IN COLLEGES AND UNIVERSITIES

Xiaofei Liu

School of Music, Shandong Women's University, Jinan 250300, China

Background: College students are the main objects of education in China. Generally speaking, college students will have a certain degree of anxiety after leaving the high school campus environment and entering the university campus, and they will have different degrees of cognitive impairment when facing the unfamiliar university campus environment. From the perspective of psychology, the main reason for college students' cognitive impairment lies in the improvement of the difficulty of college education and the increase of the knowledge involved in college teaching, which has an impact on students' conventional cognition, resulting in cognitive impairment. In addition, in psychiatry, cognitive impairment is recognized as a mental disorder with cognitive deficiency. Patients with cognitive impairment cannot understand external things and express their inner thoughts. It is a mental disease that seriously affects students' normal life. In view of the current situation of college education, in view of the cognitive obstacles of college students, colleges and universities continue to improve the teaching system and teaching mode, and urge teachers to formulate teaching plans from the aspect of students' psychological cognition. However, it is undeniable that college students' cognitive impairment has gradually shifted from curriculum learning to daily life. In order to better alleviate college students' cognitive impairment, it is necessary to implement teaching management for college students. Some studies suggest that cultural teaching such as music teaching can be carried out in college teaching to affect students' cognitive impairment and alleviate

students' ideological impairment through music perception.

Music teaching in colleges and universities is one of the main subjects in colleges and universities of art, and it is also one of the subjects that students focus on. In colleges and universities of art, teachers usually teach music courses mainly based on practice and supplemented by theory. From the current music teaching in colleges and universities, we can know that in the traditional music teaching, teachers' focus on the theoretical teaching of music is not high, mainly to guide students to use relevant music knowledge for practical learning. In practical learning, students' basic ability can be greatly increased, but it is undeniable that while students' practice increases, their theoretical knowledge is relatively backward, and the backwardness of theoretical knowledge is disadvantageous to the spread of music culture. In music teaching, theoretical culture is of great value. Students can understand the core ideas contained in music in theory. After the lack of theoretical knowledge, students' cognition will have problems. In order to ensure the cognitive problems of students in the learning process, the research puts forward the reform and innovation mode of music teaching in colleges and universities from the perspective of the treatment of students' cognitive impairment, in order to improve the teaching quality of art colleges and alleviate students' cognitive impairment at the same time.

Objective: This paper discusses the cognitive impairment of students in music teaching courses in colleges of art, analyzes the impact of cognitive impairment on music teaching reform and innovation, and puts forward the path of music teaching reform and innovation to alleviate students' cognitive impairment.

Study design: Taking the music majors in an art college of a university as the research object, the level of cognitive impairment of all students in college learning is counted. Finally, the correlation between music teaching innovation and cognitive impairment is analyzed with senior students as the main research object. The changes of music scores and the number of cognitive impairments of senior students from freshman to senior were counted, and the impact of teachers' teaching reform and innovation in the process of music teaching on students' cognitive impairment was analyzed.

Results: The changes of cognitive impairment of senior students and the application ability of hot music during the four-year teaching period are shown in Table 1. Table 1 shows that senior students have serious cognitive impairment in the four-year teaching process, the number of students decreases, and the number of students with strong application ability of music increases.

Table 1. Changes of cognitive impairment in students' learning (n=78)

Content		First year	The second year	The third year	The fourth year
Cognitive impairment	Strong	18	11	9	4
	Commonly	21	18	14	9
	Weak	12	14	10	7
Music application ability	Strong	17	29	33	45
	Commonly	32	31	32	23
	Weak	29	18	13	10

Conclusions: The cognitive impairment of college students is common, and it is also an urgent problem to be solved. In the research, aiming at students' cognitive impairment, this paper analyzes the current situation of music majors' cognitive impairment, and explores the impact of teachers' teaching reform and innovation on students' cognitive impairment in music teaching. The results show that students' cognitive impairment has been gradually alleviated in the reform and innovation of music teaching, and it can be seen that most music majors' music application ability has also begun to be gradually improved, indicating that the reform and innovation of music teaching can alleviate students' cognitive impairment to a certain extent, help students improve their cognitive ability, and finally achieve the improvement of professional curriculum ability. Therefore, in college education, college leaders and teachers need to focus on students' cognitive impairment, use teaching reform to realize the rehabilitation treatment of students with cognitive impairment, and provide guarantee for students' future development.

* * * * *

INFLUENCE OF E-COMMERCE ON INTERNATIONAL ECONOMY AND TRADE UNDER THE OBSTACLE OF THINKING LOGIC AND ITS COUNTERMEASURES

Yong Peng

School of Foreign Languages and Cultures, Panzhuhua University, Panzhuhua 617000, China

Background: Thinking is the reaction and generalization of human brain to objective things. Individual thinking includes image, logic and epiphany. Among them, logical thinking is an advanced form of thinking. Logical thinking refers to a way of thinking formed by individual judgment and reasoning in the process of cognition. It is an abstract response to objective reality. It has strong abstract characteristics and reveals the essential attributes of things. The individual's thinking logic obstacle is mainly caused by three reasons: concept, appearance and tool. The individual's cognition of the connotation and extension of things is relatively vague, and he can't grasp the essential attribute characteristics and core connotation of things, resulting in the thinking logic obstacle to the concept of things. Due to the lack or interference of the representation of things, students may also have thinking logic obstacles. The reconstruction of the image of objective things in the process of individual cognition of things fails, and the correct image of things is not established in their mind. It is difficult for the representation to connect the connotation of things with the representation, thus forming thinking logic obstacles. And in the process of cognitive understanding of things, individuals can not establish a reasonable thinking model, which may also lead to thinking logic obstacles.

Driven by the rapid development of the information age is the globalization of economic regions, and the e-commerce platform has gradually expanded its business to all over the world. Therefore, cross-border e-commerce has been born. As the main channel of international trade, cross-border e-commerce can not only drive economic development, but also promote the transformation and development of China's foreign trade. For cross-border e-commerce, cultural exchange is the foundation of cross-border e-commerce construction and a key part of promoting the development of cross-border e-commerce communication. In consumer consumption, consumers in the e-commerce platform for cross international goods, the thinking logic under cultural differences makes it difficult for consumers to accurately judge the credibility of goods in the e-commerce platform. Moreover, under the influence of thinking logic obstacles caused by consumers' cognitive differences, cross-border consumption in e-commerce platforms decreases. On this basis, e-commerce platforms will reduce the trade behavior of cross-border goods for consumers, thus delaying the efficiency of international economic development. However, there is less research on the changes of international economy and trade in e-commerce platform under the obstacle of consumers' thinking logic. Therefore, based on consumers' thinking logic, the research analyzes the impact of e-commerce on international economy and trade, in order to promote China's economic development, meet consumers' consumption psychology and alleviate consumers' thinking logic obstacle.

Objective: To study and analyze the characteristics and development situation of e-commerce, understand the psychological activity characteristics and change rules of consumers with thinking logic obstacles in the process of e-commerce consumption, and understand the thinking characteristics of consumers when shopping on the e-commerce platform. The research analyzes the thinking logic obstacles of consumers on the e-commerce platform, discusses the relationship between e-commerce and international economy and trade from the perspective of thinking logic obstacles, deeply analyzes the impact of e-commerce on international economy and trade, provides reference for promoting the development of e-commerce economy, and expects to put forward the construction path of e-commerce platform to help alleviate the thinking logic obstacles of consumers.

Research design: The research analyzes the development of e-commerce and the development situation of international economy and trade, understands the consumer psychology and emotion of consumers on the e-commerce platform, analyzes the thinking logic obstacles of e-commerce consumers, and explores the e-commerce consumption psychology and behavior characteristics of consumers with thinking logic obstacles. Using the method of correlation analysis, this paper understands the impact of e-commerce on international economy and trade under the obstacle of consumer thinking logic, studies the correlation between e-commerce economic development and international economy and trade under the obstacle of thinking logic by using Spearman correlation coefficient, and discusses the internal relationship between e-commerce and international economy and trade. Through the calculation of the correlation coefficient between e-commerce and international economy and trade, we can understand the impact of the development of e-commerce economy on the changes of international economic and trade situation.

Results: The analysis results of the impact of e-commerce on international economy and trade under thinking logic barriers are shown in Table 1. Factors such as e-commerce transaction volume, transaction person times, online person times of e-commerce platform and the proportion of consumers with thinking logic barriers have an impact on international economy and trade.

Table 1. Analysis results of the impact of e-commerce on international economy and trade under the obstacle of thinking logic

Factor	International economy and trade
Turnover	3.16
Number of transactions	2.95
Online person times of e-commerce platform	2.77
Proportion of consumers with thinking logic disorder	3.06

Conclusions: The development of economic globalization has led the domestic economy to gradually tend to globalization. In order to meet the needs of consumers, e-commerce platform has also begun to face the international stage. In order to understand the impact of e-commerce platform on international economy and trade after internationalization, study and discuss the impact of consumer thinking logic barriers on transactions in e-commerce platform. The results show that under the influence of consumers' thinking logic barriers, e-commerce platforms will introduce cross-border goods according to consumers' needs, and then affect the international economic and trade situation.

ROLE OF IDEOLOGICAL AND POLITICAL CONSTRUCTION OF COLLEGE ENGLISH CURRICULUM IN ALLEVIATING STUDENTS' PSYCHOLOGICAL OBSTACLES

Jiao Li

School of Foreign Languages, Huazhong University of Science and Technology, Wuhan 430074, China

Background: Psychological disorder refers to the psychological abnormality of an individual, or the abnormal behavior of an individual. Behavioral abnormalities include all observable actions or activities, involving a wide range. The boundary of psychological abnormality will change to a certain extent with the changes of the times and society. To judge whether a person's behavior is abnormal or not, we need to put it in his objective environment, and then judge it according to the social situation at that time. Suffering from psychological disorders will have a serious impact on the body and mind of individuals, even endanger their lives, threaten their safety and affect social security. Among the mental disorders of psychological disorders, according to the severity of mental disorders, they can be divided into serious mental abnormalities and mild mental abnormalities. Schizophrenia is a serious mental abnormality. Mild mental abnormalities are manifested in neurasthenia, anxiety, depression, etc., in addition, there are psychosomatic disorders caused by physical reasons, such as postpartum mental disorders psychological abnormalities caused by different psychosomatic diseases. When an individual is in a special environment, it will also cause psychological abnormalities, such as those caused by being at high altitude. Psychological obstacles also include thinking obstacles, emotional obstacles and other obstacles.

In Colleges and universities, psychological obstacles exist in a large number of students. Under various learning pressures, students' emotions will fluctuate in varying degrees, including mild mental disorders, such as anxiety disorder in varying degrees caused by learning, interpersonal relationship, examination, employment and other reasons, depression caused by lack of self-confidence, low self-esteem and other factors. In the "small society" of campus, students will inevitably have different degrees and types of psychological obstacles. For the problem of students' psychological obstacles, Chinese educational circles have put forward a new educational concept, namely curriculum thinking and politics. It advocates the combination of curriculum thought and politics in subject teaching, and guides students to establish correct three views in the teaching process, which plays a positive role in promoting students' mental health. Therefore, we should apply the course of Ideological and political education in college English teaching to explore its role in alleviating students' psychological obstacles.

Objective: To study the mental health status of college students, analyze the psychological obstacles of students, and on this basis, determine the path of Ideological and political construction of college English courses, improve the teaching plan, tap the potential of Ideological and political education, improve students' English level, give full play to teachers' leadership and stimulate students' learning enthusiasm, Alleviate students' psychological obstacles. Optimize the content of foreign language teaching, study the differences between Chinese and English cultures, correctly understand western culture, do not worship blindly, affirm Chinese mother tongue culture, establish good values, and be proud of Chinese mother tongue culture, so as to weaken students' psychological barriers and give students motivation for learning. Innovate teaching methods, properly use guided discussion, increase students' sense of participation, and let students have a certain right to speak. In the process of group discussion, their enthusiasm for

participation is improved, which has a certain inhibitory effect on students' psychological obstacles.

Research objects and methods: The research objects are college English majors. 330 English majors were randomly selected from three universities to understand their personal information, learning situation, mental health status and other information. These English majors were taught English with the integration of curriculum thought and politics. The experimental time was one semester, during which the relevant experimental data were recorded. The fuzzy evaluation method is used to evaluate the impact of the reformed English teaching model on the psychological disorder of English majors. The quantitative score of relevant influencing factors adopts grade 1-5. 1-3 points respectively indicate no impact, slight impact and general impact, and 4 and 5 points respectively indicate obvious impact and complete impact. Through SPSS21.0 software for relevant experimental data processing and analysis.

Results: In colleges and universities, many college students will have different degrees of psychological obstacles. In order to intervene the psychological obstacles of college students, the concept of "curriculum thinking and politics" is introduced into subject teaching. Applying the course of Ideological and political education in college English teaching, we should reform English teaching from five aspects: teaching design, teaching content, teaching methods and teaching practice. In the evaluation of the impact of the reformed English teaching model on the psychological barriers of English majors, innovative teaching methods can significantly affect the psychological barriers of freshmen. The impact score is 4 points. The results are shown in Table 1.

Table 1. The influence of the reformed English teaching model on the psychological barriers of English majors

Grade	Improve teaching design	Optimize teaching content	Innovative teaching methods	Enrich practical teaching
Freshman	4	4	5	5
Sophomore	4	5	5	5
Junior	5	5	4	5

Conclusions: Through the ideological and political construction of college English curriculum, students can establish correct three views, correctly treat western culture, have a sense of identity with Chinese mother tongue culture, and improve students' political literacy. In a good teaching atmosphere, improve learning enthusiasm and alleviate students' psychological obstacles imperceptibly.

MULTI FACTOR ANALYSIS OF PSYCHOSOCIAL AND ECONOMIC FACTORS OF MENTAL STRESS OF RETURNED OVERSEAS CHINESE UNDER EPIDEMIC SITUATION

Yue Dong

School of Western Studies, Heilongjiang University, Harbin 150080, China

Background: As the most serious public health emergencies in recent years, COVID-19 has had a great impact on the global economy. Under the influence of COVID-19, despite the rapid response of our country to minimize the impact of the epidemic, we have to admit that the economic losses caused by the epidemic are still hard to gauge. Analyzing the mechanism of COVID-19's impact on macro-economy, the major public health emergencies not only affect the income and risk of the economic environment, but also affect the emotions of the masses, thus causing the masses to have irrational expectations for the economic market. They will overestimate or underestimate the demand for products in the market, and the estimation bias will further hamper the development of the economic market. There are many factors affecting the economic obstruction, especially under the influence of the epidemic, including the reduction of social activities, the imbalance between product supply and demand, and the limited consumption capacity. At the same time, under the influence of the epidemic, great changes have taken place in international relations, a large number of international trades have been cancelled, and international social activities in the economic market have been damaged, resulting in the loss of the domestic economy for a long time.

Under the epidemic situation, the most worrying thing is the safety of overseas Chinese. Compared with the domestic epidemic situation, the overseas epidemic situation is more serious. The safety of overseas Chinese living abroad is also the concern of the national government and all sectors of society. In order to ensure the physical and mental health of overseas Chinese, China has launched a series of special channels to ensure that overseas Chinese can go home safely. However, after the impact of the epidemic, most

overseas Chinese will have obvious mental pressure after returning home. After returning home, the overseas Chinese are facing the influence of social and international public opinion. Most people complain about the returned overseas Chinese in a reprimanding tone, believing that transnational behavior is easy to aggravate the domestic epidemic. At the same time, the overseas Chinese are facing international malicious remarks against China, and they are under great mental pressure after returning home. At the same time, with the continuous improvement of Chinese people's ideology and culture, overseas Chinese face great changes in domestic ideology after returning home, and they can't adapt in time, resulting in serious mental pressure. During this period, the attention of the media from all walks of life to the return of overseas Chinese has increased significantly, and the social pressure brought by the voice of the media will also significantly change the social psychology of overseas Chinese. Moreover, in the severe economic social environment, the social life problems faced by overseas Chinese after returning home will also aggravate their mental pressure. In order to help returned overseas Chinese relieve their mental stress, this paper studies and analyzes the relevant factors of returned overseas Chinese's mental stress, in order to find the path and method of relieving their mental stress.

Objective: To explore the main changing factors in China's economic changes under the epidemic situation, collect the mental stress status of overseas Chinese after returning home, and count the social voice with overseas Chinese returning home as the keyword on social media, so as to determine the social psychology of overseas Chinese, and analyze the correlation between the social psychology and economic factors of overseas Chinese mental stress.

Study design: 20 returned overseas Chinese were investigated in the follow-up mode to evaluate the mental stress status of overseas Chinese after returning home, evaluate the social psychology of overseas Chinese, and determine the economic factors of economic changes under the epidemic through grey correlation analysis. Logistic multiple regression analysis was used to evaluate the correlation between social psychology and social activities, product supply and demand and consumption ability of returned overseas Chinese.

Results: The multi factor analysis between the psychosocial and economic factors of the mental stress of returned overseas Chinese is shown in Table 1. Table 1 shows that social activities, product supply and demand, consumption capacity and economic factors can affect the mental pressure of returned overseas Chinese.

Table 1. A multifactor analysis of the psychosocial and economic factors of the mental stress of returned overseas Chinese

Factor		OR (95%CI)	P
Social activities	Increase	1.00	<0.05
	Reduce	2.17(1.06-4.75)	
Product supply and demand	Balance	1.00	<0.05
	Unbalance	3.61(1.39-5.77)	
Consumption capacity	Strong	1.00	<0.05
	Intensity	3.34(1.73-5.91)	

Conclusions: Economic recovery and development under the epidemic is a macro issue considered by the country, while personal psychological anxiety and stress are micro issues that the country must consider. In the study, the mental stress of returned overseas Chinese was followed up to evaluate their psychological and emotional changes after returning home. Combined with the country's economic development under the epidemic, the impact of relevant economic factors on their mental stress was analyzed. The results show that in the logistic multiple regression analysis, the mental stress of returned overseas Chinese is affected by many economic factors. Therefore, it can be learned that under the epidemic situation, the national strategy of micro personal emotion regulation through economic recovery and development is correct, and under the influence of economic factors, personal emotional pressure will be significantly affected. Maintaining economic growth can effectively alleviate personal mental pressure.

ANALYSIS ON THE NECESSITY OF CULTIVATING THE MENTAL HEALTH OF STUDENTS MAJORING IN ADMINISTRATION

Xi Chen

School of Public Administration and Policy, Renmin University of China, Beijing 100872, China

Background: Mental health training is an important part of moral education in colleges and universities. In the process of mental health training, cultivate students' positive psychological quality, which can promote the improvement of college students' employment competitiveness and help solve the employment problems of graduates. Positive psychological quality comes from positive psychology. It is a positive psychological state that individuals show in the process of learning and growth. In the face of the challenges brought by work, individuals maintain self-confidence and succeed through action. They show the quality of perseverance in setting goals. In the process of realization, they will make flexible adjustments according to the situation, correctly understand the objective things around them, always maintain a positive state, and maintain a toughness to overcome difficulties and succeed in the face of difficulties. Positive psychological qualities are self-confidence, hope, optimism, resilience and so on. Self-confidence can also be called self-efficacy factor, which is the belief that individuals achieve their goals by using the resources around them. Self-confidence comes from rich experience accumulation, which requires individuals to be fully prepared before completing the task and before starting the task in the process of practice, so as to take into account the possible things, so as to show a kind of self-confidence. In addition, in the process of hard action, we should have positive faith and hope for what we have done. We should maintain an optimistic attitude towards what will happen and analyze what we have at present. In the face of difficulties, we should have a kind of psychological toughness and be able to actively adjust the current direction of efforts, so as to achieve the goal.

In the teaching of administration major in colleges and universities, the employment situation of students majoring in administration is not ideal, and many students have low expectations for the major. Limited by the specialty itself, students have a low sense of professional identity and low sense of self-worth. They feel that the occupation of administration is relatively simple, and the administrative work is cumbersome and boring. Therefore, they are confused about the direction of future employment, and are not very satisfied with the knowledge learned in this specialty. They regret choosing this specialty. The salary income of the administrative management major is not high, which leads to the idea of changing careers in the employment choice of the administrative management major students. They feel that they have wasted campus time and are anxious about their work, resulting in employment anxiety. In addition, students majoring in administrative management have a relatively shallow understanding of the professional role of administrative management. They think that this profession is only a supporting role in serving people, which can not reflect their own value. They think that anyone can do this job, which is not challenging and has a large psychological gap. From the psychological status of college students majoring in administration, we can see that students' satisfaction with their major is not high, and students have mental health problems. It is very necessary to solve students' mental health problems and carry out mental health training. Therefore, in order to guide students to establish correct three views and have a clear professional understanding, it is necessary to carry out mental health training.

Objective: To analyze the mental health problems of college students majoring in administration, study the causes, and explain the necessity of mental health training. On this basis, we should reform the teaching of administrative management, change students' views on the political management profession, find out the role orientation and self-identity, so as to reduce the emergence of mental health problems. Improve students' professional quality, seriously study and practice in the teaching process of administrative management, improve students' psychological tolerance, guide students to establish correct values, mature and improve their own personality, improve students' mental health level under the influence of positive psychological quality, and increase students' employment competitiveness.

Research objects and methods: The research objects are students majoring in administration in school. 180 students majoring in administration were randomly selected from 4 universities. Understand the students' personal situation, learning situation, views on the major of administrative management and employment plan, and carry out the reformed administrative management teaching for the selected students. The experimental time is 2 months, and the relevant experimental data are recorded during the experimental period. The fuzzy evaluation method is used to evaluate the impact of administrative management teaching on the mental health problems of administrative management students after the reform. The quantitative score of relevant influencing factors is 0-4. The score has a positive correlation with the degree of influence, and the experimental data are processed by SAS software.

Results: The cultivation of mental health plays an important role in the teaching of administrative management. Teaching reform should be carried out according to the mental health problems of students majoring in administration. After the teaching reform, the mental health level of students has been improved. The self-confidence score of freshmen is 3. The results are shown in Table 1.

Table 1. Evaluation of students' positive psychological quality after teaching reform

Grade	Self-confidence	Hope	Optimistic	Toughness
Freshman	3	3	3	4
Sophomore	3	3	4	3
Junior	4	4	3	4

Conclusions: Integrate mental health training into administrative management teaching, and carry out targeted teaching reform according to the mental health problems of administrative management students. After the teaching reform, students' learning enthusiasm has been significantly improved, students' sense of professional identity has increased, and students' mental health has been improved.

THE POSITIVE INFLUENCE OF THE CONSTRUCTION OF THE LONG-TERM MECHANISM OF “THREE COMPLETE EDUCATIONS” ON STUDENTS’ MENTAL HEALTH

Hongli Tao

Computer Engineering Technical College (Artificial Intelligence College), Guangdong Polytechnic of Science and Technology, Zhuhai 519090, China

Background: In college education, the cultivation of students' mental health is an important educational content outside the teaching of professional courses. In college learning, the learning tasks faced by students are different from those in the past. Under the multiple influence of environment and learning pressure, students are prone to negative emotions such as psychological anxiety and depression. At the same time, the negative attitude brought by students' negative emotions makes it difficult for students' academic achievement to be significantly improved. In the current college education, the cultivation of students' mental health mainly lies in the high-efficiency ideological and political education. Ideological and political education is the main way to help college students accept and digest correct values, in which the responsibility of ideological and political teachers is extremely important. According to the current situation of ideological and political teaching in colleges and universities, the attention of colleges and universities to ideological and political education still cannot reach the ideal state, which leads to the difficulty of fully solving the psychological problems of students in ideological and political teaching in colleges and universities. And with the continuous progress of modern society, enterprises or units in the society begin to improve the overall high-quality requirements of talents, so it is more necessary to improve the ideological concept of college students. In order to achieve this step, teachers' teaching concept also needs to be improved in line with social development. Teachers' teaching concept directly affects students' psychological and emotional changes in the process of learning, so it is imperative to change teachers' teaching concept.

In order to better carry out ideological and political education and cultivate students' mental health, the party put forward the concept of “three complete educations” in the spirit of the 16th National Congress, hoping to strengthen the ideals and beliefs of college talents with the help of the whole staff, whole process and whole process education mode in the “three complete educations”. The study puts forward the need to build a long-term mechanism for the “three complete educations”, including the institutionalization, procedure and standardization of the “three complete educations”. It is worth affirming that the construction of the long-term mechanism of “three complete educations” will greatly improve the ideological and political education environment in colleges and universities and help teachers obtain more perfect teaching ideas. At the same time, in the construction process of the long-term mechanism of “three complete educations”, it can gradually help teachers acquire new knowledge, establish teachers' unique teaching system, and improve teachers' professional level and teaching ability. Ideological and political education has been significantly improved under the long-term mechanism of “three complete educations”, but how to use the ideological and political education under the long-term mechanism of “three complete educations” to alleviate students' negative psychological emotions and cultivate students' healthy psychology is unknown. Therefore, taking students' mental health as the research object, this paper analyzes the positive impact on students' mental health in the construction of the long-term mechanism of “three complete educations”, in order to provide reference and suggestions for the construction of college teaching system.

Objective: This paper discusses the construction direction of the long-term mechanism of “three

complete educations”, analyzes the impact of the construction of the long-term mechanism of “three complete educations” on the teaching of ideological and political education, and then analyzes the positive impact of ideological and political education on students’ mental health under the construction of the long-term mechanism of “three complete educations”.

Study design: Taking a college student as the research object, this paper uses principal component analysis to determine the specific factors affecting students’ psychological emotion in ideological and political education, so as to improve ideological and political education with the help of the theory of “three complete educations”, and puts forward the long-term mechanism of “three complete educations”, so as to optimize the teaching system of ideological and political education. Select 100 students for teaching practice, evaluate the psychological changes of students before and after teaching, and analyze the impact of the construction of the long-term mechanism of “three complete educations” on students’ mental health.

Results: The psychological changes of students in the construction of the long-term mechanism of “three complete educations” are shown in Table 1. Table 1 shows that students’ negative emotions gradually decrease and positive emotions gradually increase in the teaching process.

Table 1. Psychological changes of students in the construction of long-term mechanism of “three complete educations” ($n=110$)

Project	Before teaching	After teaching	<i>P</i>
Number of positive psychologies	41	97	<0.05
Number of negative psychologies	69	13	<0.05

Conclusions: The cultivation of college students’ mental health is the key content of college education. How to use ideological and political education to establish students’ healthy psychological concept is very important. Based on the long-term mechanism of “three complete educations”, this study discusses the impact of ideological and political education on students’ psychological problems in the construction of the long-term mechanism of “three complete educations”. The results show that the construction of the long-term mechanism of “three complete educations” can effectively help students establish a good positive psychology. Therefore, in the cultivation of college students’ mental health, using new teaching ideas to build and improve the ideological and political teaching system can significantly improve students’ positive psychology and promote students’ future development.

RESEARCH BASED ON THE NEW CONCEPT OF DISABLED PEOPLE’S PSYCHOLOGICAL INTEGRATION AND SOCIAL SUPPORT

Hongbo Chu¹, Yu Wang², Ming Xu¹ & Han Tian³

¹Special Education College, Changchun University, Changchun 130022, China

²Kunming Deaf and Blind School, Kunming Deaf and Blind School, Kunming 650032, China

³School of Marxism, Changchun University, Changchun 130022, China

Background: Under the background of the new era, the main contradiction of society has changed, and the focus of society and government is people’s mental health. With the improvement of people’s material living standards, the mental health of people with disabilities has attracted extensive attention from all walks of life. According to the latest data of China Disabled Persons’ Federation, the proportion of disabled persons in China is as high as 6% of the total population, and this proportion shows an upward trend year by year. Most people with disabilities have different degrees of psychological problems due to the influence of physical diseases or obstacles. According to the medical data, compared with the normal group, the mental health level of the disabled is lower, and they are more prone to negative psychology such as anxiety and depression, which leads to the lower overall mental health level of the disabled. The psychology of disabled people is not only affected by physiological factors, but also by employment conditions. Employment is the main means for the disabled to obtain income, which is also the way for them to integrate into society. It is believed that the level of employment and the quality of mental health of the disabled will also have a direct impact on the level of employment and the quality of life of the disabled. However, there are few studies on the influencing factors of the mental health of the employed disabled, which plays an important role in improving the mental health of the disabled.

Some studies have pointed out that the mental health problems of the disabled are caused by the interaction between the individual and the social environment, and the help and support of the surrounding environment to the disabled is the main reason affecting the mental health of the disabled. Social support is the expressive or instrumental support provided by others. It is real and felt by individuals. It can be divided into subjective support and objective support. Subjective support is to understand social support. It is the subjective feeling and evaluation of the degree of individual support from the outside world, which is also to evaluate the social support from the subjective aspect. Some studies have shown that individuals have a positive effect on self-worth, sense of belonging, sense of goal and self-worth through the integration of social resources, so as to enhance their subjective well-being. Some scholars believe that subjective well-being is closely related to personal mental health. Domain social support plays a positive role in mental health. The greater the domain social support, the more happiness and happiness people feel. In recent years, academic circles generally believe that the disabled and normal healthy people have good social support and social relations, which will promote their physical and mental health.

Objective: In order to analyze the impact of the mental integration and social support model of the disabled based on the new concept of the disabled on the mental health level of the disabled, in order to contribute to the improvement of the mental level of the disabled.

Research objects and methods: 100 disabled people were selected as the research object. After applying the psychological integration and social support model of disabled people based on the new concept of disabled people, the psychological status was evaluated by the ordering points to identify the clustering structure (options) algorithm. The experimental period lasted for 3 months. The evaluation content includes six aspects: self-affirmation, job satisfaction, optimism, resilience, hope and self-efficacy. The evaluation results are analyzed by the five-grade scoring standard of 0-4. 0, 1, 2, 3 and 4 respectively mean no impact, slight impact, impact, strong impact and obvious impact. The ratio of the number of people with improvement rate influence, strong influence and obvious influence to the total number of people. In order to ensure the reliability of the research results, the average value of all objects is taken as the final result.

Methods: Through SPLM data analysis software, this paper analyzes the impact of the mental integration and social support model of the disabled based on the new concept of the disabled on the mental health level of the disabled.

Results: Table 1 refers to the effects on the mental health level of the disabled before and after the application of the mental integration and social support model of the disabled based on the new concept of the disabled. It can be seen from Table 1 that after the application of this model, the mental health level of the disabled has been significantly improved, and the improvement rate shows an increasing trend with the increase of application time. Therefore, from the perspective of the new concept of disability, the psychological integration and social support model of the disabled has a positive psychological intervention effect.

Table 1. The effect of mental integration and social support model of disabled people based on the new concept of disabled people on the mental health level of disabled people before and after application

Mental health indicators	After 1month	After 2 months	After 3 months
Self-affirmation	72.0	81.0	86.0
Job satisfaction	72.0	82.0	87.0
Optimistic	71.0	82.0	84.0
Toughness	74.0	82.0	89.0
Hope	73.0	82.0	86.0
Self-efficacy	75.0	82.0	86.0

Conclusions: The social support program for the psychological integration of disabled people based on the new concept of disabled people proposed by the Institute helps to improve the mental health level of disabled people, which also plays an irreplaceable role in the harmonious development of society.

Acknowledgement: The research is supported by: Jilin Science and Technology Department Project, Research on the Innovation and Development of Disabled Employment Path in Jilin Province Under the Background of Internet, (No. 20180418089FG).

CONSTRUCTION OF COMPUTER TECHNOLOGY PERSONALIZED RECOMMENDATION MODEL BASED ON ALLEVIATING E-COMMERCE USERS' CHOICE ANXIETY

Lixia Zhao

Information Engineering College, Liaoning Institute of Science and Engineering, Jinzhou 121000, China

Background: Choice anxiety disorder has become one of the common diseases of urban people. It is the anxiety caused by being unable to decide when facing many similar choices, which makes people feel panic. Choosing the performance of anxiety disorder will always hesitate, and it is difficult to make the following final conclusion. In the normal view, it is a normal psychological reaction, but there are such people who make any choice, no matter big or small, is very painful for them. This phenomenon is often called choice anxiety disorder. For example, some people think they should choose a more promising industry, college students think they should choose a more ideal university, and bosses think their newly profitable projects could have earned more. With the changes of economic development mode and social and cultural background, people have also changed in the cultural, social and psychological factors of online shopping. Online shopping has overturned the previous consumption mode and brought many problems. Many people are addicted to online shopping, resulting in online compulsive selective anxiety buying behavior, which has a serious impact on people's study and life. Compulsive online shopping choice anxiety disorder refers to a repetitive purchase activity on the Internet without strong purchase intention, accompanied by inner conflict. Individuals have emotional distress, but they can't stop, which seriously affects their study and life. Some scholars use subjective well-being to evaluate the psychological emotion of patients during online shopping. Subjective well-being is a self-perception evaluation composed of positive emotion, negative emotion and life satisfaction. From the definition, it can be seen that patients with obsessive-compulsive online shopping choice anxiety will have a strong emotional component in the process of shopping and are eager to alleviate it through shopping, after that, it often produces negative emotions such as anxiety, which greatly affects the individual's subjective feeling of well-being.

With the rapid development of Internet technology, China's e-commerce has not only developed in the direction of light industry and food industry, but also gradually developed rapidly in the fields of foreign trade, resources and heavy industry, and opened up a new world. At present, the e-commerce personalized recommendation system still has great defects, does not fully consider the perception of user experience, and the research on the needs of users is still insufficient. It also needs practical recommendation to facilitate users' cognition and improve the quality of users' decision-making, so as to alleviate the symptoms of users' choice anxiety. Therefore, this study integrates multi-agent technology into e-commerce personalized recommendation service to alleviate users' choice anxiety.

Objective: With the rapid development of Internet economy, obsessive-compulsive online shopping choice anxiety has become a common problem in the development. Based on obsessive-compulsive online shopping choice anxiety, this study analyzes the current situation of obsessive-compulsive online shopping in patients with choice anxiety, and discusses the relationship between people's online compulsive shopping and subjective well-being, anxiety and depression, advocate people's moderate online shopping from a new perspective.

Research objects and methods: This paper mainly selected 1000 experimental volunteers with online shopping choice anxiety in a city, including 480 boys and 520 girls. The monthly online shopping cost is less than 210-yuan, 703 yuan between 1000-and 2000-yuan, 51 yuan between 2000 and 3000 yuan, and 36 yuan more than 3000 yuan.

Study design: All the experimental volunteers were evaluated by global well-being scale (GWB), Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS), and the correlation between the factors of each scale was analyzed. Among them, GWB includes six factors: worry about health, energy, satisfaction and interest in life, melancholy or happy mood, control of emotion and behavior, relaxation and tension anxiety, with a total of 33 items, including 9 reverse scores. The higher the score, the stronger the subjective well-being. SAS includes 20 items, with grades 1-4. The higher the SAS standard score, the more serious the anxiety symptoms. SDS includes 20 items, which are scored by grade 1-4. It can simply and intuitively reflect the subjective feelings of patients with depression. The higher the SDS standard score, the more serious the depression.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: There was a significant negative correlation between anxiety and depression and the factors and total score of overall well-being ($P < 0.05$). The higher the overall well-being, the lower the degree of anxiety and depression. On the contrary, the lower the level of individual anxiety and depression, the higher the overall well-being. See Table 1.

Table 1. Correlation between anxiety, depression and the total score of overall well-being

GWB	SAS	SDS
Health concerns	-0.404**	-0.370**
Energy	-0.478**	-0.509**
Satisfaction and confidence in life	-0.336**	-0.409**
A melancholy or pleasant state of mind	-0.535**	-0.566**
Control of emotion and behavior	-0.517**	-0.531**
Relaxation and tension anxiety	-0.463**	-0.416**
Total score of overall well-being	-0.618**	-0.628**

Note: * $P < 0.05$, ** $P < 0.01$.

Conclusions: In the Internet era, online shopping consumption subverts the traditional shopping experience. Online items are richer and payment is more convenient. Consumers can buy without leaving home. Therefore, the Internet may lead to more choice anxiety and purchase behavior. Choice anxiety will feel guilt and conflict, so they don't want others to see their shopping behavior, and the concealment of online shopping just meets the requirements. Domestic research on online shopping choice anxiety has just started, but the Internet has penetrated into people's life. It is very necessary to pay attention to people's online shopping choice anxiety and help people face life with a positive attitude.

* * * * *

ANALYSIS ON THE INFLUENCE OF CHANGSHA URBAN BRAND SELF MEDIA COMMUNICATION ON THE PSYCHOLOGICAL EMOTION OF POST-90S GROUPS

Xinhua Wen

School of Literature and Journalism, Hunan University of Technology and Business, Changsha 410205, China

Background: In psychology, psychological emotions such as anxiety, tension, anger, depression, sadness and pain are collectively referred to as psychological negative emotions, sometimes referred to as negative emotions. The reason why people call these emotions is that such emotional experience is not positive, the body will also have discomfort, and even affect the smooth progress of work and life, which may cause physical and mental injury. Some people accumulate negative emotions. If released in the office, such as sighing in front of colleagues, frowning and making bitter gourd faces, negative emotions are likely to infect colleagues and make the atmosphere of the office depressed. If negative emotions are not released, people will hold back "internal injury" and express violence. Once negative emotions occur, you can make yourself in a sweating state by participating in physical exercise or outdoor activities, which is also a process of relaxing yourself. You can also imagine and look forward to some beautiful things to make yourself physically and mentally happy instead of complaining. Of course, the way some people deal with negative emotions is to sleep. There is a feeling that everything is new after waking up. Some people choose to take a bath, take a bath, sauna, massage and other physiological enjoyment to forget their negative emotions. Research shows that about 15%-20% of the general population have emotional disorders and psychological problems. Previous studies have found that these common physical and mental distress may be related to coronary artery disease, but few people have studied whether there is an association between physical and mental diseases and cardiovascular and cerebrovascular diseases. Psychologists concluded that the findings help doctors screen patients from ordinary psychiatric patients, thereby reducing the risk of death from heart disease and stroke.

With the development of Internet technology, cultural soft power has become an important part of urban competitiveness. As an important part of soft power construction, city brand plays an increasingly significant role in establishing city image, transmitting correct values and telling city stories through the popular we media communication. Therefore, the connotation and communication of urban brand have gradually attracted the attention of researchers at home and abroad. Among them, the communication object, communication mode and attitude effect of urban brand have become the key issues to improve the communication quality of urban brand. In particular, the impact of urban brand communication on the psychological emotions of post-90s groups has attracted the attention of the field of psychological research.

Objective: This study introduces the theoretical model of rational behavior, considers the interactive and diversified characteristics of we media communication, and takes Changsha as an example to study the psychological and emotional impact of urban brand we media communication on post-90s groups.

Research objects and methods: This paper mainly selects 318 people in Changsha as the research object, aiming at the post-90s, that is, a group of people born from 1990 to 1999, whose age range is 21 to 31 years old. According to the post-90s education level, there are 27 people below technical secondary school, 144 people at university, 63 people at junior college, 36 people at senior high school, 48 people at master's degree and above, 146 men and 172 women. The proportion is relatively balanced.

Study design: Self-rating Depression Scale (SDS) was used to evaluate the subjects before and after intervention (3 months). SDS mainly includes four dimensions: psych affective disorder (A), somatic disorder (B), psychomotor disorder (C) and the change of depressive psychological disorder (D). The score limit is 53. A score above 53 indicates depression. The lower the score, the healthier the psychology.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: Compared with the three months before the intervention, the total scores of SDS, psych affective state, somatic disorder, psychomotor disorder and depression of the post-90s group after the intervention decreased significantly ($P < 0.05$). See Table 1.

Table 1. Analysis of variance of repeated measurement of depression level in post-90s before and after the experiment

	Time	SDS	A	B	C	D
Research object	Before intervention	52.13	4.39	19.33	5.45	22.92
	After intervention	30.36	2.35	11.93	3.05	11.54
	<i>P</i>	<0.05	<0.05	<0.05	<0.05	<0.05

Conclusions: The communication intention of post-90s groups significantly affects their urban brand attitude, and their communication intention is affected by their information communication attitude and subjective norms. Subjective norms are influenced by the main body of communication. The attitude of information communication is affected by the channel, theme and communication subject, information display form, interactive experience and the initiative of individual information participation. Moreover, the post-90s with different educational levels have different attitudes towards urban brands. According to the conclusion, five suggestions are put forward as follows: coordinate the layout of urban brand and formulate urban brand strategy. Enrich the connotation of urban brands and strengthen the output of positive themes; Empowering we media channels and giving full play to the advantages of multi-level communication subjects. Adapt to the needs of public opinion and innovate communication forms and means. Pay attention to communication and interaction and strengthen the guidance of public opinion.

Acknowledgement: The research is supported by Scientific Research Project of Hunan Provincial Department of Education: Research on the Shaping and Communication Strategy of Changsha's Urban Brand Image (No. 18C0596); Hunan Philosophy and Social Science Fund Project: Research on the Influence of Self-Media Communication on the Attitudes of Changsha City Brands of the Post-90s Group (No. 19YBA120).

ANALYSIS ON THE INFLUENCE OF THE INNOVATIVE DEVELOPMENT OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON ALLEVIATING STUDENTS' ANXIETY

Fangfang Zhang¹ & Kunfan Wang²

¹Academy of Fine Arts, Weifang University, Weifang 261061, China

²School of Humanities and Law, Northeast Forestry University, Harbin 150040, China

Background: Anxiety disorder is different from ordinary mental diseases. It not only has all negative emotions, but also may be the accumulation of all kinds of negative emotions. The physiological characteristics of anxiety disorder include insomnia, dreaminess, general weakness, dizziness, headache, dry mouth, loss of appetite, frequent urination, etc. Intellectual characteristics include inattention, dizziness, thinking disorder, etc. Emotional characteristics include irritability, tension, uneasiness, pessimism, etc. The main social characteristics are lack of self-confidence and inferiority. Some studies have pointed out that personality, growth environment and living experience are the main influencing factors of college students' anxiety. College students' anxiety can be divided into five types: learning, economy, emotion, social interaction and employment. College students' anxiety is generally reflected in their psychological anxiety and moral anxiety. Although moderate anxiety has certain positive significance

to life, anxiety is always a negative emotion. Excessive anxiety will bring a series of negative effects to life. Once anxiety is generated, you can make yourself in a sweating state by participating in physical exercise or outdoor activities, which is also a process of relaxing yourself. You can also imagine and look forward to some beautiful things to make yourself physically and mentally happy instead of complaining. Of course, the way some people deal with negative emotions is to sleep. There is a feeling that everything is new after waking up. Some people choose to take a bath, take a bath, sauna, massage and other physiological enjoyment to forget their negative emotions. Anxiety is not only harmful to physical and mental health, but also accompanied by many bad emotions, such as serious sleep disorders, cognitive disorders, mental disorders and so on. Mental health education is an important part of ideological and political education in colleges and universities, but the traditional mental health education of college students generally lacks attention to anxiety. Therefore, this study discusses the impact of the innovative development of ideological and political education on alleviating college students' anxiety, in order to study the characteristics and adjustment countermeasures of contemporary college students' anxiety.

Objective: This study discusses the impact of the innovative development of ideological and political education in colleges and universities on alleviating college students' anxiety, in order to study the characteristics and adjustment countermeasures of contemporary college students' anxiety.

Research objects and methods: In order to alleviate the anxiety of college students, 400 college students with anxiety in a school were selected for questionnaire survey, and the students were randomly divided into two groups. The experimental group, composed of 200 students, gave education to the innovative development model of ideological and political education in colleges and universities. The duration of the experiment was 2 months. The control group consisted of 200 students. The group did not receive special education but only daily education within 2 months. The age range of all college students remained between 18 and 21, with an average age of 19.7.

Study design: Using ideological and political education program to analyze the influencing factors of mood in patients with anxiety disorder, and 200 patients were investigated. After the intervention, a questionnaire survey was conducted on college students with anxiety disorder. According to the survey results, the anxiety and depression of the two groups were mainly analyzed. Among them, anxiety status: the Self-rating Anxiety Scale (SAS) was used to evaluate before and after the intervention (2 months). The score limit was 50 points. More than 50 points indicated anxiety status. The lower the score, the healthier the psychology. Depression: Self-rating Depression Scale (SDS) was used to evaluate before intervention and after intervention (2 months). The score limit was 53 points. More than 53 points indicated depression. The lower the score, the healthier the psychology.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After the intervention, the scores of the experimental group were significantly lower than those of the control group, and the difference was statistically significant ($P < 0.05$), as shown in Figure 1. This not only shows the effect of ideological and political education on the psychological improvement of young college students, but also shows that the effect of this intervention is significantly better than that of routine daily education. The ideological and political education mode embodies the characteristics of personalization, which can let patients put down their guard, so as to greatly eliminate the symptoms of anxiety and depression.

Figure 1. The anxiety and depression of the two groups were compared

Conclusions: The innovative development of ideological and political education in colleges and universities has a great impact on the physical, psychological and behavior of students with anxiety disorder. Anxiety patients with different personalities can adopt different treatment methods, and patients can get diversified and all-round treatment. Different forms of ideological and political education take ideological and political education as the core guiding ideology, but its methods have significant diversity, which can guide students to think from different angles and achieve the purpose of alleviating teenagers' anxiety.

* * * * *

CONSTRUCTION OF NEW RETAIL SMART CIRCULATION SUPPLY CHAIN SYSTEM UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Xiling Yang

College of Business Administration, Henan Finance University, Zhengzhou 451464, China

Background: The human brain is involved in a wide range of cognitive functions, including learning, memory, language, movement, thinking, creation, spirit, emotion, etc. Therefore, the manifestations of cognitive impairment are also diverse. These manifestations can exist alone, but they often appear together. Cognitive impairment mainly includes: perceptual impairment, such as sensory allergy, sensory retardation, internal discomfort, sensory deterioration, sensory deprivation, pathological illusion, hallucination and perceptual comprehensive disorder. Memory impairment, such as strong memory, memory defect and memory error. Thinking obstacles, such as abstract generalization process obstacles, association process obstacles, thinking logic obstacles, delusions, etc. There are many reasons for the above cognitive impairment, most of which are caused by mental disorders, except for organic diseases. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder, senile dementia, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression and so on. For patients with obvious mental and neurological symptoms, such as depression, anxiety and sleep disorder, symptomatic treatment can be carried out according to their condition. On the basis of traditional retail, new retail uses big data and artificial intelligence to accurately mine, locate and guide the consumption needs of online and offline consumers, and quickly improve consumers' shopping experience and meet consumers' escalating consumption needs through a flexible and efficient intelligent supply chain. The new retail reshapes the "people, goods and market" of traditional retail, that is, "customers, categories and scenes". Whether it is "new retail" or "traditional retail", in essence, the ultimate goal is to meet the changing needs of consumers. In the new retail era, the supply chain response ability of retail enterprises is very important. The survey shows that retail enterprise managers generally believe that the biggest challenge in the retail industry is supply chain management. The smart supply chain in the new retail era will no longer be a simple internal support function, but a comprehensive service support function. When designing the smart supply chain from the perspective of consumer demand, we pay more attention to the flexibility and accuracy of the supply chain rather than pursuing economies of scale. End to end data collection and end-to-end operation can quickly respond to the changing picky needs of consumers.

Objective: This study discusses the impact of the construction of the new retail smart circulation supply chain system on alleviating patients with cognitive impairment, and aims to study the characteristics and improvement promotion of the new retail smart circulation supply chain system on patients with cognitive impairment.

Research objects and methods: 400 patients with cognitive impairment were divided into control group (200 cases) and observation group (200 cases). The observation group was given the intervention scheme under the construction mode of new retail smart circulation supply chain system, and the control group was given the routine intervention scheme.

Research design: Before and after the construction of the new retail smart circulation supply chain system, all subjects were evaluated with the Mini-mental State Examination (MMSE), including memory, attention, understanding and time orientation, with a total score of 0-30, which is directly proportional to their ability. The Activities of Daily Living (ADL) was used for evaluation, which involved eating, dressing, grooming, toilet and other dimensions. The total score was 0-100, and the score was in direct proportion to the ability. Judge the curative effect of the new retail smart circulation supply chain system on patients with psychological cognitive impairment.

Methods: The relevant data were analyzed by Excel and SPSS20.0 for calculation and statistics.

Results: There was no significant difference in MMSE score and ADL score between the two groups before intervention ($P > 0.05$). However, after the intervention, the score of the observation group was significantly

higher than that of the control group ($P < 0.05$). As shown in Figure 1.

Figure 1. The improvement effect of cognitive impairment in the two groups before and after intervention

Conclusions: The smart supply chain in the new retail era can help retail enterprises better deal with the challenges brought by the highly competitive retail market, diversified consumption channels, rapidly fluctuating market and changing consumer demand. The data collection of smart supply chain is also end-to-end. The data collection of smart supply chain will continue to extend from internal to external, from operation data to consumer behavior data to market and public opinion data, so as to realize comprehensive end-to-end data visualization of supply chain. From R & D to consumers, the circulation chain of smart supply chain has been gradually shortened, and the data flow cost has been continuously reduced. The repeated data processing and analysis separated from each link of the traditional supply chain is transformed into the interconnected mesh data flow and traceable transparent data of the intelligent supply chain, which integrates the originally lengthy and fragmented supply chain, improves the flexibility of the supply chain, makes it closer to consumers and provides the ultimate consumer experience. Smart supply chain gives cold supply chain temperature and passion through closer connection between data and consumers and commodities, so as to enable end consumers to obtain the ultimate shopping experience.

ANALYSIS ON TALENT TRAINING MODE AND REFORM PATH OF UNIVERSITY THINK TANKS FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Wentao Wang

Party Committee Office, Changzhou University, Changzhou 213164, China

Background: The incidence of cognitive impairment is very high in schizophrenia. About 85% of patients will have cognitive impairment, such as information processing and selective working memory, short-term memory and learning, executive function and so on. There is a certain correlation between cognitive deficit symptoms and other psychotic symptoms. For example, patients with obvious thinking form disorder will have more obvious cognitive deficit symptoms, and patients with obvious positive symptoms will also have more obvious cognitive deficit symptoms. Mild Cognitive Impairment (MCI) is a transitional state between healthy aging and Alzheimer's disease (AD). It is recognized by researchers and clinicians as a "window" for teaching and delaying the development of AD. Moreover, the global prevalence of MCI is 9.6%-21.6%, which is considered to be a precursor of AD. Therefore, the study of cognitive impairment is particularly important. The research shows that the talent training mode of university think tank has a positive impact on the cognitive function of MCI patients. It is a non pharmacological method to delay the decline of MCI cognitive function. At present, the mental health problems of college students in China have attracted more and

more attention. Because college students are generally under the pressure from school, family, society, employment and other aspects, there are more and more mental health problems, especially mental diseases such as cognitive impairment. Therefore, it is necessary for colleges and universities to reform the talent training mode and integrate physical and mental health.

University think tank is an organization set up in colleges and universities to carry out policy research and decision-making consultation. The organization affects the process of public policy formulation and implementation by forming public policy ideas and cultivating innovative talents. The new think tanks have bid farewell to the positioning of early think tanks with policy research as the core function. Instead, they aim to enhance global competitiveness, build a diversified policy network, emphasize the role of “evidence-based” think tanks, and play a bridge between knowledge and policy supported by research and data. In recent years, China’s university think tanks have developed into an important part of the national think tank system by giving full play to the special advantages of complete disciplines, talent aggregation and high degree of internationalization. However, their main functions are more reflected in decision-making consultation. The function of talent training and the mental health of talents have not been paid enough attention.

Objective: To carry out teaching practice based on the innovative mode of talent training of think tanks for college students, in order to eliminate and improve the symptoms of cognitive impairment of college students, so as to further improve the ability of talent training in colleges and universities.

Research objects and methods: 400 college students with cognitive impairment in colleges and universities in a region were selected as the research object. The students were divided into control group and experimental group, with 200 students in each group for three months. The experimental group used the innovative mode of talent training based on think tanks for teaching, and the control group used conventional teaching courses. Analyze and compare the remission of cognitive impairment between the two groups of college students before and after teaching.

Research design: MMSE was used to evaluate before and after teaching (3 months), including memory, attention, understanding and time orientation. The total score was 0-30, and the score was directly proportional to ability. The ability of daily living (ADL) was evaluated before and after teaching (3 months), involving eating, dressing, grooming, toilet and other dimensions. The total score was 0-100, and the score was in direct proportion to the ability.

Methods: The relevant data were analyzed by Excel and SPSS20.0 for calculation and statistics.

Results: There was no significant difference in MMSE and ADL scores between the two groups before teaching ($P > 0.05$). After teaching, the scores of the observation group were significantly higher than those of the control group ($P < 0.05$).

Table 1. The cognitive function and activities of daily living of the two groups were compared

Group	MMSE		ADL	
	Before teaching	After teaching	Before teaching	After teaching
Control group	12.48	20.42	43.17	60.28
Experience group	11.47	22.63	44.24	65.03

Conclusions: Colleges and universities can rely on the university think tank platform to innovate the student guidance system, formulate and implement talent training plans such as “compound talent training plan” and “interdisciplinary innovation research plan”. Specifically, domestic colleges and universities can learn from the student guidance system of world-famous universities such as Harvard University and Princeton University, and establish a student “revolving door” system based on the college and think tank platform with the link of project or research team, that is, the whole university selects outstanding students with different academic backgrounds, and the think tank project research team forms an “interdisciplinary tutor group”, guide students’ learning from interdisciplinary knowledge and interdisciplinary research methods, so that students can quickly obtain interdisciplinary knowledge and research methods, and further improve students’ knowledge structure system.

Acknowledgement: The research is supported by: Jiangsu University Philosophy and Social Science research project “Analysis on The Development Status and Path of Talent Team Construction of University Think Tank” (2017SJB1784).

OPTIMIZATION OF THINKING LOGIC OBSTACLE ANALYSIS IN COMPUTER TECHNOLOGY ALGORITHM SIMULATION EXPERIMENT

Xiangli Zeng

Information Engineering School, Jiaozuo Normal College, Jiaozuo 454000, China

Background: Thinking is the reflection of human brain's indirect generalization of objective things and the highest form of human cognitive activities. The materials obtained from perception form concepts through brain analysis, comparison, synthesis, abstraction and generalization. The whole process is called thinking. The process of normal thinking is purposeful, coherent and logical. The specific practice of thinking can get a result and correct the result. Thinking is a pathological state that lacks its inherent logical connection and cannot be understood by normal people, which is called thinking logic disorder. Thinking disorder belongs to a group of important symptoms of mental patients. Because the symptoms of such patients are mainly expressed through language, we can judge whether they have thinking disorder through the expression of patients. At present, the specific manifestations of thinking disorders in clinic mainly include four categories: thinking speed disorder, thinking form disorder, thinking control disorder and thinking content disorder. This classification is suitable for clinical diagnosis, but it focuses on the research of schizophrenic thinking disorder, and pays less attention to organic encephalopathy or other mental thinking disorders. College students should get rid of their own logical thinking obstacles, such as the inability to accurately grasp the connotation of concepts, the misjudgment of reasoning premise, the inversion of cause and effect and so on. There are many different classifications of thinking disorders, including thinking speed disorder, thinking form disorder, lack of purpose orientation, pathological symbolic thinking and so on. Patients occasionally feel that their thinking does not belong to them, that their thinking activities lose their autonomy, or that they are controlled by external forces, such as thinking deprivation, thinking insertion, thinking dissemination and other experiences. People's normal thinking activities have their corresponding introspective experience and can control their own thinking activities. If the thinking activity is abnormal and changes the normal thinking characteristics, it can be called thinking obstacle. With the continuous development of computer technology, machine learning has been widely used in various fields in recent 20 years. In particular, deep learning has achieved unprecedented success in dealing with tasks that need human perception, and natural science is one of the highest achievements of human wisdom. Therefore, using Machine Learning (ML) to solve natural science problems has also become a hot spot in AI circles in recent years. However, the virtual simulation experiment of computer technology algorithm still needs to be further improved. In various virtual experimental environments realized by virtual reality technology, the experimenter can complete various predetermined experimental projects as in the real environment, and the learning or training effect is equal to or even better than that obtained in the real environment. Virtual simulation experiment is an interactive environment for creating and guiding simulation experiments, which is composed of simulation programs, experimental units, tools and references. Users can expand and enrich the laboratory by adding new objects, establishing new experiments and transforming them into hypertext files.

Objective: In the research of computer technology algorithm simulation and optimization, university laboratories need to focus on the problem of thinking logic obstacles in the process of computer technology algorithm simulation and optimization of college students. The purpose of this study is to explore the impact of college students' computer technology algorithm simulation and optimization on college students' thinking logic obstacles.

Research objects and methods: In order to verify the effectiveness of computer technology algorithm simulation optimization teaching in improving patients with thinking logic disorder, 200 students with thinking logic disorder in colleges and universities in a region were selected as the research objects. The subjects were randomly divided into experimental group and control group, with 100 people in each group. The experimental group was given computer technology algorithm simulation optimization teaching. The control group used routine teaching. This paper analyzes the effect of computer technology algorithm simulation optimization teaching to improve students' thinking logic obstacles.

Research design: This study uses the self-designed "college students' thinking logic disorder diagnosis scale" to evaluate students. The scale is divided into qualitative and quantitative, with a full score of 10. The lower the score, the healthier it is.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: After teaching, the total score of thinking disorder in the experimental group decreased significantly ($P < 0.01$), while there was no significant change in the control group ($P > 0.05$).

Conclusions: In terms of simulation hardware, digital computers have been used more than analog computers since the 1960s. Hybrid computer system once stagnated in the 1970s and has a development trend since the 1980s. Due to the development of minicomputers and microprocessors, as well as the

adoption of pipeline principle and parallel operation, there has been a new breakthrough in the improvement of digital simulation operation speed. In terms of simulation software, in addition to further developing interactive simulation language and more powerful simulation software system, another important trend is to combine simulation technology with artificial intelligence to produce simulation software with expert system function. The scale and complexity of simulation models and experimental systems are growing, and the research on their effectiveness and confidence will become very important.

Table 1. Comparison of scale scores between the two groups before and after intervention

Group	Before teaching	After teaching
Experience group	3.20	2.71*
Control group	3.21	3.125
<i>t</i>	0.395	2.863
<i>P</i>	0.807	0.021

Note: Comparison of this group, * $P < 0.05$.

EVALUATION AND CONSTRUCTION OF BUSINESS ENVIRONMENT FOR THE DEVELOPMENT OF PRIVATE ECONOMY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Lai Wei

School of Economics, Management and Law, Shenyang Institute of Engineering, Shenyang 110136, China

Background: Social psychology is a thinking pattern formed by subjective and subtle evolution. For example, people's understanding of people in a certain country, even if they have not been there or seen it, will think of a certain model, or even biased and extreme elements. For example, in the eyes of many Europeans and Americans, China is still what it was before the reform and opening up, even in the Qing dynasty. Social psychology refers to the whole social psychological state that permeates the society and its groups in a specific period of time. It is the sum of the emotional tone, consensus and value orientation of the whole society. People's general feeling and understanding of social phenomena is a form of social consciousness. It is reflected in people's general life emotions, attitudes, remarks and habits. Social psychology is spontaneous and messy. It is a primary and intuitive reflection of social life. People's social psychological status ultimately depends on the reality of social life, which is directly formed by the stimulation and understanding and feeling of various signs of real life. Social psychology promotes a certain social atmosphere. Ideological system and social psychology are two categories of social consciousness in the field of historical materialism. The former is the advanced form of social consciousness, and the latter is the primary form of social consciousness. This primary form is the basic premise for the formation of ideological system. Due to the different subjects of social consciousness, social psychology is divided into individual psychology and group psychology.

Business environment is an important factor for the healthy growth of private enterprises and the development of private economy. The evaluation and construction of business environment of private economy is of great significance to the development of private economy. In order to attract domestic and foreign investment, the Chinese government has promoted the introduction of many measures to optimize the business environment. Some scholars analyzed the characteristics and challenges of China's competitiveness, the advantages and disadvantages of the macro environment, internal and external challenges and measures to enhance competitiveness. Some scholars have also constructed the tax business environment index system and found that the tax environment shows the characteristics of balanced regional development but low enterprise satisfaction. The research also shows that in a better business system environment, the higher the proportion of time spent by enterprises on production management compared with foreign public relations entertainment, which provides policy enlightenment for improving the policy environment. Generally speaking, the current research mostly evaluates the state-owned business environment and provides relevant suggestions from a certain angle or based on a certain report, and there are few results of multi angle analysis.

Objective: With the slowdown of global economic development, the business environment for the development of private economy needs to be improved. Managers of private enterprises often have negative emotions such as irritability and anxiety, and even cause psychological diseases such as anxiety and

depression, which seriously affect the physical and mental health of enterprise managers, and thus affect their daily life and work. Based on the theory of social psychology, this study constructs a business environment evaluation model for the development of private economy, improves work efficiency, reduces workload, and then alleviates the anxiety and depression of private enterprise managers.

Research objects and methods: In this study, 120 management workers with anxiety symptoms in 30 private enterprises were selected as the research objects. They were randomly divided into research group and control group by random number table method, with 60 people in each group. The research group was given the working mode of the business environment evaluation model for the development of private economy based on social psychology, and the control group was given the traditional method to work.

Study design: Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and hospital anxiety and Depression Scale (HADS) were used to evaluate the mental health status of patients.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After the intervention, the scores of SAS, SDS and HADS in the study group were significantly lower than those in the control group ($P < 0.05$).

Figure 1. Comparison of SAS, SDS and HADS scores between the two groups

Conclusions: China's relevant financial institutions should continue to provide financing support for China's private enterprises in high-tech industries such as artificial intelligence and robots. Focusing on optimizing the business environment of the private economy, the Chinese government has issued relevant simplification plans and measures, and local governments have also established relevant e-government platforms and adopted measures such as "running once at most" and "one network" to greatly improve the efficiency of government affairs and reduce the operating costs of enterprises. In the future, we should further strengthen the publicity and interpretation of policies, implement key policies, and implement the government supervision and accountability system to ensure the real effectiveness of policy implementation. In addition, in terms of the protection of minority shareholders' rights and interests, corresponding laws and regulations should also be issued to strengthen the protection.

Acknowledgement: The research is supported by: This paper is a phased result of the Scientific Research Fund Project of Education Department of Liaoning Province in 2021 "The Research of Shareholder Dispute Arbitration Mechanism Based on World Bank Doing Business Environment Evaluation Index" (No. LJKR0534).

CONSTRUCTION OF LEGAL PROTECTION SYSTEM FOR THE RIGHTS AND INTERESTS OF PATIENTS WITH DEPRESSIVE MENTAL DISORDERS

Yan Lei

Department of Law, Shaanxi Police College, Xi'an 710021, China

Background: Depressive mental disorder belongs to manic depression. The mental disorder is characterized by slow thinking, depressed emotion, don't want to talk, don't want to go out, mostly just stay at home and slow response to the outside world. It will even have a serious impact on life and work, and make the family bear a greater burden. Relevant research shows that one in ten patients with mental depressive disorder die of suicide, and depressive disorder ranks high in the disease burden in China. The

depression of patients can be divided into mild and severe according to the degree of symptoms. Mild depression will lead to decreased interest, depression and lack of pleasure in the surrounding things. Patients with severe depression will be in a state of pessimism and despair. They feel very painful every minute and have no hope of survival. They will have criminal delusions and hallucinations. Decreased will activity is a symptom of depressive mental disorder. Patients will live a more passive life and are unwilling to contact with others. They usually stay alone in a corner or stay closed, and even affect their normal life and don't care about their image, if you don't pay attention to the hygiene of living habits, sometimes you will say nothing and don't eat, showing painful emotions, and holding your fingers and walking back and forth. Serious decline in will activity will lead to negative and pessimistic thoughts, the concept of suicide, and think that they have no survival value in the world and are redundant people. In addition, depressive mental disorder will also have cognitive impairment and somatic symptoms. In terms of cognitive impairment, patients will not remember recent events, lose attention, slow response to things, increase vigilance, poor ability in abstraction and association of things, unable to carry out normal learning, slow learning speed, stumbling in language expression, gradually weaken the sense of direction, cannot remember the route they have traveled, and their body movements are obviously less flexible and rigid than before. In physical symptoms, sleep disorders occur. The patient's appetite decreases, his weight will slowly drop, and he will be tired and weak. Obviously, it can be seen that the quality of life of patients with depressive mental disorders is not high, and they need the help of others in life. They should be given legal protection to ensure that the life of patients with depressive mental disorders can be carried out normally. In this regard, the construction of the legal protection system for the rights and interests of patients with depressive mental disorders is studied to protect the legitimate rights and interests of patients with depressive mental disorders.

Objective: To understand the current living situation of patients with depressive mental disorders in China, analyze the theoretical basis of legal protection of the rights and interests of patients with depressive mental disorders, as well as the current situation and existing problems of relevant legal protection in China. Based on the legal protection of rights and interests in other countries, clarify the basic principles of constructing the law and the rights and interests that patient with depressive mental disorders should enjoy. By determining the responsibility of guardians and formulating relevant punishment systems, we can ensure the life of patients with mental depression. Improve the relevant supervision system, strengthen the supervision of patients, and carry out psychological intervention to alleviate their depressive mental disorders. Finally, through the construction of the legal protection system, let the depressed mental patients enjoy the legitimate rights and interests, and ensure that their life can continue normally.

Research objects and methods: The research objects are patients with depressive mental disorders. Understand the current living conditions, family conditions and condition of patients with depressive mental disorders, analyze the relevant application functions of the constructed legal protection system for the rights and interests of patients with depressive mental disorders, and record the relevant data. The influence of the legal protection system of rights and interests on patients with depressive mental disorders was evaluated through fuzzy evaluation, and the relevant influencing factors were quantified. The score was 1-5 grade, which was positively correlated with the degree of influence, and the SAS software was used to process and analyze the data.

Results: Patients with depressive mental disorders had different degrees of disorders in mood, thinking, will, cognition and body. The quality of life of patients decreased significantly. Their life and work cannot be carried out normally. In serious cases, it will bring a heavy burden to the family, and the legitimate rights and interests of patients cannot be guaranteed. As the best weapon to protect citizens' legal rights, law can be applied to the protection of the rights and interests of depressive mental disorders. According to the situation of patients with depressive mental disorders, we should build a legal protection system for their rights and interests. Through the construction of the legal protection system of rights and interests, the legitimate rights and interests of patients are protected. In the construction of the system, the impact score of improving the compulsory medical system on young patients with depressive mental disorder is 5 points. The results are shown in Table 1.

Table 1. Influence of legal protection system of rights and interests on patients with depressive mental disorder

Age group	Improve the compulsory medical system	Improve the supervision system	Determine the responsibilities of Guardians
Youth	5	5	4
Young and middle-aged	4	4	5
Middle age	5	5	5

Conclusions: By constructing the legal protection system for the rights and interests of patients with depressive mental disorders, the legitimate rights and interests of patients can be guaranteed. Clarify the responsibilities of the guardian, so that patients can get basic care and ensure the quality of life. Under the perfect supervision system, the patient's condition has been timely intervened, and the depressive mental disorder has been alleviated, which is expected to recover.

RESEARCH AND EXPLORATION ON THE NEW MODEL OF FINANCIAL AND ACCOUNTING EDUCATION STRUCTURE IN COLLEGES AND UNIVERSITIES UNDER COGNITIVE IMPAIRMENT

Yun Bai¹, Pengsong Guo² & Suiming Yang³

¹*School of Humanities and Management, Xi'an Traffic Engineering Institute, Xi'an 710300, China*

²*Air and Missile Defense College, Air Force Engineering University, Xi'an 710038, China*

³*Zte Institute of Communication, Xi'an Traffic Engineering Institute, Xi'an 710300, China*

Background: Cognition refers to a process in which the human brain processes external information and transforms it into internal psychological activities or understanding. Cognition involves a wide range, including memory, language, logical reasoning and so on. When an individual's cognitive function is impaired in any aspect, cognitive impairment occurs. Cognitive impairment, also known as cognitive impairment, is mainly caused by various external influencing factors or internal pathological factors. When the brain's advanced intelligent processing process related to learning, memory and thinking is abnormal, which leads to a series of manifestations such as aphasia, apraxia, learning impairment and memory impairment, it can be judged that the individual has certain cognitive impairment. There are many types of cognitive impairment, and they are closely related and can affect each other, which greatly hinders the accuracy of diagnosis and the effectiveness of treatment. The basic causes of cognitive impairment show a certain diversity. Brain aging, craniocerebral trauma, cerebrovascular diseases, chronic systemic diseases, mental and psychological states, environmental factors and so on may lead to a great negative impact on the high-level neurological function of individual cerebral cortex, resulting in cognitive impairment of different severity. As a kind of mental disease, the psychological state of patients with cognitive impairment is extremely unstable. Patients with cognitive impairment will not only show typical symptoms such as memory impairment, visuospatial impairment, executive dysfunction and computational impairment, but also may have a series of complications, which will eventually lead to the loss of basic daily living ability, which is a heavy burden for patients and their families. At present, the social economy is showing a rapid development trend, and the problem of less reserve of accounting professionals is becoming more and more obvious, which is difficult to meet the needs of social and economic development. In the traditional mode of financial and accounting education in colleges and universities, there are a series of problems, such as outdated teaching methods, single teaching means, lack of rationality of teaching structure and so on. This will lead to greater pressure on college students majoring in finance and accounting, and then cognitive impairment. In the new economic form, it is very important to optimize the structure and mode of accounting education in colleges and universities. Through the improvement and innovation of teaching methods, we can deepen and implement the reform measures of accounting teaching, so as to improve the teaching effect and students' mental health level, and finally effectively improve the cognitive impairment of college students.

Objective: The rationality of financial and accounting education structure in colleges and universities plays a decisive role in its educational effect. The research will make an in-depth analysis of college students with cognitive impairment, in order to obtain the application effect of the new model of financial and accounting education structure in colleges and universities, as well as the impact of the model on students with cognitive impairment.

Research objects and methods: 47 accounting students with cognitive impairment, a total of 94, were randomly selected from the accounting majors of the two universities. Based on the model of "three rings, four sides and independent development", we should update the structure of financial and accounting education in colleges and universities. The Montreal Cognitive Assessment (MoCA) is used to compare and analyze the cognitive impairment of students before and after the implementation of the new model of financial and accounting education structure in colleges and universities. Combined with students' mental health status and financial and accounting professional learning results, we can obtain the impact of the new model of financial and accounting education structure in colleges and universities on students with

cognitive impairment.

Research design: Taking principal component analysis as the main research method, and taking the new model of financial and accounting education structure in colleges and universities as intervention measures. 94 students with cognitive impairment were asked to receive a three-month educational intervention. By comparing and analyzing the level of cognitive impairment of students before and after the intervention, we can know the application effect of the new model of financial and accounting education structure in colleges and universities. The MoCA used is mainly to evaluate the functions of cognitive fields such as memory, language and executive function, with a total score of 30 points. If the student's MoCA evaluation score is not less than 26 points, it indicates that he does not have cognitive impairment.

Methods: SPSS24.0 and Excel software sort out and analyze the obtained data information.

Results: Table 1 shows the application effect of the new model of financial and accounting education structure in colleges and universities, which is specifically reflected in the change of students' cognitive impairment level. According to Table 1, before the implementation of the new model of financial and accounting education structure in colleges and universities, students' cognitive impairment symptoms were more serious and their MoCA score was low. After the implementation of this model, the MoCA score of the tested students increased significantly.

Table 1. The impact of the new model of financial and accounting education structure in colleges and universities on the level of students' cognitive impairment

Evaluation time	Before intervention	One month intervention	After 2 months intervention	After 3 months of intervention
MoCA score	12.34±1.25	14.78±1.07*	21.85±1.13*	28.59±1.02*

Note: Compared with that before implementation, * $P < 0.05$.

Conclusions: Cognitive impairment has a great negative impact on students majoring in finance and accounting. After analyzing the performance of students' cognitive impairment, the proposed new model of college finance and accounting education structure can significantly improve students' cognitive impairment and ensure the learning effect of accounting courses on the basis of alleviating their cognitive impairment.

* * * * *

COOPERATIVE EDUCATION STRATEGY OF TRACK AND FIELD TEACHING IN COLLEGES AND UNIVERSITIES AND ITS IMPACT ON COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY

Yanbo Wang

Sport University, Inner Mongolia Minzu University, Tongliao 028000, China

Background: In the current environment of increasing social competition, anxiety has become a common negative emotion. College students are in an important turning stage of life, and their social role and psychological maturity will change to a certain extent. When they face various external pressure sources, they are likely to have different degrees of psychological anxiety. The causes of college students' psychological anxiety have a certain diversity, mainly covering six levels: Freshman anxiety, academic and examination anxiety, employment anxiety and interpersonal anxiety. The so-called freshman anxiety mainly refers to that when most college students enter the university campus, they are difficult to adapt to the forced and independent environment. When they bear heavy academic tasks, they also need to deal with their daily life independently. The change of the external environment and the transformation of their own roles make college students show some weakness in coping, which leads to freshman anxiety. Academic and exam anxiety refers to that college students will show some tension or worry in the face of credit requirements when facing the knowledge difficulty that is completely different from that of high school courses. They are too worried that they will not be able to successfully pass the exam and obtain the corresponding credits, and then lose their confidence and toughness in taking the exam, and finally face the college exam and daily learning with a negative attitude. Employment anxiety usually appears near graduation. In the process of job hunting in many job fairs, written tests and interviews, college students may encounter blows such as rejection of resumes and failure of interviews. With the extension of the job-hunting period, college students' job-hunting confidence will gradually weaken and eventually produce

employment anxiety. Interpersonal anxiety refers to that when facing classmates or roommates from all over the world, college students often fail to properly deal with interpersonal relationships or even give up making friends due to their introverted and shy personality and differences in personal living habits. College students with psychological anxiety will be negatively affected in their normal learning activities and daily life, which will greatly hinder their all-round development.

The cooperative education strategy of track and field teaching in colleges and universities refers to the integration of physical education curriculum into the comprehensive promotion of moral education curriculum. Although the teaching of track and field specialty is a physical education discipline, there are moral education materials integrating richness and diversity in its subject knowledge and skills. Using track and field teaching in colleges and universities to implement collaborative education strategy can effectively cultivate college students' moral ideas, emotional attitudes and values on the basis of improving their physical quality. The integration of track and field teaching and moral education can promote the all-round development of college students. When the cooperative education strategy shows a certain implementation effect, the ideological and moral and mental health level of college students will be improved, and their psychological anxiety will be effectively alleviated.

Objective: To explore the implementation path of collaborative education strategy of track and field teaching in colleges and universities, and its impact on college students' psychological anxiety. The purpose of the research is to ensure the application effect of collaborative education strategy of track and field teaching and promote the alleviation of college students' psychological anxiety.

Research objects and methods: Through the random number table method, 145 college students with psychological anxiety were selected as the research objects. Hamilton Anxiety Scale (HAMA) and Beck Anxiety Inventory (BAI) were used to evaluate the anxiety of college students.

Research design: Before and after the implementation of collaborative education strategy in track and field teaching in colleges and universities, HAMA and BAI were used to evaluate the psychological anxiety of 145 college students. HAMA adopts grade 5 evaluation standard, from 0 to 4, indicating asymptomatic, mild, moderate, severe and extremely severe. It is mainly divided into 14 evaluation items, including anxiety, fear, tension, cognitive function, etc. HAMA's score threshold for judging whether there is psychological anxiety is 14 points. If it is greater than 14 points, it indicates that the subject is accompanied by anxiety.

Methods: Factor analysis is used to evaluate the influence of collaborative education strategy of track and field teaching in colleges and universities on college students' psychological anxiety. The HAMA and Bai data were statistically analyzed by MATLAB software. All measurement data were expressed in the form of mean \pm standard deviation, and $P < 0.05$ was taken as the standard with statistical significance.

Results: Before and after the implementation of the collaborative education strategy for track and field teaching in colleges and universities, the psychological anxiety scores of college students are shown in Table 1. According to Table 1, compared with that before the implementation, the HAMA score and BAI score at different time nodes after the implementation showed different degrees of reduction, and the psychological anxiety of college students was significantly alleviated, and the difference was statistically significant ($P < 0.05$).

Table 1. Evaluation results of psychological anxiety at different time nodes before and after the implementation of collaborative education strategy for track and field teaching in colleges and universities

Evaluation time	HAMA score	BAI score
Before implementation	28.17 \pm 1.04	35.66 \pm 1.27
1 week after implementation	26.35 \pm 1.13*	31.73 \pm 1.09*
1 month after implementation	12.44 \pm 1.07*	22.58 \pm 1.15*
3 months after implementation	6.52 \pm 1.05*	15.49 \pm 1.12*

Note: Compared with that before implementation, * $P < 0.05$.

Conclusions: The collaborative education strategy of track and field teaching in colleges and universities has a good implementation effect. After the implementation of this strategy, the HAMA score and Bai score of college students are reduced to varying degrees. Three months after the implementation, the results of HAMA score and Bai score of college students show that they are not accompanied by psychological anxiety, which shows that the collaborative education strategy of track and field teaching in colleges and universities can effectively alleviate the psychological anxiety of college students.

THE INFLUENCE MECHANISM OF URBAN PARK GREEN SPACE ON PHYSICAL ACTIVITY AND MENTAL HEALTH OF THE ELDERLY FROM THE PERSPECTIVE OF CONFIGURATION

Jun Ying^{1,2,3}, Liang Dai¹, Hexian Jin¹, Yiqi Zhang¹, Zhangyu Shao¹ & Qiuyu Lu¹

¹College of Landscape Architecture, Zhejiang A&F University, Hangzhou 311300, China

²Institute of Ecological Civilization & Institute of Carbon Neutrality, Zhejiang A&F University, Hangzhou 311300, China

³Zhejiang Provincial Key Laboratory of Germplasm Innovation and Utilization for Garden Plants, Zhejiang A&F University, Hangzhou 311300, China

Background: In the environment of increasing global aging, China has entered an aging society. It is very important to focus on the physical and mental health of the elderly, which has profound social and economic significance. After entering the old age, people's physiology and psychology will change significantly. The physical activity and mental health level of the elderly are very vulnerable to various external factors. Physical activity and psychological activity will have a certain impact on the neuroendocrine and immune system function of the elderly, and then increase or reduce the risk of self-infection. From the perspective of physiological changes, once entering the old age, the internal and external characteristics of the elderly will show certain aging changes, and their brain nervous system will produce degenerative changes. For the elderly, the nerve cells in the brain and cerebellum are greatly reduced. Compared with the middle-aged, the weight of the brain is reduced by about 20%, which leads to the reduction of blood flow to various tissues and organs of the whole body, resulting in the reduction of the working efficiency of the circulatory system, digestive system and respiratory system. Under the effect of brain tonifying aging, the elderly usually has the phenomenon of reduced response function and psychological decline. From the perspective of psychological changes, the sensory ability of the elderly has decreased, mainly manifested in the weakening of vision, and they are very prone to various eye diseases. Hearing loss and communication difficulties. Decreased taste and smell, etc. Compared with the younger, the resilience and overall health of the elderly showed a significant downward trend, and the incidence rate of certain serious diseases increased in the old age. Under this influence, the psychological state of the elderly is prone to complex and negative changes, such as depression, Alzheimer's disease and so on. Relevant research shows that the occurrence and development of nearly half of the common diseases in the elderly are closely related to their psychological and behavioral factors.

Both configuration perspective and Qualitative Comparative Analysis (QCA) are based on overall and system analysis logic. The perspective of configuration analysis originates from the system thought. In the system thought, organization is defined as a complex system. Its attributes are interrelated and combined in a complex and integrated way. The organizational attributes complement and enhance each other, even cause and affect each other. Each element plays a role in an overall configuration. From the perspective of configuration, there is a relationship between elements and the whole between the planning and construction of urban park green space. Each element affects each other and ultimately acts on the whole. Urban Park green space is an important place to shape the daily healthy lifestyle and social communication activities of the elderly. Its good space quality plays a vital role in the use efficiency of outdoor public space, the behavior choice of the elderly and even their physical and mental health. The growth of age means that the elderly has lost their mobility and control over the surrounding environment. Therefore, the traffic convenience, sanitary conditions and beauty of the community location and the surrounding environment will directly affect the frequency of outdoor activities and the satisfaction of daily life of the elderly, and then have different effects on their physical activities and mental health.

Objective: In the process of human natural aging, it is usually accompanied by the occurrence and development of various diseases. Under the condition that the physical function of the elderly allows, moderate physical exercise will help to maintain the quality of life and physical state of the elderly and maintain a good state of mental health. The research will explore the impact mechanism of urban park green space on the physical activity and mental health of the elderly from the perspective of configuration, in order to improve the mental health level of the elderly.

Research objects and methods: 24 elderly people were randomly selected from two urban parks and greenbelts, a total of 48 research objects. Multiple linear regression model was used to explore the construction and quality of urban park green space, the time and frequency of physical activity, mental health and stress level of the elderly.

Research design: A Symptom Checklist-90 (SCL-90) was used to evaluate 48 elderly people in urban parks and green spaces, and to explore the effect of physical activity and mental health. SCL-90 adopts a 5-level scoring standard, which indicates the different severity of symptoms from 1 to 5, followed by none, very light, medium, heavy and serious.

Methods: Multiple regression analysis and SPSS software were used to explore the impact of urban park green space on the physical activity and mental health of the elderly from the perspective of configuration, and SCL-90 was used to collect and process the data.

Results: The statistical results of depression subscale and anxiety subscale in SCL-90 showed that urban park green space environment, basic physical exercise facilities, transportation convenience, exercise time and exercise frequency would affect the physical activity and mental health of the elderly. If all kinds of influencing factors are high-quality, the scores of SCL-90 depression subscale and anxiety subscale of the elderly can be maintained at a low level, as shown in Table 1.

Table 1. Effect of urban park green space on physical activity and mental health of the elderly from the perspective of configuration

Influence factor		Depression subscale	Anxiety subscale
Urban Park green space environment	Excellent	23.51	15.62
	Poor	41.29	37.13
Basic physical exercise facilities	Many	24.14	19.49
	Less	39.68	36.57
Traffic convenience	Excellent	20.08	17.66
	Poor	49.65	41.98
Exercise time	More than 1 hour	18.57	12.39
	Less than 1 hour	37.14	32.35
Exercise frequency	More than 3 times a week	21.43	13.91
	Less than 3 times a week	45.62	36.77

Conclusions: From the perspective of configuration, the impact of urban park green space on the physical activity and mental health of the elderly has a certain correlation. The better the urban park green space environment and the more convenient the transportation, the more time and frequency of physical activity of the elderly, and the higher the level of mental health.

AN ANALYSIS OF THE INFLUENCE OF INFORMATION-BASED TEACHING STRATEGIES ON COLLEGE STUDENTS' ENGLISH TEACHING BEHAVIOR

Chengwei Wang

School of International Education, Yellow River Conservancy Technical Institute, Kaifeng 475004, China

Background: In the process of accelerating the pace of modern life and intensifying social competition, people often face huge psychological pressure. If the pressure cannot be effectively relieved, it is very easy to produce anxiety. College students are in the critical period of self-consciousness formation and individual psychological maturity. Various external factors may have a certain impact on them, including the transformation of social roles, interpersonal communication between teachers and students, competitive pressure of study or employment, etc. When various external factors affect college students, college students will have different degrees of anxiety, and then show different types of anxiety behavior. There is a close correlation between college students' anxiety behavior and its causes, which is mainly reflected in three aspects: social anxiety behavior, examination anxiety behavior and employment anxiety behavior. In terms of social anxiety behavior, it is often seen in introverted college students. Once such college students contact a large number of strangers on the university campus or in the social environment, they are very prone to tension and anxiety, manifested as blushing and fever, rapid heartbeat, sweating and trembling, and even take temporary avoidance. Test anxiety behavior mainly refers to that college students are at a

loss and lack of memory due to inner tension and fear in the examination room. Under the negative influence of anxiety psychology, it is difficult to apply their usual knowledge reserve to the examination room, and finally hand in their papers perfunctorily and flee the examination room. Employment anxiety behavior refers to that college students have a certain fear of the process of employment and job hunting under the severe employment situation, and choose to avoid employment under the joint action of fear and anxiety. College English informatization teaching strategy has good teaching effect in the process of English course teaching, and can effectively improve college students' learning enthusiasm and English level. College English information-based teaching strategies mainly include four levels. One is to stimulate students' internal motivation and help them establish learning self-confidence. Through guidance, teachers can promote students to get rid of negative psychological hints and maintain a positive and optimistic attitude towards English learning. The second is to help students clarify their English learning objectives and urge them to formulate and implement learning plans. The third is to innovate the traditional English teaching methods and improve the teaching quality. Fourth, it mainly refers to the targeted psychological counseling for students, in order to eliminate their anxiety and eliminate their anxiety behavior.

Objective: College students' anxiety behavior comes from psychological anxiety. Both of them will have a great negative impact on college students' English learning, and even cause some trouble in their daily life. This study will analyze the information-based English teaching strategies in colleges and universities and explore their impact on college students' anxiety behavior,

Research object and method: 79 college students with anxiety behavior were randomly selected as the research objects. Before and after the implementation of college English information teaching strategy, Hamilton Anxiety Scale (HAMA) and Self-rating Anxiety Scale (SAS) were used to evaluate the anxiety of college students.

Research design: Before and after the implementation of college English information teaching strategy, HAMA and SAS were used to evaluate the impact of anxiety behavior of 79 college students. HAMA adopts grade 5 evaluation standard, from 0 to 4, indicating asymptomatic, mild, moderate, severe and extremely severe. Hama's score threshold for judging whether there is psychological anxiety is 14 points. If it is greater than 14 points, it indicates that the subject is accompanied by anxiety.

Method: C4.5 decision tree algorithm is used to evaluate the impact of college English information teaching strategies on college students' psychological anxiety. The data of HAMA and SAS are statistically analyzed by MATLAB software.

Results: Table 1 shows the changes of HAMA of college students with anxiety behavior. It can be seen from Table 1 that before the implementation of college English informatization teaching strategy, the number of people with asymptomatic and mild anxiety was less. After the intervention, the number of asymptomatic and mild anxiety increased significantly, while the number of college students with moderate, severe and severe anxiety decreased significantly. The implementation of college English information teaching strategy can effectively alleviate college students' anxiety and reduce their anxiety behavior.

Table 1. Alleviating effect of college students' anxiety behavior in HAMA data evaluation ($n=79$)

Evaluation time	Asymptomatic	Light	Moderate	Severe	Extremely heavy
	0	1	2	3	4
Before strategy implementation	7	13	32	17	10
After strategy implementation	19	35	17	6	2

Conclusions: College students' anxiety behavior and anxiety psychology complement each other, and their interaction has a significant negative impact on college students' English learning level and mental health level. College English informatization teaching strategy can eliminate college students' anxiety behavior in the process of practical application.

REFORM AND DEVELOPMENT OF PRESCHOOL EDUCATION MANAGEMENT SYSTEM FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Simin Cao

School of Education, Xuchang University, Xuchang 461000, China

Background: Cognition mainly refers to the description of the development process and complexity of all kinds of knowledge. Therefore, the corresponding cognitive psychology is closely related to people's attention, perception, memory and thinking logic, which is embodied in the actual process of people collecting, retrieving, receiving and exchanging information. The concept of cognitive psychology has long been one of the main research directions of western psychology, which involves short-term memory, perceptual observation, logic theory and so on. In the basic concept of cognitive psychology, the human brain is equivalent to an information processing system similar to the computer. Cognitive impairment is a mental health disorder that has a negative impact on various cognitive abilities. It will lead to the impairment of individual basic cognitive function, which is mainly externalized into executive dysfunction, learning and memory impairment, sensory motor function limitation, complex attention decline, aphasia and agnosia. The memory ability and language ability of patients with cognitive impairment will be significantly reduced, accompanied by abnormal emotion or behavior, which is difficult to carry out normal social, work and life. Patients with cognitive impairment will show some functional impairment or decreased ability in all aspects, which is not conducive to their own development. In the process of gradually deepening the reform of education management system, the potential problems of various management systems have become more and more prominent. Among them, there are diversified negative factors in the preschool education management system, which makes it face more severe development prospects and urgently need to be reformed and optimized. In the current preschool education management system, there are mainly some disadvantages, such as the lack of soundness of the setting of managers, the unclear positioning of management post responsibilities, the lack of rationality of the division of responsibilities among management departments, and the lack of management supervision system to be improved. All kinds of potential disadvantages have formed a great obstacle to the effective development of preschool education management, which is not conducive to the healthy and sustainable development of preschool education. During the implementation of the current preschool education management system, due to the imperfect departmental cooperation mechanism and the non-implementation of various education guidance policies, various education management systems become mere formality and superficial, which is difficult to effectively solve various problems in the preschool education management. In addition, preschool education management institutions and staffing standards have poor operability and broad provisions, and the provisions on staffing quantity, institutional setting and qualification are slightly lacking. Preschool education managers have a certain randomness, and the absence of institutions is serious. From the perspective of cognitive psychology, it is very important to deeply analyze the potential disadvantages of the preschool education management system, and it is very important to reform and develop the preschool education management system.

Objective: In order to better promote the development of preschool education management system, fulfill the responsibilities of preschool education, promote the reform of education management system, and comply with the changes of macro policy situation. This study will focus on the perspective of cognitive psychology and conduct in-depth exploration on the management system of preschool education, in order to further promote the healthy and sustainable development of preschool education and improve the construction of preschool education management system.

Research objects and methods: 54 preschool education managers were randomly selected as the research object to explore their cognitive level and specific performance in the process of preschool education management. Use C4 The decision tree classifies the problems existing in the preschool education management system, probes into them, and then puts forward the corresponding reform and development measures from the perspective of cognitive psychology.

Research design: According to the potential problems and reform and development needs of the preschool education management system, the reform and development measures are set as four specific implementation methods, namely, improving the division of responsibilities of the preschool education management department, transforming and giving full play to government functions, strengthening the management of preschool education, and optimizing the allocation of preschool education management personnel, which are expressed as A, B, C and D respectively. The influence of the four reform and development measures on the cognitive level of preschool education managers is compared and analyzed. The influence evaluation adopts three-level evaluation criteria, from 0 to 2, indicating small, general and large influence respectively.

Methods: All the research data were statistically analyzed by Excel software and MATLAB software.

Results: Among the four reform and development measures, in addition to changing and giving full play to the influence of government functions on the cognitive level of preschool education managers, the three measures of improving the division of responsibilities of preschool education management departments, strengthening preschool education management and optimizing the allocation of preschool education

managers have a greater influence. The impact evaluation results are shown in Table 1.

Table 1. Influence of different reform and development measures on the cognitive level of preschool education managers from the perspective of cognitive psychology

Reform and development initiatives	A	B	C	D
Effect	2	1	2	2

Conclusions: From the perspective of cognitive psychology, the reform and development of preschool education management system is of far-reaching significance. Improving the division of responsibilities of preschool education management departments, strengthening preschool education management and optimizing the allocation of preschool education managers have a great influence on the cognitive level of preschool education managers. Focusing on the implementation of the above three measures is conducive to improving the cognitive level of preschool education managers, Promote the effective reform and sustainable development of preschool education management system.

ON COLLEGE ENGLISH TRANSLATION TEACHING THEORY AND TRANSLATION SKILLS UNDER COGNITIVE IMPAIRMENT

Qiyang Yan¹ & Shanshan Li²

¹*Foreign Language Teaching Department, Changchun University of Chinese Medicine, Changchun 130117, China*

²*Research Center of Higher Education, Changchun University of Chinese Medicine, Changchun 130117, China*

Background: Cognition refers to the process in which an individual processes external information to obtain relevant knowledge and theories, including memory, language, execution, calculation, visual space, understanding and judgment. When the cognitive function in any aspect is impaired and affects the individual's daily life and social ability, it can be judged that the individual has certain cognitive impairment. The behavioral characteristics of cognitive impairment are mainly manifested in the changes of executive ability, attention, language ability and social cognition. As for executive ability, the basic manifestations of cognitive impairment are the decline of individual organization and decision-making ability, inability to complete complex tasks and so on. At the attention level, it is mainly manifested in the reduction of information processing speed, selectivity and other types of attention changes. At the level of language ability, the most common manifestations are grammatical errors, ignoring social etiquette, the phenomenon of words failing to express their meaning in interpersonal communication, problems in abstract language expression and understanding, and so on. As far as social cognitive ability is concerned, it is mainly manifested in anxiety in social communication, weakening of emotional control ability, decline of resonance ability and reduction of recognition of social clues. In the process of clinical diagnosis and treatment, cognitive impairment is a transitional state between normal people and early Alzheimer's disease. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further reduction of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment is caused by the deterioration of moderate cognitive impairment. The patients show the decline of overall function and develop to dementia disease. There will be delusion, indifference, lack of self-care ability and so on.

In the process of college English translation teaching, teachers should build a good English translation situation and innovative English translation system according to the basic situation of students, so as to enrich the teaching content and finally ensure that students achieve good learning results in the teaching process of college English translation. If students are accompanied by cognitive impairment, their English learning and translation ability will be significantly negatively affected. It is difficult to master college English translation skills and achieve excellent academic results. Exploring college English translation teaching theory and translation skills from the perspective of cognitive impairment is conducive to the smooth development of college English translation teaching and the improvement of college students'

English translation level.

Objective: When students with cognitive impairment study college English translation, they often have some problems, such as low interest in English learning, low efficiency of English translation and poor practical ability of English translation. In order to improve the English translation level of students with cognitive impairment, this study will explore college English translation teaching theory and Translation skills from the perspective of cognitive impairment.

Research objects and methods: 117 college students with cognitive impairment were randomly selected from three universities to explore their cognitive impairment level and English translation ability. The level of cognitive impairment of college students was evaluated by Montreal Cognitive Assessment (MoCA).

Research design: From the perspective of cognitive impairment, this paper analyzes and improves college English translation teaching theory and translation skills. Then, the improved college English translation teaching was used as an intervention means, and the total duration of the intervention was set to 60 days. MoCA is used to evaluate the improvement of cognitive impairment of college students with cognitive impairment before and after intervention, so as to provide data support for optimizing college English translation teaching theory and translation skills.

Methods: All data were statistically analyzed by Structured Query Language (SQL) and state software, and all data were expressed as mean \pm standard deviation, $P < 0.05$ indicates that the difference is statistically significant.

Results: According to Table 1, compared with before the intervention, the MoCA scores of college students at three different time nodes after the intervention showed different increases, and the differences were statistically significant ($P < 0.05$).

Table 1. MoCA scores of college students at different time nodes before and after intervention

Evaluation time	MoCA score
Before intervention	9.51 \pm 1.78
20 days after intervention	13.74 \pm 1.56*
40 days after intervention	19.13 \pm 1.66*
60 days after intervention	27.95 \pm 1.13*

Note: Compared with that before implementation, * $P < 0.05$.

Conclusions: From the perspective of cognitive impairment, the exploration and optimization of college English translation teaching theory and translation skills under cognitive impairment can enrich the teaching content and improve the teaching means, so as to effectively alleviate the cognitive impairment of college students, improve their cognitive level, and provide strong support for the improvement and all-round development of their English translation level.

MULTIPLE QUALITY ASSURANCE PATHS OF HIGHER EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Meizhong Huang^{1,2}

¹Teaching Affairs Department, Wuhan Business University, Wuhan 430050, China

²Institute of Higher Education, Wuhan Business University, Wuhan 430050, China

Background: Educational psychology is an interdisciplinary subject that organically combines psychology and pedagogy. It occupies an important position in the branch of applied psychology. In essence, educational psychology is a science that studies the basic laws of school situation and middle school teaching. In the actual research process, educational psychology mainly explores five educational elements and three educational activities. The former includes students, teachers, teaching content, teaching media and teaching environment, while the latter includes learning process, teaching process, evaluation and reflection process. The five educational elements are intertwined with each other and act on the three educational activities together, and there is a close correlation between them. Educational elements middle school students are the main body of learning, and they have diversified psychological development characteristics, namely difference, imbalance, orientation and order, continuity and stage. Therefore, educational psychology needs to be explored through different research methods. In the process of practical application, educational psychology plays a decisive role in the successful development of educational

activities. It can help teachers accurately understand the problems existing in the teaching process, provide scientific theoretical guidance for the actual teaching activities, and effectively predict and intervene the possible behaviors of students. In essence, teaching psychology can play the role of description, interpretation, prediction and control in educational practice. It is an essential basic science in the field of education.

Higher education is a high-level educational model, and its development is based on the guarantee of diversified quality. After the state has adjusted the higher education management system, it puts forward higher requirements for its diversified quality, aiming to cultivate more high-quality professional talents based on the high-level diversified quality of higher education. The guarantee path of diversified quality of higher education is mainly divided into four aspects: Stimulating the internal demand of colleges and universities for the improvement of teaching quality, carrying out educational intervention by combining quantitative evaluation and quality analysis, constructing the operation mechanism of multi-party participation and cooperation, and paying attention to and strengthening the diagnosis and optimization of teaching and learning. From the perspective of educational psychology, this paper explores the effectiveness of these four diversified quality assurance paths of higher education, in order to improve teaching quality and ensure teaching results.

Objective: To build a diversified quality assurance system for higher education, which aims to improve the quality of educational services, ensure the teaching effect, and meet the practical needs of different stakeholders for higher education. This research will focus on the perspective of educational psychology, deeply analyze the needs of diversified quality assurance of higher education, take the students' education level as the basis, put forward and implement the corresponding diversified quality assurance path of higher education, in order to improve the quality of higher education.

Research object and method: 32 college students were randomly selected from two universities, a total of 64. Using the combination of standardized test and comparative analysis, this paper makes a detailed exploration on the actual performance and individual psychological characteristics of 64 subjects in the process of education.

Research design: Using standardized tests to explore the changes of college students' learning effectiveness and psychological characteristics under different multiple quality assurance paths of higher education, and obtain different results of diagnostic assessment, formative assessment and summative assessment. Taking four multiple quality assurance paths of higher education as intervention means, this paper uses hash algorithm to analyze the external learning performance and internal psychological characteristics of students under different intervention methods, so that the total score of the two is 10 points. The higher the score, the higher the ability level of college students.

Methods: MATLAB and SPSS26.0 software is used as the main research method to analyze the impact of multiple quality assurance paths of higher education on students from the perspective of educational psychology. All measurement data are expressed as mean \pm standard deviation.

Results: Under the intervention of four different multiple quality assurance paths of higher education, the scores of college students' actual teaching performance and individual psychological characteristics showed a trend of continuous improvement. With the advancement of teaching progress, the scores of college students in the three different evaluation stages of diagnostic evaluation, formative evaluation and summative evaluation increased significantly, from 5.67, 4.98, 5.54 and 6.01 to 8.54, 8.67, 9.07 and 9.25 respectively.

Table 1. Evaluation results of college students' ability level under the diversified quality assurance path of Higher Education

Quality assurance path	Diagnostic assessment	Formative assessment	Summative assessment
Stimulate the internal demand of colleges and universities for the improvement of teaching quality	5.67	7.93	8.54
Adopt the combination of quantitative evaluation and quality analysis to carry out educational intervention	4.98	8.01	8.67
Build an operation mechanism with multi-party participation and mutual cooperation	5.54	8.36	9.07
Pay attention to and strengthen the diagnosis and optimization of teaching and learning	6.01	8.13	9.25

Conclusions: From the perspective of educational psychology, the diversified quality assurance path of higher education has a good implementation effect, and can carry out diversified quality assurance work according to the different psychological characteristics of college students in the learning process. The four multiple quality assurance paths of higher education can significantly improve the actual teaching

performance and individual psychological characteristics of college students.

KNOWING THE “LANGUAGE” WELL, MOISTENING THE “HEART” SILENTLY -- AN EXPLORATION OF INTEGRATING MENTAL HEALTH EDUCATION INTO CHINESE CLASSROOM TEACHING

Rui Zhang

Department of Chinese, Zhengzhou Preschool Education College, Zhengzhou 450002, China

Background: Under the influence of “cross century quality education project” and “action plan for revitalizing education for the 21st century”, mental health education has received extensive attention. As the core component of quality education, mental health education plays a great role in the cultivation of high-quality and all-round development talents. It can meet the inevitable requirements of modern education and ensure the mental health level of students. In essence, mental health education takes the law of students’ physiological and psychological development as the basic basis and combines the educational methods in psychology to cultivate students’ psychological quality. Its main purpose is to promote the overall improvement of students’ overall quality. In mental health education, it mainly includes two executive functions: the maintenance of students’ mental health and the correction of students’ psychological and behavioral problems. As far as the maintenance of students’ mental health is concerned, it is aimed at all students. It mainly carries out educational work under the conventional education and training modes such as intelligent training, emotional education, personality training and interpersonal relationship guidance, in order to improve the basic quality level of students. As for the correction of students’ psychological and behavioral problems, mental health education mainly carries out psychological counseling and positive guidance for students’ learning adaptation problems, emotional problems and common behavioral problems.

Primary school is an important stage of life. All students’ behavior habits, interests, will and character will be formed at this stage. Mental health education can promote the all-round physical and mental development of primary school students and improve their overall quality. Based on this, strengthening the mental health education of primary school students is an important work of implementing quality education. Only by starting from childhood, sowing the seeds of mental health into children’s hearts and letting them take root can we provide guarantee for their healthy growth in the future. To carry out mental health education in schools, teachers should fully infiltrate mental health education into teaching, cultivate students’ sound personality and provide strong basic support for their sustainable development in the future. In Chinese teaching, from the perspective of positive psychology, adhere to the core goal of mental health education, adhere to teaching students according to their aptitude, fully tap Chinese teaching materials, sensitively capture the opportunity of psychological education in the classroom, warm students with language, pay attention to the cultivation of students’ personality development and will quality, constantly infiltrate students’ hearts and promote students’ all-round development.

Objective: In the process of Chinese classroom teaching, the purpose of teaching is not only to improve students’ language organization ability, reading comprehension ability and literary literacy, but also to guide students to establish a sound personality and improve their comprehensive quality. This study integrates mental health education into Chinese classroom teaching in order to promote students’ all-round development and explore the positive impact of mental health education on students.

Research objects and methods: 125 primary school students were randomly selected as the research object to explore. Integrate mental health education into Chinese classroom teaching as an educational intervention means, and evaluate the mental health level of the students by Mental Health Test (MHT).

Research design: Before and after the implementation of educational intervention, the mental health level of 125 students was evaluated and analyzed by MHT. MHT mainly contains eight content scales, namely, self-blame tendency, allergic tendency, phobic tendency, impulsive tendency, lonely tendency, anxiety about people, learning anxiety and physical symptoms. There are 100 evaluation items in total, and the scoring standard is “yes” for 1 point, and “no” for 0 point. When the MHT score of the tested students is higher than 65, it indicates that they have certain psychological obstacles.

Methods: Factor analysis was used to evaluate the influence of collaborative education strategy of track and field teaching in colleges and universities on college students’ psychological anxiety. The MHT data were statistically analyzed by MATLAB software. All measurement data were expressed in the form of mean \pm standard deviation, and $P < 0.05$ was taken as the standard with statistical significance.

Results: Table 1 shows the comparison results of MHT scores of students after integrating mental health education into Chinese classroom teaching at different evaluation time nodes before and after the intervention. The numbers marked in the brackets of each evaluation item indicate the full score of the corresponding evaluation item. Before the intervention, the total MHT score of students was higher than 65, which showed that they had certain mental health problems. The data after the intervention show that the way of integrating mental health education into Chinese classroom teaching can effectively reduce the MHT score.

Table 1. Comparison results of MHT scores of students before and after intervention

Evaluation items	Before intervention	After intervention
Self-reproach tendency (10)	9.16	7.46
Allergic tendency (10)	8.73	7.11
Terrorist tendency (10)	8.01	6.52
Impulsive tendency (10)	8.14	6.63
Loneliness tendency (10)	7.49	6.10
Anxiety about people (10)	9.48	7.72
Learning anxiety (15)	8.15	6.63
Physical symptoms (15)	8.86	7.21
MHT evaluation score (90)	68.02	55.37

Conclusions: Integrating mental health education into Chinese classroom teaching can play a good application effect. On the basis of ensuring the effect of students' Chinese learning, it can also significantly improve their mental health level.

ANALYSIS ON THE INFLUENCE OF COLLEGE ENGLISH TEACHING ON COLLEGE STUDENTS' ANXIETY UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Suili Wang

School of Health Science and Nursing, Shanghai Sipo Polytechnic, Shanghai 201300, China

Background: Educational psychology mainly refers to the exploration of the basic psychological laws between education and learning in the context of education and teaching. In the application category of educational psychology, it includes the internal and external situations of teachers and students, mainly reflected in teaching psychology and teaching behavior, and students' psychology and learning behavior. Under the guidance of scientific teaching theory, the basic laws in the teaching process and the interaction between teachers and students are studied and discussed. Educational psychology is helpful to improve the teaching effect and promote the smooth development of teaching work. Educational psychology is by no means just a simple addition of pedagogy and psychology, but through various ways to make them organically combine and interact with each other to jointly serve the work of education and teaching. Educational psychology is a comprehensive subject that pays attention to the process of teaching and learning at the same time. It not only flexibly uses the relevant theories of psychology, but also has its own unique theoretical methods. In educational psychology, the process of interaction between teaching and learning is a complete system, which mainly includes five elements: students, teachers, teaching content, teaching media and teaching environment. The five elements can be connected through corresponding teaching activities, and finally achieve the purpose of teaching and learning. As the main information part, the structure and content of teaching content will have a certain impact on students' academic and psychological development, so its importance is self-evident.

College English teaching needs to combine the relevant theoretical knowledge of educational psychology and abandon the potential disadvantages of the traditional English teaching model, such as taking teachers as the main body of the teaching process and ignoring the necessity of students' active learning. In the process of English learning, college students may have some English learning pressure and show varying degrees of anxiety under the influence of factors such as difficulty in improving their oral English expression ability, lack of English vocabulary, unbalanced development of English listening, speaking, reading and writing ability and so on. College students' anxiety has a great negative impact, which will not only reduce

their enthusiasm and self-confidence in English learning, but also make it difficult for them to obtain satisfactory English learning results, and even have a serious impact on their normal learning and life. Carrying out college English Teaching under the background of educational psychology can effectively optimize the English teaching mode, promote the normal promotion of English teaching process, and provide reliable help for students' English learning.

Objective: At present, the phenomenon of anxiety among college students has been more common, and its causes mainly include college students' academic pressure, employment pressure, interpersonal communication and so on. In the process of college English teaching practice, college students are likely to have anxiety due to their low enthusiasm for English learning and poor English learning effect. This study will explore from the background of educational psychology, in order to explore the impact of college English teaching on college students' anxiety and eliminate college students' anxiety to the greatest extent.

Research objects and methods: 56 college students were randomly selected from two colleges and universities as the research objects. They were analyzed by Self-rating Anxiety Scale (SAS) and Depression Anxiety Stress Scale (DASS) to explore the effect of college English teaching on college students' anxiety under the background of educational psychology.

Research design: Taking the college English teaching model under the background of educational psychology as an intervention means, the time of educational intervention is set as 4 months. At different time points before and after the intervention, SAS and DASS anxiety subscales were used to evaluate and analyze the anxiety level of college students. In terms of SAS evaluation criteria, 50 points and below mean normal, 50-59 points mean mild anxiety, 60-69 points mean moderate anxiety, and 70 points and above mean severe anxiety. In the evaluation criteria of DASS anxiety subscale, 0-7 points indicate normal, 8-9 points indicate mild anxiety, 10-14 points indicate moderate anxiety, 15-19 points indicate severe anxiety, and 20 points and above indicate extremely severe anxiety.

Methods: Principal component analysis was used to explore the influencing factors of college students' anxiety. Use MATLAB software to count, calculate and analyze the relevant data obtained by SAS and DASS. All measurement data are expressed in the form of mean \pm standard deviation.

Results: After the intervention of college English teaching under the background of educational psychology, the SAS score and DASS anxiety subscale score of college students decreased significantly. Compared with the evaluation results before the intervention, there were significant differences between SAS scores and DASS anxiety subscale scores 1 week, 1 month and 3 months after the intervention ($P < 0.05$).

Table 1. Changes of college students' anxiety before and after intervention

Evaluation time	SAS score	DASS anxiety subscale score
Before educational intervention	64.12 \pm 0.97	18.64 \pm 1.14
One week after educational intervention	58.44 \pm 1.04*	16.94 \pm 0.93*
1 month after educational intervention	53.78 \pm 1.13*	11.48 \pm 1.16*
3 months after educational intervention	43.98 \pm 1.07*	7.01 \pm 0.95*

Note: Compared with that before implementation, * $P < 0.05$.

Conclusions: College English teaching under the background of educational psychology has a significant positive impact on college students' anxiety. It can significantly reduce the SAS score and DASS anxiety subscale score of college students, and effectively alleviate their anxiety.

Acknowledgement: The research is supported by: 2022 China Academy of Management Science: The Study on the Mood of the Students in the Lecture of Nursing English.

PROBLEMS AND COUNTERMEASURES OF FINANCIAL MANAGEMENT IN THE DEVELOPMENT OF CROSS-BORDER E-COMMERCE BUSINESS BASED ON THINKING LOGIC BARRIERS

Rong Li^{1,2}, Dongquan Wang¹ & Meijiao Sun^{1*}

¹School of Economics and Management, Nanchang Vocational University, Nanchang 330050, China

²Hanyang Graduate School of International Studies, Hanyang University, Seoul 04763, South Korea

Background: Thinking logic barrier refers to the phenomenon that individuals violate the form and law of logical thinking when thinking and processing something by using thinking modes such as concept,

judgment and reasoning. Patients with thinking logic disorder have defects in social function or individual development, which will greatly affect their normal integration into society, not conducive to the harmonious development of society, but also greatly affect their daily life, study and work. The thinking of patients with thinking logic disorder lacks or loses the inherent logical connection, and is in a pathological state, which is difficult to be understood by normal people. Among the manifestations of thinking logic obstacles, it mainly includes four different types: symbolic thinking, new words, logical fallacy thinking and sophistry thinking. Symbolic thinking refers to the abstract processing of a specific thing to obtain an abstract concept. In normal symbolic thinking, tradition and habit are the basic basis in the symbolic process. In pathological symbolic thinking, what is used to represent abstract concepts cannot be understood by others. New works of words refer to that patients with thinking logic disorder can create some words, graphics and symbols that only they can understand. Patients give them a certain special meaning. Although it is difficult for others to understand, patients think others should understand. Logical inversion thinking refers to that patients take the existing logical obstacles in the process of thinking Association as the main feature, and show the characteristics of bizarre reasoning process and inversion of cause and effect on the basis of lack of premise and logical basis. Sophistry thinking mainly refers to that the patient's view on a certain problem seems reasonable, but it will be found that its view is completely illogical, lack of basis and rationality.

In recent years, the development of cross-border e-commerce business has made breakthrough progress. However, in this process, due to the negative impact of thinking logic obstacles, financial management gradually reveals some problems, such as the lack of unified standards for enterprise financial accounting, the difficulty of standardized foreign exchange settlement, incomplete disclosure of financial statements, etc. all kinds of problems will have a great impact on the healthy and sustainable development of cross-border e-commerce business. In terms of the lack of unified standards for enterprise financial accounting, the main reason is that the commodity transactions of cross-border e-commerce have strong real-time. The financial management departments of most cross-border e-commerce enterprises directly connect with the cash settlement and revenue and expenditure business. However, because the transactions of cross-border e-commerce occur in different countries or regions, and there are significant differences in the financial management systems of each country and region, this is very difficult for the financial management of cross-border e-commerce. The difficulty of standardizing foreign exchange settlement mainly refers to the differentiated classification and management of financial settlement according to different types of enterprises. However, cross-border e-commerce enterprises are mainly small and medium-sized enterprises, which is contrary to the qualification of traditional trade exporters. In the actual cross-border e-commerce financial settlement process, the customs process does not have formal settlement procedures and foreign exchange policies. It is urgent to add a large number of cross-border payment platforms to obtain greater support from foreign exchange policies. The disclosure of cross-border e-commerce financial statements is not comprehensive, and does not show key data reflecting the growth potential of enterprises, such as average customer retention time, click through rate and exchange rate.

Objective: Under the influence of thinking logic obstacles, financial management staff are prone to make certain mistakes in practical work in the process of cross-border e-commerce business development, resulting in serious financial management problems. If the financial management problem cannot be solved in time and properly, it will have a serious impact on the development of cross-border e-commerce enterprises. This study makes a detailed analysis on the problems of financial management in the development of cross-border e-commerce business under the thinking logic barrier, and puts forward corresponding countermeasures, in order to alleviate the thinking logic barrier of financial management staff and promote the normal development of cross-border e-commerce business.

Research objects and methods: Among the two cross-border e-commerce enterprises, 12 financial management staff with thinking logic barriers were randomly selected as the research objects, a total of 24. The K-means algorithm is used to mine the financial management problems in the development of cross-border e-commerce business, and then put forward targeted solutions, so as to explore the improvement of the thinking logic obstacles of financial management staff after the implementation of relevant countermeasures.

Research design: Use Yale Brown Obsessive-Compulsive Scale (YBOCS) to explore the financial management staff with thinking logic obstacles in cross-border e-commerce enterprises, and analyze the impact of different solutions to financial management problems on the staff. The YBOCS evaluation results of financial management staff adopt the 5-level evaluation standard, which indicates the different levels of symptoms from light to heavy from 0 to 4.

Methods: According to the data obtained in the study, SPSS24.0 and EViews software.

Results: According to Table 1, the three countermeasures of strengthening the standardization of accounting work, developing mature financial management technology and reasonably solving tax problems have a significant impact on the financial management staff with thinking logic disorder, and the rating

results of thinking logic symptoms are reduced from 4 to 0 or 1.

Table 1. Impact of financial management solutions on financial management staff with thinking logic barriers

Countermeasure	Before implementation	After implementation
Enhance the standardization of accounting work	4	1
Develop mature financial management technology	4	0
Reasonably solve tax problems	4	1

Conclusions: From the perspective of thinking logic barrier, the implementation of three targeted countermeasures can effectively alleviate the symptoms of thinking logic barrier of financial management staff and provide strong support for the sustainable development of cross-border e-commerce business.

PRACTICE OF POP MUSIC TEACHING REFORM IN COLLEGES AND UNIVERSITIES UNDER COGNITIVE IMPAIRMENT

Qiao Zheng

Music College, Sichuan Normal University, Chengdu 610066, China

Background: Cognition refers to the process in which the human brain processes information intelligently to obtain corresponding theoretical knowledge or applied knowledge when receiving various external information. In the whole process of cognition, it will involve learning, memory, emotion, language, execution, thinking, understanding and other complex social behaviors and activities. When the human cerebral cortex is damaged due to various factors, the brain's intelligent processing process will be affected and limited to some extent, resulting in abnormal or damaged cognitive function, and finally leading to cognitive impairment. Cognitive impairment is a multiple mental disease, which is mainly manifested in memory impairment, learning impairment, executive dysfunction and other symptoms. The various symptoms of cognitive impairment are closely related and interact with each other, which will significantly accelerate the deterioration of patients' condition, which leads to cognitive impairment becoming a serious psychological disease that is difficult to diagnose and cure effectively. College students with cognitive impairment will have negative manifestations such as memory loss, learning ability decline and executive function decline. Patients with severe cognitive impairment may gradually lose their basic self-care ability, resulting in a heavy psychological burden on patients and their families. As a common form of mass culture, pop music has a strong attraction to young people and occupies an important position in people's daily life. Pop music is not only a form of artistic expression, but also carries the spirit of entertainment and emotional value, and has become the object of great pursuit by young people. In order to train more music talents, colleges and universities introduce pop music into the curriculum. However, there are some problems in the current college pop music teaching process, including the backward concept of music education, the lack of local national color, the lack of independent editing ability, the lack of music aesthetics and so on. In the process of listening to pop music, college students with cognitive impairment will have different understanding of the practice of pop music teaching reform in colleges and universities due to the severity of their cognitive impairment. The artistic effect and emotional expression of pop music will also react on students with cognitive impairment and play a certain role in alleviating their cognitive impairment.

Objective: The development of college pop music is restricted by certain influencing factors. We should ensure the teaching effect of college pop music and realize its artistic expression value. This study will effectively analyze and solve the potential problems of pop music teaching in colleges and universities from the perspective of cognitive impairment, and explore the improvement of students with cognitive impairment under the practice of pop music teaching reform in colleges and universities.

Research objects and methods: Through random selection, 74 college students with cognitive impairment were selected as the research objects. Then, the reform of pop music teaching in colleges and universities is carried out. The main reform measures are to innovate pop music teaching ideas, effectively supplement local national music content, and pay attention to the cultivation of students' independent editing and creation ability. A comparative analysis is made on the level of cognitive impairment of all college students before and after the reform.

Research design: The Mini-mental State Examination (MMSE) was used to evaluate the degree of

cognitive impairment of college students, and to explore the level of cognitive impairment before and after the reform of pop music teaching in colleges and universities. MMSE mainly includes five levels: orientation, memory, attention and calculation, memory and language ability. The scores of each level are 10, 3, 5, 3 and 9 respectively, with a total of 30 points. In MMSE's criteria for cognitive impairment, if the score is less than 27, it indicates cognitive impairment, and the smaller the score, the more serious the cognitive impairment. If the score is in the range of 27-0 points, it means normal.

Methods: SPSS software and Stata software were used to calculate and analyze the MMSE evaluation data of students with cognitive impairment.

Results: Table 1 shows the comparison results of the average cognitive impairment scores of 74 students before and after the practical intervention of pop music teaching reform in colleges and universities. It can be seen from Table 1 that before the intervention, the average score of all indicators of cognitive impairment of all students was low, and the total MMSE score was only 14.49, indicating that the symptoms of cognitive impairment of students were serious. After the reform intervention, the average score of MMSE evaluation indexes increased significantly, and the average total score of MMSE of the tested students reached 27.82, an increase of 91.99%. This shows that the symptoms of college music majors with cognitive impairment have been effectively alleviated and are in a normal state.

Table 1. Comparison of MMSE scores of college students with cognitive impairment before and after pop music teaching reform

Evaluation time	Directional force	Memory	Attention and computational power	Recall ability	Language ability	Total score
Before reform intervention	5.27	0.77	2.56	1.04	4.85	14.49
After reform intervention	9.01	2.79	4.83	2.85	8.34	27.82
Growth range (%)	70.97	262.34	88.67	174.04	71.96	91.99

Conclusions: Exploring the practice of pop music teaching reform in colleges and universities under the background of cognitive impairment can provide targeted psychological counseling for college students with cognitive impairment and promote the smooth progress of pop music teaching reform. Moreover, the reform of pop music teaching in colleges and universities can significantly improve students' MMSE score and effectively alleviate their cognitive impairment.

ANALYSIS ON THE EFFECT OF COLLEGE EMPLOYMENT ECOLOGICAL TRANSFORMATION ON STUDENTS' EMPLOYMENT ANXIETY IN THE ERA OF INTELLIGENCE

Baocheng Wang

College of Economics and Management, China Three Gorges University, Yichang 443002, China

Background: Anxiety refers to the tension, uneasiness, worry, worry and other unpleasant complex emotional states caused by an individual's imminent and possible danger or threat. In other words, anxiety is people's emotional reflection of the serious deterioration trend of the value characteristics of real or future things. On the contrary, the emotional form is expectation, and immediate expectation is the emotional reflection of people's obvious positive tendency to the value characteristics of reality or future things. Specifically, anxiety is a kind of irritability caused by excessive worry about the safety, future and fate of relatives or themselves. It contains worry, worry, sadness, tension, panic, uneasiness and other components. It is related to key situations and events that are difficult to predict and respond to. When the situation changes, anxiety may be relieved. Some people are in a state of anxiety for a long time without objective reasons. They often fear major disasters for no reason, fear of incurable serious diseases, leading to symptoms such as agitation and panic. This abnormal anxiety is a manifestation of psychosis. In short, the clinical manifestations of anxiety disorder are chronic anxiety disorders such as tension, excitement of autonomic nerve function and excessive vigilance, accompanied by a series of symptoms such as muscle tension, autonomic nerve disorder and exercise anxiety, which last for a long time. It is generally believed that over compensation for negative emotions can lead to anxiety disorder. It should be pointed out that

mild anxiety has a positive impact, which can stimulate spirit, improve attention and make talents think quickly. However, excessive anxiety can inhibit the brain and make people confused all day. The “employment anxiety” of contemporary college students is closely related to “graduation anxiety”. “Graduation anxiety” is a common psychological phenomenon among graduates. With the popularization of higher education, the pressure faced by college graduates is increasing day by day. This is not only due to the difficult choice of finding a job or taking the postgraduate entrance examination before graduation, but also due to the tense atmosphere of the school, the urging of parents, the competition among peers, and the hesitation and anxiety caused by lack of work. The anxiety of college students in the upcoming graduation, job hunting or other learning stages of the university is mainly caused by excessive employment pressure, which is called “employment anxiety”. Employment anxiety is a strong and lasting emotional experience accompanied by physiological changes. In psychology, mild employment anxiety is everyone’s normal psychological response. Moderate anxiety will make people feel pressure and urge graduates to seek work hard. However, excessive anxiety will not only affect college students’ career choice, but also interfere with their normal life.

The rise and arrival of the intelligent era has promoted the renewal of the employment and entrepreneurship service system in colleges and universities. The era of wisdom has not only changed the entrepreneurial mode of colleges and universities under the traditional mode, but also changed the thinking mode and concept of participants and objects. At present, the development of employment service system in colleges and universities still lags behind the development speed of the intelligent era. There are some problems, such as lack of three-dimensional information release, imperfect platform function and so on. It is urgent to build a perfect employment service system in colleges and universities. On the whole, the main characteristics of college employment ecological transformation in the intelligent era include: wider information coverage, more three-dimensional information dissemination and feedback, and opening the barriers between traditional industries. In addition, the ecological transformation of college employment in the era of intelligence has also formed an interactive development mechanism of harmonious ecology among schools, enterprises, society and college students. In addition, in terms of the main body of the employment service system of colleges and universities, colleges and universities, governments, enterprises, social organizations and college students have formed an interrelated and interdependent benign development mechanism on the basis of network interaction. In the process of continuous running in and integration, the employment and entrepreneurship ability of college students and the level of government supervision have been improved, the enterprise benefits and the development level of social organizations have been reasonably developed, and finally the ecosystem of employment and entrepreneurship service system in colleges and universities has been improved. Relevant research points out that the construction of college employment ecological transformation system in the intelligent era plays an important role in alleviating modern students’ employment anxiety. In view of this, this paper analyzes the impact of college employment ecological transformation on students’ employment anxiety in the intelligent era.

Objective: In order to alleviate the employment anxiety of college students, this paper constructs the employment ecological transformation system of colleges and universities in the intelligent era, which aims to dredge the employment anxiety of college students, and then establish confidence for college students’ easy employment.

Research objects and methods: 200 college students are selected as the research object, and the psychological measurement of college students’ employment anxiety is carried out in combination with the Self-rating Anxiety Scale (SAS). The higher the score, the more serious the anxiety psychology is. Then, based on the ecological transformation system of college employment in the era of intelligence, the intervention cycle is June. Finally, the improvement of college students’ employment anxiety before and after the intervention is compared and analyzed.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: The psychological anxiety of college students improved 6 months after the intervention. As shown in Table 1, compared with that before the intervention, after the implementation of the intervention of college employment ecological transformation system in the intelligent era, the employment anxiety of students has been improved, with statistical difference ($P < 0.05$).

Conclusions: The implementation of the intervention of college employment ecological transformation system in the intelligent era can effectively alleviate the employment anxiety of college students, so as to help college students establish the confidence of smooth graduation and easy employment.

Acknowledgement: China Employment Structure Simulation Prediction and Regulatory Policy Research, Ministry of Education Planning Fund, Department of Humanities and Social Sciences, Ministry of Education, (No. 18YJA880078).

Table 1. The psychological improvement of college students’ employment anxiety after 6 months of intervention ($n=200$)

Factor	Before intervention	Intervention 3 months	Intervention 6 months
Somatization	3.75±0.61	2.28±0.43*	1.45±0.56*
Obsessive compulsive symptoms	3.69±0.59	2.66±0.61*	1.25±0.43*
Interpersonal sensitivity	4.47±0.43	2.52±0.60*	1.43±0.57*
Depressive status	3.54±0.55	2.45±0.56*	1.28±0.43*
Anxiety state	2.36±0.41	2.25±0.43*	1.66±0.61*
Hostile situation	3.44±0.56	2.43±0.57*	1.52±0.60*
Psychological state of terror	4.29±0.42	2.28±0.43*	1.45±0.56*
Paranoid mental state	3.75±0.61	2.66±0.61*	1.25±0.43*
Psychotic	3.69±0.59	2.52±0.60*	1.43±0.57*

Note: * $P < 0.05$ compared with that before intervention.

THE INFLUENCE OF IMPROVING THE ABILITY OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS' PSYCHOLOGICAL COGNITIVE ABILITY UNDER THE ENVIRONMENT OF NEW MEDIA

Kaige Ren¹ & Hong Zhang²

¹*School of Marxism, China University of Geosciences, Wuhan 430074, China*

²*School of Education, China University of Geosciences, Wuhan 430074, China*

Background: Self-cognition refers to the insight and understanding of oneself, including self-observation and self-evaluation. Self-observation refers to the awareness of one's own perception, thinking and intention. Self-evaluation refers to the judgment and evaluation of one's own thoughts, expectations, behavior and personality characteristics. It is an important condition for self-regulation. At a specific level, the formation of individual self-consciousness, or consciousness, comes from the individual's response to external environmental stimuli through memory and thinking. Therefore, before the formation of memory, individuals will not have self-consciousness. If memory is the basis of all thoughts, then self-awareness is the individual's response to the environment based on thoughts. When one's memory and thinking reach a certain level, such as thinking and imagination completely appear from the brain, one's self-consciousness will be stronger. I exist, I have, I need, I think, and constantly strengthen personal self-awareness through thinking and imagination until the end of personal organic life. Therefore, self-cognition is a continuous development process from the beginning of brain memory to the disappearance of memory. The psychological cognition of self-cognition is a relatively advanced cognitive ability. For people with low education or low intelligence, they may not have such self-awareness for a lifetime. For some people, they can go beyond this psychological cognition. Generally speaking, psychological cognition is an infinite process, because psychological activity itself is infinite. It will develop with the development of personal experience, memory, thought and imagination. Therefore, after the emergence of psychological activities different from the previous stage or period, individual psychology will be summarized and adjusted. If a person can't understand himself correctly, can't see his own advantages and feel inferior everywhere, he will have a sense of inferiority, lose confidence and dare not do anything. On the contrary, if a person overestimates himself, he will also be arrogant and blindly optimistic, leading to mistakes in his work. Since the popularization of new media network, the fragmentation of culture and thought has also come, so that college students can browse more information without restriction in the fragmented time. However, so far, fragmentation is not only a fragment of time, but also a fragment of content, which has a great negative impact on college students' psychological cognition. Therefore, how to improve the psychological cognition of contemporary college students in the new media environment has become a new problem that modern colleges and universities have to face. Because only by overcoming the cultural impact and corruption of the new media environment can college students fully understand themselves and form a correct and healthy psychological cognition.

Ideological and political education is not only the primary content of China's spiritual civilization construction, but also one of the main ways to solve social contradictions and problems. Ideological and political education is both important and difficult to do. Especially under the condition of market economy, China's ideological and political work is relatively weak and does not meet the requirements of the

development of modern society. There are many reasons for the poor effect of ideological and political work, but one of the important reasons is the long-term neglect of psychological education and training. Psychological education and cultivation are the basis of ideological and political education. Without this foundation, ideological and political education cannot go deep into students' cognitive world and help students establish correct rational judgment. Relevant research points out that ideological and political education in colleges and universities has an important impact on Improving college students' psychological cognition. It can not only help college students form correct values, but also dredge and overcome the psychological pressure of colleges and universities. Therefore, exploring the role of ideological and political education in improving college students' psychological cognition has both theoretical and practical value.

Objective: In order to effectively improve the widespread psychological cognitive defects of modern college students, this study constructs a psychological intervention model of ideological and political education in colleges and universities based on the new media environment, which aims to promote the psychological cognition of modern college students and continuously output high-quality physically and mentally sound talents for the construction of the motherland.

Research objects and methods: 300 college students were selected as the research object, and the measurement of students' cognitive impairment was carried out in combination with the Montreal Cognitive Assessment Scale (MoCA). The scale includes seven factors: executive ability, naming ability, attention, language ability, image extraction ability, delayed recall and orientation ability. The higher the score, the better the cognitive function. Then, based on the psychological intervention model of ideological and political education in colleges and universities in the new media environment, the psychological cognition of students is intervened. The intervention cycle is 6 months. The changes of college students' psychological cognition before and after the intervention are compared and analyzed.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Results: Table 1 shows the psychological cognitive changes of college students after 6 months of intervention. It can be seen from Table 1 that compared with before the intervention, after the intervention of the psychological intervention mode of ideological and political education in colleges and universities based on the new media environment, the psychological cognitive ability of college students has been improved, with statistical difference ($P < 0.05$).

Table 1. Changes of college students' psychological cognition after 6 months of intervention (n=300)

Factor	Before intervention	Intervention 3 months	Intervention 6 months
Executive ability	1.45±0.56	3.69±0.59*	4.37±0.48*
Naming ability	1.25±0.43	3.47±0.43*	4.62±0.58*
Attention	1.43±0.57	3.54±0.55*	4.66±0.61*
Language ability	1.28±0.43	3.36±0.41*	4.52±0.60*
Abstract ability	1.66±0.61	3.69±0.59*	4.39±0.43*
Delayed recall	1.52±0.60	3.47±0.43*	4.45±0.56*
Orientation ability	1.45±0.56	3.54±0.55*	4.25±0.43*

Note: * $P < 0.05$ compared with that before intervention.

Conclusions: The psychological intervention model of ideological and political education in colleges and universities based on the new media environment can effectively improve the psychological cognitive ability of college students, and then better ensure the mental health development of modern college students.

* * * * *

BASED ON THE PSYCHOLOGICAL PERSPECTIVE, WE SHOULD TAKE THE NORMAL PROFESSIONAL CERTIFICATION AS THE GUIDE TO IMPROVE THE TEACHING SKILLS OF MATHEMATICS NORMAL STUDENTS IN AN ALL-ROUND WAY

Jian Pan

School of Mathematics and Statistics, Yulin Normal University, Yulin 537000, China

Background: Psychology is a science that studies the psychological phenomena, spiritual functions and behaviors of humans and animals. It is not only a theoretical discipline, but also an applied discipline. Including theoretical psychology and applied psychology. Psychological research involves many fields such as

perception, cognition, emotion, personality, behavior and interpersonal relationship, as well as many fields of daily life-family, education, health and so on. On the one hand, psychology attempts to use brain operation to explain the basic behavior and psychological function of individuals. At the same time, psychology also tries to explain the role of individual psychological function in social behavior and social dynamics. At the same time, it is also related to neuroscience, medicine, biology and other sciences, because the physiological functions discussed in these sciences affect individual thinking. Psychology is defined as the scientific study of behavior and psychological processes, as well as the physiological and psychological states of organisms and the influence of external environment. Psychology is divided into five sub fields: neuroscience, developmental psychology, cognitive psychology, social psychology and clinical psychology. In short, neuroscience studies the psychology of the human brain by observing its response. Developmental psychology is a subject that studies how human beings grow, develop and learn. Cognitive psychology studies psychology through computer methods, that is, psychology is compared with computers to understand how humans play games and distinguish between language and object recognition. Social psychology is the study of human group behavior and how to communicate with others. Clinical psychology mainly studies mental health and mental illness. Psychology is mainly a course to help people's mental health. Psychology has a long history, but only a short history. In short, both in theory and in practice, psychology has made important achievements. Therefore, it is worth continuing to expand the scope of application of psychology.

Professional certification is a special certification of professional education colleges and professional education plans implemented by professional certification institutions. It is jointly implemented by professional associations and educators in professional fields to provide quality assurance of university education for students entering professional fields. The implementation of normal professional certification is of great benefit to normal students. Guided by the concept of "student-centered, output oriented and continuous improvement", the certification hopes to promote construction, reform and strength through evaluation, and provide strong support for the training of tens of thousands of qualified teachers, millions of backbone teachers and hundreds of thousands of excellent teachers. The effect of professional certification will appear in the next few years. Under the background of professional certification, mathematics majors in normal universities should pay attention to cultivating students' teaching ability. Teaching skills refer to a series of teaching activities in which teachers complete certain teaching tasks in the teaching process. Teaching skills are an important part of teachers' teaching ability. Teaching skill is a special technology. With the application of modern educational technology, the technical content of teaching skill is higher and higher. However, there are still some problems in the teaching skills of mathematics normal students, which are mainly reflected in the inability to accurately locate the teaching materials, the unsatisfactory curriculum design and the unsatisfactory teaching process. Therefore, deepening the understanding of classroom teaching theory, paying attention to the training and training of normal students' teaching skills, and improving normal students' teaching skills and level are one of the important tasks of normal universities.

Objective: In order to improve the teaching skills of mathematics normal students in an all-round way, this study takes the normal professional certification as the guide, and carries out psychological intervention for the problems existing in the teaching skills of mathematics normal students, so as to improve the teaching skills and level of mathematics normal students.

Research objects and methods: 100 mathematics normal students were selected as the research object to carry out psychological intervention. The intervention cycle was 12 months. The improvement of teaching skills of mathematics normal students before and after psychological intervention was compared and analyzed. The evaluation indicators include: the teaching materials cannot be accurately positioned, the curriculum design is not ideal, and the teaching process is not ideal.

Methods: The data are analyzed through the latest version of minitab20 data statistics software.

Table 1. Improvement of teaching problems of mathematics normal students before and after psychological intervention

Category	Before	After 3 months	After 6 months	After 12 months
Inaccurate positioning of teaching materials	83.29	89.23*	93.32*	94.65*
The curriculum design is not ideal	86.98	89.65*	92.90*	95.36*
The teaching process is not ideal	84.66	89.23*	93.32*	94.65*

Note: Compared with that before psychological intervention, * $P < 0.05$.

Results: Table 1 shows the improvement of teaching problems of mathematics normal students before and after psychological intervention. On the whole, compared with before the psychological intervention,

after the psychological intervention, the teaching problems of mathematics normal students have been significantly improved ($P < 0.05$). This shows that psychological intervention can significantly improve the teaching skills and level of mathematics normal students.

Conclusions: In view of the problems existing in the teaching of mathematics normal students, taking the normal professional certification as the guide and carrying out psychological intervention at the same time can significantly improve the teaching skills and level of mathematics normal students. Therefore, it can be said that based on normal professional certification and psychological intervention, it is of great value to promote the teaching skills and level of mathematics normal students, and it is worth popularizing and applying in the teaching reform of normal students.

APPLICATION OF CREATIVE PRODUCT DESIGN OF CULTURAL PRODUCTS IN COLLEGES AND UNIVERSITIES BASED ON DESIGN PSYCHOLOGY

Chao Huang & Jianing Qi

School of Art Design, Tianjin University of Technology, Tianjin 300384, China

Background: Design psychology is a theoretical course for design majors. This is a subject that designers must master. Design psychology is a science based on psychology. It uses people's psychological state, especially people's demand psychology, to design through consciousness. It also studies people's mentality in the process of design and creation. And the psychological response of design to society and social individuals, and then act on design, so that design can better reflect and meet people's psychological role. It can be said that the research of design psychology is trying to communicate the relationship between producers, designers and consumers, so that every consumer can buy satisfactory products. In order to achieve this goal, we must understand consumer psychology and study the law of consumer behavior. Observation is one of the basic methods of design psychology. The so-called observation is a method to directly observe the speech and behavior of the research object and analyze its psychological activities and behavior rules in a purposeful and planned way under natural conditions. In most cases, the audience's sense of touch when designing products is mobilized through "visual texture", or it is mobilized first and then verified by his personal sense of touch. Therefore, modern designers, especially graphic designers, should mobilize the audience's touch to the scope of thinking according to their needs. In other words, it is necessary to consider the relatively common life experience of the target audience. In addition, any kind of design is inseparable from color. Designers and audiences have a wealth of knowledge about the color of designed products. Some Japanese scholars have summarized people's color feelings into seven kinds: cold and warm, light and heavy, soft and hard, strong and weak, light and dark, quiet and exciting, and simple beauty. In short, designing psychological and emotional stimuli is a valuable tool to encourage users to take action. Arousal includes feelings of guilt and worry, as well as an attractive sense of belonging and recognition of people's values. A common way to combine motivation and emotion in design is to add some graphic elements as auxiliary support if using the advertising language on the website, and use pictures and charts to enhance the incentive effect. In short, both in theory and in practice, design psychology has made important achievements. Therefore, it is worth continuing to expand the application scope of design psychology.

The composition of cultural and creative products in colleges and universities is mainly products and creativity. In ancient China, products were called "utensils". They contain elements such as shape, color, material, and graphics. However, they are different from ordinary products. Because this product is a part of the cultural and creative industry. It includes many links such as design, production, marketing and consumption. It itself contains the cultural heritage of colleges and universities. This "instrument" records the living conditions, spiritual outlook and the pursuit trend of college teachers and students. They are the carrier of spiritual culture in colleges and universities. They can not only meet people's material needs, but also meet people's aesthetic and spiritual needs. At the same time, this carrier can also affect the whole university, make it face up to its current situation, optimize material civilization and spiritual civilization, and make continuous progress. Of course, product creativity is essential. Designers use creative thinking to transform cultural resources. For example, combined with the different characteristics of colleges and universities, taking campus beauty, landmark buildings, traditional culture, historical stories and campus anecdotes as resources and expressing them in interesting forms, the cultural and creative products designed by colleges and universities have both practical functions and aesthetics and artistry, so as to increase the added value of the products and attract people's attention at the first time, stand out among

similar products. In short, design psychology is closely related to cultural and creative products in colleges and universities, which is worthy of research on the design and application of creative products of cultural products in colleges and universities based on design psychology.

Objective: Through in-depth research on the classification of consumer groups of cultural and creative products in colleges and universities, combined with the design elements of cultural and creative products, this paper analyzes the cultural and creative design in colleges and universities from the perspective of design psychology, and explores and studies the design and application of cultural and creative products in colleges and universities from a newer and more targeted entry point. Infiltrate the theory of design psychology into the design of cultural and creative products in colleges and universities, and summarize the corresponding design methods and relatively scientific design theory, so as to provide a certain theoretical reference for the future campus cultural and creative design, and better spread the campus culture with the help of cultural and creative products in colleges and universities.

Research objects and methods: 100 consumers were randomly divided into control group and experimental group, with 50 in each group. The control group adopted the conventional design method, and the experimental group adopted the design method based on design psychology. Then, the psychological experience of the two groups of consumers is compared and analyzed. The evaluation indicators of consumers' psychological experience include: consumption expectation, psychological demand, sensory stimulation, consumption situation, function extension and purchase intention. 0-3 points are dissatisfied, 4-6 points are satisfied, and 7-10 points are very satisfied.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the psychological experience of the two groups of consumers. It can be seen from Table 1 that compared with the control group, the experimental group based on design psychology has better psychological experience effect on cultural and creative products in colleges and universities, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. Psychological experience of two groups of consumers ($n=100$)

Factor	Control group ($n=50$)	Experience group ($n=50$)	P
Consumption expectation	2	8	<0.05
Psychological needs	3	7	<0.05
Sensory stimulation	2	8	<0.05
Consumption situation	1	8	<0.05
Functional extension	2	9	<0.05
Purchase intention	3	8	<0.05

Conclusions: College cultural and creative products designed based on design psychology have better psychological experience for consumers. It can be said that the theory of design psychology is scientifically and reasonably integrated into the design and application of cultural and creative products in colleges and universities, so as to establish a closer relationship between design psychology and cultural and creative products, which can not only solve the crux of cultural and creative products in colleges and universities in China, but also fully improve the psychological experience and purchase intention of consumers.

* * * * *

INFLUENCING FACTORS AND COUNTERMEASURES OF LEARNING ANXIETY OF ENGINEERING STUDENTS IN HIGHER VOCATIONAL COLLEGES

Surong Huang

Quality Management and Research Department, Zhuhai City Polytechnic, Zhuhai 519090, China

Background: People living today are under great pressure from the environment. Enterprising and competitive, noisy and crowded, busy and heavy make people's mental state often in a state of tension. When they feel a threat, they cannot avoid and deal with, fear becomes anxiety. Anxiety seriously affects people's spiritual life. Continuous or frequent anxiety can lead to overall weakness, loss of appetite, poor sleep and excessive fatigue. Fear, tension and powerlessness are aggravated, attention is relaxed, memory is impaired, thoughts are flustered, do not know what to do, it is easy to have extreme thoughts, exaggerate their incompetence, worry and depression, and sometimes the expectation of terror will lead to irritability,

irritability, complaint and boredom. Learning anxiety is usually manifested as restlessness, inferiority and self-blame, headache, dizziness, fear and impatience. Excessive anxiety makes it difficult to concentrate, interferes with the memory process, affects thinking activities, and causes great harm to physical and mental health. Learning anxiety is not only a stumbling block to excellent learning, but also a kind of chronic suicide in our life. In other words, students are a special group. They are in the enviable flowering season, but sometimes they are overwhelmed by heavy learning. They have to participate in various assessments every semester and bear the inner panic and loss caused by ranking, which is sometimes unimaginable for adults. Anxiety will rise over time. Learning anxiety is mainly caused by the following factors: physiological and psychological factors. At the level of physiological factors, anxiety patients have certain genetic factors, but more are acquired factors. The content and level of a person's personality formation, physical development, health status at that time and the development level of non-intellectual factors will affect the generation of learning anxiety. Healthy people are energetic and emotionally stable. Physical weakness and illness can easily lead to mood swings and anxiety. Weak willed people are afraid of difficulties and setbacks and are prone to anxiety. The ways to overcome learning anxiety mainly include: self-relaxation, increasing confidence, self-stimulation, self-hypnosis and self-reflection. In short, in today's society, students are under various pressures from family, school and even society. Learning anxiety has become an important factor hindering students' learning, which should attract extensive attention and attention from all parties.

The main goal of higher vocational colleges is to cultivate technical talents. That is, the goal is practicality, which is to cultivate a group of talents with university knowledge and certain professional technology and skills on the basis of complete secondary education. The teaching of their knowledge is based on ability and practicality. There is no doubt that China's higher vocational education has developed rapidly and the situation is gratifying in recent years, but behind the appearance of prosperity, the current higher vocational education is facing many difficulties, many problems and contradictions are becoming more and more acute. At the specific level, the recognition of higher vocational education is not high, which is also the mainstream thought of today's society. Various phenomena seem to show that, in terms of national society, higher vocational education is secondary education. For parents and students, higher vocational education is a helpless choice. For employers, the enrollment rate of higher vocational graduates is generally low. In this situation, higher vocational college students have doubts about their majors, which leads to great learning anxiety. In this regard, we should clarify the influencing factors of higher vocational college students' learning anxiety, and find the corresponding countermeasures on this basis.

Objective: To understand the influencing factors of learning anxiety of engineering students in higher vocational colleges, so as to provide reference for higher vocational colleges to carry out corresponding health education and eliminate the learning anxiety of higher vocational students.

Research objects and methods: A total of 2143 engineering students from two higher vocational colleges in our city were selected by convenient cluster sampling. A self-designed questionnaire was used to conduct a collective anonymous questionnaire survey. The contents include: General sociodemographic characteristics, Self-rating Anxiety Scale (SAS). In the analysis of the influencing factors of learning anxiety of engineering students in higher vocational colleges, taking anxiety as the dependent variable and the selected research factors as the independent variable, this paper makes single factor and multi factor unconditional logistic regression analysis.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the results of logistic regression analysis on the influencing factors of learning anxiety of engineering students in higher vocational colleges. As shown in Table 1, the influencing factors of learning anxiety of engineering students in higher vocational colleges include gender factors, their own personality, family factors, environmental impact and employment pressure.

Table 1. Logistic regression analysis of influencing factors of learning anxiety of engineering students in higher vocational colleges

Variable	B	S.E(B)	Wald χ^2	P	OR	95% CI
Gender factor	-0.188	0.087	4.657	0.000	0.896	0.641-0.911
Own character	-0.269	0.090	8.469	0.000	0.910	0.641-0.977
Family factors	-0.148	0.048	9.346	0.000	0.896	0.487-0.948
Environmental effect	-0.266	0.048	30.145	0.000	0.896	0.698-0.434
Employment pressure	-0.194	0.057	4.259	0.000	0.910	0.814-1.011

Conclusions: In view of the gender, personality, family, environment and employment characteristics of engineering students in higher vocational colleges, we should pay attention to students' psychological counseling and strengthen social support for students, so as to reduce the learning anxiety of engineering

students in higher vocational colleges.

MARKETING IDEAS AND INNOVATION OF INTERNATIONAL TRADE UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Ping Shen

Department of Economic Management, Shazhou Professional Institute of Technology, Zhangjiagang 215600, China

Background: Cognitive impairment is a disease with cognitive function problems. To clarify its definition, we need to understand and grasp what cognitive function is. Cognitive functions include memory, calculation, space-time location, structural ability, executive ability, language understanding, expression and application. Its behavioral characteristics are concentrated in four aspects: executive ability, attention, language ability and social cognition. For cognitive impairment, for social cognitive ability, it is mainly manifested in anxiety in social communication, weakening of emotional control ability, decline of resonance ability and reduction of recognition of social clues. For attention, it is mainly manifested in the reduction of information processing speed, selectivity and other types of attention changes. For the executive ability, it is mainly manifested in the decline of organization and decision-making ability and the inability to complete complex tasks. For language ability, it is mainly manifested in grammatical errors, ignoring social etiquette, the phenomenon of words failing to express their meaning in communication with people, and problems in abstract language expression and understanding. Clinically, cognitive impairment is a transitional state between normal people and early Alzheimer's disease. Among them, cognitive impairment mainly includes three levels: mild cognitive impairment is characterized by wandering, anxiety, depression, depression, forgetfulness, and decreased memory and attention. Moderate cognitive impairment is characterized by further aggravation of cognitive ability. Patients can be characterized by large emotional fluctuation, paranoia, anxiety, reduced understanding and language expression ability, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show decreased overall function and develop to dementia, which will lead to delusion, indifference, lack of self-care ability and so on. Relevant studies have pointed out that since new era, the problem of cognitive impairment has covered all areas of life, and the state and society should pay special attention to it.

International trade is the main form of interconnection between countries (or regions) based on international division of labor. It reflects the economic interdependence among countries (or regions) in the world and is the sum of foreign trade of all countries. International trade mainly includes two types: bilateral trade and multilateral trade. Bilateral trade refers to the trade between the two countries based on the settlement of bilateral agreements. In this kind of trade, both parties use the export of one party to pay for the import of the other party. This method is mainly implemented in foreign exchange control countries. In addition, bilateral trade generally refers to the trade between the two countries. Multilateral trade, also known as multilateral trade, refers to the trade in which three or more countries buy and sell each other on the basis of multilateral agreements. Obviously, under the trend of economic globalization, multilateral trade is more common. At the same time, with the popularization and acceleration of international trade, the demand for innovative marketing ideas is also higher and higher. Because a clear marketing idea can predict the future development situation, which can not only reduce the blindness of operation, but also clarify the development objectives, so as to facilitate international trade to take corresponding measures and strive to achieve the expected objectives. However, there are the following cognitive obstacles in the current marketing ideas of international trade: lack of change in trade mode, relatively backward marketing concept, and too single marketing characteristics.

Objective: In view of the problems existing in the current international trade marketing ideas, carry out cognitive barrier intervention for the personnel of relevant organizations, and crack the disadvantages of the current development of international trade marketing by innovating the marketing mode of international trade.

Research objects and methods: 100 marketing organization personnel of international trade were

selected as the research object to carry out cognitive impairment intervention. The experimental period was 6 months. The changes of international trade marketing ideas before and after the improvement of cognitive impairment of marketing organization personnel were compared and analyzed. Evaluation indicators include: lack of change in trade mode, relatively backward marketing concept, and too single marketing characteristics.

Methods: The data are analyzed through the latest version of Minitab20 data statistics software.

Results: Table 1 shows the improvement of problems in international trade marketing ideas under the intervention of cognitive impairment. On the whole, compared with before the intervention of cognitive impairment, after the intervention of cognitive impairment, the thinking of international trade marketing has been significantly improved ($P < 0.05$). This shows that cognitive impairment intervention can significantly improve the existing problems of international trade marketing ideas.

Table 1. Improvement of existing problems in international trade marketing ideas under the intervention of cognitive impairment

Category	Before	After 1 month	After 3 months	After 6 months
Lack of changes in trade patterns	85.68	91.21*	92.26*	94.26*
The marketing concept is relatively backward	82.34	91.23*	92.32*	94.65*
Marketing features are too single	84.66	89.65*	92.30*	95.36*

Note: Compared with that before the intervention of cognitive impairment, * $P < 0.05$.

Conclusions: In view of the problems existing in the current international trade marketing ideas, the cognitive impairment intervention was carried out for the personnel of relevant organizations. The results show that the problems existing in the international trade marketing ideas have been improved. Therefore, it can be said that the intervention based on cognitive impairment can innovate the marketing mode of international trade, so as to solve the disadvantages of the current development of international trade marketing.

ACCOUNTING PROBLEMS AND CHARACTERISTICS IN CROSS-BORDER E-COMMERCE IMPORT BUSINESS FROM THE PERSPECTIVE OF PSYCHOLOGY

Meijiao Sun¹, Cheng Pan¹ & Rong Li^{1,2*}

¹*School of Economics and Management, Nanchang Vocational University, Nanchang 330050, China*

²*Hanyang Graduate School of International Studies, Hanyang University, Seoul 04763, South Korea*

Background: Psychology is a science that studies the psychological phenomena, spiritual functions and behaviors of humans and animals. It is not only a theoretical discipline, but also an applied discipline. Including theoretical psychology and applied psychology. Psychological research involves many fields such as perception, cognition, emotion, personality, behavior and interpersonal relationship, as well as many fields of daily life-family, education, health and so on. On the one hand, psychology attempts to use brain operation to explain the basic behavior and psychological function of individuals. At the same time, psychology also tries to explain the role of individual psychological function in social behavior and social dynamics. At the same time, it is also related to neuroscience, medicine, biology and other sciences, because the physiological functions discussed in these sciences affect individual thinking. Psychology is defined as the scientific study of behavior and psychological processes, as well as the physiological and psychological states of organisms and the influence of external environment. Psychology is divided into five sub fields: neuroscience, developmental psychology, cognitive psychology, social psychology and clinical psychology. In short, neuroscience studies the psychology of the human brain by observing its response. Developmental psychology is a subject that studies how human beings grow, develop and learn. Cognitive psychology studies psychology through computer methods, that is, psychology is compared with computers to understand how humans play games and distinguish between language and object recognition. Social psychology is the study of human group behavior and how to communicate with others. Clinical psychology

mainly studies mental health and mental illness. Psychology is mainly a course to help people's mental health. Psychology has a long history, but only a short history. Among them, cognitive psychology studies psychological activities, including problem solving, perception, memory, learning and so on. As a part of cognitive science, this branch of psychology is closely related to other disciplines, including neuroscience, philosophy, linguistics and so on. Cognitive psychology believes that hidden psychological activities should be studied in a scientific way. Psychologists have created two concepts: subthreshold stimulation and implicit memory, which correspond to the accidental formation of psychoanalytic subconsciousness or behavior. Behaviorism and cognitive psychology are the basis of cognitive therapy. Cognitive psychology and other disciplines, such as philosophy of mind, computer science and neuroscience, are classified as advanced disciplines cognitive science. In short, both in theory and in practice, cognitive psychology has made important achievements. Therefore, it is worth continuing to expand the application scope of cognitive psychology.

With the rapid development of China's social economy, many domestic enterprises have expanded their business scope to other countries, and overseas e-commerce platforms have become another economic growth point for enterprises. In the process of carrying out cross-border e-commerce import and export business, the completion quality of accounting work directly determines the normal promotion of various economic activities and the overall economic benefits of enterprises. In other words, for enterprises, expanding overseas markets is not only an important channel for enterprises to obtain higher economic benefits, but also an important means for enterprises to improve their comprehensive competitiveness and economic strength. However, compared with domestic business, there are many new characteristics and problems in the accounting of cross-border e-commerce import and export. At present, the existing problems of cross-border e-commerce import and export accounting mainly include unscientific accounting methods, imperfect system and inadequate supervision. In this regard, based on the perspective of psychology, this paper studies the accounting problems and characteristics in the cross-border e-commerce import business.

Objective: This paper analyzes the problems and characteristics of accounting from the perspective of psychology, and explores its role in cross-border e-commerce import business, in order to explore a set of accounting management mode suitable for cross-border e-commerce import and export, so as to improve the accuracy and efficiency of accounting work and enable the orderly development of import and export business.

Research objects and methods: Select 100 accounting organization personnel of cross-border e-commerce import and export as the research object, carry out cognitive psychological intervention, and the intervention cycle is 6 months. Compare and analyze the changes of problems in cross-border e-commerce import and export accounting before and after the improvement of accounting organization personnel's cognitive impairment. Evaluation indicators include: unscientific accounting methods, imperfect system and inadequate supervision.

Methods: The data are analyzed through the latest version of Minitab20 data statistics software.

Results: Table 1 shows the improvement of cross-border e-commerce import and export accounting problems before and after the intervention of accounting organization personnel with cognitive impairment. On the whole, compared with before the intervention of cognitive psychology, after the intervention of cognitive psychology, the problems existing in the import and export accounting of cross-border e-commerce have been significantly improved ($P < 0.05$). This shows that the intervention of cognitive impairment can significantly improve the existing problems in the import and export accounting of cross-border e-commerce.

Table 1. Improvement of problems in cross-border e-commerce import and export accounting before and after knowledge barrier intervention

Category	Before	After 1 month	After 3 months	After 6 months
Unscientific accounting method	85.68	89.21*	93.26*	94.66*
Imperfect system	82.34	89.23*	93.32*	94.65*
Supervision is not in place	84.66	89.65*	92.90*	95.36*

Note: * $P < 0.05$ compared with that before the intervention of accounting organization personnel with cognitive impairment.

Conclusions: In view of the problems in the import and export accounting of cross-border e-commerce, cognitive psychological intervention was carried out for the personnel of relevant accounting organizations. The results show that the problems in the import and export accounting of cross-border e-commerce have been improved. Therefore, it can be said that the intervention based on cognitive psychology can solve the current development disadvantages of cross-border e-commerce import and export accounting.

INFLUENCE OF IDEOLOGICAL EDUCATION ON ALLEVIATING COLLEGE STUDENTS’ MENTAL ANXIETY UNDER THE BACKGROUND OF DIVERSIFICATION

Chengjun Yuan

Department of Mathematics, Harbin University, Harbin 150086, China

Background: Since entering modern society, with the rapid change of life mode and the intensification of social competition, anxiety has become a common problem in daily life. Anxiety Psychology, as a psychological disease, has not been widely concerned, but it has an important impact on all fields of society. From the perspective of conceptual analysis, anxiety is mainly due to the tension and fear derived from the inability to achieve their own goals or overcome the potential threats around them. Being anxious for a long time will not only frustrate people’s self-esteem and self-confidence, but also distract people’s attention, and then have a negative impact on people’s normal daily life. From the physiological level, the increase of psychological anxiety is the result of disturbing brain memory and thinking, making people show anxiety, tension, indecision and disturbing emotional changes. Anxiety can lead to neurological dysfunction, mental illness or abnormal anxiety. However, if these manifestations are excessive, they will evolve into anxiety disorders, even physical and language stiffness, mental breakdown, or common mental diseases in medicine, which will undoubtedly bring great threats and challenges to people’s body and mind, study and work. At the same time, anxiety, as a common and common psychological disease, also has an important impact on people’s judgment and thinking in their daily life, that is, people in a state of anxiety will not be able to deviate from the normal track of daily life and fall into a kind of self-repression that cannot extricate themselves, so it is difficult to practice their goals, and linger in place in depression. In short, anxiety has spread to all areas of people’s daily life, which should be paid attention to.

With the increasing complexity of human society and the development of information circulation, the renewal and transformation of culture are accelerating day by day. The development of various cultures is facing different opportunities and challenges, and new cultures will emerge one after another. In the modern complex social structure, it is inevitable that different cultures are needed to serve the development of society. However, facing the impact of multiculturalism, college students generally have mental anxiety, which is mainly reflected in indulging in multiculturalism and unable to make a correct value judgment. Ideological and political education is not only the primary content of China’s spiritual civilization construction, but also one of the main ways to solve social contradictions and problems. Ideological and political education is both important and difficult to do. Especially under the condition of market economy, China’s ideological and political work is relatively weak and does not meet the requirements of the development of modern society. There are many reasons for the poor effect of ideological and political work, but one of the important reasons is the long-term neglect of psychological education and training. Psychological education and cultivation are the basis of ideological and political education. Without this foundation, ideological and political education is like a rootless duckweed, always drifting on the surface of people’s thoughts and cannot go deep. Relevant studies have pointed out that ideological and political education in colleges and universities has an important impact on alleviating college students’ mental anxiety, and can help college students form correct values, so as to deal with the impact and corrosion of pluralistic culture. Therefore, based on the multicultural background, exploring the role of ideological and political education in alleviating college students’ mental anxiety has both theoretical and practical value.

Objective: Facing the impact and corrosion of multiculturalism, in order to alleviate the mental anxiety of college students, this paper constructs a reform model of ideological and political education in colleges and universities with psychological training, which aims to dredge the mental anxiety of college students, so as to promote college students to correctly judge the content of multiculturalism and ensure the all-round development of college students’ physical and mental health.

Research objects and methods: 300 college students were randomly divided into control group and experimental group, with 150 students in each group. The control group implemented traditional ideological and political education, and the experimental group implemented the reform mode of ideological and political education based on psychological training for 3 months. Then, combined with the

Self-rating Anxiety Scale (SAS), the mental anxiety of college students is measured. The higher the score, the more serious the spirit is. Finally, the improvement of mental anxiety of the two groups of college students is compared and analyzed.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the improvement of mental anxiety of college students in the two groups. Compared with the control group with routine ideological and political education, the experimental group with the reform mode of psychological training ideological and political education improved college students' mental anxiety more significantly, and there was significant difference between the two groups ($P < 0.05$).

Table 1. The improvement of mental anxiety of college students in the two groups ($n=300$)

Factor	Control group ($n=150$)	Experience group ($n=150$)	<i>P</i>
Somatization	2.47±0.43	1.39±0.43	0.00
Obsessive compulsive symptoms	2.54±0.55	1.45±0.56	0.00
Interpersonal sensitivity	2.36±0.41	1.25±0.43	0.00
Depressive status	2.44±0.56	1.43±0.57	0.00
Anxiety state	2.29±0.42	1.28±0.43	0.00
Hostile situation	2.47±0.43	1.39±0.43	0.00
Psychological state of terror	2.54±0.55	1.45±0.56	0.00
Paranoid mental state	2.36±0.41	1.25±0.43	0.00
Psychotic	2.44±0.56	1.43±0.57	0.00

Conclusions: Facing the impact and corrosion of multiculturalism, the reform mode of ideological and political education based on psychological training has an important impact on alleviating college students' spiritual anxiety, helping college students form correct values and promoting the healthy development of college students' body and mind. Therefore, it can be said that the reform model of ideological and political education based on psychological training has high theoretical and practical value.

ANALYSIS ON THE INFLUENCE OF IDEOLOGICAL AND POLITICAL EDUCATION INNOVATION ON STUDENTS' SPIRITUAL AND EMOTIONAL PRESSURE UNDER THE PATTERN OF "GREAT IDEOLOGICAL AND POLITICAL EDUCATION"

Wei He

School of Marxism, Hunan Polytechnic of Environment and Biology, Hengyang 421000, China

Background: The teaching contents and tasks provided in college teaching are stricter, which also causes a large number of students to have mental and emotional pressure. The mental and emotional stress of students can be collectively referred to as psychological anxiety in psychology. The generation of psychological anxiety is mostly due to the difference of students' expectations in learning, that is, students are difficult to complete the predetermined goal under pressure, resulting in mental anxiety. In addition, in college life, not only the teaching pressure in learning leads to students' mental and emotional pressure, but also the surrounding students and school environment will bring serious mental pressure to students in daily life, resulting in students' mental and emotional pressure. In psychological research, the treatment for students' mental and emotional stress is educational reform, and students' psychological trauma is repaired through innovative teaching programs. A large number of studies have proved that in college education, students' mental and emotional pressure can be induced by teachers to alleviate the phenomenon. In view of this, major colleges and universities have successively carried out teaching courses to alleviate students' spiritual and emotional pressure, among which the ideological and political education course in colleges and universities has the most remarkable effect. The core content of ideological and political education is to cultivate students' correct values, guide students to build a complete value system by instilling positive

ideas into students, and expect students to be able to deal with external shocks in their study and life.

With the proposal of the great ideological and political pattern, the ideological and political teaching in colleges and universities is defined as the system and mechanism of “integrated leadership, professional operation and collaborative education”. In the practice of ideological and political education in colleges and universities for many years, the pattern of great ideological and political education has become more and more perfect, and has gradually become the basic theory of ideological and political education in colleges and universities. In view of the students’ mental and emotional pressure, ideological and political teaching forms a special ideological system for students from the students’ ideological construction, so as to alleviate the students’ emotional pressure. Under the great ideological and political pattern, there are further understanding and requirements for the ideological and political education in colleges and universities. Under the great ideological and political pattern, it is emphasized that the ideological and political teaching in colleges and universities needs to build a more perfect teaching system and a more comprehensive team of teachers, so as to further improve the teaching quality of ideological and political classroom teaching. The innovation of ideological and political education in colleges and universities under the great ideological and political pattern is the main development direction of ideological and political education in colleges and universities. On the basis of the original ideological and political education, the innovative scheme will undoubtedly have a more direct and obvious impact on students’ spiritual and emotional pressure. Therefore, this paper studies and constructs the innovative scheme of college ideological and political education under the great ideological and political pattern, so as to analyze its specific impact on students’ spiritual and emotional pressure, so as to provide reference for the development of efficient ideological and political education, in order to reduce college students’ negative emotions.

Objective: This paper discusses the construction process of the innovation scheme of ideological and political education in colleges and universities under the great ideological and political pattern, and explores the impact of the innovation of ideological and political education under the influence of the great ideological and political pattern on the spiritual and emotional pressure of college students.

Study design: Taking a university as the research object, the number of students with mental and emotional anxiety in colleges and universities was counted. Professional performance assessment is used to determine the scores of college students’ ideological and political courses, and Self-rating Anxiety Scale is used to count the anxiety of students. The innovative scheme of ideological and political education is constructed by using the great ideological and political pattern. The scheme is applied to the ideological and political education courses in three schools, and the teaching time is 6 months. Compare and analyze the differences of students’ ideological and political course scores and students’ learning anxiety before and after teaching, and analyze the effect of ideological and political innovation education program under the great ideological and political pattern and its impact on students’ learning anxiety. Adopt SPSS24.0. The data difference before and after statistical analysis was statistically significant ($P < 0.05$).

Results: The number of college students suffering from mental and emotional stress is 119. The changes of student performance and anxiety evaluation after passing the ideological and political innovation teaching program under the great ideological and political pattern are shown in Table 1. Table 1 shows that there are significant differences in students’ professional scores and mental and emotional stress before and after the teaching of innovative programs, and they have been significantly improved after teaching.

Table 1. Changes of students before and after teaching

Project	Before teaching	After teaching	P
Ideological and political achievements	63.4	78.9	<0.05
Mental and emotional stress	66.37±2.12	35.78±1.65	<0.05

Conclusions: The emotional stress of college students is the main factor affecting the normal development of students’ study and life. Therefore, colleges and universities need to pay close attention to students’ psychological problems and treat them. Based on the theoretical basis of the great ideological and political pattern, this study constructs an innovative scheme of ideological and political teaching in colleges and universities, so as to alleviate the anxiety of college students under mental and emotional pressure. The results show that under the innovative scheme, students’ professional performance has been significantly improved, and students’ emotional stress score has been significantly reduced, indicating that students’ negative emotions can be alleviated through the innovative teaching scheme. Therefore, in the ideological and political teaching in colleges and universities, teachers need to have strong sensitivity, build students’ correct values and promote students’ growth by constructing innovative schemes.

THE VALUE OF CULTIVATING COLLEGE STUDENTS' PSYCHOLOGICAL QUALITY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Lei Xin

School of Tourism Management, Guilin Tourism University, Guilin 541006, China

Background: As a psychological subject studying social activities, social psychology can effectively analyze social activities and explore the behavior changes between social organizations. In college teaching, social change determines the change of teaching mode. Therefore, analyzing the application of social psychology in college teaching innovation is of great significance to the improvement of college education level. The research of social psychology is mainly aimed at the behavior process and interpersonal relationship of individuals under the influence of the external environment. Social psychology believes that individual experience is affected by social activities, resulting in psychological and behavioral changes. At the same time, within the research scope of social psychology, social activities, social communication behavior and group psychology are its main research contents. With the continuous changes of the international community, how to plan the teaching mode of colleges and universities through social psychology is debatable. With the deepening of research, a large number of educators found that social activities have a certain impact on students' psychological quality. Therefore, colleges and universities began to gradually try to use the content of social psychology to realize the cultivation of students' psychological quality.

Students' psychological quality includes the ability to deal with interpersonal relationships, the ability to withstand blows and setbacks, healthy and correct values and a good outlook on life. In college education, it is not only to comprehensively cultivate students' professional achievements, but also to promote the growth of students' psychological quality. It is also one of the main contents of your college education. Many studies have shown that in college teaching, students' psychological quality is affected by many aspects. The learning environment of colleges and universities is a relatively free environment. In college learning and life, students can participate in various activities and freely choose their favorite courses. In the process of carrying out various activities in colleges and universities, the social level that students can contact has also begun to expand. Most college activities require students to have high social skills, so it can promote the improvement of students' interpersonal relationship processing ability to a certain extent. College education has huge resources. Students can contact the knowledge of all sectors of society through the college education platform, which indirectly or directly affects students' values and outlook on life. Moreover, the social pressure faced by the university also increases gradually with the teaching time. How students deal with the difficulties they face determines the direction of students' future development. Therefore, in college education, the impact of social environment on students is very significant. From the perspective of social psychology, this paper analyzes the specific performance and changes of college students' psychological quality in the social environment, and puts forward theoretical support for the healthy growth of students.

Objective: Explore the social activities of college students in their study and life, analyze the impact of different social activities on students' social psychology, and explore the specific impact of students' social psychology on students' psychological quality.

Study design: Taking a university as an example, 500 students were selected for empirical investigation, the social activities that all students were exposed to in their study and life in the university were counted, and the social psychological status and changes of students in various social activities were determined by fuzzy evaluation method. Collect the interpersonal relationship processing ability, the ability to withstand blows and setbacks, healthy and correct values and good outlook on life and psychological quality of all students, and use SPSS24.0 software analyzes the correlation between students' social psychology and psychological quality, and evaluates the value of social psychology in the cultivation of college students' psychological quality.

Table 1. The influence of social psychology on students' psychological quality

Content	Interpersonal skills	Ability to withstand setbacks	Healthy and correct values	Good outlook on life
Social psychology	4	4	4	4
Social consciousness	4	4	4	4

Results: The influence degree of students' social psychology on students' interpersonal relationship

processing ability, ability to withstand blows and setbacks, healthy and correct values and good outlook on life is shown in Table 1. 0-4 points are used to indicate the degree of influence, 0 indicates no influence and 4 indicates complete influence. Table 1 shows that students' social psychology has a significant and complete impact on students' various psychological qualities.

Conclusions: The cultivation of college students' psychological quality in professional learning is also a key issue that students and college teachers need to pay attention to all the time. Therefore, how to cultivate college students' psychological quality is of great significance. The research determines the teaching direction of colleges and universities by analyzing the social psychology produced in college students' social activities and evaluating the specific value of social psychology in the cultivation of college students' psychological quality. The results show that college students' social psychology has a very obvious impact on their psychological quality. Therefore, in college teaching and daily life, students need to participate in social activities to cultivate their own social psychological growth, and cultivate their own psychological quality based on social psychology, so as to improve students' comprehensive quality and ensure their healthy development in society.

ANXIETY PSYCHOLOGICAL PROBLEMS OF COLLEGE STUDENTS FROM THE PERSPECTIVE OF IDEOLOGICAL AND POLITICAL EDUCATION

Ha Da¹ & Jia Liu²

¹*School of Engineering and Technology, Hulunbuir University, Hulunbuir 021008, China*

²*School of Foreign Language, Hulunbuir University, Hulunbuir 021008, China*

Background: In psychology, it is believed that college students are just at the boundary between school and society. Many college students can't calmly deal with the pressure of learning, economy, communication and love, passively avoid, and can't actively explore and solve problems, which leads to negative emotions such as complaint, anxiety and fear of difficulties, which seriously affects their physical and mental health. With the acceleration of social development, the social pressure that college students need to face also begins to increase. Under this social pressure, the mental health status of college students has become the main topic of social concern. It is undeniable that in the psychological changes of college students, more psychological problems are anxiety disorders. The conventional psychological anxiety relief program is to carry out psychological courses, instill relevant psychological knowledge into students, and help students understand the serious impact of negative psychological emotions. However, in the development of psychological curriculum, students' interest in the psychological curriculum is not high, which leads to little effect of psychological curriculum on students' psychological counseling. Colleges and universities gradually shift the focus of students' mental health training to ideological and political teaching and alleviate students' psychological anxiety through the cultivation of values in ideological and political teaching.

In the current ideological and political education in colleges and universities, ideological and political education is to build a correct ideological and political outlook for students through ideological and political education, and help students maintain normal healthy values for a long time in their follow-up study and life. In the teaching practice of ideological and political education in colleges and universities for many years, it is found that students are more prone to psychological changes in the study of ideological and political courses, and in the ideological and political teaching in colleges and universities, the results reflected in their teaching can effectively alleviate students' negative psychological emotions. With the change of social situation, the ideological and political teaching curriculum in colleges and universities also needs to be innovated and reformed. The ideological and political teaching reform in colleges and universities is to assist students to establish correct values after enrollment. In colleges and universities, students need to cultivate strong self-management ability, which also needs to cultivate students' self-emotional management. Therefore, it is particularly important to alleviate students' anxiety through ideological and political education in colleges and universities. From the perspective of ideological and political education, the research analyzes the current situation of college students' psychological anxiety in ideological and political teaching, and helps colleges and universities establish innovative teaching programs of ideological and political education that can alleviate students' anxiety, in order to put forward solutions for the development of ideological and political education in colleges and universities and the alleviation of students' anxiety.

Objective: College students are about to enter society, so they are facing great pressure and fierce

competition. Many students fall into confusion about the future in this environment, resulting in anxiety and depression, affecting the level of mental health, and then affecting the healthy growth of students. Ideological and political education in colleges and universities is the main way to shape students' personality, cultivate students' outlook on life and values, and improve college students' psychological quality. Therefore, in order to solve the psychological anxiety of college students, this paper puts forward a teaching scheme with ideological and political education as the core, and analyzes its impact on students' psychology.

Study design: 120 students in a university were selected as the main research object, the psychological anxiety of all students was counted, and the students were divided into groups according to their different psychological anxiety. The innovative program of ideological and political teaching was used to alleviate students' psychological anxiety. All data were collected by SPSS24.0, $P < 0.05$ was statistically significant.

Results: There are different levels of anxiety among all students. The specific analysis of the anxiety of all students shows that the changes of students' anxiety before and after teaching are shown in Table 1. Table 1 shows that the anxiety scores of students in different grades can be significantly reduced in teaching.

Table 1. Changes in students' anxiety

Project	Anxiety score		P
	Before teaching	After teaching	
Freshman (n=30)	69.57±2.31	35.45±1.26	<0.05
Sophomore (n=30)	66.12±2.06	39.52±1.66	<0.05
Junior (n=30)	60.11±2.28	40.02±1.33	<0.05
Senior (n=30)	70.1±2.69	42.06±1.25	<0.05

Conclusions: As an important part of the college curriculum, ideological and political education in colleges and universities needs to pay attention to how to alleviate students' increasing anxiety. The research starts from the improvement of teaching schemes in ideological and political education, and formulates a good teaching innovation scheme for the purpose of improving students' psychological anxiety. The results show that in the innovative teaching of ideological and political education, college students of different grades can get a significant decline in scores, that is, students' psychological anxiety can be significantly alleviated. The psychological anxiety of college students needs to be paid close attention to and solved in college teaching. At the same time, colleges and universities should also build teaching plans based on students' psychological negative emotions in ideological and political teaching, provide the basis of teaching environment for students' healthy growth, promote students' normal growth, and provide a theoretical basis for talent training in our country.

THE TEACHING REFORM PATH OF ART EDUCATION CURRICULUM IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xuan Han

Academy of Arts & Design, Sichuan University of Arts and Science, Dazhou 635000, China

Background: Educational psychology is the theoretical basis of teaching reform in colleges and universities. In the teaching reform in colleges and universities, the application of educational psychology can realize the practice of teaching reform to the greatest extent. The purpose of educational psychology is to guide the reform of teaching mode and system. From the perspective of educational psychology, any teaching system has its aspects that can be reformed. Educational psychology emphasizes the intervention of human learning and educational programs in the educational context, so as to improve the teaching level. In educational psychology, taking students' learning tasks as the background and psychology as the basis, this paper analyzes students' learning psychology, designs courses and optimizes teaching plans from students' learning levels. In recent years, due to the needs of social development, educational development is constantly updating and iterating, and the tasks of educational psychology are increasing. Therefore, the scope of research objects of educational psychology is also expanding. And with the change of social education concept, education is not only the infusion of knowledge, but also shoulder the role of cultivating students' moral behavior and aesthetic emotion. In college teaching, teachers and schools pay more and more attention to students' aesthetic emotion in colleges and universities. Therefore, how to cultivate

students' aesthetic emotion by using educational psychology from the perspective of students' psychology has become a problem gradually broken through by colleges and universities.

At the same time, in order to cultivate students' aesthetic and psychological values in art courses, teachers in colleges and universities need to carry out aesthetic education in order to cultivate students' aesthetic and psychological values. The proposal of educational psychology provides a reference path for the reform of fine arts in colleges and universities. In educational psychology, it is considered that the formulation of curriculum scheme is based on the three humanistic foundations of school, teachers and students. Schools need to fully support teachers' teaching reform and provide teachers with the necessary environment and conditions for teaching reform. In the process of teachers' teaching curriculum formulation, teachers also need to be student-centered, start with students' learning psychology, and establish a teaching plan in line with students' learning enthusiasm. In art education, students have different views on different things, so there are significant differences in the final art embodiment. Therefore, how to apply the relevant contents of educational psychology in art teaching and optimize the art education curriculum in colleges and universities with the help of the educational viewpoint of educational psychology is of great significance. In the research, by analyzing the relevant core ideas of educational psychology, this paper attempts to analyze the innovative path of art teaching in colleges and universities, so as to provide theoretical reference for the comprehensive development of college students.

Objective: This paper discusses the value of educational psychology in the teaching application of colleges and universities, analyzes the aesthetic psychology of students in art education courses in colleges and universities, applies educational psychology to the reform of art courses, and discusses the impact of teaching reform on students' aesthetic psychology under educational psychology.

Study design: Based on the analysis of the factors affecting the development of art education curriculum in colleges and universities, this paper determines the influencing factors of art education. 200 students were selected from three schools. Each school was divided into an experimental group and control group, with 100 students in each group. The experimental group used the new strategy for art education, and the control group used the traditional scheme for art education. All students were tested for art professional achievement and aesthetic psychological evaluation.

Results: See Table 1 for the performance test and aesthetic psychological evaluation results of middle school students in the three schools after teaching. Table 1 shows that after teaching, the number of excellent students and the number of students with good aesthetic psychology in the experimental group is more than those in the control group, and the difference is statistically significant ($P < 0.05$).

Table 1. Changes of students after innovative teaching of art curriculum

Index		School A	School B	School C
Excellent professional performance	Experience group (n=100)	86	77	95
	Control group (n=100)	64	61	69
<i>P</i>		<0.05	<0.05	<0.05
Good aesthetic psychology	Experience group (n=100)	97	95	97
	Control group (n=100)	74	72	81
<i>P</i>		<0.05	<0.05	<0.05

Conclusions: The comprehensive quality development of college students refers to that students need to develop their other abilities while developing their professional level. The establishment of art curriculum in colleges and universities is to cultivate students' aesthetic values in the way of professional teaching. In the research, educational psychology is used to reform art teaching in colleges and universities, and explore the path of art teaching reform. The results show that in the perspective of educational psychology, students' aesthetic psychology is the main influencing factor of teaching reform, and the teaching scheme constructed on this basis can effectively improve students' aesthetic psychology level. Therefore, in art teaching in colleges and universities, paying attention to students' aesthetic psychology to formulate perfect teaching plans is the main way to help students improve their professional knowledge. At the same time, it can also improve students' aesthetic emotion and promote students' all-round development.

THE APPLICATION OF BIG DATA AND CLOUD COMPUTING IN THE INTERNET OF THINGS UNDER THE BACKGROUND OF THINKING DISORDER

Mingdong Chen

Institute of Computer Science and Technology, Aba Teachers University, Wenchuan 623002, China

Background: Thinking disorder is a common mental problem. There are many reasons for thinking disorder, among which personality, gender and education level are the more obvious factors. At the same time, it is also proposed in some studies that the knowledge environment of individuals in learning is also an important influencing factor. Thinking disorder can be summarized in psychology and psychiatry at the same time. In psychiatry, thinking disorder is not only a kind of cognitive disorder, but also a mental disorder after brain damage. Psychiatry believes that the treatment of thinking disorders requires more thorough surgical treatment or long-term drug relief. In psychology, it is believed that the generation of individual thinking disorder is largely affected by the outside world. In the teaching process, the generation of middle school students' thinking disorder is considered to be affected by families, classmates and teachers. In college teaching, thinking obstacles is the confusion or deviation of students' thinking in the learning process, including symbolic thinking, new words, logical inversion and sophistication thinking. The above four thinking logic obstacles will affect individual cognition for a long time. Therefore, general psychology believes that in order to alleviate students' cognitive impairment, the treatment of students' thinking impairment in curriculum can depend on teachers' teaching mode.

China has a large land area, and the education methods in different regions are very different, which leads to the non-correlation between the education systems in various regions. In this environment, China's educational resources will be seriously wasted, because the repeated construction of the teaching system leads to the repeated utilization of various teaching resources. In addition, under the background of the teaching system running its own affairs, a large number of teaching resources cannot be fully utilized due to the difficulty of sharing, and the generation of massive data increases the burden of the school. The teaching resources that cannot meet the shared applications also limit the teaching development of the school to a certain extent. Therefore, with the support of information technology, research began to integrate educational resources by using advanced cloud computing technology, and push various teaching resources to teachers and students in different colleges and universities through big data technology. However, it is undeniable that the thinking obstacles of college students hinder the expansion and application of big data and cloud computing, as well as the application of big data and cloud computing in IOT Internet cafes. Therefore, in order to promote the development of science and technology in China, we should start with the application of big data in colleges and universities, alleviate the thinking obstacles of college students, so as to realize the wide application of big data and cloud computing technology, in order to provide technical and theoretical support for the development of science and technology in China and provide solutions for the treatment of thinking obstacles of college students.

Objective: This paper discusses the current situation of thinking obstacles of college students, analyzes the application status of big data and cloud computing in the Internet of things in colleges and universities, and evaluates the blocking effect of college students' thinking logic on the application of big data and cloud computing in the Internet of things.

Study design: Make statistics on the application of big data and cloud computing in the Internet of things in a university from 2017 to 2021, count the thinking obstacles of students exposed to big data and cloud computing technology during this period, and evaluate the correlation between the level of thinking obstacles of college students and the application of big data and cloud computing in the Internet of things. Build a treatment plan based on the treatment of thinking disorders, and evaluate the changes in the application of big data and cloud computing in the Internet of things after the implementation of the treatment plan.

Results: After the implementation of the scheme, the number of students with thinking disabilities and the application rate of big data and cloud computing in the Internet of things are shown in Table 1. Table 1 shows that within 6 months after the implementation of the treatment scheme, the number of students with thinking disorders shows a decreasing trend, and the application rate of big data and cloud computing in the Internet of things shows an increasing trend.

Table 1. Effect analysis of thinking disorder after treatment

Project	0 month	3 months	6 months
Number of people with thinking disorders	64	52	21
Application rate (%)	11.7	33.6	52.7

Conclusions: The thinking obstacle of college students is a problem that cannot be ignored in college teaching. The existence of thinking obstacle seriously hinders the development of students and the utilization of school teaching resources. The research starts with students' thinking obstacles, and analyzes the impact of students' thinking obstacles on the application of big data and cloud computing in the Internet of things in the development of colleges and universities. The results show that college students' thinking

obstacles seriously affect the application rate of big data and cloud computing in the Internet of things, seriously hinder the normal development of colleges and universities, and in the application of thinking obstacle treatment scheme. The number of students with thinking disabilities in colleges and universities is decreasing, and the application rate of big data and cloud computing in the Internet of things is increasing. In daily education, colleges and universities need to always pay attention to the problem of students' thinking obstacles, and put forward treatment plans to alleviate students' thinking obstacles, which will not only help colleges and universities solve students' negative emotional problems, but also help colleges and universities develop at a high speed in the torrent of the times.

THE DEVELOPMENT AND INNOVATION OF LEISURE SPORTS INDUSTRY IN HAINAN FREE TRADE PORT FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Kun He

School of Physical Education, Qiongtai Normal University, Haikou 571127, China

Background: Social psychology is a psychological science that studies the communication psychology among social individuals, groups and organizations. In social development, coastal areas have adopted leisure sports and cultural tourism, emphasizing the use of social communication to promote cultural communication and achieve the purpose of regional development. In social psychology, social representation is the guarantee that determines the development of social communication. According to the research content of social psychology, social representation can help individuals have a clearer understanding ability in social communication. In addition, social psychology shows that social representation can help the specific analysis of a specific phenomenon in social communication and increase the ability of communication and interaction between societies. On the other hand, social psychology believes that the discourse sharing of social representation provides a development background for regional development and enables all sectors of society to communicate effectively. For leisure sports and cultural tourism in coastal areas, tourists are eager to participate in leisure sports, and the tourism industry is eager for tourists to participate in the consumption of leisure sports. There is a certain social relationship between them, that is, tourists, get corresponding services with social consumption psychology, while tourism obtains corresponding consumption with social service psychology. According to social psychology, tourism and tourists complement each other and reach a certain agreement in social communication.

The proposal of Hainan free trade port has greatly improved the economic development of Hainan. At the same time, with the support of policies, Hainan free trade port continues to carry out various tourism projects, among which leisure sports, as an important development industry, has gradually attracted the attention of the broad masses of the people. Hainan has gathered people from all directions. Different cultures have become unique and distinctive urban logo in China. On this basis, it has gradually become a tourist destination for Chinese people. With the support of economic development and tourism development, leisure sports have brought new opportunities and challenges to the local area. There are significant differences between leisure sports and conventional sports. Conventional sports emphasize helping people improve their physical quality and enhance their personal physical performance. The main purpose of leisure sports is to help people understand the local cultural customs and achieve the purpose of leisure and entertainment through sports. In the development of tourism, the social effect brought by social psychology cannot be ignored. Therefore, from the perspective of social psychology, this paper analyzes the development ways of leisure sports industry in Hainan free trade port, so as to provide theoretical support for China's economic development.

Objective: Explore the development status of leisure sports industry in Hainan free trade port, analyze the role of leisure sports culture tourism industry in Hainan's economic development, analyze the impact of social psychology on the development of leisure sports industry in Hainan free trade port, and explore the future development direction of leisure sports industry in Hainan free trade port.

Study design: Using the method of literature, this paper collects the development status of the leisure sports industry in Hainan free trade port, analyzes the changes of social and psychological activities in the

development of leisure sports industry in Hainan free trade port, and puts forward the development direction of the tourism industry to promote the development of leisure sports industry in Hainan free trade port. Statistics on the psychological changes of tourists in Hainan free trade port and the psychological impact of leisure industry on Hainan free trade port in 2021.

Results: The correlation coefficient of tourists' social psychology in the development of the leisure sports industry in Hainan free trade port is shown in Table 1. Table 1 shows that tourists' self-cognition and social cognition have a significant impact on the safety, efficiency, characteristics and personalized satisfaction in the development of the leisure sports industry in Hainan free trade port.

Table 1. The influence of tourists' social psychology on the development of leisure sports industry in Hainan free trade port

Content	Security	Efficiency	Characteristics	Personalized satisfaction
Self cognition	0.572	0.425	0.616	0.497
Social cognition	0.499	0.366	0.378	0.445

Conclusions: Hainan free trade port leisure sports industry is one of the important policies in China's economic development policy. How to realize the rapid development and innovation of Hainan free trade port leisure sports industry is a problem that needs to be solved for social development. Starting from the perspective of social psychology, this paper analyzes the impact of tourists' social psychology on the development of leisure sports industry in Hainan free trade port. The results show that tourists' self-cognition and social cognition have a significant impact on the development of leisure sports industry in Hainan free trade port. Therefore, in the process of social and economic development, we need to focus on the role of social psychology, and use social psychology to provide innovative direction for economic development. On the premise of meeting the basic needs of tourists, it can help to increase the rate of China's economic development.

ON THE NATIONAL CULTURAL CONNOTATION AND POETIC CHARM OF IMAGE OIL PAINTING FROM THE PERSPECTIVE OF COLOR PSYCHOLOGY

Hui Li

School of Arts, Anhui Polytechnic University, Wuhu 241000, China

Background: Color around people, in all aspects of life can reflect its role, but also continue to affect people's daily life. Some psychological studies have pointed out that the existence of color can affect people's emotions, make people feel excited or excited, and make people feel stressed or happy. And some studies have deeply understood that people's mental health and behavior are largely affected by color balance. Color tends to be basically balanced, and people's psychological satisfaction is more sufficient. When people face unbalanced colors, they will have anxious psychological emotions. In addition, some color psychologists believe that the color stimulation generated in social activities will affect individual emotions, which is mainly reflected in paintings. With the deepening of research, the importance of color psychology has not been improved, and has gradually evolved into an important discipline in higher education. At the visual level, psychology believes that the symbolism and association of color bring unique sensory stimulation to individuals, so it can also bring a variety of emotional expression to individuals and induce stronger emotional language. Therefore, from the perspective of color psychology, more and more studies apply it to the analysis of the emotional content of paintings.

It is clear that in college teaching, art course is a very important course, which can cultivate students' aesthetic psychology in art teaching. In art teaching, the cultural connotation of image oil painting is stronger. Image oil painting is a work created by artists under the influence of Chinese culture. It is based on the life experience of the development of Chinese culture. The color and content in the work have unique characteristics. The external expression of image oil painting has its own unique characteristics. There are significant differences between image oil painting and other art forms such as abstract oil painting. Image oil painting changes with the changes of artists' aesthetic taste and cultural spirit, and will be constantly

updated to meet people's aesthetic ideas. The development of Chinese oil painting depends on the image of Chinese traditional culture. Although with the development of society and Chinese culture, image oil painting has achieved satisfactory results, there are still problems of difficult nationalization in the development. Therefore, in college education and research, how to combine Chinese culture and show the traditional cultural connotation and poetic charm in image oil painting is extremely important. The study uses color psychology to construct students' basic appreciation ability, so as to obtain the traditional cultural connotation and poetic charm from image oil painting.

Objective: This paper discusses the application status of color psychology in art courses in colleges and universities, discusses the relevant teaching contents of image oil painting in art teaching in colleges and universities, and analyzes the understanding degree of teachers and students using color psychology to the national cultural connotation and poetic charm of image oil painting.

Study design: There are students majoring in fine arts in a university as the research object. In teaching, teachers take image oil painting as the main teaching content. Using color psychology to analyze students' aesthetic emotional expression and conscious association in the face of image oil painting, teachers evaluate students' ability to understand the national cultural connotation and poetic charm of image oil painting in teaching.

Results: Under the teacher's evaluation, the students' ability to understand the national cultural connotation and poetic charm of image oil painting by using the aesthetic emotional expression and conscious association in color psychology is shown in Table 1. Table 1 shows that under the influence of aesthetic emotional expression and conscious association, students have more strong understanding of national cultural connotation and less weak understanding. Similarly, the number of students with strong understanding of poetic charm is also significantly higher than that with weak understanding.

Table 1. Students' understanding ability of image oil painting under color psychology ($n=100$)

Index	National cultural connotation		Poetic charm	
	Strong understanding	Weak understanding	Strong understanding	Weak understanding
Emotional expression	67	33	79	21
Conscious association	71	29	77	23

Conclusions: College teaching needs to cultivate students' aesthetic ability, and students need to have a certain understanding of China's traditional culture. The research starts with color psychology, analyzes the content of color psychology in students' learning and appreciation of image oil painting, and evaluates students' ability to understand the national cultural connotation and poetic charm of image oil painting under the influence of color psychology. The results show that under the influence of color psychology, most students can fully understand the cultural connotation and poetic charm of image oil painting. In art teaching in colleges and universities, we should cultivate students' basic abilities based on color psychology and emphasize students' aesthetic emotional expression and conscious association, which can not only help students understand image oil painting, but also help colleges and universities carry out courses and inherit Chinese traditional culture.

TEACHING REFORM AND PRACTICE OF DIGITAL MEDIA APPLICATION TECHNOLOGY SPECIALTY IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Zhijian Wang

Design Art College, Changzhou Vocational Institute of Engineering, Changzhou 213164, China

Background: The proposal of educational psychology puts forward a new direction for the development and practice of teaching in colleges and universities. Educational psychology emphasizes the intervention of human learning and educational programs under the educational background, so as to improve the teaching level. In educational psychology, taking students' learning tasks as the background and psychology as the basis, this paper analyzes students' learning psychology, designs courses and optimizes teaching plans from students' learning levels. In psychological research, educational psychology includes pedagogy and psychology, but the mechanism of educational psychology is psychology leading pedagogy. Generally

speaking, students' psychology is the key factor of teaching curriculum development. The reason is that curriculum development serves students' learning. Students' attention to curriculum and changes in learning psychology is what teachers need to pay close attention to in teaching reform and innovation. With the development of society, the application scope of educational psychology has gradually expanded. Previous studies have found that early educational psychology focuses on the research of students' psychology and learning rate. Under the premise of social development, some studies have pointed out that educational psychology gradually tends to cultivate students' professional and technical ability. However, it must be admitted that the main way of college educational psychology is to use students' psychology to intervene students' curriculum learning, so as to improve the teaching system.

With the development of the information age, colleges and universities gradually informationize curriculum education. The emergence of multimedia provides a new direction for teachers' teaching innovation. In college multimedia teaching, teachers can use Internet technology to seek professional knowledge from the network and obtain richer and more convincing teaching means, so as to improve students' learning enthusiasm. With the support of multimedia network technology, the teaching of digital media application technology specialty also tends to be information-based. From the daily teaching of digital media application technology specialty, it can be seen that the important thing of digital media is to need people's subjective consciousness. In image production and processing, students take charge of aesthetics and emotion, which can affect their learning results. Therefore, in the teaching of digital media application technology in colleges and universities, how teachers use students' psychology to build a more reasonable internet teaching model is debatable. In order to solve the above problems, the research proposes to use educational psychology to excavate students' learning psychology, so as to analyze the teaching path of digital media application technology specialty.

Objective: To explore the current situation of the teaching curriculum of digital media application technology specialty in colleges and universities, and to explore the role of educational psychology in the teaching reform of digital media application technology specialty in colleges and universities, in order to put forward the direction of the teaching curriculum reform of digital media application technology specialty in colleges and universities in China, and provide theoretical support for the teaching development of colleges and universities.

Study design: In the research, students from freshman to senior grades in a university are taken as the research object, and 60 students in each grade are selected as the main research object to count the students' psychological demands and psychological changes in the study of digital media application technology, and build an innovative teaching scheme of digital media application technology based on students' psychological activities. The innovative scheme is adopted for teaching to evaluate the psychological changes and ideological and political achievements of middle school students in different grades in the teaching process. The teaching time is set as 6 months.

Results: In the teaching process, the psychological changes of middle school students and the changes of students' professional achievements are shown in Table 1. Taking students' learning psychological demands as the main index to evaluate students' psychological changes, they represent no demands and high demands according to the 0-4 score system.

Table 1. Comparison results of students' psychological grade changes

Survey object		Before teaching	After teaching
Professional achievement (points)	Freshman	47.2±5.1	57.9±4.9
	Sophomore	51.4±5.3	60.1±5.1
	Junior	55.6±4.2	61.3±5.2
	Senior	59.1±4.3	66.4±4.8
Psychological appeal	Freshman	1	4
	Sophomore	1	4
	Junior	0	3
	Senior	1	4

Conclusions: Digital media is a popular major at present. How to improve students' performance in professional teaching is a problem that colleges and universities need to solve. In order to improve students' professional performance, educational psychology is used to understand students' psychological changes in the learning process, so as to build an innovative teaching scheme of digital media application technology. The results show that students' professional performance has been significantly improved under the innovative mode. At the same time, students' psychological demands for digital media specialty have become stronger in teaching, and students' learning enthusiasm has been improved. In college teaching,

students' learning enthusiasm is the key factor affecting students' independent and long-term learning. Therefore, it is necessary to take students' psychological demands as the basis and use educational psychology to reflect students' psychological activities, so as to build a perfect college teaching system, which can help students continuously improve their ability in learning, achieve the purpose of college education and provide guarantee for students' future development.

THE COUPLING OF INNOVATION AND ENTREPRENEURSHIP EDUCATION AND IDEOLOGICAL AND POLITICAL EDUCATION OF FOOD MAJORS IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Guanglei Song & Lili Xiu

School of Food Science and Biotechnology, Zhejiang Gongshang University, Hangzhou 310018, China

Background: In clinical medicine, it is considered that the generation of cognitive impairment is the brain injury caused by the stimulation or external environment. The brain is the part that controls human activities. The impairment of brain cognitive function will lead to people's inability to accurately judge the external information they receive. However, most studies define cognitive impairment as a mental disease, and divide cognitive impairment into thought cognitive impairment and perceptual deficit disorder. From the perspective of psychology, cognitive impairment is a negative psychological problem. Research suggests that most patients are obstacles after psychological income generation and blow. In psychiatric research, the treatment of cognitive impairment mainly depends on the long-term efficacy of drugs. The treatment brought by drugs is limited, which can only alleviate individual cognitive impairment to a certain extent, and drugs have side effects. Long-term use will bring all kinds of unpredictable consequences. However, some psychiatrists have suggested that cognitive impairment, as an ideological disorder, can effectively cultivate the cognitive ability of patients with cognitive impairment through thinking and cognitive reconstruction. Thinking and cognitive reconstruction is the use of psychological induction to educate and cultivate patients with cognitive impairment, including reshaping the world outlook of patients with cognitive impairment, re-understanding things and events, etc. In modern society with the continuous development of society, people are more likely to have cognitive impairment under the influence of the external environment, and college students are more severely affected. Therefore, how to effectively alleviate and treat college students with cognitive impairment is of great significance.

In college teaching, we will construct students' correct values through ideological and political education, so as to alleviate students' cognitive obstacles. Ideological and political education is a kind of curriculum education to help students maintain normal health value for a long time in their follow-up study and life. Generally speaking, ideological and political education curriculum also continues to affect other curriculum education. With the development of society, food problems have received more attention, so the teaching of food specialty in colleges and universities is more important. In the innovative teaching of food specialty in colleges and universities, it is not only affected by the unique attributes of the current specialty, but also affected by ideological and political education. Some studies have proposed that the reason why ideological and political education affects other courses is that ideological and political course is a course to cultivate students' psychology and thought. The effectiveness of ideological and political education determines the direction of students' psychological and ideological changes, and then affects students' psychological activities in college learning. Although a large number of studies have put forward the correlation between ideological and political education and other majors, few studies have conducted in-depth discussion. Therefore, in order to clarify the impact of ideological and political education on college professional education, the study proposes to analyze the coupling relationship between innovative teaching and ideological and political education of college food major from the perspective of students' cognitive impairment.

Objective: This paper discusses the current situation of students' cognitive impairment in college food specialty courses, analyzes the impact of students' cognitive impairment on their professional achievements, analyzes the mitigation effect of ideological and political education on students' cognitive impairment, and then discusses the coupling relationship between ideological and political education and innovative teaching of college food specialty.

Study design: The research takes the students majoring in food in a university as the object, counts the professional performance and ideological and political education of the students from 2018 to 2021, and counts the changes of students' cognitive impairment during this period. The evaluation index system is

constructed, the entropy method is used to determine the weight of the index, and the coupling co-scheduling model is constructed to calculate the coupling co-scheduling of food innovation and entrepreneurship education and ideological and political education in colleges and universities.

Results: From 2017 to 2021, the degree of coupling and coordination between innovation and entrepreneurship education and ideological and political education of food majors in colleges and universities is shown in Table 1. The quality of ideological and political education is quantified through the changes of cognitive impairment of students in ideological and political education. The coupling degree between 0.8 and 1.0 indicates very strong coupling, between 0.6 and 0.8 indicates strong coupling, between 0.4 and 0.6 indicates moderate coupling, between 0.2 and 0.4 indicates if coupling, and between 0 and 0.2 indicates very weak coupling. Table 1 shows that with the increase of time, the coupling between ideological and political education in colleges and universities and innovative teaching of food specialty gradually increases, and finally reaches a strong coupling in 2021.

Table 1. The coupling relationship between cognitive impairment and teaching innovation in ideological and political education

Project	2017	2018	2019	2020	2021
Ideological and cognitive impairment	0.25	0.30	0.45	0.57	0.67
Perceptual deficit	0.24	0.28	0.44	0.53	0.63

Conclusions: Social cognitive impairment has become a common phenomenon, and the phenomenon of cognitive impairment is also increasing in colleges and universities. Therefore, it is very important to analyze the impact of students' cognitive impairment on professional teaching. In the study, the coupling relationship between ideological and political education and innovative teaching of food specialty is analyzed to evaluate the impact of students' cognitive impairment on teaching innovation under ideological and political teaching. The results show that the coupling between students' ideological and cognitive impairment, perceptual deficiency impairment and food specialty innovation in ideological and political education is increasing, indicating that there is a strong coupling between ideological and political education and food specialty. Therefore, in the teaching innovation of colleges and universities, ideological and political teaching should be used to alleviate students' cognitive obstacles, so as to ensure the development of professional innovative teaching.

* * * * *

THE APPLICATION OF FLIPPED CLASSROOM TEACHING MODEL IN COLLEGE JAPANESE TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaoying Liu

College of International Education, Shanghai Jian Qiao University, Shanghai 201306, China

Background: Educational psychology is a type of psychology proposed according to the current situation of education. The purpose of educational psychology is to solve the problems of traditional teaching schemes in innovative design. Educational psychology believes that in the educational situation, human learning behavior is affected by psychology, and in the design of teaching methods, it advocates paying attention to students' learning habits and development space. With the development of society, the field of educational psychology has gradually expanded, and the courses of educational psychology that can be accepted in colleges and universities have also begun to increase. At the same time, the research and development of educational psychology have gradually been widely used in the reform of foreign language teaching in colleges and universities. The reason is that through the research of educational psychology, it is found that the learning psychology of students in foreign language teaching is far more affected than other disciplines. Therefore, teachers begin to try to use educational psychology to reform and innovate foreign language teaching. In foreign language teaching, Japanese is a popular foreign language course for students. In order to improve students' Japanese ability, college Japanese teachers are constantly looking for teaching programs suitable for students' learning. In the application of educational psychology, with the development of information technology, teachers begin to apply flipped classroom to college teaching. How to use educational psychology to conduct Japanese counseling and testing for Japanese course students? The problems that need to be solved under the current development situation.

The proposal of flipped classroom brings hope to the reform of Japanese classroom teaching. Flipped

classroom represents the reversal of knowledge transfer and knowledge internalization. Culture teaching in Japanese teaching has always been a difficulty in the classroom. For incomprehensible language classroom, teachers' lectures cannot arouse students' interest. Therefore, it is necessary to use flipped classroom to reasonably and effectively improve the Japanese teaching mode. In the formulation of flipped classroom teaching mode, it is easy to find that students' psychological activities will have an impact on the formulation of flipped classroom teaching mode. The generation of students' negative psychology in Japanese learning is the students' negative emotion in the face of complex English learning environment in the process of learning. With the continuous development of society, a large number of methods to alleviate students' negative emotions in Japanese learning have gradually emerged, among which education and teaching have an obvious impact on students. In higher education, the reform of educational model for students' psychology in Japanese teaching has also become one of the methods for higher education to improve teaching quality. Therefore, exploring the reform of educational psychology on college English flipped classroom model will not only help to improve college teaching level, but also alleviate college students' negative learning emotions and promote students' healthy development.

Objective: Starting with students' learning psychology, this paper analyzes the role of student-centered educational psychology in the innovation of flipped classroom model in college English teaching, and discusses the impact of Japanese flipped classroom innovation model on students' learning enthusiasm.

Study design: Using the method of stratified sampling, 120 students majoring in Japanese in a university were investigated in class, and the students' learning experience in flipped classroom teaching was judged from the students' classroom performance. Using educational psychology, this paper makes statistics on the changes of students' psychological mutual activities in college learning, so as to formulate the innovative model of Japanese flipped classroom teaching, and applies it to the teaching of Japanese majors. The teaching duration is 4 and. It makes statistics on the positive psychological changes of students before and after flipped classroom teaching, and evaluates the impact of educational psychology on the application of flipped classroom teaching model in college Japanese teaching.

Results: The positive psychological changes of 120 students are shown in Table 1. Table 1 shows that the Japanese flipped classroom teaching mode under educational psychology can significantly affect students' positive psychology, which is reflected in the continuous growth of students' persistent psychology, firm psychology and self-confidence psychology.

Table 1. Changes in students' positive psychology under innovative teaching mode

Positive psychology	Before teaching	After teaching	P
Persistent	46	101	<0.05
Firm	64	107	<0.05
Self-confidence	59	111	<0.05

Conclusions: College foreign language teaching is the main course to expand students' cognition. In college foreign language teaching, how to improve teaching quality and cultivate students' positive learning psychology is very important. Based on educational psychology and starting with the flipped classroom teaching in the teaching of Japanese majors, this paper discusses the innovative mode of Japanese flipped classroom teaching. In the application of the teaching mode, it can be found that the students' positive psychology shows a good development trend, which shows that the college Japanese flipped classroom teaching mode applying educational psychology can greatly improve the students' positive psychology of learning, and then improve the teaching quality. In college foreign language teaching, teachers not only need to improve students' professional ability with language and culture, but also should pay attention to students' psychological changes and find an appropriate teaching mode from students' psychological activities, so as to improve the quality of college teaching and ensure the normal development of students.

* * * * *

RUSSIAN LANGUAGE AND CULTURE COMMUNICATION STRATEGY BASED ON COGNITIVE IMPAIRMENT

Dandan Wu^{1*} & Shuai Fu²

¹*School of Languages and Communication Studies, Beijing Jiaotong University, Beijing 100044, China*

²*National Research Centre for Foreign Language Education, Beijing Foreign Studies University, Beijing 100089, China*

Background: Cognitive impairment is a kind of mental disorder. People with cognitive impairment usually show different cognition from ordinary people. In psychology, people's cognitive impairment is a functional abnormality in learning and thinking logic judgment. Cognitive psychology believes that the body will go through the process of receiving, transmitting and processing when receiving information. Cognition is information processing. Cognitive impairment is the result of information processing failure in information processing, resulting in the body unable to receive relevant information and cognitive blind spot. At present, the main treatment methods for cognitive impairment are divided into protective treatment and surgical treatment. Protective treatment refers to the medication management of people with cognitive impairment and the use of drugs to treat their nerve cell disorders. Surgical treatment refers to the brain repair of people with cognitive impairment through surgery, and the targeted destruction of some parts of the brain by targeted target. College students' cognitive impairment is a learning disorder caused by students' difficulty in quickly understanding and accepting relevant knowledge when accepting new knowledge. From the current situation of college education, college students come from different regions and have certain differences in basic education. Therefore, there will be cognitive differences in the face of the same knowledge, and cognitive impairment will occur in severe cases.

Foreign language teaching is the subject that is most prone to students' cognitive impairment in college teaching. Foreign language is a language different from students' mother tongue. In foreign language learning, students need to understand the language culture and language connotation of the language they learn, and a large amount of miscellaneous information will have a serious cultural impact on students, resulting in students' cognitive impairment. In the foreign language teaching of colleges and universities in China, Russian, as a main language, is gradually loved by a large number of students. However, the pronunciation of Russian is different from that of Chinese. Russian pronunciation needs skills, and Russia, as a world-class country, contains extremely rich cultural ideas. In the process of learning Russian, students first need to fully understand the local culture and the spirit of Russian with the help of cultural connotation, so that they can master Russian. However, the difficulty of Russian and its language and culture lead to students' cognitive impairment, which makes it difficult to carry out Russian teaching. At that time, Russian language and culture were difficult to spread. From the perspective of the current situation of foreign language teaching in colleges and universities, it is expected that the improvement of foreign language teaching environment in colleges and universities will continue. However, from the perspective of the current situation, colleges and universities pay little attention to the improvement of foreign language teaching environment. Therefore, based on the students' cognitive impairment, the study puts forward Russian cultural communication strategies from the perspective of alleviating students' cognitive impairment, in order to improve the quality of foreign language teaching in colleges and universities and increase students' knowledge.

Objective: This paper discusses the current situation of college students' cognitive impairment, analyzes the impact of students' cognitive impairment on the communication of Russian language and culture, and puts forward the communication strategy of Russian language and culture with solving students' cognitive impairment as the primary task.

Study design: Taking a university in Northeast China as an example, this paper selects Russian majors as the research object, counts the number of students with cognitive impairment among Russian majors, and evaluates the level of cognitive impairment of students. Correlation analysis is used to judge the impact of students' cognitive impairment on students' Russian language ability, so as to construct a Russian language teaching scheme based on alleviating students' cognitive impairment. This paper carries out teaching practice for students with cognitive impairment for 6 months, evaluates the improvement of students' cognitive impairment in teaching, and puts forward the communication path of Russian language and culture in colleges and universities.

Results: The changes of students with cognitive impairment in the teaching process are shown in Table 1. Table 1 shows that in the six-month teaching practice, the number of students with severe cognitive impairment has shown a significant downward trend. At the same time, a large number of students with severe cognitive impairment have gradually changed to low cognitive impairment, and the number of students with low cognitive impairment has increased.

Table 1. Changes of students' cognitive impairment ($n=72$)

Project	0 month	2 months	4 months	6 months
Severe cognitive impairment	37	32	26	18
General cognitive impairment	21	25	29	34
Low cognitive impairment	14	15	17	20

Conclusions: The cognitive impairment of college students is one of the main factors affecting students'

learning, and it is also the main factor hindering the normal development of college teaching. In college teaching, a foreign language is an important subject to help students broaden their horizons. In the research, aiming at the obstruction of Russian language and culture communication in colleges and universities, starting with students' cognitive obstacles, and taking solving students' cognitive obstacles as the starting point, this paper puts forward Russian language and culture communication strategies. The results show that under the new teaching scheme, the number of students with serious cognitive impairment is decreasing, and students' Russian scores are significantly increasing. Therefore, in order to improve the teaching quality and help students learn the language and culture in foreign languages, colleges and universities need to consider students' cognitive barriers and formulate teaching plans by alleviating students' cognitive barriers.

THE IMPORTANCE OF CONTEMPORARY COLLEGE STUDENTS' VALUES EDUCATION FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Huaijun Zhuang¹ & Aiqin Chen²

¹*International Business School, Nanjing Audit University Jinshen College, Nanjing 210023, China*

²*Department of Electronic Engineering & Optoelectronic Technology, Nanjing University of Science and Technology Zijin College, Nanjing 210023, China*

Background: As a psychological subject studying social activities, social psychology can effectively analyze social activities and explore the behavior changes between social organizations. In college teaching, teachers gradually pay attention to social dynamic changes when formulating teaching plans, and formulate teaching plans closer to life through social activities. Therefore, analyzing the application of social psychology in college teaching innovation is of great significance to the improvement of college education level. The research of social psychology is mainly aimed at the behavior process and interpersonal relationships of individuals under the influence of the external environment. Social psychology believes that individual experience is affected by social activities, resulting in psychological and behavioral changes. From the current situation of college teaching, students' campus activities are a kind of social activities, and students' social behavior on campus also affects students' psychology all the time. In some studies, it is proposed that the campus, as a transitional stage in which students are inferior to the society, all the social activities arranged by the school on the campus are set up to help students adapt to social activities in advance. Similar to external social communication, in the research of social psychology in colleges and universities, Tong Yang believes that it includes social activities, social communication behavior, group psychology and other main contents. With the continuous changes of the international community, it is questionable how to gradually improve students' psychological values through social psychology.

The values of contemporary college students are mainly constructed and improved through college teaching. In college teaching, the responsibility of school leaders and teachers is not only to instill relevant professional knowledge into students' thoughts in the form of theory, but also to help students establish healthy values in teaching courses. Generally speaking, the healthy values of college students include establishing correct ideological and moral quality, cultivating students' firm patriotism, cultivating students' positive outlook on life and establishing correct values. From the current college education, students' values education is mainly in ideological and political teaching, but it is undeniable that the current college ideological and political education curriculum is still not deep enough. The current ideological and political education in colleges and universities emphasizes that students receive correct ideological and political education in the classroom and build a perfect moral system, but most of them are only reflected in theory and are difficult to deal with the changing real environment. Therefore, the research starts from the perspective of social psychology, takes the changes of social activities and students' social psychology in the content of social psychology as the theoretical basis of teaching, and puts forward a more targeted value education model for college students for the purpose of cultivating students' values.

Objective: This paper discusses the current situation of students' social activities in colleges and universities, analyzes students' social psychology in social activities, discusses the impact of students' social psychology on students' daily learning state, and analyzes the role of students' social psychology in their values education.

Study design: Taking a university as an example, 200 students were randomly selected from the university for tests and analysis. The school social activities participated by all students from 2019 to 2021

were counted, and the main social psychology of students was obtained by cluster analysis. Evaluate the impact of students' social psychology on students' daily learning, including students' professional achievements and students' psychological changes. The innovative model of college students' values education is formulated based on students' social psychology, which is applied to 200 participating students to evaluate students' professional achievements and psychological changes under the innovative model.

Results: The professional scores and psychological changes of students are shown in Table 1. Table 1 shows that the average score of students' professional performance has been significantly improved after receiving the innovation mode education. At the same time, under the influence of the innovation mode, the number of students with positive psychology has also increased significantly, especially the number of students with correct values.

Table 1. Changes of students' values before and after education

Project	Professional achievement	Firm patriotism	Positive outlook on life	Correct values
Before education	67.8	127	92	66
After education	81.4	184	163	179
<i>P</i>	<0.05	<0.05	<0.05	<0.05

Conclusions: In college education, how to cultivate students' correct values has always been a problem that colleges and universities try to breakthrough. In the research, aiming at the problem of cultivating the correct values of college students, an innovative teaching model in colleges and universities based on social psychology is proposed. This model emphasizes that students' social psychology is the main element affecting students' thoughts. The test results show that under the influence of the innovative model, students' ideological and political professional scores have been significantly improved, and students' values have been cultivated, among them, the number of students who establish correct values has increased significantly. Therefore, in college teaching, in order to help students, develop good values, we should fully understand students' social psychology, take social psychology as the theoretical basis, and build an innovative model that fully affects students' learning attitude, so as to improve students' correct values and promote students' healthy growth.

THE INFLUENCE OF SINGER'S PSYCHOLOGICAL ANXIETY ON SINGING STABILITY

Dan Ye

Lu Xun College of Art Vocational School, Yancheng Kindergarten Teachers College, Yancheng 224000, China

Background: For vocal singers, people pay more attention to their singing skills, and often ignore the influence of the singer's psychological state on the singing effect, but the vocal singing effect is closely related to the singer's own psychological activities. Psychological factors play an important role in the singer's singing process. Vocal singers are prone to produce varying degrees of psychological anxiety in training, performance, singing examination and other singing practice activities, which affects the singers' singing performance in singing practice. Psychological anxiety refers to the tension and uneasiness caused by the inability to effectively solve the problem or the premonition that it is difficult to deal with when individuals are facing difficulties or obstacles. Some vocal singers have poor adaptability to the performance environment and are prone to serious psychological tension when performing in unfamiliar venues. There are also some singers who care too much about their singing results and perform in front of a large audience. They have panic and anxiety because they are worried about their performance mistakes. When the vocal singer's psychological anxiety reaches a certain degree, it will seriously interfere with the singer's singing performance and affect the singer's physical and mental health development.

Vocal performance is a comprehensive art, which conveys the singer's emotion and shows the singer's understanding of the song through the performance of human voice and body. In the actual music performance activities, singing may often produce singing psychological anxiety due to insufficient preparation and self-confidence, which will affect the singer's singing performance and the final performance effect. Good mental health can play a positive role in the effect of singers' singing programs,

and good singers' psychological activities can endow singing songs with soul. The poor psychological state is not conducive to the singer giving full play to his singing strength. The performance effect of vocal performance is affected by the vocal singer's sound state and psychological state. Therefore, the research on the importance of the singer's psychological factors in the singing process has important practical significance for the improvement of the singer's singing level and technology.

Objective: The research analyzes the singer's psychological anxiety state in the singing process, discusses the influence of the singer's psychological anxiety state on the singing stability, and analyzes the mechanism of psychological factors in the singing process of vocal singers, so as to provide a reference for maintaining the singing stability of vocal singers.

Study design: Through the statistical analysis of the psychological anxiety of vocal singers, through the analysis of the degree and causes of the psychological anxiety of vocal singers, this paper deeply analyzes the influence of the psychological anxiety of singers on the stability of their singing, discusses the influence mechanism of the psychological anxiety of singers, and puts forward the mitigation measures of the psychological anxiety of singers on this basis, help vocal singers reduce the influence of psychological anxiety on the effect of singing. The study uses the method of correlation analysis to analyze the influence of vocal singers' psychological anxiety on their stable performance, and uses Spearman correlation coefficient to measure the correlation between vocal singers' psychological anxiety and their stable performance.

Results: The statistical analysis results of the causes of singers' psychological tension and anxiety are shown in Table 1. Nervous stage fright, self-confidence, eager for success, inadequate preparation and other adverse emotional effects are the important reasons for singers' psychological anxiety. Then vocal singers are not confident in their own performance strength and lack practical experience, resulting in tension, which affects the stable play of their singing strength. Some singers are eager for success, and their study of vocal music singing knowledge is not complete. Regardless of their own actual development situation, they blindly pursue singing skills, which will also lead to the psychological anxiety of singers. Sometimes other bad emotions of the singer will directly or indirectly affect the stability of the singer's psychological state and interfere with the singer's singing performance.

Table 1. Statistical analysis of the causes of singers' psychological tension and anxiety

Survey object	Male	Female
Nervous stage fright	3	4
Lack of confidence	3	4
Eager for success	4	3
Inadequate preparation	4	3
Other adverse emotional effects	3	3

Conclusions: A good psychological state and singing physiological state have a direct impact on the performance effect of the singer. A good psychological state can help the singer show his emotions more comprehensively, integrate the singer's understanding of the song into the vocal singing, and comprehensively show the emotional connotation that the singer expects to convey to the audience through the singing performance. A good psychological state will have a positive impact on the singer's physiological state and help the singer to keep a relaxed state to sing. Psychological anxiety will have a negative impact on the singer's singing effect, affect the stable play of the singer's singing strength, reduce the singer's real-time singing level, and affect the singer's final singing performance effect. And the singer's psychological state will also affect the movement of his throat organs. When the singer falls into psychological anxiety, the singer's whole-body muscles will enter a tight state, which will lead to the rigidity of his throat organs, which is not conducive to the stable play of singing performance.

THE IMPACT OF TOURISM PROTECTION AND DEVELOPMENT OF FAMOUS HISTORICAL AND CULTURAL VILLAGES ON ALLEVIATING CONTEMPORARY PEOPLE'S MENTAL ANXIETY

Yu Li

Department of Culture and History, Party School of Gansu Provincial Committee of C. P. C (National

Academy of Gansu Governance), Lanzhou 730070, China

Background: With the advancement of social and economic development, the speed of social development is accelerating day by day, and social competition is fierce, which makes contemporary people's mental anxiety problems occur frequently, and many people are suffering from different degrees of mental anxiety. The ever-changing social form has brought great pressure on people's life, work, family and interpersonal communication, which makes people fall into a state of mental anxiety for a long time, affects people's mental health and reduces people's quality of daily life. Being in a high state of mental anxiety for a long time will seriously affect the quality of people's mental health and have a serious negative impact on people's daily life, resulting in people's trance, inattention, insomnia and other problems, which is not conducive to the development of people's physical and mental health. In the high-pressure modern social situation, mental anxiety has become the spiritual normality of modern people. People more or less have certain mental anxiety, which requires people to relax their body and mind and adjust their psychological balance by diverting their attention and other ways.

As a precious cultural heritage in China, ancient villages with profound historical and cultural heritage have witnessed the vicissitudes and changes of the Chinese nation and the process of historical development. With the development and upgrading of China's tourism industry, the protection and development of China's famous historical and cultural villages have attracted extensive attention from all walks of life. With the expansion of modern tourism, the development of tourism resources in ancient villages has been deepened, the impact of tourism industry development on famous historical and cultural villages has been strengthened, and the contradiction between the protection and utilization of culture and heritage has become increasingly prominent. It is required to maintain a good balance between the tourism development of famous historical and cultural villages and the protection of cultural heritage, handle the relationship between cultural heritage protection and tourism development.

Objective: The research analyzes the current situation of the protection and tourism development of famous historical and cultural villages, understands the protection and development methods of famous historical and cultural villages, deeply analyzes the internal contradiction between the cultural heritage protection and tourism development of famous historical and cultural villages, and discusses the development means to ensure the balance between the protection and tourism development of famous historical and cultural villages. This paper studies and analyzes the mental health status of contemporary people, understand the degree of contemporary people's mental anxiety, and deeply analyzes the role and effect of the protection of historical and cultural villages and tourism development in alleviating contemporary people's mental anxiety, hoping to provide new ideas for alleviating contemporary people's mental anxiety and promoting the transformation of rural economic development.

Study design: The research collects the tourism protection and development of famous historical and cultural villages through network channels, understands the promotion effect of tourism protection and development progress of famous historical and cultural villages, analyzes people's mental anxiety in contemporary social forms, and obtains the current situation information of contemporary people's mental anxiety. The study uses the method of correlation analysis to analyze the relationship between the tourism protection and development of famous historical and cultural villages and the alleviation of contemporary people's mental anxiety, combined with the Spearman correlation coefficient to understand the effect of the tourism protection and development of famous historical and cultural villages on the alleviation of contemporary people's mental anxiety, deeply excavate the internal relationship between them, and analyze the entry point of the tourism protection and development of famous historical and cultural villages, it provides help for promoting the tourism protection and development of famous historical and cultural villages and improving the mental health level of contemporary people.

Results: The statistical analysis results of contemporary people's mental anxiety emotional state are shown in Table 1. Mental anxiety is a common psychological problem of contemporary people, and most people have different degrees of mental anxiety.

Table 1. Statistical analysis results of contemporary people's mental anxiety and emotional state

Tourist age	18-30	31-40	41-50	51-60
Anxious	4	3	4	3
Depressed	3	2	3	2
Hostile	1	1	1	1
Terror	1	1	2	1
Paranoid	2	1	1	1
Psychotic factor	1	2	1	1

Conclusions: To realize the protection and tourism development of famous historical and cultural villages, we can deeply excavate the non-cultural heritage infamous historical and cultural villages, take the non-cultural heritage as the starting point, give play to the guiding role of folk culture, use the local characteristics of famous historical and cultural villages to attract more tourists and promote the development of rural tourism. The protection and development of famous historical and cultural villages should strengthen the living inheritance of non-cultural heritage, pay attention to the living inheritance of cultural heritage, protect and respect the development laws and characteristics of cultural heritage, and promote the commercial and economic development of famous historical and cultural villages based on the inheritance of intangible cultural heritage of famous historical and cultural villages. Moreover, the government should establish the protection system of intangible cultural heritage inheritors from the institutional level, realize the intelligent protection of intangible cultural heritage through digital technology, establish the database of intangible cultural heritage inheritors, and promote the impact of historical and cultural village protection and tourism development on modern people's spiritual anxiety.

ANALYSIS OF THE INFLUENCE OF THE INNOVATIVE DEVELOPMENT OF IDEOLOGICAL AND POLITICAL EDUCATION ON STUDENTS' MENTAL ANXIETY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Feng Xue

Graduate School, Nanjing Normal University, Nanjing 210023, China

Background: Educational psychology is a branch of social psychology, and it is closely related to general psychology and pedagogy. Its main research object is the learning and educational psychology of students and the teaching psychology of educators in the environment of receiving education. By studying the psychology of students and educators, the application of educational psychology can achieve many purposes, such as improving teaching methods, stimulating students' learning motivation, assisting students to face difficulties in the learning process and so on. Under the background of the rapid changes of the Chinese era, the growth environment of China's youth groups has become more complex. Due to the unbalanced development of the social environment, the confusion of values on the Internet, the intensification of employment competition among college students and other problems, some college students have the anxiety of irrational emotional tendency. If this anxiety is not eliminated and guided, it may even develop into mental anxiety disorder, which seriously affects students' life, social intercourse, study, employment and other affairs. Dispelling this anxiety, or restricting and eliminating it in the early stage of anxiety, is conducive to helping college students form stable and positive social values. However, at present, most colleges and universities in China do not set up compulsory mental health courses, and a few elective mental health courses are not valued by students and teachers. Therefore, integrating the content of college students' mental health education into the existing courses is a more realistic and effective strategy, and the ideological and political education course has the characteristics of guiding students' thoughts and psychology, it is most suitable for integration with mental health education. Therefore, this study is committed to exploring the feasibility of applying educational psychology methods in college ideological and political courses to guide and treat students' mental anxiety and emotion.

Objective: To investigate the current overall mental anxiety of college students in China, and carry out teaching experiments to verify whether the integration of educational psychology theory and method into ideological and political education in colleges and universities can alleviate the symptoms of mental anxiety to a certain extent.

Participants and methods: Four colleges and universities were randomly selected from China, and then SAS (Self-rating Anxiety Scale) questionnaire survey was conducted on the students willing to participate in the study. 284 students were selected from the student group with a total score of no less than 50 (it is considered that such students have a certain degree of anxiety symptoms), and they were divided into experimental group and control group on average, carry out ideological and political teaching with the same content, and the teaching experiment lasts for one semester. However, in the teaching process of the experimental group, teachers are required to use the method of educational psychology as much as possible to observe the real-time psychological state of students. When students are found to have anxiety, they should ask and understand the causes of their anxiety in time, and take targeted measures to comfort, encourage solve students' anxiety by solving anxiety affairs, and teach some skills of self-regulation of anxiety. After the experiment, the two groups of students were investigated by SAS questionnaire again. In

addition, all measurement type features in the study are displayed in the form of mean \pm standard deviation for *t*-test, and counting type features are displayed in the form of number or proportion of number for Chi-square test. The significance level of difference is taken as 0.05.

Results: After the experiment, the effective questionnaire data were entered into the computer and Python3.0 programming language, and Table 1 is obtained.

Table 1. Statistics of SAS scale scores of two groups of students before and after the experiment

Statistical time	Experience group	Control group	<i>t</i>	<i>P</i>
Before experiment	56.4 \pm 5.2	56.6 \pm 5.6	0.845	1.749
After the experiment	41.7 \pm 4.8	56.3 \pm 4.5	0.130	0.01
<i>t</i>	0.142	0.822	-	-
<i>P</i>	0.012	1.848	-	-

It can be seen from Table 1 that the *P* values of *t*-test of SAS total score data of the two groups of students and the control group before and after the experiment are 1.749 and 1.848 respectively, which are far greater than the significance level of 0.05. It is considered that the data difference is not significant, that is, the severity of anxiety symptoms of the two groups of students before the experiment is roughly the same and comparable, and pure ideological and political teaching has no effect on treating students' anxiety symptoms. However, after the experiment, the average SAS total score of the experimental group was 41.7, which was significantly lower than that of the control group, and the data difference was significant.

Conclusions: In view of the psychological anxiety of Chinese college students, after investigating and understanding the current situation of the overall mental anxiety of Chinese college students, an ideological and political teaching experiment was designed and implemented. In the experiment, both groups of students received the same ideological and political teaching, but the teachers in the experimental group were required to pay attention to the anxiety of students in the teaching process and take targeted measures to deal with it. After the experiment, the average SAS total score of the experimental group was 41.7, which was significantly lower than that of the control group, and the data difference was significant. The experimental results show that using educational psychology to deal with students' anxiety in the process of ideological and political teaching is helpful to improve students' mental anxiety.

THE CONSTRUCTION STRATEGY OF LOGISTICS TRANSPORTATION PACKAGING RECYCLING NETWORK MODEL FROM THE PERSPECTIVE OF ENVIRONMENTAL PSYCHOLOGY

Mingyue Xiang

Logistics Information Academy, Hunan Modern Logistics College, Changsha 410131, China

Background: Environmental psychology, also known as ecological psychology, is an applied social psychology discipline that studies the relationship between human psychology, behavior and environment. The research purpose of environmental psychology is to apply the discovered psychological laws and psychological theories and methods to the workers' production process, so as to optimize the production process, reduce or eliminate the occurrence of accidents, and improve the workers' production efficiency. The research scope of environmental psychology and social psychology overlap, but the former pays more attention to the relationship between human psychology and natural environment, while the latter pays more attention to the relationship between the psychology of the research object and the social environment. However, from a macro perspective, the natural environment and social environment are coordinated and unified, because both will have an important impact on the behavior of individuals and organizations. In recent years, the logistics industry has developed rapidly, accompanied by the increasingly serious problem of over decorated package packaging, and customers' lack of corresponding awareness in package recycling and environmental protection, which has further exacerbated the degree of environmental pollution. Scholars in the industry have put forward a number of solutions to this problem, among them, the most effective is to build a logistics transportation packaging recycling network to recycle the used packaging materials. Therefore, this study attempts to use the method of environmental psychology to analyze the psychological factors of residents and system employees who affect the operation

of logistics transportation packaging recycling network system.

Objective: To analyze the current situation of the processing mode of domestic logistics transportation packaging materials, and design a social experiment based on environmental psychology to understand the psychological factors of residents and system employees affecting the operation of logistics transportation packaging recycling network system, so as to provide constructive suggestions for further promoting logistics transportation packaging recycling network system.

Objects and methods: Select an area where the logistics transportation packaging recycling network system is highly accepted, and select 149 residents with different occupations, ages, marital status and financial status and 30 internal staff of the logistics transportation packaging recycling network system as the research objects, residents are required to use the logistics, transportation and packaging recycling network system in this area (the internal employees of the enterprises participating in the experiment are not required to use the system because they have been exposed to it many times at work). After 3 months of use, all students will be trained in special knowledge of environmental psychology to prepare for follow-up research. Conduct semi-structured interviews with all the selected research objects. The interview content is the psychological factors of users they think will have an impact on the operation of the system (it is required to analyze from the perspective of environmental psychology). The influence degree of each psychological element is determined according to the five-level system of no influence, slight influence, general influence, obvious influence and full influence, and it is given 1-5 five-digit integers in turn to improve the accuracy of statistical results.

Results: After the semi-structured interview, the statistical interview data were obtained in Table 1. Note that the characteristics of all measurement types in the study are displayed in the form of mean \pm standard deviation, and the *t*-test is conducted. The significance level of the difference is taken as 0.05.

Table 1. Statistics of semi-structured interview results of research objects

Type of research object	Psychological factor	Average score	Standard deviation of score
Local residents	Dislike trouble psychology	4.36	0.15
	Conservative psychology	4.50	0.25
	Fear of difficulties	3.87	0.13
Employees in the enterprise	Fluke mentality	4.15	0.14
	Comparative psychology	3.49	0.28

It should be explained that the “fear of difficulties” in Table 1, which means that users give up contact with this system because they are afraid that it will be troublesome or difficult to recycle packaging materials. “Fluke mentality” and “contrast mentality” respectively mean that employees think it’s okay to recycle fewer packages. Compared with the packaging that employees think they don’t recycle and the packaging wasted by others, the quantity is small and irrelevant. It is found in Table 1 that residents and enterprise employees respectively think that troublesome psychology, conservative psychology and fluke psychology have the most significant impact on the operation of the system. The average quantitative scores of the impact degree of these psychological factors are 4.36, 4.50 and 4.15 respectively.

Conclusions: In order to alleviate the waste of resources caused by the excessive use of logistics transportation packaging materials in China, this research design carried out a social experiment after investigating and analyzing the current situation of the treatment mode of domestic logistics transportation packaging materials. The experimental results show that residents and enterprise employees think that troublesome psychology, old-fashioned psychology and fluke psychology have the most significant impact on the operation of logistics transportation packaging recycling network system. The quantitative scores of the impact degree of these psychological factors selected by the research objects are 4.36, 4.50 and 4.15 respectively, which are higher than the grade of “significant impact” as a whole.

RESEARCH ON ONLINE TEACHING EVALUATION AND PROMOTION IN THE CONTEXT OF EDUCATIONAL PSYCHOLOGY

Wei Tang^{1,2}

¹*School of Accounting and Finance, Shaanxi Business College, Xi'an 710119, China*
²*School of Accounting and Finance, The Open University of Shaanxi, Xi'an 710119, China*

Background: Educational psychology is a branch of social psychology, and it is closely related to general psychology and pedagogy. Its main research object is the learning and educational psychology of students and the teaching psychology of educators in the environment of receiving education. By studying the psychology of students and educators, the application of educational psychology can achieve many purposes, such as improving teaching methods, stimulating students' learning motivation, assisting students to face difficulties in the learning process and so on. Using the theoretical methods of educational psychology to study and optimize the problems existing in the teaching process will not only help to improve teachers' teaching ability and the ability to solve complex educational problems, but also help schools adjust teaching measures and management mode according to the research results, so as to improve the quality of education and teaching in schools. Dragons and fishes jumbled together to carry out routine teaching while controlling the level of infection. Since the outbreak of COVID-19, online teaching has been applied more and more in China's education industry. However, online teaching mode has just started up in China, and how to accurately and scientifically evaluate online teaching systems is of great significance for easing students' learning anxiety and weariness. And only by making a fair and scientific evaluation of each online teaching system can we quickly put forward targeted strategies to improve the system.

Objective: To understand the operation mode and user feedback of China's mainstream online teaching system, and on the basis of relevant literature and educational psychology, use analytic hierarchy process to build a model for evaluating online teaching system, and use Delphi method to improve the model. According to the evaluation model, this paper puts forward some methods to improve the online teaching system.

Participants and methods: Three schools that are using online teaching system to carry out teaching work in China were selected to investigate the advantages and disadvantages of online teaching mode and online teaching system of these schools, consult the academic research materials of educational psychology and internet teaching, and then sort out the materials according to the above work, using analytic hierarchy process to design a set of online teaching effect evaluation model with secondary indicators. 45 educational psychology, front-line backbone teachers and internet teaching mode researchers from China were found to form an expert group, which sent the initial model to the expert group, asked experts to adjust and optimize it, and gave opinions on the importance ranking of each index. Improve the evaluation model according to these opinions, and then send it to the expert group again for feedback until the expert group reaches an agreement.

Results: After the expert group reached an agreement on the evaluation model, the output evaluation model is shown in Table 1.

Table 1. Evaluation Model of online teaching system

Primary index	Primary index weight	Primary index Cr	Secondary index	Secondary index weight
Content of courses	0.766	0.0251	Learning enthusiasm	0.382
		0.0513	Learning anxiety	0.253
		0.0369	Learning depression	0.131
Exercise module	0.177	0.0870	Knowledge memory assistance	0.104
		0.0261	Calculation difficulty	0.073
System function	0.057	0.0249	Security	0.031
		0.0433	Stability	0.026

It can be seen from Table 1 that the Cr (i.e., random consistency ratio) values of all primary indicators are less than 0.1, so it is considered that the weight distribution of primary indicators of the evaluation model is reasonable (due to page restrictions, the CR coefficient of secondary indicators is not displayed, but its value shows that the weight distribution of secondary indicators is also reasonable). It can be seen from Table 1 that the top three weights in the secondary indicators of the evaluation model are students' learning enthusiasm, students' learning anxiety and students' learning depression, and the weight coefficient values are 0.382, 0.253 and 0.131 respectively. In other words, an excellent online education system evaluation model should stimulate students' learning enthusiasm and positive psychology to the greatest extent, and reduce students' anxiety and depression in the learning process.

Conclusions: In view of the uneven quality of China's online education system, which affects the effect of online students, this study selects three schools that are using online teaching systems to carry out teaching work in China, investigates the advantages and disadvantages of these schools' online teaching modes and online teaching systems, and consults the academic research materials of educational psychology and internet teaching. Then, according to the data sorted out by the above work, the evaluation

model of online teaching system is designed by using analytic hierarchy process. And seek feedback from the expert group. After observing the adjusted evaluation model, it is found that the top three weights in the secondary indicators of the evaluation model are students' learning enthusiasm, students' learning anxiety and students' learning depression, and the weight coefficient values are 0.382, 0.253 and 0.131 respectively. In other words, an excellent online education system evaluation model should stimulate students' learning enthusiasm and positive psychology to the greatest extent, and reduce students' anxiety and depression in the learning process. The results show that based on the current situation of online teaching and the method of educational psychology, and evaluation model can be designed to effectively evaluate the teaching quality of online teaching system, and provide reliable suggestions for the optimization of online teaching mode.

THE INFLUENCE OF REVITALIZING MODERN AGRICULTURAL MODEL ON FARMERS' ANXIETY

Ze Liu

Faculty of Architecture, Civil and Transportation Engineering, Beijing University of Technology, Beijing 100124, China

Background: With the development of poverty alleviation in China, a large number of new industries and policies have been implemented in various poor areas in China. There are a large number of relatively poor farmers in Northwest and Southwest China. Most of them envy or envy the villagers who have become rich around them on the one hand, but are afraid or unwilling to take action to cooperate with relevant government personnel in poverty alleviation, resulting in a certain degree of anxiety due to backward cognition, old-fashioned psychology, fear of difficulties and other reasons. If these farmers remain in anxiety for a long time, it will significantly reduce their sense of happiness and satisfaction in life, inhibit their positive spiritual power to change their current situation, and even make some of them lose their psychological will to resist fate and strive for a happy life forever. At the same time, most of these contradictory farmers have some agricultural production resources, such as farmland management rights and mountain forest development rights. If modern agricultural technology is taught to them and some technical and financial support is provided, it will probably have a significant positive impact on their lives and improve their material living conditions, so as to improve or completely eliminate their anxiety, let them have the psychology and ideas of a positive life.

Objective: To investigate the psychological anxiety of low-income farmers in some rural areas of China, and to find data to verify the impact of modern agricultural technology on their psychological anxiety symptoms, so as to provide some ideas for building a modern countryside and narrowing the gap between urban and rural areas.

Participants and methods: A village with the low overall income level of farmers and planned introduction of modern agricultural technology was selected from China, and the permanent villagers in the

village were investigated with SAS (Self-rating Anxiety Scale),

28 farmers with a total score of more than 50 in the survey results were identified as the research object. Then the local government introduced modern agricultural production technology and production tools to help these farmers improve their income. Later, it was found that 20 farmers chose to receive assistance and 8 chose not to accept. The former was classified as the experimental group and the latter as the control group. One year later, SAS survey was conducted on the two groups of farmers again. Note that the subjects whose total SAS score is in the range of “50-59”, “60-69” and “no less than 70” can also be further divided into mild anxiety, moderate anxiety and severe anxiety. In addition, all measurement type features in the study are displayed in the form of mean \pm standard deviation for *t*-test, and counting type features are displayed in the form of number or proportion of number for Chi-square test. The significance level of difference is taken as 0.05.

Results: After all the investigation steps were completed, the data were entered into the computer, and the previous SAS scoring data of the two groups of farmers were counted by Python program language and Excel software, and Table 1 was sorted out.

Table 1. Statistical results of SAS scores of two groups of farmers

Test time	Experience group	Control group	<i>t</i>	<i>P</i>
First test	58.2 \pm 3.6	58.4 \pm 4.1	0.841	0.967
Second test	41.3 \pm 3.2	63.5 \pm 3.5	0.359	0.005

“The first test” and “the second test” in Table 1 refer to before the start of the modern agricultural assistance project and one year after the implementation of the assistance project respectively. It can be seen from Table 1 that in the first test, the *P* value of the *t*-difference significance test output of SAS score data between the experimental group and the control group is 0.967, which is greater than the significance level of 0.05. It is considered that the data difference is not significant. In the second test, the *P* value of the *t*-difference significance test output of the SAS score data of the two groups of farmers is 0.005, which is far less than the significance level of 0.05. It is considered that the data difference is significant. Specifically, in the second test, the average SAS score of the experimental group was 41.3, which belonged to the level of no anxiety symptoms, while that of the control group was 63.5, which belonged to the level of moderate anxiety. Moreover, the SAS average score of the control group in the second test was also significantly higher than that in the first test.

Conclusions: In view of the problem that some farmers in China suffer from varying degrees of anxiety due to backward cognition, conservative psychology, fear of difficulties, and other reasons, this study investigated the current psychological anxiety status of farmers and the main causes of anxiety. Then an investigation experiment was designed and carried out. The experimental results show that the average SAS score of farmers in the experimental group receiving modern agricultural technical support and assistance one year after receiving assistance is lower than that of farmers in the control group without assistance, and the overall anxiety level of the former reaches the level of “no anxiety symptoms”, while the anxiety degree of the latter rises to the level of “moderate anxiety”. The experimental results show that allowing farmers to accept the assistance of modern agriculture can not only improve their living standards, but also help to reduce the severity of their psychological anxiety symptoms. This is because after the increase of farmers’ income, most of the reasonable and unreasonable reasons for their anxiety about the future and the current situation no longer exist, and the increased income is enough to cover the risk losses they are worried about in their consciousness.

RESEARCH ON THE INFLUENCE OF APPRECIATION OF JAPANESE LITERARY WORKS ON ALLEVIATING STUDENTS’ AFFECTIVE DISORDER

Jiao Li^{1,2} & Shifu Huo¹

¹School of Foreign Studies, Xi’an Jiaotong University, Xi’an 710049, China

²School of Foreign Languages, Changshu Institute of Technology, Suzhou 215506, China

Background: Affective disorder, also known as mood disorder, refers to a psychological disease caused by genetic, neurochemical, endocrine, personality, social and other factors, with significant and lasting emotional or mood changes as the main symptoms. The clinical manifestations of the affective disorder are mainly divided into monophasic disorder, which generally refers to depressive disorder. Depressive episode refers to a significant and lasting depression, which may occur from depression to grief, often accompanied by physical discomfort and other symptoms. Manic, refers to the lasting upsurge of emotion and faster-thinking speed than ordinary people. Bipolar disorder has both manic and depressive manifestations, and the two symptoms often occur alternately and repeatedly. At present, the mainstream treatment of affective disorder is drug treatment, psychotherapy and the combination of the two. The prognosis of most patients recovers well, but if the treatment is not timely, the recurrence rate is high. On the one hand, due to many learning contents, difficult learning contents, less free time, narrow social space and other reasons, the overall mental state of middle school students in China has deteriorated compared with their peers decades ago, and some students even suffer from affective disorders. On the other hand, because the Japanese nation has a special historical and cultural background and geographical environment, Japanese literary works are recognized by the world as more delicate emotional expression. Therefore, some scholars propose to let patients with affective disorders read and appreciate Japanese literary works. As a means of treating affective disorders, doctors and scholars in the industry have conducted a lot of relevant research, but it is rare to apply this method to the treatment of middle school students' affective disorders, and carry out case experiments.

Objective: To master the current situation and causes of affective disorders among middle school students in China, then design and carry out treatment experiments, explore the role of appreciating Japanese literary works in treating and alleviating students' affective disorders, and provide some new non-drug treatment methods to improve the mental health level of Chinese students.

Participants and methods: Collect and study the academic materials and classic Japanese literary works of affective disorder, and place three domestic middle school education experts to understand the current situation of middle school students' affective disorder and various psychological reasons. The research team designed a set of questionnaires to investigate the severity of students' affective disorder symptoms. The subjects with a total score of 100 and a score of "less than 60", "60 to 69", "70 to 79" and "more than 80" can be classified as a non-affective disorder, mild disorder, moderate disorder and severe disorder. Two high schools with enough representative teaching content, teaching mode, student size, and basic information in the country were selected from China. The first questionnaire survey was conducted on the students willing to participate in the research in the two high schools to find out whether they have affective disorders. Then 102 students with a questionnaire score of no less than 60 were selected as the research objects, and they were required to read the designated Japanese literary works, read at least three times a week for at least 20 minutes. After three months, conduct a questionnaire survey on the subjects again, and select some students to conduct interviews to understand their feelings of reading Japanese literary works.

Results: After the experiment, the effective questionnaire data were entered into the computer and SPSS21.0 was used for analysis and statistics, and Table 1 is obtained. Note that the test method for the difference of quantitative data in the study is *t*-test, and the different significance level is set to 0.05.

Table 1. Survey results of affective disorders of subjects before and after the experiment

Investigation time	Mean test score	Overall affective disorder level	Standard deviation of test scores	<i>P</i>
Before experiment	68.2	Mild affective disorder	3.5	0.014
After experiment	53.0	No affective disorder	4.1	

It can be seen from Table 1 that before the experiment, the average score of the emotional disorder test of the research object is 68.2, which can be considered that the whole is suffering from mild emotional disorder. After the experiment, the average score of the emotional disorder test of the students is 53.0, which is considered that the whole has no symptoms of emotional disorder, and the data is significantly lower than that before the experiment. The *P* value of the *t*-difference significance test of the two groups of data is 0.014, which is less than the significance level, it is considered that the data difference is significant.

Conclusions: With the increase of talent competition and incentive in China, middle school students in China are facing more and more pressure on study and life. In this environment, some students even suffer from emotional disorders and mental diseases. This study is after sorting out the data and mastering the current situation of affective disorder of middle school students in China. An experiment was designed and carried out, and some high school students were selected as the research objects. The experimental results showed that the average score of the affective disorder test of the research objects before the experiment

was 68.2, and it was considered that they had mild affective disorder as a whole. After the experiment, their average score of the affective disorder test was 53.0, and it was considered that there were no symptoms of the affective disorder as a whole, and the data difference was significant. The experimental results show that allowing students to read and appreciate Japanese literary works can help alleviate students' emotional disorder, because the emotional expression in Japanese literary works is exquisite, which can appease students' depression, mania, and other emotions, so as to reduce the intensity of their symptoms.

INTEGRATION OF INNOVATION AND ENTREPRENEURSHIP EDUCATION AND NEW LIBERAL ARTS EDUCATION IN PRIVATE COLLEGES AND UNIVERSITIES UNDER COGNITIVE IMPAIRMENT

Peihua Sun¹ & Feiyue Li²

¹*School of Literature and Journalism, Sanjiang University, Nanjing 210012, China*

²*College of Liberal Arts, Shanghai University, Shanghai 200444, China*

Background: In the process of continuous improvement of social and economic level, in order to meet the changing needs of the development of the times and improve the creativity of national construction, China has put forward the development concept of “mass entrepreneurship and innovation”. The thought of “mass entrepreneurship and innovation” has had a certain impact on the development planning of all sectors of society. The innovation and entrepreneurship education model in colleges and universities has been officially launched and vigorously developed. Moreover, under the background of the new liberal arts construction, the traditional liberal arts education has also undergone corresponding changes. Innovation and entrepreneurship education and new liberal arts education in private colleges and universities should integrate with each other and work together in the cultivation of college students. However, in the actual process of integration and application, there have been a series of contradictions and mistakes. The main reason for this phenomenon is that some students in private colleges and universities who accept innovation and entrepreneurship education and new liberal arts education have certain cognitive obstacles, which makes the integration of the two education modes difficult to carry out smoothly. Cognitive impairment is a multiple mental disease, which is mainly manifested in memory impairment, learning impairment, executive dysfunction and other symptoms. The various symptoms of cognitive impairment are closely related and interact with each other, which will significantly accelerate the deterioration of patients' condition, which leads to cognitive impairment becoming a serious psychological disease that is difficult to diagnose and cure effectively. College students with cognitive impairment will have negative performances such as memory loss, learning ability decline and executive function decline, which will hinder the integration of innovation and entrepreneurship education and new liberal arts education in private colleges and universities. The integration of innovation and entrepreneurship education and new liberal arts education in colleges and universities will react on college students with cognitive impairment and alleviate their cognitive impairment to a certain extent.

Objective: The integration of innovation and entrepreneurship education and new liberal arts education in colleges and universities is closely related to students' acceptance of the two education modes. From the perspective of cognitive impairment, exploring the integration mode of innovation and entrepreneurship education and new liberal arts education in private colleges and the impact on students in the integration process can dig out the influencing factors affecting the effective integration of the two, and then put forward targeted improvement measures, so as to achieve the goal of promoting the integration of innovation and entrepreneurship education and new liberal arts education. Finally achieve the purpose of alleviating students' cognitive impairment.

Research objects and methods: Through random selection, 52 college students were selected from two universities, a total of 104. Under the background of cognitive impairment, all college students receiving innovation and entrepreneurship education and new liberal arts education were given corresponding psychological counseling intervention to explore the improvement of cognitive impairment.

Research design: The duration of the intervention experiment was determined as 5 months. 104 college students were given corresponding psychological counseling for cognitive impairment under cognitive impairment. Before and after the intervention, the level of cognitive impairment was evaluated and analyzed by Mini-mental State Examination (MMSE).

Methods: Before and after the intervention, MMSE was used to evaluate the degree of cognitive

impairment of college students, and to explore the improvement of cognitive impairment under the integration of innovation and entrepreneurship education and new liberal arts education. MMSE mainly includes five levels: orientation, memory, attention and calculation, memory and language ability. The scores of each level are 10, 3, 5, 3 and 9 respectively, with a total of 30 points. Use Excel software to calculate and analyze the evaluation data.

Results: Table 1 shows the comparison results of the average scores of students' cognitive impairment before and after the integration of innovation and entrepreneurship education and new liberal arts education in colleges and universities. It can be seen from Table 1 that before the intervention, the average score of each index of students' cognitive impairment was low, and the total MMSE score was only 19.14, indicating that the symptoms of students' cognitive impairment were serious. After the intervention, the average score of each index increased significantly, and the average total MMSE score of the students reached 28.31, indicating that they did not have cognitive impairment.

Table 1. The average score of students' cognitive impairment before and after the integration of innovation and entrepreneurship education and new liberal arts education in colleges and universities

Evaluation index of cognitive impairment	Before intervention	After intervention
Directional force	7.21	9.12
Memory	1.07	2.93
Attention and computational power	2.13	4.73
Recall ability	1.88	2.79
Language ability	6.85	8.74

Conclusions: Exploring the integration of innovation and entrepreneurship education and new liberal arts education in private colleges under the background of cognitive impairment can provide targeted psychological counseling for college students with cognitive impairment, and significantly promote the integration of the two education modes. Moreover, the integration of innovation and entrepreneurship education and new liberal arts education in colleges and universities can significantly improve students' MMSE score and effectively alleviate their cognitive impairment.

BIM ASSEMBLY DESIGN BASED ON COGNITIVE PSYCHOLOGY

Hao Wang & Miaoling Wang

School of Construction Management, Chongqing Metropolitan College of Science and Technology, Chongqing 402160, China

Background: Cognitive psychology is a subject that studies the psychological changes and laws of the processing process of collecting information in the brain and the formation process of subsequent thinking. The research objects of cognitive psychology are mainly people's advanced thinking processes, such as perception, attention, memory, language, etc., in contrast to behaviorism psychology, cognitive psychology also studies processes that cannot be directly observed, such as memory processing, storage and extraction. Cognitive psychology pays more attention to the basic psychological causes of human behavior, but the process from psychological state to behavior cannot be directly observed. Therefore, cognitive psychologists can only speculate about this process by analyzing the information received by the object and the behavior generated. Therefore, the research of cognitive psychology often needs to carry out experiments to provide basis and support for speculation, the experimental methods commonly used in this discipline include interview, questionnaire, expert consultation and so on. Prefabricated buildings have higher requirements for technology and need to be constructed without mistakes in the whole process, which is a great challenge for constructors. BIM Technology can solve this problem to a certain extent. BIM Technology can simulate and predict construction projects, and realize optimization on this basis to reduce the original technical difficulty. However, when designing BIM prefabricated buildings, if the cognition and psychological situation of construction personnel are not considered, there may be some unnecessary or more cumbersome construction steps, which will increase the workload of construction personnel, resulting

in irritability, depression and negative psychological mood, which is not conducive to the development of construction.

Objective: To analyze the current situation of construction psychology and cognitive ability of constructors of prefabricated buildings in China, design and carry out comparative construction experiments, and explore the psychological impact of considering the cognitive psychology of constructors on constructors in the design of BIM transfer architecture.

Objects and methods: To investigate the current situation of construction psychology and cognitive ability of constructors of prefabricated buildings in China, and analyze their psychological needs and fear of BIM design and construction. Then a comparative construction experiment is designed to design the two projects in the early stage of BIM prefabricated architectural design in China, and it is necessary to ensure that the selected two projects are generally consistent in terms of building type, construction scale, building geological environment and other conditions. Then, the designers of one of the projects are required to consider the cognitive status and psychological needs of the construction personnel during BIM design (share the above survey results with them) to optimize the design content, especially the cumbersome construction, and determine the construction personnel of this project as the experimental group. The construction personnel of another project are the control group. Then, the mental health of the two groups of personnel was investigated before construction and 1 year after construction. The investigation method was to fill in the SCL-90 scale. In addition, the measurement data in the study are displayed in the form of mean \pm standard deviation for *t*-test. The counting data are displayed in the form of number or proportion of number for Chi-square test, and the significance level of difference is set to 0.05.

Results: The effective data were sorted and entered into the computer, and Amos23.0 software for statistical analysis, and the results in Table 1 are obtained.

Table 1. Survey results of psychological status of construction personnel

Investigation time	Experience group	Control group	<i>t</i>	<i>P</i>
Before construction	1.76 \pm 0.32	1.76 \pm 0.30	0.869	1.205
After construction	1.42 \pm 0.27	1.78 \pm 0.29	0.314	0.003
<i>t</i>	0.270	0.638	-	-
<i>P</i>	0.002	1.173	-	-

In Table 1, the display data of the experimental group and the control group before and after construction are the mean and standard deviation of the single average score of SCL-90. It can be seen from Table 1 that the *P* value of *t*-difference significance test of SCL-90 scores of the two groups before construction is 1.205, which is much greater than the significance level of 0.05. It is considered that the data difference is not significant. After construction, the average scores of SCL-90 single items in the experimental group and the control group were 1.42 and 1.78 respectively, the former was 20.22% lower than the latter, and the *P* value of *t* test was less than the significance level, and the data difference was significant.

Conclusions: In view of the insufficient psychological consideration of constructors in the design of BIM prefabricated buildings in China, unnecessary construction steps and cumbersome construction processes occur many times in the construction process, causing negative emotions such as irritability and depression of constructors. This study investigated the current situation of construction psychology and cognitive ability of constructors of prefabricated buildings in China, and then selected two projects under BIM prefabricated building design to carry out construction experiments. The experimental results show that one year after construction, the average scores of SCL-90 single items of the constructors in the experimental group who adjusted the design content in the design process considering the convenience of construction and the psychological needs of constructors are 1.42 respectively, which is 20.22% lower than that in the control group, and the *P* value of *t* test is less than the significance level, and the data difference is significant. The experimental results show that in the process of BIM prefabricated building design, considering the psychological needs and cognitive level of constructors, adjusting the design content will help to improve the mental health level of constructors.

THE THEORY AND APPLICATION OF ROAD TRAFFIC SAFETY MANAGEMENT PLANNING FROM THE PERSPECTIVE OF PSYCHOLOGY

Jianyi Wu

School of Traffic Management and Engineering, Guangxi Police College, Nanning 530028, China

Background: With the development of national economy, China's residents' car ownership has increased rapidly, but a considerable number of drivers have made various non-standard behaviors in road traffic driving due to fluke psychology, anger psychology, racing psychology, comparative psychology and other reasons. As a result, the number of road violations and traffic accidents in China has increased a lot in recent years. The main participants in road traffic accidents are people, and the main causes of traffic accidents are also related to people, especially drivers and pedestrians. For drivers, misjudgment and prolonged reaction time caused by fatigue and mental slack during driving are one of the important reasons for traffic accidents, followed by drivers' overconfidence in their driving skills, so they are willing to try some high-risk driving actions, which greatly increases the possibility of accident. For pedestrians, contempt for traffic rules and excessive trust in vehicle drivers are also important reasons for putting themselves in a dangerous situation. From the above analysis, it can be seen that psychological factors are of great significance for road traffic safety management planning and strategy application.

Objective: To analyze the psychological characteristics and common psychological misunderstandings of pedestrians and vehicle drivers on the road from the perspective of psychology, on this basis, combined with China's road safety management planning strategy, put forward some suggestions conducive to improving road traffic safety, and optimize and verify the reliability of the suggestions through Delphi method.

Objects and methods: Communicate with personnel of many local traffic management government agencies in China, and collect and learn the latest theoretical data of road traffic safety management planning from the open resource database. Then, based on the contact information, this paper puts forward some suggestions conducive to the implementation and application of the current traffic road safety planning theory from the psychological perspective of drivers and pedestrians. 53 experts in traffic safety management and applied psychology were found from China to form an expert group, and the suggestions were sent to the expert group. Each expert was required to evaluate the reliability of the suggestions and whether there were omissions. If there were omissions, the missing methods should be supplemented, and the impact of each method on the application of traffic safety management planning theory should be evaluated. Note that the impact degree shall be evaluated according to five categories: no impact, slight impact, general impact, obvious impact and full impact, and shall be quantified with five integers of 1, 2, 3, 4 and 5 respectively, so as to improve the evaluation accuracy of impact degree. Integrate and adjust the opinions and information fed back by the expert group, and then return it to the expert members again and ask them to evaluate again. The consultation cycle will not be stopped until the opinions of the expert group are consistent.

Results: After the consultation, the final opinions of the expert group were sorted out and Table 1 was obtained.

Table 1. Statistics of expert group consultation results

Proposal	No effect	Slight impact	General impact	Obvious influence	Full impact
Enhance driver safety education	6	17	20	7	3
Common psychological misunderstandings prompted by road electronic signs	1	9	22	18	3
Signs remind pedestrians of psychological misunderstandings	2	5	17	23	6
Add road facilities according to the psychological characteristics of drivers	8	17	16	7	5

The values in the cells in Table 1 represent the number of expert groups who believe that the corresponding suggestions will have a corresponding level of impact on the application of road traffic safety planning theory. According to the analysis of Table 1, the expert group believes that the psychological suggestions of "signs remind pedestrians of psychological misunderstandings" and "road electronic signs remind common psychological misunderstandings" have the most significant impact on the application of road traffic safety planning theory, followed by "adding road facilities according to drivers' psychological

characteristics” and “enhancing drivers’ safety education”, Moreover, the number of experts who believe that the impact of the above opinions is greater than the “general impact” is 29, 21, 12 and 10 respectively.

Conclusion: In view of the problems that need to be improved in the implementation of China’s road safety management planning, this study analyzes the psychological characteristics and common psychological misunderstandings of pedestrians and vehicle drivers on the road from the perspective of psychology. On this basis, combined with China’s road safety management planning strategy, this study puts forward some suggestions conducive to improving road traffic safety, The Delphi method is used to optimize and verify the reliability of the suggestions. The Delphi consultation results show that the expert group believes that the two psychological suggestions of “signs remind pedestrians of psychological misunderstandings” and “road electronic signs remind common psychological misunderstandings” have the most significant impact on the application of road traffic safety planning theory. The results show that considering the psychological factors of pedestrians and drivers in the development of road traffic safety management is helpful to improve the level of road safety management and reduce the possibility of road safety accidents.

COPING STRATEGIES OF CROSS-BORDER E-COMMERCE DEVELOPMENT INNOVATION MODEL FOR CONSUMERS WITH AFFECTIVE DISORDERS

Shaopeng Shang¹ & Jiyu Liu^{2*}

¹*Vocational College, Shanghai Jian Qiao University, Shanghai 201306, China*

²*School of Economics and Management, Shanghai Technical Institute of Electronics & Information, Shanghai 201411, China*

Background: Affective disorder, also known as mood disorder, is a disease with long-term, serious emotional or mood changes caused by various reasons. The clinical manifestation of affective disorder is mainly the abnormal mood of patients, with obvious rise or fall, accompanied by a series of psychotic symptoms, such as cognitive impairment, behavioral disorder, hallucination, delusion and so on. The onset of affective disorder is repetitive, alternating and mixed. The clinical manifestations of affective disorders include depressive episode, manic episode, mixed episode, cyclic mood disorder and dysthymic disorder. Through e-commerce, consumers can realize various business, transaction and financial activities such as online shopping, online transactions between merchants, and online electronic payment. In the context of economic globalization, the regional restrictions on consumption have also been broken, and cross-border e-commerce retail imports are increasingly favored by consumers and investors. However, the current cross-border e-commerce development model does not take into account patients with affective mental disorders. There are many products provided by e-commerce platforms, and many of them have similar functions, appearance and prices, which makes it difficult for consumers to choose and aggravate the condition of patients with mental disorders. Therefore, the innovative model of cross-border e-commerce development is of great significance.

Consumer psychology is a branch of psychology that mainly studies the consumer behavior and psychological change law of consumers in consumer activities, including the process of consumers’ psychological activities, consumers’ personality psychological characteristics and so on. In the theory of consumer psychology, it is believed that consumers have a series of complex psychology in the process of making purchase decisions, such as seeking truth, beauty, convenience, comparison, preference, conformity, pride, possession, preservation, nostalgia, love to take advantage, fear of regret and so on. Based on consumer psychology, the research analyzes the psychological activities of consumers with affective mental disorders in cross-border e-commerce consumption, and then puts forward strategies to innovate the development model of cross-border e-commerce, so as to avoid consumers falling into choice anxiety to the greatest extent, alleviate consumers’ affective mental disorders, reflect humanistic care and jointly build a harmonious society.

Objective: The current cross-border e-commerce development model does not take into account patients with affective mental disorders. There are many products provided by e-commerce platforms, and many of them have similar functions, appearance and price, which makes it difficult for consumers to choose and aggravate the condition of patients with mental disorders. The research proposes strategies based on consumer psychology to innovate the development model of cross-border e-commerce, so as to avoid consumers falling into choice anxiety to the greatest extent, alleviate consumers’ emotional mental disorders, reflect humanistic care and jointly build a harmonious society.

Research objects and methods: 200 cross-border e-commerce consumers with affective disorders were selected as the research objects, and Wechsler Memory Scale (WMS) was used to evaluate consumers' cognitive ability. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the mental health status of consumers.

Research design: Using the random number table method, 200 cross-border e-commerce consumers with affective disorders were randomly divided into two groups: the research group and the control group, with 100 people in each group. For the consumers in the research group, the cross-border e-commerce development innovation model constructed by the research is adopted for shopping. Consumers in the control group used the traditional cross-border e-commerce development model for shopping. After a period of time, the degree of affective disorder and mental health status of the two groups were compared.

Methods: The corresponding data were processed and calculated by software SPSS22.0.

Results: The anxiety level of consumers in the study group decreased significantly and was significantly lower than that in the control group ($P < 0.05$). The changes in the anxiety level of consumers in the two groups are shown in Figure 1.

Note: * means $P < 0.05$ compared with that before the test; # It means that compared with the control group at the same time, $P < 0.05$.

Figure 1. Changes in the degree of anxiety of consumers in the two groups

Conclusions: Affective disorder, also known as mood disorder, is a disease with long-term, serious emotional or mood changes caused by various reasons. The current cross-border e-commerce development model does not take into account patients with affective disorders, and the degree of humanistic care is not enough. The research proposes strategies based on consumer psychology to innovate the development model of cross-border e-commerce, so as to avoid consumers falling into choice anxiety to the greatest extent, alleviate consumers' emotional mental disorders, reflect humanistic care and jointly build a harmonious society. The experimental results showed that the anxiety level of consumers in the study group decreased significantly and was significantly lower than that in the control group ($P < 0.05$).

THE INFLUENCING FACTORS OF YOUTH TENNIS GAME SIMULATION SYSTEM ON COMPETITION PSYCHOLOGICAL STABILITY

Qiuwen Liang

Sports Department, Wuyi University, Jiangmen 529020, China

Background: In tennis competition, athletes often need to carry out a lot of physical consumption. Not only that, the competition process is also the consumption process of athletes' psychological energy. Especially for young athletes, their psychology is in the stage of continuous development and improvement, and their psychological quality is still unstable. If they lack appropriate psychological counseling and psychological training in the process of participating in the competition, their competition psychological stability is likely to be affected with the enhancement of external psychological stimulation factors in the

difficult competition environment, causing teenagers to form competition psychological barriers. The common psychological disorders of teenagers' competition stability include competition motivation disorder, tension and anxiety disorder, competition activation disorder, psychological saturation disorder and competition aggression disorder. Competition motivation barrier refers to the phenomenon that young athletes, affected by competition results, think that their achievements are not proportional to their efforts, which leads to the reduction of competition initiative and inability to devote themselves to the competition. Tension and anxiety disorder refers to that the psychological anxiety of young athletes during the competition is greater than the appropriate degree to improve their enthusiasm, which leads to psychogenic physiological phenomena such as uncontrolled body, nausea and nausea, which seriously affects the physical and mental health of young athletes. It refers to the psychological disorder caused by the failure of teenagers to activate themselves during the competition, which leads to the psychological disorder of teenagers before the competition. Psychological saturation disorder refers to the psychological reaction force that hinders the competition because the psychological fatigue of young athletes cannot be effectively alleviated due to long-term physical and psychological pay. Competition attack disorder refers to the psychology of young athletes is easily affected by the high-intensity antagonistic hint in the tennis court, which leads to teenagers' aggressive behavior outside the court. In view of the above obstacles of competition psychological stability, young tennis players can solve them by increasing their competition experience, adapting to the feeling of the field and balancing the competition form. By using the tennis competition simulation system, young tennis players can provide a platform to increase competition psychological experience, so as to achieve the effect of stabilizing their mentality.

Objective: This study increases the competition psychological experience of young tennis players by using the tennis competition simulation system, so as to improve the psychological stability of young tennis players.

Subjects and methods: This study combines the K-means clustering algorithm with the simulation comparison experiment, clusters the young athletes with different characteristics, lays the foundation for the comparison experiment, and analyzes the effect of the simulation competition system on different types of teenagers in the comparison experiment.

Study design: This study uses K-means clustering algorithm to classify the unstable psychological characteristics of young tennis players in the competition process, and adopts the way of simulation experiment to conduct simulation system competition experiments on young people with different unstable psychological characteristics, The psychological effects of tennis match simulation experiment on teenagers with different psychological characteristics were compared and analyzed.

Methods: In this study, computer-based algorithm clustering is used, and excel is used for comparative experimental data statistics and analysis. In this study, computer degree algorithm clustering is used, and excel is used for comparative experimental data statistics and analysis. At the same time, this study adopts the five-level quantitative method for quantitative analysis in the analysis of impact degree. The higher the quantitative level is, the more significant the impact degree is.

Results: The impression of simulated tennis matches on teenagers with different stability disorders is shown in Figure 1.

Figure 1. Psychological cognitive performance of patients

As shown in Figure 1, it can be seen that the positive impact of simulated tennis competition on tension and anxiety disorder, activation disorder and aggression disorder is more significant, reaching level 4 of the quantitative level, and the positive impact on competition motivation disorder and psychological saturation disorder is obvious, but not significant, only reaching level 3 of the quantitative levels shown in Figure 1, it can be seen that the simulated tennis game has a significant positive impact on three aspects: tension and anxiety disorder, activation disorder and aggression disorder, and has a significant but not significant positive impact on competition motivation disorder and psychological saturation disorder.

Conclusions: Teenagers are in a period of psychological growth, and the psychological response mechanism to strong external stimuli is not perfect. In this study, the competition psychological stability of young athletes in tennis competition is analyzed, and the tennis competition simulation system is applied to the daily training of young athletes. The results show that the system has significant effects on the tension and anxiety disorder, activation disorder the three types of aggressive disorder have a significant impact, and the positive impact on competition motivation disorder and psychological saturation disorder is also obvious. It can be seen that tennis competition simulation system can effectively improve teenagers' competition psychological experience, help teenagers improve competition psychology and improve their comprehensive quality

PROFESSIONAL DEVELOPMENT OF ESP ENGLISH TEACHERS IN CHINESE COLLEGES AND UNIVERSITIES BASED ON EDUCATIONAL PSYCHOLOGY

Lan Shi

School of Foreign Languages, Civil Aviation Flight University of China, Guanghan 618307, China

Background: Educational psychology takes the psychological activities of students in the process of education as the main research content, and the main basis in the research process is the psychological law of students. The use of language itself is a psychological phenomenon, and the process of using language is the process of psychological activities. Educational psychology advocates those students and teachers in the teaching process should be studied as a separate whole, rather than individual psychology should be divided into independent parts with weak correlation. Educational psychology highlights the influence and role of psychology and emotion in teaching activities, and believes that there is a close interaction between teachers and students in the teaching process. In the effective teaching of educational psychology, teachers will actively contact with students, and give students a positive impact on cognitive behavior and emotional behavior in the learning process. This concept of educational psychology can be extended to that the educational relationship is a psychological relationship between teachers and students before it is a behavioral relationship. In order to ensure the efficiency and positive of this relationship, it is not enough to only pay attention to the students, but also give more psychological attention to the teachers, because teachers grasp the psychological dominance to a great extent in the teaching process. Teachers' love for work, their sense of responsibility to students, their noble ideological and moral character and personal charm will have a positive impact on students. This study takes Chinese college ESP English teachers as the key focus in the teaching relationship, and judges the quality of college ESP English teaching by paying attention to the self-development of Chinese college ESP English teachers in the teaching process. By paying attention to college ESP English teachers and taking teachers' professional development direction and strategy as the development direction and strategy of teaching relationship, this paper will help college ESP English majors improve their teaching level and indirectly improve the learning effect of ESP English majors.

Objective: This study takes educational psychology as the theoretical basis, judges the teaching quality brought by a teaching relationship by paying attention to the professional development of teachers in the teaching relationship, and indirectly improves the ESP English teaching effect and students' learning experience by providing directions and strategies for the professional development of ESP English teachers.

Subjects and methods: This study combines the field survey method, BP neural network and importance analysis method to study which psychological elements are more conducive to the professional development of ESP English which elements are more conducive to the efficiency of teaching relations in the teaching

process by analyzing the importance of ESP English teachers' psychological factors.

Study design: This study uses the field survey method to investigate students' preferences for different types of teachers through the university campus curriculum website. On this basis, BP neural method is used to classify the psychological factors of ESP English teaching, and the importance analysis method is used to analyze the importance of different psychological factors in the development of ESP English teachers' professional development and teaching relationship.

Methods: In this study, excel was used to make statistics and analysis of the survey data.

Results: The distribution of teachers' psychological personality tendency preference is shown in Table 1.

Table 1. Distribution of teachers' psychological personality preference

Teachers' psychological personality tendency	Frequency	Percentage (%)
Academic knowledge tendency	59	12.83
Intellectual thinking tendency	126	27.39
Skill practice tendency	39	8.48
Moral trend	57	12.39
Humorous tendency	179	38.91
Total	460	100.00

Table 1 shows the preference distribution of ESP English majors in Chinese colleges and universities for teachers' psychological personality tendency. It can be seen that ESP English majors in colleges and universities have the highest preference for ESP English teachers with humorous and intelligent thinking tendency in psychological personality, reaching 27.39% and 38.91% respectively. It can be seen that in the professional development of ESP English teachers. Changing the mentality towards these two directions is conducive to enhance students' love for themselves, and then establish a positive psychological information transmission mechanism in the relationship between teachers and students.

Conclusions: Educational psychology pays attention not only to the educated side in a teaching relationship, but also to the educational side in the teaching relationship. Through positive professional development in the teaching relationship, teachers can improve their psychological guidance ability for students, and then help students enhance their learning driving force and improve their learning effect while planning their own development process, so as to realize the two-way development, good development and common development of both sides in the teaching relationship, and provide an optimized path for the overall development of ESP English major in Chinese colleges and universities.

A COMPARATIVE LITERARY STUDY OF THE CULTURAL TURN IN ENGLISH TRANSLATION UNDER COGNITIVE IMPAIRMENT

Qian Zhou

College of International Studies and Education, Tongren University, Tongren 554300, China

Background: Cognitive impairment is a cognitive disorder between normal aging and dementia. In the past, it was called "slight impairment of cognitive ability" and now it is also called "cognitive impairment syndrome". It is characterized by the abnormal decline of memory, attention, cognitive understanding and other abilities inconsistent with the age of relevant patients. Although patients will have mild impairment of cognitive function to varying degrees, However, normal living ability is not affected. Cognitive impairment is not a single concept, but can be divided into three different types according to the degree and type of cognitive impairment of patients, which are memory impairment symptoms, non-memory impairment symptoms and multiple cognitive impairment symptoms. If patients with cognitive impairment have only a single memory function module damaged, they can be identified as a single forgetting cognitive impairment. On the contrary, if multiple memory function modules are identified as damaged, they are forgetting cognitive impairment in multiple fields. If the memory function module of patients with cognitive impairment is not impaired, they can be defined as non-forgetting cognitive impairment. If only a single non-memory cognitive function module is damaged, it can be identified as non-forgetting cognitive impairment. On the contrary, if multiple non memory cognitive function modules are identified as damaged, it is non-forgetting cognitive impairment in multiple fields. According to the survey, the probability of mild

cognitive impairment in the population is 3% to 36%. Once cognitive impairment occurs, it may turn into dementia without intervention. Because most patients with cognitive impairment have a certain degree of normal living ability, the impact on their own life is not serious enough to the bottom of the need for medical treatment, so patients and their families will delay the time of medical treatment, which will lead to the transformation of patients from cognitive impairment to dementia symptoms. Understanding exercise using artistic and literary information in daily life is conducive to the improvement of patients with cognitive impairment. In daily life, people with cognitive impairment have relatively weak ability to accept and understand art information, especially in the comparative literature research under the cultural turn of English translation. Therefore, this study will establish an English comparative literature learning model suitable for daily self-training of patients with cognitive impairment, and provide a new path for self-training of patients with cognitive impairment.

Objective: This study provides a more acceptable way of self-thinking training for patients with cognitive impairment by establishing an English comparative literature learning model for daily self-training for patients with cognitive impairment.

Subjects and methods: This study combines support vector machine with correlation analysis, correlates the main symptom types of cognitive impairment in patients with cognitive impairment with comparative literature training method, and makes impact analysis.

Study design: In this study, patients with cognitive impairment were selected from convalescent institutions and tested for basic cognitive ability. Support vector machine was used to classify the main symptoms of experimental personnel, and correlation analysis was used to connect the symptoms of cognitive impairment with comparative literature training method to verify the influential relationship between them.

Methods: In this study, Excel and algorithm programming are used to count and classify the data.

Results: The impact of comparative literature training on patients with cognitive impairment is shown in Figure 1.

Figure 1. Effect of comparative literature training on patients with cognitive impairment

As shown in Figure 1, comparative literature training will have a certain degree of positive impact on basic concept cognitive ability, cross-cultural thinking ability and memory ability. The positive impact on basic concept cognitive ability and cross-cultural thinking ability is level 4, reaching a significant impact, while the positive impact on memory ability is level 3, reaching a significant impact. It can be seen that the comparative literature training method of English translation culture turn can take cross-cultural cultural speculation and literary concept interpretation as the main tools to promote the thinking of patients with cognitive impairment, so as to effectively improve the cognitive ability of basic concepts and cross-cultural speculation ability of patients with cognitive impairment. Although the positive impact of comparative literature training method on the memory ability of patients with cognitive impairment is slightly insufficient, it can still have no significant impact, this is due to the limitations of intervention methods, which is a normal phenomenon.

Conclusions: Because patients with cognitive impairment have a certain degree of normal living ability, they often postpone the option of medical treatment and choose to intervene through self-cognitive thinking training. This study takes the comparative literature training method of English translation culture turn as the main cognitive training method to help patients with cognitive impairment carry out daily

cognitive thinking training. The results show that the comparative literature training method of English translation culture turn will have a positive impact on patients with cognitive impairment in basic concept cognition ability, cross-cultural speculation ability and memory ability. Through low-cost cognitive training, patients with cognitive impairment can achieve effective self-help in their daily life.

THE INFLUENCE OF ADVERTISING MARKETING COMMUNICATION AND CONSUMER CONSUMPTION ANXIETY – FROM THE PERSPECTIVE OF CUSTOMER EXPERIENCE

Yijue Wang

School of Tourism and Communication, Chongqing Jiaotong University, Chongqing 400074, China

Background: Social anxiety is a typical irrational mentality, which refers to a widespread psychological state and emotion of tension, confusion and pessimism about the future. The anxiety psychology of people of different ages and different occupational attributes are different. For example, the anxiety psychology of teenagers is mainly based on recent and related trivia, and the consideration level is relatively narrow. The anxiety psychology of older groups is complex and multifaceted, and involves more networks and things. The anxiety psychology of students mainly comes from their studies or family, while the anxiety psychology of working-class people mainly comes from work relations, human sophistication and so on. The tension caused by anxiety and the suspicion, irritability, fear, frustration, confrontation, as well as the accompanying confusion of thinking, mental laxity, lack of confidence, and even psychological distortion, will have a negative impact on people's emotional regulation and behavior guidance. In serious cases, it will endanger personal physical and mental health and lead to antisocial behavior. When people make different psychological decisions and behaviors, they are not easy to be guided by different degrees of anxiety. Consumer consumption anxiety refers to a kind of indecisive, anxious and uneasy psychological emotion and performance caused by the influence and interference of various factors such as consumption emotion and consumption motivation, which further affects their purchase intention, shopping behavior and psychological mechanism.

Any commercial communication activity must have a clear intention, and advertising marketing communication is to carry out commodity publicity and promotion by means of advertising and other forms, and improve consumers' attention to commodities by conveying commodity information and corporate image to consumers. At the same time, advertising marketing communication promotes consumers to produce corresponding purchase behavior by guiding consumers' consumption tendency and psychological emotion. However, some bad businesses ignore the value and safety of goods in order to achieve high profits, and carry out a series of consumer promotion behaviors such as false publicity and advertising fraud, which damage consumers' physical health and psychological emotion and affect their experience perspective. For example, the aesthetic style of "white, young and thin" advocated by businesses will aggravate the appearance anxiety of female consumers, and then drive them to produce consumption intention and consumption tendency. Consumers' moderate consumption anxiety will promote its transformation to the good. Therefore, exploring the relationship between it and advertising marketing communication from the perspective of consumers' anxiety psychology will help to improve consumers' anxiety psychology from the perspective of behavior regulation and guide them to consume correctly and rationally.

Objective: To explore the internal and external drivers of consumers' purchase intention and the causes of consumers' consumption anxiety, and to explore the impact of advertising marketing communication and consumers' consumption anxiety from the perspective of psychology and consumer experience, in order to make a normal intervention on consumers' anxiety and consumption psychology, so as to improve their mental health level.

Research objects and methods: 1000 consumers of different ages and occupations were randomly selected as the research objects, and the anxiety psychology of consumers was adjusted with the help of self-rating anxiety scale. Then the research objects were randomly divided into groups to arrange different shopping behavior instructions and shopping intentions, consciously intervene in advertising and marketing, and then guide their rational consumption, then explore the influence and intervention mechanism of advertising marketing communication and consumer consumption anxiety.

Method design: Firstly, the degree of anxiety and willingness of daily shopping behavior of consumers were collected, and then they were randomly divided into groups according to the characteristics of subjects, and their shopping behavior intervention was carried out. After a period of four weeks, the anxiety psychology and anxiety level of consumers were collected by using the Self-Rating Anxiety Scale.

Methods: With the help of social statistical analysis tool SPSS23 the changes of consumers' anxiety and purchase intention before and after the experimental intervention were statistically compared.

Results: Consumers' consumption anxiety will affect consumers' shopping tendency and shopping intention, and then produce different emotional values and consumption behavior. Some businesses induce consumers' anxiety to promote consumers to buy self-improvement products. From the perspective of consumer experience and psychological theory, this study explores the influence and intervention mechanism of advertising marketing communication and consumer consumption anxiety, and finds that when individuals feel anxiety, individuals have higher self-improvement and consumption intention. Table 1 shows the scores of anxiety scale of consumers of different ages before and after the experimental intervention.

Table 1. Statistics of anxiety scale scores of consumers of different ages before and after experimental intervention

Before and after the experiment	Young consumers	Middle aged consumers	Elderly consumers
Before experiment	16.65±1.98	25.37±1.77	14.14±1.72
After the experiment	9.34±1.24	8.16±1.47	9.66±1.07

Conclusions: Different emotional values will affect people's different consumption tendencies and shopping intentions, and consumers' purchase behavior will be affected by consumption motivation, perception, learning stimulation and behavior attitude. Consumers' consumption anxiety will produce different emotional tendencies and consumption intentions when choosing goods and services, and different products will bring consumers different experiences and feelings. Advertising marketing will have an impact on consumers' psychology. Good marketing communication means can effectively improve consumers' anxiety.

THE INFLUENCE OF PHYSICAL EDUCATION IN UNDERGRADUATE COLLEGES ON THE CULTIVATION OF STUDENTS' PSYCHOLOGICAL QUALITY

Lu Zhang

Department of Physical Education, Luoyang Institute of Science and Technology, Luoyang 471000, China

Background: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very prone to mental diseases, such as anxiety, depression and so on. Generally speaking, when an individual is nervous about something, such as learning, work, social networking, etc., the individual will be attracted most of the attention by the event, and make a lot of efforts and imagination assumptions to solve or complete the event. When individuals pay more attention to the event because of repeated failures, until they break through the critical point, individuals will feel anxious. Many studies have shown that maintaining moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life.

Physical education can strengthen students' physique, enhance students' self-confidence, and then cultivate students' psychological quality to avoid students suffering from psychological diseases. However, there are many defects in traditional college physical education, such as students' low interest and insufficient practice, which leads to poor teaching quality and cannot play its role in improving students' physical and psychological quality. Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Therefore, the research is based on educational psychology to innovate and improve physical

education in undergraduate colleges, so as to improve the teaching quality, improve students' physical quality, establish students' confidence, help students alleviate negative emotions and avoid psychological diseases.

Objective: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very easy to suffer from mental diseases, such as anxiety, depression and so on. Physical education can strengthen students' physique, enhance students' self-confidence, and then cultivate students' psychological quality. Based on educational psychology, the research innovates and improves physical education in undergraduate colleges, so as to improve the teaching quality, improve students' physical quality, establish students' confidence, help students alleviate negative emotions and avoid mental diseases.

Research objects and methods: 80 students with anxiety disorder were selected as the research objects in a university. Self-rating Anxiety Scale (SAS) and Self-Rating Depression Scale (SDS) were used to evaluate students' mental health, and the examination results of physical education courses were used to evaluate the teaching effect.

Design: 40 students in each group were randomly divided into study group and control group. Among them, the students in the research group used the improved college physical education teaching model based on educational psychology to teach. The students in the control group used the traditional teaching mode of college physical education. After a period of time, the anxiety and test scores of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: After two months of teaching, the SAS and SDS scores of the students in the study group decreased significantly ($P < 0.05$), and were significantly lower than those in the control group ($P < 0.05$). The academic performance of the study group was significantly higher than that of the control group ($P < 0.05$). The changes in the degree of depression of the two groups are shown in Table 1.

Table 1. Changes in the degree of depression of the two groups of students

Timing	SDS Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	75.3±12.2	76.1±11.8	0.147	0.852
After teaching	46.7±6.4	65.7±14.9	8.051	0.009
<i>t</i>	9.475	4.352	-	-
<i>P</i>	0.000	0.043	-	-

Conclusions: College students are in a special moment of life, facing academic pressure, work pressure and social pressure, so they are very easy to suffer from mental diseases, such as anxiety, depression and so on. Based on educational psychology, the research innovates and improves physical education in undergraduate colleges, so as to improve the teaching quality, improve students' physical quality, establish students' confidence, help students alleviate negative emotions and avoid mental diseases. The results showed that after two months of teaching, the SAS and SDS scores of the students in the study group decreased significantly ($P < 0.05$), and were significantly lower than those in the control group ($P < 0.05$). The academic performance of the study group was significantly higher than that of the control group ($P < 0.05$).

A COMPARATIVE ANALYSIS OF THE IMAGES OF "SUPERFLUOUS PEOPLE" IN RUSSIAN LITERATURE FROM THE PERSPECTIVE OF PSYCHOLOGY

Rong Du

School of Foreign Languages, Xinxiang University, Xinxiang 453003, China

Background: Psychology is a science that studies human behavior and psychological laws. Modern psychology believes that psychological perspectives include six aspects: biological perspective, cognitive perspective, behaviorism perspective, whole person perspective, development perspective and social and cultural perspective. Its theoretical content involves connection theory, behaviorism theory and humanistic theory. Psychology focuses on people's cognitive activities, psychological activities, individual spiritual core and influencing factors, and guides people's behavior mechanism and psychological changes from the perspective of long-term development. Connectionist theory holds that the essence of learning is the

process of “trial and error”, that is, to deepen learners’ understanding and mastery of learning content through the reciprocating process of “try error try again”. Behaviorism theory emphasizes the key role of reinforcement in individual behavior conditions. Humanistic theory emphasizes the values within the individual and advocates respecting and caring for students. Apply psychology to the field of education, that is, in a specific educational situation, with the help of psychological theory, carry out conscious intervention and guidance according to the psychological laws and change characteristics of both teaching subjects and objects, and then carry out design improvement in curriculum design, teaching method improvement and teaching motivation guidance, so as to help students solve psychological problems in the learning process and enlighten their negative emotions. A comparative analysis of the images of “superfluous people” in Russian literature from the perspective of psychology can deepen students’ appreciation and interpretation of Russian literary works and reduce their negative emotions and psychological problems caused by the study of literary content. The image of “superfluous people” in Russian literature refers to those dissatisfied with reality, ambitious but lack practical action in Russian literature in the first half of the 19th century, and finally become superfluous and useless people to the society. Nowadays, when appreciating the image of “superfluous people” in Russian works, college students majoring in literature are very prone to negative learning emotions and psychological problems due to the limitations of ability differences and classroom teaching methods.

Objective: To further grasp the laws of the teaching process and students’ psychological characteristics from the perspective of psychology, improve students’ cognitive ability of literary works with the help of the comparative analysis of the image of “superfluous people” in Russian literature, and enrich and innovate the teaching contents, teaching schemes and teaching means by using multimedia and other teaching tools, so as to alleviate students’ negative emotions and psychological problems in the teaching process.

Research objects and methods: The research takes the students with learning disabilities and psychological problems in the literature major of a university as the research object, and then optimizes and improves the Russian literature appreciation classroom according to their learning status and psychological status, in order to improve the students’ mental health level.

Method design: First, the students’ learning disabilities and classroom learning were evaluated, and then the influencing factors of students’ cognitive differences and mental health were analyzed with the help of meta-analysis and principal component analysis. Then the teaching mode is innovated and applied in practice. The experimental time is 2 months. After the experiment, the statistical analysis tools are used to deal with the changes of students.

Methods: The factors affecting the teaching effect were extracted and analyzed by principal component analysis, and the innovative teaching model was used to improve the psychological problems of students in the image comparison of “redundant people” in Russian literature.

Results: The psychological perspective can effectively guide teachers to grasp the characteristics of the teaching process and the psychological law of students, so as to improve the classroom teaching effect of Russian literature and improve students’ cognitive analysis of the image of “redundant people” and their mental health. Table 1 shows the score statistics of students’ psychological status under different classroom teaching modes.

Table 1. Score statistics of students’ psychological status under different classroom teaching modes

Psychological barrier dimension	New teaching mode	Old teaching mode
Obsessive compulsive symptoms	19.7±2.6	25.2±2.4
Interpersonal sensitivity	14.1±2.5	31.2±2.9
Depressed	7.4±3.8	27.4±2.1
Anxious	13.9±2.1	22.9±2.2
Hostile	5.7±2.7	29.1±1.3
Paranoid	14.3±1.2	31.7±1.3

Conclusions: The image of “superfluous person” in Russian literature is an important literary image. This literary image integrates the contradiction between individual and society, and the contradiction between thought and action. Learning this image and comparing it with other literary images will help us better understand the special era background carried by Russian literature and the author’s emotional value. At the same time, bringing the psychological perspective into teaching practice can effectively help teachers better improve and innovate the teaching process of appreciation of Russian literary works on the basis of grasping students’ psychological laws and learning characteristics, so as to improve students’ understanding and learning initiative of literary works, improve learning obstacles and improve teaching quality.

INVESTIGATION AND RESEARCH ON THE CURRENT SITUATION OF OPEN EXPERIMENTAL TEACHING MANAGEMENT FROM THE PERSPECTIVE OF APPLIED PSYCHOLOGY

Li Liu¹, Wei Liu² & Kaiqin Peng³

¹*College of Railway Locomotive and Rolling Stock, Wuhan Railway Vocational College of Technology, Wuhan 430205, China*

²*Electromechanical Design Division, Hubei Institute of Water Resources Survey and Design, Wuhan 430064, China*

³*Personnel Division, Wuhan Railway Vocational College of Technology, Wuhan 430205, China*

Background: The basic premise of applied psychology is to use the principles and theories of psychology to overcome the problems in other fields, such as management, engineering, law and clinical medicine, and evolve the concepts of organizational psychology, educational psychology, sports psychology and community consciousness. Practicality and applicability are the main characteristics of applied psychology. The key to psychology is to find the relationship between it and other fields with the help of psychological theory or perspective, and then explore the psychological relationship between people and people and between people dealing with things. People majoring in applied psychology are required to have basic knowledge and theoretical system, better practical operation ability and psychological perception ability, that is, they can effectively connect, integrate and innovate with other theories, so as to guide social practice and social activities. Psychology is a science that studies human behavior and psychological laws. Modern psychology mainly includes biological perspective, cognitive perspective, behaviorism perspective, whole-person perspective, development perspective and social and cultural perspective. The cognitive perspective emphasizes cognitive activities or psychological activities, the behaviorism perspective focuses on the degree and quality of the impact of the environment on individuals, and the whole person perspective focuses on people's spiritual core, believing that people have the internal demand for growth and goodness. The combination of psychology and education is mainly embodied in educational psychology, that is, in a specific educational situation, carry out conscious and phased practical application according to the psychological laws and change characteristics of both teaching subjects and objects. Educational psychology can be applied to curriculum design, teaching method improvement and teaching motivation guidance to help students deal with difficulties and challenges in life and learning. Open experimental teaching management refers to resource management and effective integration according to the characteristics of open laboratories. At present, there are unclear ownership, lack of professionals and insufficient attention in the teaching management, which makes the management and application effect of open laboratories in colleges and universities poor, and further affects the integration of resources and the improvement of teaching efficiency. Effective intervention according to the current open laboratory management is the content that should be paid attention to in the work of colleges and universities. Analyzing the problems existing in the open teaching management of the laboratory with the help of applied psychology and intervening effectively can improve the efficiency of teaching resource management and reduce the negative psychological emotions of teaching managers.

Objective: To analyze and reconstruct the problems existing in the current open experimental teaching management from the perspective of applied psychology, and actively and effectively intervene the teaching managers according to the problems existing in the current situation of the laboratory, so as to improve their professional management ability and their mental health.

Research objects and methods: The research takes the managers and teaching personnel of an open laboratory in a university as the research object, and actively intervenes their existing psychological problems and the current management situation, such as psychological counseling, so as to effectively promote the level and quality of laboratory teaching management and realize the psychological intervention to managers.

Method design: With the help of principal component analysis, the factors affecting laboratory teaching management were extracted and analyzed, and then the management mode was improved to carry out targeted psychological counseling and intervention on the psychological problems of managers. The

experimental time was three weeks. After the experiment, the data of the management level and mental health changes of the subjects were statistically analyzed, and the experimental results were obtained.

Methods: SPSS22.0 analysis tool to process the experimental data, extract the influencing factors and test the regression coefficient with principal component analysis, and actively intervene and guide the managers' psychological problems and emotions with the laboratory management mode. After that, the open and effective teaching mode of laboratory management can be adjusted according to the psychological needs of laboratory personnel, and then the psychological management mode can be improved more effectively. Table 1 shows the statistics of anxiety scores of teaching managers in the open laboratory before the experiment. Grades 1-5 indicate the degree of anxiety from light to heavy.

Table 1. Statistics of anxiety scores of teaching managers in open laboratory before the experiment

Dimension	Mean	S.D.
Work anxiety	4.325	0.647
Management anxiety	4.897	0.843

Conclusions: Applied psychology can combine the psychological theory with the application field, so as to improve the information degree of system optimization and the university nature of resource management, so as to reduce the problems of information managers dealing with things and improve their mental health level. At the same time, students majoring in applied psychology have a wide range of employment, and their practicality and applicability are good.

PROMOTING EFFECT OF TEACHING, RESEARCH AND CREATIVE COMPETITION INTEGRATION OF CHEMICAL MARKETING PRACTICE COURSE ON COLLEGE STUDENTS' MENTAL HEALTH

Ning Zhao, Zhiwen Lv & Changquan Rao

School of Materials and Environment, Shenzhen Polytechnic, Shenzhen 518055, China

Background: Mental health means that all aspects of psychology and its activity process are in a continuous and positive psychological state, and in this state, the subject can make a good adaptive response and give full play to its physical and mental potential. The factors affecting mental health include the influence of the objective environment, the level of psychological quality, self-cognition and psychological conflict. Whether we can correctly deal with the changes and stimulation of the surrounding environment and whether we can have good psychological tolerance and quality is an important aspect to evaluate the level of mental health. At the same time, the emotional value and psychological attitude of different individuals will affect the normal development of their mental health. Paying attention to students' mental health is of great significance in the current educational environment and the background of teaching reform. The change of teaching environment, the handling of interpersonal relationships, the pressure of academic courses and the influence of other internal and external environments have an impact on students' cognitive habits and psychological differences, leading to the generation of negative emotions, affecting their mental health level, and making them have psychological problems such as anxiety, anxiety, depression, fear and mental disorders. If these psychological problems are not intervened and solved in time, it will damage and hinder their normal study and life and even their physical health. As the main body in the teaching mode, students' psychological status has not been fully developed, and they are very vulnerable to the influence of the surrounding environment and others, and will produce psychological depression due to professional learning problems. Appropriate positive psychological emotions will stimulate students' learning initiative and enthusiasm, while negative psychological emotions will cause learning conflict. The goal of chemical engineering education is to promote people's all-round development, adhere to the educational thought of teaching in one, and cultivate the ability of professional knowledge and better practical operation ability. However, in the current chemical marketing practice course, the teaching process ignores the importance and cultivation of students' professional practical ability, and uses theoretical teaching to guide them to memorize and learn knowledge, rather than using practical training, which makes the learning effect deviate greatly from students' psychological expectation, and then leads to a series of psychological problems.

Objective: In view of the students' psychological problems and negative emotions in the chemical

marketing practice course, from the perspective of psychology, grasp the students' dominant position, innovate and enrich the teaching courses and modes, and explore the guidance and intervention mechanism of the integration of teaching, research and creative competition on students' mental health.

Research objects and methods: This paper takes the students majoring in chemical marketing in a university as the research object, evaluates their psychological status, optimizes the curriculum learning mode based on the analysis of the current situation of the marketing practice curriculum, and actively intervenes the students' psychological problems with the realization of the integration of teaching, research and creative competition, in order to improve the mental health level of the students majoring in chemical marketing.

Method design: According to the different psychological problems of the research objects, they are divided into different groups, such as anxiety group, depression group, emotion regulation disorder group, etc. then, in the integration of teaching and research, we pay attention to the intervention of students' negative emotions and psychological problems. The experiment lasted for six weeks. After the experiment, the mental health status of the research object was re-evaluated in order to explore the promoting effect of the integration of teaching, research and creative competition of chemical marketing practice course on the mental health of college students.

Methods: The psychological status and psychological problems of the subjects before and after the experiment were collected and evaluated with the help of mental health test scale, and SPSS23.0 statistical analysis tools to sort out and analyze data differences.

Results: Different teaching modes, teaching means, teaching contents and teaching resources will affect the learning effect and psychological emotion of students in teaching practice. The integration of teaching, research and creation of chemical marketing practice courses can effectively mobilize students' enthusiasm to participate in the classroom, alleviate their negative psychological emotion and improve their mental health level. Table 1 shows the statistics of students' psychological anxiety scores in classroom teaching before and after the experiment.

Table 1. Statistics of students' psychological anxiety scores in classroom teaching before and after the experiment

Anxiety dimension	Before the experiment		After the experiment	
	Average value	Standard deviation	Average value	Standard deviation
Academic difficulty anxiety	3.74	2.32	2.15	1.96
Curriculum goal anxiety	3.04	1.41	2.76	1.19
Anxiety of professional operation ability	4.59	2.06	1.15	1.98

Conclusions: Students are easy to have psychological problems in the complex social and learning environment, and different degrees of psychological problems will have a great negative impact on their study, life and even society. Exploring the psychological intervention and influence of the integration of teaching, research and creative competition on students in the chemical marketing practice course from the perspective of psychology is helpful to help teachers grasp the dominant position of students in curriculum learning and promote the improvement of their mental health level.

THE INFLUENCING FACTORS OF COMMUNICATION ADAPTATION BARRIERS ON COLLEGE STUDENTS' EMPLOYABILITY

Yuan Tu

Admissions and Career Guidance Division, Jinling Institute of Technology, Nanjing 211169, China

Background: Communication adaptation disorder is manifested in the difficulties of opinion exchange and information transmission between people and teams. It often includes language barrier, concept barrier and temperament barrier, and different types of obstacles are caused by different information senders, information receivers and information transmission channels. In the adaptive state of language communication, the emotional tendency, expression ability and judgment of the sender of information will

affect the integrity of information transmission. For example, the sender of information will produce different emotional values and behavior orientation under the influence of language environment, age structure and individual differences, and then affect the fluency and logic of communication and expression. At the same time, different information recipients have different ideas and views on the same thing by subjective tendency and value orientation, and there are different characteristics in information screening and tolerance. Certain psychological distance, environmental conditions and changes in identity positioning will hinder the communication and communication process between different groups, lead to communication adaptation obstacles, and then affect the information transmission between the two sides of the information. The singleness of communication media channels and the communication feedback of the surrounding environment to individuals will affect the differences in their own communication skills. For example, the main communication objects and inform recipients of efficient college students come from teachers, and teachers' communication behavior to students is direct and rapid. Communication adaptation disorder will affect students' emotional tendency and expression ability, which is directly reflected in the communication process between students, others and the environment, and affect their communication ability when facing employment. With the continuous expansion of enrollment scale and the increase of the number of college graduates, there is an imbalance between supply and demand between graduates and scarce jobs, which further increases the employment form and competitive pressure, making it very important for college students to improve their employability under the severe employment situation. The employability of college students refers to the ability generated by college graduates to adapt to the changes of the employment market, and the level of their ability reflects the probability of their success in employment, including basic ability, professional ability, personal characteristics and social adaptability. There are many factors affecting college students' employability, including personal values

Subjective controllable factors such as professional knowledge, skills and comprehensive quality, as well as objective factors such as social demand and employment policy. Communication adaptability is an important factor in college students' employability. Therefore, exploring the literacy improvement path of college students' employability from the perspective of communication adaptability obstacles will help to improve students' negative emotions and psychological problems such as employment anxiety, and improve their comprehensive quality and employability.

Objective: In order to improve students' cognition of their own positioning and the improvement of psychological problems, this paper studies the influencing factors of their employability from the perspective of communication adaptation barriers, so as to help them better adapt to the job market and situation, look at their own and surrounding changes with a more positive and comprehensive attitude, and improve their psychological tolerance.

Research objects and methods: Firstly, the study conducted mental health screening on the students of a university, took the students with communication adaptation disorder as the research object, and collected the preliminary information on their employability level, then intervened them in professional knowledge learning, communication and psychological quality strengthening, and collected the improvement of communication adaptation disorder of students after the intervention to explore the negative factors affecting college students' employability and improve their employability.

Method design: With the help of principal component analysis, explore the correlation between communication adaptation disorder and college students' employability, intervene and treat the experimental subjects, collect their psychological improvement data and changes in employability before and after the experiment for eight weeks, and make statistical analysis of the data to obtain the experimental results.

Methods: Principal component analysis was used to explore the correlation between communication adaptation disorder and college students' employability.

Table 1. Statistics on the score difference of students with communication adaptation disorder before and after the experiment

Representation dimension	Before the experiment	After the experiment
Fluency of language use	13.77±2.59	25.14±2.43
Logic of language	15.28±2.53	29.42±2.77
Correctness of terms	19.32±3.82	27.53±2.05

Results: The employability of college students includes the ability to develop wisdom, the ability to establish a new concept of employment and the ability to pay attention to the training of sound personality. Exploring the influencing factors of college students' employability from the perspective of communication adaptation barriers will help college students understand the relationship between career and life, change their thinking ideas, and then improve their communication adaptation ability. The results show that

targeted intervention for students with communication and adaptation disabilities can effectively enhance their understanding and grasp of the connotation of employability, help to improve psychological problems and improve their psychological pressure resistance and adaptability. Table 1 shows the statistical difference of scores of students with communication adaptation disorder before and after the experiment.

Conclusions: The level of mental health and communication expression is also one of the core competitive advantages of college students' employability. Targeted intervention for students with communication adaptation disorder is helpful to grasp the changes of their psychological needs and the backward progress of communication adaptation problems, and take targeted intervention measures to help them solve their psychological problems and improve their core professional quality and ability.

THE IMPACT AND DEVELOPMENT OF CONSUMER BIG DATA PSYCHOANALYSIS ON E-COMMERCE

Ming Feng

School of Applied Economics, University of Chinese Academy of Social Sciences, Beijing 102488, China

Background: Consumer psychology is an independent branch of psychology, which mainly studies the response psychological activities and psychological rules of consumers when purchasing goods according to their own psychology and actual needs under the premise of specific overall social level and consumption level. Psychological activity is the reaction process of human beings when they are controlled by external objective things. When consumers face consumption choices, their own consumption psychological needs, consumption preferences and behavior preferences are affected by consumption psychology, which can be reflected in consumers' behavior. Sellers and designers can also grasp consumers' consumption psychology by observing consumers' consumption behavior, and then meet consumers' consumption psychological needs through a series of promotional activities and other business behaviors. People's consumption activity is not a general mechanical activity, which is manifested in the fluctuation of consumer psychology in a certain field. First, people's consumption psychology is divided into two kinds: consumption psychology caused by physiological factors and consumption psychology caused by social consumption environment. The consumption psychology caused by physiological factors is the consumption psychology dominated by instinct when people are in a natural state, while the consumption psychology caused by social consumption environment is the consumption psychological demand caused by the influence of external social environment, similar groups in life or the overall consumption environment. Relatively speaking, the consumption psychology caused by physiological factors is easier to predict, but the consumption psychology caused by social consumption environment is relatively difficult to predict. In the field of e-commerce, the big data consumption prediction system can summarize and summarize consumer behavior, form a guide map of individual consumption habits and overall social consumption trend, analyze consumption psychology from existing consumption behavior, and predict future consumption psychology. By analyzing the psychological trend of consumers' big data, we can effectively improve the business strategy of e-commerce, achieve the effect of accurate recommendation and guide consumption. Psychology is a science that studies human behavior and psychological laws. Modern psychology believes that psychological perspectives include six aspects: biological perspective, cognitive perspective, behaviorism perspective, whole-person perspective, development perspective and social and cultural perspective. Its theoretical content involves connection theory, behaviorism theory, humanism theory and so on. Psychology focuses on people's cognitive activities, psychological activities, individual spiritual core and influencing factors, and guides people's behavior mechanism and psychological changes from the perspective of long-term development. With the help of psychological perspective and theoretical analysis, the research on the impact and development of consumer big data psychological analysis on e-commerce will help to grasp the psychological needs of consumers and the cognitive law of both sides of the interaction in the e-commerce process.

Objective: In order to better explore the impact of consumer big data psychoanalysis on e-commerce and explore the psychological mechanism in the process of this impact, under the guidance of the internal and external driving factors of consumer purchase psychology, analyze consumer psychology with their existing consumption behavior, and predict the future consumption psychology, so as to guide the correct establishment of consumers' psychological values, rational consumption and improve their mental health level.

Research objects and methods: The study randomly selected 1000 consumers of different ages and

occupations as the research object, evaluated and analyzed consumers' previous consumption psychology, and then conducted psychological guidance and predictive intervention on consumers' behavior with the help of psychological theory, so as to explore the impact of consumers' different emotional orientation and consumption psychology on e-commerce shopping activities under the background of big data. After four weeks of psychological intervention, the consumers' consumption tendency and psychological intervention were randomly analyzed according to the characteristics of consumers' consumption tendency.

Methods: With the help of big data analysis tools, the information of consumers' consumption tendency and psychological status was collected, and then SPSS23.0 statistical analysis tools were used to compare the changes of consumers' consumption psychology, consumption expectation and shopping intention before and after the experimental intervention.

Results: There is a certain correlation between consumers' consumption psychology and their shopping intention, and individual consumption psychology will affect their shopping expectation and behavior. There is a connection between consumption emotion and subsequent shopping behavior. With the help of big data consumption prediction system, it can effectively guide consumers' psychological orientation and then affect their shopping intention. Figure 1 shows the correlation between consumers' positive consumption psychology and shopping intention.

Figure 1. Correlation between consumers' positive consumption psychology and shopping intention

Conclusions: Consumers' purchase behavior will be affected by consumption motivation, perception, learning stimulation and behavior attitude. The big data consumption prediction system can predict consumers' consumption psychology by collecting consumers' past consumption behavior, and then affect their shopping intention. Analyzing consumers' consumption behavior from the perspective of psychology is helpful to the development of e-commerce and the establishment of consumers' correct consumption view.

THE WAYS TO IMPROVE THE CORE LITERACY OF DIGITAL CREATIVE TALENTS FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Guiming Huang¹ & Ziyang Mo²

¹School of Culture and Media, Hezhou University, Hezhou 542899, China

²School of Tourism and Sports Health, Hezhou University, Hezhou 542899, China

Background: Educational psychology refers to the use of psychological theories or research results to carry out educational intervention, carry out conscious intervention according to the psychological laws and change characteristics of both teaching subjects and objects, and explore its teaching design in a specific situation, so as to achieve the best teaching effect and teaching quality, and improve students'

psychological problems. Educational psychology can help teachers effectively intervene and solve students' psychological and learning problems in curriculum design, teaching method improvement and teaching motivation guidance. Based on psychology, educational psychology constructs the relationship between pedagogy and psychology, including the relationship between students' personality development and educational environment, the relationship between ability development and knowledge learning, social development and standardized learning, and the regularity between the effectiveness of teaching and talent training. On the basis of practicing the cultivation concept of people-oriented and cultivating people through moral education, educational psychology actively intervenes in the teaching process and teaching subject and object with the help of psychological theory, which is internalized in the heart and practice in a subtle form. The teaching process is the process of teaching interaction. Its essence is the choice of methods, and the psychological characteristics of teachers and students will make the teaching effect and teaching focus different. Different psychological characteristics and goal orientation will lead to the difference and enthusiasm of students' learning attitude. At present, the cultivation of students' innovative consciousness is ignored in the teaching process of digital creativity major in higher vocational colleges. Most of them are taught with theoretical knowledge. The teaching form is superficial, which is difficult to grasp students' employment needs and psychological problems. Due to the lack of understanding of the course, students are prone to psychological problems when the teaching effect deviates from their own expectations, and the complex environmental conditions and changeable job market will also lead to students' anxiety, anxiety and other negative emotions and psychological problems in the teaching process, which will affect their life and learning. Therefore, from the perspective of educational psychology, we should carry out teaching reform from the aspects of the design of teaching content, the selection of teaching resources and the evaluation of teaching mode, pay full attention to the needs and psychological change characteristics of students, improve their emotional burden and psychological problems, and improve their mental health and learning attitude.

Objective: To analyze the law and characteristics of students' psychological changes in the teaching process of digital creative course with the help of educational psychology, so as to realize teaching reform, pay attention to students' psychological problems and emotional difficulties in the teaching process, alleviate their negative emotions, and improve their learning quality and learning attitude.

Research objects and methods: Taking the students majoring in digital creativity in a university as the research object, the research first collects information on the current situation of classroom teaching and the learning problems and needs of college students, and then constructs a new promotion path in line with students' psychological needs and classroom teaching objectives from the perspective of educational psychology, this model is used to test the improvement of students' psychological status and core literacy in teaching practice, so as to reduce their negative emotions caused by professional problems.

Method design: Explore the correlation between educational psychology and digital creative education with the help of principal component analysis, innovate and optimize the original classroom teaching on this basis, analyze the psychological improvement and core literacy improvement of the experimental subjects within three months with the new model, and make statistical analysis of the data to obtain the experimental results.

Methods: Principal component analysis was used to explore the correlation between educational psychology and digital creative education. Analysis tool to process the experimental data.

Figure 1. Statistics of students' negative emotion scores before and after the experiment

Results: Educational psychology can effectively guide teachers to optimize teaching courses according to students' psychological needs and problems, and then help them solve psychological problems and improve their core professional quality and ability. Figure 1 shows the statistics of students' negative emotion scores before and after the experiment. The score value represents the severity of students' negative emotion.

Conclusions: The level of mental health is also one of the core competitive advantages of talent training. With the help of educational psychology, teachers can give full play to the joint force of education on the basis of grasping the psychological laws and teaching characteristics of teaching subjects and objects in the process of digital creative teaching, pay more attention to students' subjects, and solve their psychological problems and emotional changes in teaching practice, improve their core literacy and ability to adapt to society. Digital creativity requires students to be able to flexibly and creatively use professional knowledge for product design, so teachers should pay attention to give full play to students' subjective initiative in the future teaching process.

THE CAUSES OF EMPLOYEES' PSYCHOLOGICAL ANXIETY IN ENTERPRISE HUMAN RESOURCE MANAGEMENT

Wei Song

School of Management, Nanjing Audit University Jinshen College, Nanjing 210000, China

Background: From the perspective of psychology, anxiety is a psychological feeling and action tendency in the face of future uncertainty. It is mainly characterized by widespread persistent anxiety or recurrent panic, and the anxiety psychology shown by different audiences has individual differences. In the current anxiety group, the psychological problems of employees are more prominent, and gradually show a younger and more serious trend. The psychological anxiety of employees will have a negative impact on their own value evaluation and work content. A more negative emotional attitude is not conducive to the development of their work and the satisfaction of emotional value. Moderate psychological anxiety will urge employees to constantly examine their own shortcomings and problems existing in their work, and then produce internal driving force, so that they can solve problems with a more proactive attitude and behavior, realize the regulation of their own emotions, and then promote their all-round development. However, excessive psychological anxiety will make employees fall into the emotional quagmire, resulting in emotional disorder and out of control behavior, which will lead to a series of psychological problems and affect the completion of work tasks and the investment of mental state. There are many influencing factors that cause employees' psychological anxiety, such as work content, interpersonal relationship, enterprise management system, job burnout and so on. Different employees have different tolerance and emotional sensitivity, and then hold different attitudes and emotional endurance in solving the same thing and problem. If there is no timely and effective targeted intervention on the anxiety of employees, it will have a good impact on the physical and mental health of employees. In the long run, it will affect the effect of human resource management and the long-term benign development of the enterprise economy. Human resource management of enterprises is an important strategic resource in modern enterprises. It determines the depth and breadth of the development and utilization of material resources. It is the key factor for the core competitiveness of enterprises and the realization of long-term and orderly development. The rationality and scientificity of human resource management will have an impact on employees' emotions, such as salary system, job content distribution and basic rights and interests' maintenance, which will cause employees' emotional fluctuations, resulting in job burnout and anxiety. Therefore, exploring the influencing factors of employees' psychological anxiety in enterprise human resource management will help enterprises to better improve the human resource management system and improve their anxiety from the psychological status of employees.

Objective: In order to improve the anxiety of enterprise employees, alleviate their anxiety symptoms and help them improve their mental health level, study the optimization of management mode from the current situation and problems of human resource management, reveal the relationship between it and

employees' psychological anxiety, and realize the active intervention of employees' psychological anxiety.

Research objects and methods: The research takes the employees suffering from psychological anxiety in an enterprise as the research object, and optimizes and improves the human resource management mode according to the causes of employees' anxiety and the problems existing in the current human resource management, in order to achieve the intervention and mitigation of employees' psychological anxiety.

Method design: Firstly, according to the grade of employees' psychological anxiety symptoms, explore the causes of their anxiety and its influence relationship with human resource management, and then optimize the current human resource management mode to meet the psychological needs of employees, so as to alleviate their psychological anxiety and related psychological problems. The experiment lasted for three months. After the experiment, the changes of psychological anxiety of employees in different positions and age structures were analyzed with the help of self-rating anxiety scale, so as to better explore the intervention mechanism of human resource management mode and employee anxiety psychology, so as to improve the mental health level of employees.

Methods: With the help of social statistical analysis tool SPSS23.0 make statistical analysis on the difference of employees' psychological anxiety relief in human resource management.

Results: The psychological imbalance caused by the surrounding environment and the pressure and burden brought by the enterprise environment will make employees have negative emotions, and employees' emotions are closely related to the physical environment, psychological environment, work and industry characteristics. The key to improving employees' psychological anxiety is to improve their sense of efficacy and recognition of their own work and value. The human resource management model can effectively adjust employees' psychological emotions with the help of the improvement of various human culture systems, which has greatly improved employees' anxiety and their mental health. Table 1 shows the statistical results of the psychological anxiety levels of employees of different genders after the experiment. Grades from 1 to 5 indicate the degree of psychological anxiety from light to heavy.

Table 1. Statistical results of psychological anxiety levels of employees of different genders after the experiment

Gender	Before and after intervention	Interpersonal anxiety	Work anxiety	Job burnout anxiety	Value realization anxiety
Male	Before intervention	4	5	4	5
	After intervention	2	2	1	1
Female sex	Before intervention	3	3	4	4
	After intervention	1	2	1	2

Conclusions: The improvement of human resource management system can effectively convey the recognition of the enterprise to itself and work to employees, and then improve their work enthusiasm and confidence. The personnel transfer, responsibility division and the improvement of reward and punishment system in human resource management will affect the positioning of employees' social roles, and then produce different emotional values, effectively alleviated their psychological anxiety. Therefore, enterprises should pay attention to the emotional value and psychological problems of employees in the future human management in order to achieve long-term sustainable development.

THE EFFECT OF INTERNAL CONTROL DOMINATED CORPORATE GOVERNANCE MODEL ON CEO ANXIETY IN STATE-OWNED ENTERPRISES

Hanxiao Zhang¹ & Weiqiong Fu²

¹*School of Accounting, Guangzhou Huashang College, Guangzhou 511300, China*

²*School of Economics and Management, Huizhou University, Huizhou 516007, China*

Background: Anxiety disorder is a very complex psychological and emotional disorder. Its clinical manifestations are usually motor agitation and sympathetic hyperactivity, often accompanied by negative emotions such as anxiety, shame, disappointment, anxiety and fear. Anxiety is a typical irrational state of mind, which refers to a common psychological state and emotion of tension, confusion and pessimism about the future. The tension caused by anxiety and the suspicion, irritability, fear, frustration, confrontation, as well as the accompanying confusion of thinking, mental laxity and lack of confidence, will have an impact on people's emotional regulation and behavior guidance, and in serious cases, it will endanger personal

physical and mental health. Appropriate anxiety can make individuals maintain a positive attitude to deal with the changes and challenges of surrounding things, but excessive anxiety will affect the objectivity and rationality of people's evaluation of things, and it is very easy to be guided by negative emotions to make impulsive behavior, which will affect the normal living state of individuals. The reasons for the anxiety psychological performance of people of different ages and different occupational attributes are also different. The younger the age, the narrower and simpler the anxiety psychology involves, the richer the social experience, the more aspects considered by groups, and the source of anxiety is complex, including not only the pressure burden at the individual level, but also the anxiety related to the connection with external things. As an important part of China's economic system, state-owned enterprises undertake more important economic construction problems. The CEO of state-owned enterprises has important executive rights within the organization. Their individual decisions play a key role and value in the overall development direction and strategic deployment of enterprises, and their decision-making behavior needs to consider many factors, so they are facing pressure and burden, it is also prone to anxiety and psychological problems. The differences of internal governance modes of enterprises will affect the decision-making and power ownership of their CEO, and then affect their emotional orientation. Therefore, exploring the impact of internal control LED corporate governance model on the anxiety of CEOs of state-owned enterprises will help to improve their mental health level.

Objective: Different corporate governance modes and forms will affect the efficiency of enterprise top management. An efficient and orderly governance mode can improve the effect of enterprise management. Explore the impact mechanism of internal control LED corporate governance model on the anxiety of state-owned enterprise CEOs, help them improve their anxiety and improve their mental health level.

Research objects and methods: The study took the CEOs of 10 state-owned enterprises as the research object, collected data on their anxiety and psychological problems with the help of a self-rating anxiety scale, and then actively intervened their psychological status and anxiety with the governance model dominated by internal control, and explored the changes of their psychological emotions.

Method design: Firstly, the subjects were graded according to their anxiety and mental health, and then they were involved in the practical simulation of the designed internal dominant governance model. They participated once a week, and after a period of four weeks, the anxiety and mental level of the CEO were collected by using the Self-Rating Anxiety Scale.

Methods: With the help of social statistical analysis tool SPSS23.0. The changes in anxiety psychology and emotional value of CEOs of state-owned enterprises before and after the experimental intervention were compared.

Results: CEOs of state-owned enterprises have greater decision-making power, and they are faced with greater environmental conditions and burden pressure. They are vulnerable to psychological problems caused by various factors. The CEO's dominant mode of governance can effectively reduce the psychological burden of the state-owned enterprise, and the division of its internal capital can effectively alleviate the anxiety of the CEO. Table 1 shows the scores of anxiety scale of CEOs of state-owned enterprises at different ages before and after the experimental intervention.

Table 1. Statistics of anxiety scale scores of consumers of different ages before and after the experimental intervention

Before and after the experiment	Young consumers	Middle-aged consumers	Elderly consumers
Before experiment	17.65±1.98	26.37±1.68	15.14±1.72
After the experiment	9.24±1.24	8.26±1.47	9.65±1.05

Conclusions: The internal leading governance model takes the maximization of shareholder value as the governance goal, optimizes the salary system, greatly improves the flexibility and autonomy of enterprise internal management, can effectively alleviate the anxiety of state-owned enterprise CEOs, and then improve their mental health level. To a certain extent, the internal governance model shows that the enterprise has a clear division of responsibilities and rights, a reasonable management performance system and incentive mechanism, which can optimize the enterprise management efficiency to a certain extent, effectively reduce the adverse aspects of the CEO affected by the enterprise's internal management, and improve the happiness and psychological adaptability of managers.

THE INFLUENCE OF THE REFORM AND INNOVATION OF COLLEGE STUDENTS' IDEOLOGICAL AND POLITICAL EDUCATION PRACTICE ON STUDENTS' SPIRITUAL AND EMOTIONAL ANXIETY

Jun Wu & Hui Zhang

Department of Imaging, Jiangsu Vocational College of Medicine, Yancheng 224005, China

Background: Mental and emotional anxiety belongs to widespread anxiety in anxiety psychology, which belongs to pathological anxiety. Mental and emotional anxiety is chronic and diffuse. It takes a long time to form and will produce unrealistic anxiety, tension and other emotions in life situations. Mental and emotional anxiety will appear different physiological symptoms, such as numbness in hands and feet, rapid heartbeat, chest suffocation and so on. Life situation is generally some daily trivia, such as examination, study, work and other situations. Mental and emotional anxiety will worry and fear about what doesn't happen in the future, worry about some things you can't control, and often panic. For example, housewives often fear that their children will be hurt, often pay attention to their children's situation, and take a look at their children at intervals when doing things. When going out, they will lead their children, often pay attention to the surrounding environment, worry about sudden changes, and fear that they will not have time to respond. Parents are afraid that if they don't master all kinds of knowledge before and after the exam, they will worry about whether they will fail the exam. Take a negative view of what has not happened, worry too much, and cause mental and emotional anxiety. In this state, the individual's spirit is difficult to concentrate, and is more sensitive to sound and light. The spirit is in a tight state, and the emotion is more sensitive. He will even feel sad and cry when thinking about it.

Due to the different personality characteristics of college students, there will be differences in their sensitivity to the stimulation of surrounding things and their response to pressure. Some students have strong psychological tolerance and can adjust themselves. Some students have relatively weak adjustment ability and will have slight psychological problems. Some students have poor psychological tolerance and emotional regulation ability and are very sensitive to the surrounding stimuli, resulting in mental and emotional anxiety, easy having negative associations with what has not happened, and then feeling worried and afraid. After paying attention to students' mental health, colleges and universities put forward new requirements for ideological and political education to integrate psychological counseling. According to the psychological status of college students, adjust the teaching methods of ideological and political education, and conduct psychological counseling for students in the process of educational practice, so as to alleviate and cure students' mental health problems. Therefore, in view of college students' mental and emotional anxiety, we should reform the practice of college students' ideological and political education, and study its influence on students' mental and emotional anxiety.

Objective: To comprehensively grasp the mental and emotional anxiety of college students and study its causes. The practical reform of ideological and political education is carried out for college students' spiritual and emotional anxiety. By combining textbook knowledge with students' role-playing, the behavior of college students is standardized, guiding them to make positive association with themselves and collectives and compare with reality, triggering them to think positively and realize the unity of consciousness and behavior, so as to cure mental and emotional anxiety. In teaching, we should consciously cultivate students' positive psychological quality, develop good moral quality, improve their psychological tolerance and anti-interference ability, improve their mental tension, and alleviate or even cure their mental and emotional anxiety.

Research objects and methods: The research objects are college students with mental and emotional anxiety. Through data mining technology, 260 college students with mental and emotional anxiety were selected from the mental health database of two colleges and universities. These college students come from different majors, different grades and different family backgrounds. Analyze their situation in learning and interpersonal relationship, and carry out the ideological and political education for these college students after the reform for two months, once a week, 60 minutes each time. During the experiment, the relevant data were recorded, the treatment was statistically analyzed through SAS house arrest, and the influence of the reform and innovation of ideological and political education practice on the cure of students' mental and emotional anxiety was studied.

Results: In colleges and universities, college students have different degrees and types of psychological problems, and mental and emotional anxiety is one of them. College students with mental and emotional anxiety are difficult to concentrate and their learning efficiency is not high. After the reform of ideological and political education, the relevant symptoms of college students have been significantly improved, the attention of students has been improved to a certain extent, and the mental and emotional anxiety has been slowly cured. The effect of role plays on the cure of mental and emotional disorders of students

majoring in human geography is scored as 4 points, and the results are shown in Table 1.

Table 1. The influence of ideological and political curriculum obstacles on students' will education in colleges and universities

Major	Social survey	Cosplay	Cultivate students' positive psychological quality
Mathematics major	5	4	5
Human geography	4	4	5
Accounting profession	4	5	5

Conclusions: After the reform and innovation of the practice of ideological and political education for college students, the mental and emotional disorders of college students have been slowly alleviated and cured after innovative education, their learning attention has been significantly improved, they no longer feel worried and uneasy about what has not happened, and their emotions have become positive.

EFFECTIVENESS OF POSITIVE PSYCHOLOGY IN PROMOTING IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES

Hui Deng¹ & Ning Wang²

¹*Principal's Office, Hezhou University, Hezhou 542899, China*

²*Guangxi Guidong Electromechanical Engineering School, Hezhou 542899, China*

Background: Positive psychology belongs to psychology, which rose at the end of last century. It mainly studies human positive psychology, virtue and other positive aspects. Positive psychology attaches importance to the positive promotion of human positive psychological quality in different industries, and has a wide range of applications, including enterprise management, education, society and so on. In the research of positive psychology, it is emphasized to use scientific methods on the principle of adhering to science to guide the positive psychological quality of individuals. Through positive psychology, individuals with psychological problems are guided to pay attention to the positive aspects of things, and slowly become positive and optimistic under the stimulation of various positive things, broaden their mind and alleviate the negative emotions in their hearts. When you look at things, you will no longer blindly look at the bad side of things, and you will maintain a positive and optimistic attitude. In the face of difficulties, meet challenges bravely, make unremitting efforts, and actively adjust the direction of efforts according to the situation until success. The application of positive psychology in the process of relevant education and training will create a positive atmosphere, promote the smooth development of these activities and improve the effect of activities, so as to make individuals and groups develop well, improve people's quality of life and contribute to the stability of social security.

At present, ideological and political education in colleges and universities has achieved some good results after continuous reform, but there are still some problems. For students, they do not pay much attention to the role of ideological and political education. In class, many students simply listen to the class without in-depth thinking, do not know much about the role of ideological and political education, and their learning enthusiasm is low. Some students even regard the ideological and political education course as a course of playing with mobile phones. They often look down at the mobile phone and don't listen to what the teacher is talking about. They are even perfunctory about the homework of the ideological and political education course. On the whole, the teaching effect of ideological and political education course is not very good, and the students' harvest is limited. For teachers, their teaching and research level still needs to be continuously improved. Some teachers' teaching ideas do not keep up with the pace of teaching development, and there is a lag phenomenon. The teaching methods used by teachers in ideological and political education courses are single and relatively old, the innovation of teaching mode is insufficient, the relevant evaluation mechanism needs to be improved, and there is a phenomenon that theory is light of practice. The real performance of students cannot be reflected in the examination results. According to the role of positive psychology, it is applied to improve the effectiveness of ideological and political education in colleges and universities, stimulate students' learning enthusiasm, let teachers actively explore and research in ideological and political education, and carry out all-round innovation.

Objective: To analyze the current situation of students, teachers and teaching in ideological and political education in colleges and universities, and study its causes. In view of the current problems, this paper analyzes the path to improve the effectiveness of effective ideological and political education, and integrates positive psychology into this process. Update the teaching concept, pay attention to the needs and development of students, connect social life in teaching, attract students' attention, stimulate students' learning enthusiasm, and enable students to think together with the teaching content to achieve the purpose of teaching. When teaching, teachers are full of teaching enthusiasm, pass this positive emotion to students, drive students' emotions, stimulate students' positive strength, and shape students' positive psychological quality. In addition, through the reform of teaching methods, diversified and personalized evaluation and encouraging evaluation, students can learn and feel the knowledge of ideological and political education in the ideological and political education curriculum, help teachers understand students' learning more clearly, and adjust the teaching plan, so that students can study more actively and experience the sense of learning achievement.

Research objects and methods: The research objects were college students. Three colleges and universities were selected, and 260 college students were randomly selected from these colleges and universities. Analyze the learning and personal situation of these college students and their views and suggestions on ideological and political education. Carry out the teaching of the reformed ideological and political education course for these students for one semester, 90 minutes a week, record relevant data, and carry out the impact of the reformed ideological and political education on students' learning effect through fuzzy comprehensive evaluation. Grade 1-5 is adopted, use SAS software to process and analyze data.

Results: In recent years, students have not realized the importance of ideological and political education in colleges and universities, and their attitude towards lectures is more perfunctory. Many of them are bow-headed parties, do not care about what teachers say, and their learning enthusiasm is very low. Teachers just teach textbook knowledge to different students, which is not innovative and boring, and their teaching enthusiasm is not high. By applying positive psychology to the teaching reform of ideological and political education, students' learning enthusiasm and learning effect have been significantly improved, and the sense of achievement of civil engineering students has been significantly improved. The score is 4 points. See Table 1 for the results.

Table 1. Evaluation of students' positive psychological quality after the teaching reform of ideological and political education

Major	Fulfillment	Optimistic	Self-confidence
Civil engineering	4	5	4
Garden specialty	5	4	4
Business English major	4	5	5

Conclusions: The application of positive psychology in the teaching reform of ideological and political education can improve the effectiveness of teaching, improve students' learning enthusiasm, guide students to cultivate positive psychological quality, and improve teachers' teaching level.

* * * * *

IMPACT OF CONSUMERS' RECOGNITION OF BRAND VALUE ON ENTERPRISE PERFORMANCE BASED ON CONSUMER PSYCHOLOGY

Mengning He^{1*} & Zanzuan Su²

¹Faculty of Economics and Business Administration, Complutense University of Madrid, Madrid 28040, Spain

²Psychological Counseling Center, Zhencheng Radio & TV University, Guangzhou 511300, China

Background: Consumer psychology is a branch of psychology. It studies the psychological and behavioral changes of consumers in the process of consumption, as well as the laws of their psychological and behavioral changes. Consumer psychology involves many disciplines such as social psychology and economics, and studies consumers' consumption motivation and consumption needs. Need means the subjective feeling that an individual lacks something. It is a response to objective needs. For example, consumers' needs for clothing, food, housing and transportation. Demand means that after consumers have the conditions to change the dissatisfying status quo, they pursue the demand that can make them more satisfied. Consumer

demand has five characteristics: objectiveness and variability. After consumers have some shopping demand, it will affect their shopping behavior. The more consumers need something, the more likely they are to buy it. The factors affecting consumers' consumption needs are subjective and objective. Subjectivity means that consumption needs will be affected by physiological and psychological conditions. The purchase motivation of consumers is divided into physiological consumption motivation and psychological consumption motivation. The former is the consumption motivation generated by the survival needs of consumers. For example, eating and drinking water are things that must be carried out for human survival. Generating consumption motivation on these things that must be consumed for survival belongs to physiological consumption motivation. Psychological consumption motivation means that consumers want to achieve respect needs and social needs, resulting in consumption motivation. For example, in order to make yourself look better, the idea of buying cosmetics comes into being, which belongs to psychological consumption motivation. After consumers have consumption motivation, they will evaluate what they want to buy and judge whether it is worth buying. In the purchase process, consumers will be affected by price, quality, brand, personal economic level, aesthetics and so on. Among them, in the brand factor, consumers will choose those products with higher recognition as their purchase choice. For example, consumers tend to recognize the same brands in the process of online shopping. When they compare the quality and cost performance of these products, they tend to recognize them more. According to the characteristics of consumer psychology and consumer behavior, this paper analyzes the impact of consumers' recognition of brand value on enterprise performance based on consumer psychology.

Objective: To understand the current consumer psychology and behavior law, and analyze the influencing reasons. On this basis, this paper studies the impact of consumers' recognition of brand value on enterprise performance. Through the influence of consumers' recognition of brand value on enterprise performance, make corresponding adjustments to enterprise management, so as to improve enterprise performance.

Research objects and methods: The research objects were consumers, and 100 consumers were randomly selected from a large shopping mall. These consumers come from different occupations, and there are differences in their education, family economic level, aesthetic hobbies and social status. Understand their daily consumption, consumption motivation and their views on the brand, and record relevant data. The fuzzy evaluation method is used to evaluate the impact of consumers' recognition of brand value on enterprise performance, and the relevant influencing factors are quantified. A score of 0-4 is used. 0-4 indicates no impact, slight impact, general impact, obvious impact and complete impact respectively. The data are processed and analyzed by Excel software and SAS software.

Results: Consumers' consumption psychology and behavior are affected by many factors. Personal economic conditions, product quality and brand awareness will affect consumers' consumption behavior and which product consumers choose as their final choice. Consumers' recognition of brand value will promote the growth of enterprise performance and create more benefits for enterprises. The impact of middle-aged consumers' cognitive recognition of brand value on enterprise performance is scored as 4 points, and the results are shown in Table 1.

Table 1. The influence of consumers' recognition of brand value on enterprise performance

Age group	Cognitive identity	Emotional identity	Identity
Youth	3	4	4
Young and middle-aged	3	4	3
Middle age	4	3	3

Conclusions: Consumers' recognition of brand value has a great impact on enterprise performance. In the process of enterprise management, we can expand the popularity of enterprises through advertising, maintaining and improving product quality and other measures, so that more consumers can understand the brand, recognize the brand value and choose to buy brand products.

ANALYSIS OF PERSONAL INVESTMENT PSYCHOLOGY AND JOB ANXIETY BASED ON BEHAVIORAL FINANCE

Yan Wang^{1,2} & Yue Ma²

¹School of Economics and Finance, Xi'an Jiaotong University, Xi'an 710061, China

²Endicott College, Woosong University, Daejeon 300-718, South Korea

Background: Since the reform and opening up, China's economy has developed rapidly and people's disposable income has been increasing. In this context, China's financial market is also developing. Investment is an economic activity with high risk and high return. Many investors suffer from anxiety because they are too worried about investment risks. At the psychological level, anxiety belongs to a kind of negative emotion. It is a dangerous state in which individuals are unable to achieve their goals or overcome obstacles, which leads to the frustration of individual self-confidence and self-esteem, increases the sense of frustration and frustration, and then forms a state of tension, anxiety and fear. Long-term and excessive anxiety will damage the patient's body function and reduce the patient's mental health level. Patients with excessive anxiety often have a sense of near-death, loss of control and mental breakdown, so patients will lose confidence in life, leading to the idea of suicide. Therefore, finding an appropriate way to alleviate investors' anxiety is of great significance to investors' physical and mental health.

Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception, thinking and language. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition, which is mainly to explain the law of individual psychological changes in the process of cognition. In the theory of cognitive psychology, individual learning process is actually a process of gradual construction and improvement of knowledge, not only the absorption and digestion of knowledge, but also the process of using their own knowledge to build new knowledge. After the environment stimulates the individual to produce information, the individual obtains the ability through the internal cognitive processing of these information, so that the learning and the learning situation are always consistent. Therefore, cognitive psychology believes that the individual cognitive process is essentially the process of individual brain processing symbolic information. The main human activities include three aspects: cognitive activities, emotional activities and will behavior, which can be explained and expounded by the theory of cognitive psychology. Based on cognitive psychology, this study analyzes investors' investment behavior, investment psychology and investment cognition by using behavioral finance, discusses the factors leading to investors' anxiety, and constructs an investment risk prediction model according to the analysis results to alleviate investors' anxiety.

Objective: Investment is an economic activity with high risk and high return. Many investors suffer from anxiety because they are too worried about investment risk. Based on cognitive psychology, this study uses behavioral finance to analyze investors' investment behavior, investment psychology and investment cognition, and constructs an investment risk prediction model according to the analysis results to alleviate investors' anxiety.

Research objects and methods: 80 investors with anxiety disorder were selected as the research objects. Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90) were used to evaluate the mental health status of investors.

40 investors in each group were randomly divided into study group and control group. The research group used the investment risk prediction model based on cognitive psychology to carry out investment activities. The control group carried out investment activities based on traditional decision-making methods. After a period of time, compare the anxiety of the two groups of investors.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Note: * $P < 0.05$ compared with that before teaching; # It indicates that compared with the control group, $P < 0.05$.

Figure 1. Changes of SAS scores of two groups of investors before and after investment

Results: Before investment, there was no significant difference in SAS score and SCL-90 score between the two groups ($P > 0.05$). After a period of time, the SAS score and SCL-90 score of investors in the study group were significantly lower than those in the control group ($P < 0.05$). The changes of SAS scores of the two groups of investors before and after investment are shown in Figure 1.

Conclusions: Since the reform and opening up, China's economy has developed rapidly and people's disposable income has been increasing. In this context, China's financial market is also developing. Investment is an economic activity with high risk and high return. Many investors suffer from anxiety because they are too worried about investment risks. Based on cognitive psychology, this study analyzes investors' investment behavior, investment psychology and investment cognition by using behavioral finance, discusses the factors leading to investors' anxiety, and constructs an investment risk prediction model according to the analysis results to alleviate investors' anxiety. The results showed that there was no significant difference in SAS score and SCL-90 score between the two groups before investment ($P > 0.05$). After a period of time, the SAS score and SCL-90 score of investors in the study group were significantly lower than those in the control group ($P < 0.05$).

THE INFLUENCE OF TRADITIONAL AESTHETICS IN ART DESIGN ON PEOPLE WITH COLOR VISUAL IMPAIRMENT UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Zheng Chen¹ & Yu He²

¹*Yuelu Academy, Hunan University, Changsha 410082, China*

²*School of Art and Design, Guilin University of Electronic Technology, Guilin 541004, China*

Background: Due to congenital or acquired reasons, some people have different degrees of obstacles to some visual organs, resulting in color visual impairment. Patients with color visual impairment have weak perception of color, and some patients with color visual impairment have negative emotions such as depression and inferiority complex. When negative emotions are accumulated for a long time and cannot be released, it will damage the patient's body function, lead to damage to the cerebral cortex and cognitive impairment. Cognitive impairment is a pathological process involving brain function. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment, aphasia and so on, which seriously affects the patients' daily life and reduces the patients' quality of life. At the same time, it also causes a large economic and management burden to the patients' family and society. Art design works can convey emotions and calm the mind. They can alleviate the negative emotions of the audience and then treat cognitive impairment. However, traditional art design pays attention to the use of color, and the treatment effect is not obvious for patients with cognitive impairment with color visual impairment. Therefore, it is of great significance for patients and their families to innovate art design so that people with color visual impairment can fully appreciate the beauty and emotion of art works, and then alleviate the degree of cognitive impairment of patients.

Design psychology can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Design psychology contains many contents, including visual design, color psychology, consumer psychology, product design, environmental design, personality tendency, hierarchical demand, etc. it also involves perceptual texture and psychological effect. Chinese traditional aesthetics, such as ink painting, poetry and calligraphy, do not pay attention to the application of color, but pay more attention to the expression of artistic conception. In the theory of design psychology, it meets the color psychology, psychological effect and hierarchical needs of people with color visual impairment. In addition, the emotional expression and cultural connotation contained in China's traditional aesthetics are easier to make the audience feel cordial and identity. Therefore, it is in line with the personality tendency, hierarchical needs and environmental design in the theory of design psychology. Therefore, based on design psychology, the research applies traditional aesthetics to art design, so as to innovate art design, better meet the visual aesthetic needs of people with color visual impairment, alleviate their cognitive impairment, reflect

humanistic care, and promote the construction and development of a harmonious society.

Patients suffering from visual inferiority disorder, color perception disorder, and so on. The research is based on design psychology to innovate art design, alleviate the cognitive impairment of people with color visual impairment, reflect humanistic care, and promote the construction and development of a harmonious society.

Subjects and methods: 100 patients with cognitive impairment with color vision impairment were selected from a third-class hospital. The Cognitive Impairment Assessment Scale (CIAS) was developed in combination with the mental health part of the concise mental state examination scale and the 36-Item Short Form Survey (SF-36) to assess the degree of cognitive impairment.

Study design: Using random number table method, 100 patients with cognitive impairment with color visual impairment were randomly divided into study group and control group, with 50 people in each group. Both groups were given routine drug treatment. Among them, patients in the research group enjoy innovative art design works based on design psychology for 30 minutes every day. Patients in the control group enjoyed traditional art and design works for 30 minutes every day. After a period of intervention, the degree of cognitive impairment was compared between the two groups.

Methods: Using Excel software and SPSS22.0 software to process and analyze relevant data.

Results: Before intervention, there was no significant difference in CIAS score between the two groups ($P > 0.05$). After the intervention, the CIAS score of the study group was significantly higher than that of the control group ($P < 0.05$), as shown in Table 1.

Table 1. CIAS scores of two groups of researchers

Timing	CIAS Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before intervention	56.4±8.5	56.5±9.2	0.254	0.671
After intervention	86.4±6.4	77.2±7.0	6.673	0.025
<i>t</i>	7.643	5.361	-	-
<i>P</i>	0.001	0.032	-	-

Conclusions: Traditional art design pays attention to the use of color, and the therapeutic effect on cognitive impairment patients with color visual impairment is not obvious. Chinese traditional aesthetics, such as ink painting, poetry and calligraphy, do not pay attention to the application of color, but pay more attention to the expression of artistic conception. In addition, the emotional expression and cultural connotation contained in traditional aesthetics are easier to make the audience feel cordial and identity. Therefore, based on design psychology, the research applies traditional aesthetics to art design in order to innovate art design. The results showed that there was no significant difference in CIAS score between the two groups before intervention ($P > 0.05$). After the intervention, the CIAS score of the study group was significantly higher than that of the control group ($P < 0.05$). To sum up, innovative art design based on design psychology can significantly alleviate the cognitive impairment of people with color vision impairment, reflect the humanistic care of art design, and promote the construction and development of a harmonious society.

Acknowledgement: The research is supported by: 2021 Guangxi Philosophy and Social Sciences Planning Research Project “Research on the Life Aesthetics and Contemporary Value of Scholars in the Song Dynasty from the Perspective of Neo Confucianism” (21FZX004).

THE NECESSITY OF STRENGTHENING IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES BASED ON THE CONNOTATION OF STUDENTS' PSYCHOLOGICAL ANXIETY

Hai Lin & Yaqi Wang

Hubei University of Science and Technology, Xianning 437000, China

Background: When there are unsolvable problems in life and learning, individuals will have anxiety, fear and tension, feel uneasy without coming, and worry about possible threats. This experience and psychological state are called psychological anxiety. Individuals with anxiety lack a sense of security, and

there will be some physiological reactions, such as facial panic, rapid heartbeat, feeling dry mouth, etc. Psychological anxiety has both advantages and disadvantages for individuals. Appropriate psychological anxiety will promote the improvement of their work efficiency and learning efficiency, mentally in a state of positive progress, full of enthusiasm for the goals to be achieved, actively find ways to solve the problems existing in the process of efforts, and full of hope. Excessive psychological anxiety will affect the individual's work and learning process, and the enthusiasm is not high. Because anxiety, panic, and other psychology occupy the heart, they will disturb their thinking. The more they reach a critical juncture, they will be at a loss, have confused ideas, and don't know what to do. Moreover, severe psychological anxiety will also cause damage to the body and mind of individuals. Their spirit will be in a very tired state, and they will have mental abnormalities, be suspicious of the subtle movements around, cause damage to various organs of the body, cause some diseases and even death. The factors of psychological anxiety are divided into personal factors and environmental factors. In personal factors, different individual personality characteristics have a different probability of psychological anxiety. Introverted individuals are more likely to suffer from psychological anxiety than extroverted individuals. Environmental factors refer to all kinds of work, learning environment and the interpersonal environment with great pressure and fierce competition. Stimulated by these environmental factors, individuals have psychological anxiety.

In colleges and universities, due to the great pressure brought by learning and interpersonal, students are overwhelmed, resulting in different psychological anxiety. At present, the ideological and political education in colleges and universities has a tendency of knowledge, and insufficient attention is paid to students' mental health problems, which leads to the lack of timely and correct guidance of students' outlook on life, values and world outlook. Students' ability to distinguish right from wrong is insufficient, their psychological tolerance is weak, and they cannot analyze and deal with difficulties and temptations well. Students' mental health problems are obvious, one of which is psychological anxiety. The research of ideological and political education in colleges and universities in mental health education is still in the preliminary stage, there is no perfect mental health education system, the research on mental health education is not in-depth, and there is a trend of "emphasizing governance over prevention" in the implementation of mental health education. The construction of teachers in mental health education is not enough, and teachers' teaching initiative is not enough. Therefore, it is imperative to strengthen ideological and political education in colleges and universities.

Objective: To understand the psychological anxiety problems of college students and analyze the causes. Study the current situation and differences of ideological and political education in colleges and universities, and enhance the timeliness of ideological and political education in colleges and universities according to the connotation of students' psychological anxiety. Through the reconstruction of educational concept, relationship optimization, environmental planning and returning to reality, we should reform the ideological and political education in colleges and universities, solve the existing problems and intervene the students' psychological anxiety in time.

Research objects and methods: The research objects were college students with psychological anxiety. Four colleges and universities were selected, and 280 college students with psychological anxiety were randomly selected from these colleges and universities. These students come from different majors and grades, and there are some differences in their mental health problems. Understand their learning situation, mental health status and their views on the course in the ideological and political education course, carry out the teaching of the reformed ideological and political education course for these students, and record the relevant data. Through the fuzzy evaluation method, this paper evaluates the influence of ideological and political education teaching on students' psychological anxiety after the reform. The relevant influencing factors are quantified, and 0-4 scores are adopted. 0-4 scores respectively mean no impact, slight impact, general impact, obvious impact, and complete impact. SAS software is used for data processing and analysis.

Table 1. The influence of ideological and political education on students' psychological anxiety after reform

Grade	Reshaping the concept of education	Create a relaxed educational environment	Relationship optimization
Freshman	4	3	3
Sophomore	3	3	4
Junior	4	4	4

Results: Ideological and political education in colleges and universities did not involve much in students' mental health education. Students' mental health problems could not be solved through ideological and political education, and students' psychological anxiety could not be intervened in time. Through the measures of reshaping educational concepts, relationship optimization, environmental planning, and returning to reality, integrating mental health education into ideological and political education, respecting

students, understanding their spiritual needs, enhancing their self-confidence and alleviating psychological anxiety. In the ideological and political education after the reform, the impact of creating a relaxed educational environment on sophomores with psychological anxiety is scored as 3 points. The results are shown in Table 1.

Conclusions: After the reform of ideological and political education, teachers pay more attention to students' mental health, optimize the relationship between teachers and students, promote the elimination of students' psychological anxiety, and guide students to form positive, healthy, and upward values.

AESTHETIC DESIGN OF SMART HOME PRODUCTS BASED ON THE PSYCHOLOGY OF ANXIETY PATIENTS

Hang Yin¹ & Guangpeng Yue²

¹*College of Architectural Art Design, Luxun Academy of Fine Arts, Shenyang 110000, China*

²*College of Industrial Design, Luxun Academy of Fine Arts, Shenyang 110000, China*

Background: Anxiety disorder belongs to mental disorder. The influencing factors of anxiety disorder include quality factors and social psychological factors. Among the quality factors, individual personality characteristics will affect the occurrence of anxiety disorders. For example, introverted and shy individuals are generally more likely to suffer from anxiety disorders, and those who are too neurotic are more likely to suffer from anxiety disorders than normal individuals. Among the social psychological factors, interpersonal tension and long-term mental work are more likely to produce anxiety disorder. The psychology of patients with anxiety disorder will reflect different characteristics due to different manifestations of anxiety disorder. The manifestations of anxiety disorder, they can be divided into six types: Patients with lack of stability and self-control, patients with heavy life pressure, patients with anxiety and urgency, patients with decreased work and learning efficiency, patients with long-term anxiety and tension due to disease, and patients with immature psychological defense mechanism. Patients who lack stability will make a strong response to external stimuli. When they hear some subtle movements, their heartbeat will accelerate, their expression will be nervous, their emotions are easy fluctuate, and the range is large. Patients with a sense of load-bearing life will feel a lot of pressure brought by life, which is close to the edge that they can bear. Their attitude towards things is basically that they have to do and can't do it. They just work for survival and are more passive. When the effect of work and study is not ideal, it will cause a serious blow to the patients, promote the patients to have anticipatory anxiety and feel timid about what they will do. Patients with a sense of urgency will feel that they have little time left for themselves, which is not enough to complete tasks and goals. They feel that they have a lot of things to do but can't do anything. They are very nervous. Even during the rest time, they will worry about what they haven't done, which will affect their work efficiency.

With the continuous development of the times, after people's living needs are met, they begin to pursue higher-level spiritual needs, and the requirements for home environment are gradually improved. With the rapid development of network technology, its application field is expanding, and all walks of life have in-depth research. Under this background, smart home has developed slowly and popularized rapidly. When designing smart home products, people should not only pursue functional practicability, but also carry out aesthetic design. As for aesthetic design, people put forward the requirements of emotional design of smart home. Through smart home products to adjust people's emotions, relieve pressure and make home a place of spiritual dependence. The emotional design of smart home products includes three principles: humanization of interactive experience, naturalization of situation simulation and agility of information processing. According to these principles, make home a harbor for the soul. Therefore, according to the psychological characteristics of anxiety patients, targeted design is carried out to meet their emotional design requirements for smart home products.

Objective: To analyze and study the psychology of anxiety disorder and patients with anxiety disorder, and analyze the causes of related problems. In the aesthetic design of smart home products, the emotional design of products should be carried out considering the emotional needs of anxiety patients. Under the three design principles of humanization of interactive experience, naturalization of situation simulation and agility of information processing, the five functional areas of door, living room, bedroom, study and kitchen are designed separately, so that patients with anxiety disorder can relax at home, feel a moment of tranquility and alleviate anxiety and tension.

Subjects and methods: The subjects were patients with anxiety disorder. Understand the requirements

of anxiety patients for smart home product design, such as color preference, functional requirements, spatial layout, product material, etc. Design smart home products according to their psychological needs, and design smart home products that meet their psychological needs. Record their experience, feelings, mental health level and other relevant data, and use the fuzzy evaluation method to evaluate the impact of emotional design of smart home products on alleviating anxiety in patients with anxiety disorder. The relevant influencing factors are quantified. After quantification, the score is 1-5, and the score of 1-5 indicates no impact, slight impact, general impact, obvious impact and complete impact. The relevant data processing and analysis software is SAS software.

Results: Under the comprehensive action of quality factors and social psychological factors, patients have different degrees of anxiety. The mental state of patients is often in a state of tension, even at home. They urgently need a place to relax their body and mind. According to the psychological needs of anxiety patients, the aesthetic design of smart home products is carried out, and the design requirements of emotional influence are put forward. After the completion of smart home product design, it has been highly praised by patients, and the anxiety of patients has been alleviated. In the experience of smart home products, the impact of emotionalization of smart home products on alleviating anxiety in middle-aged patients is scored as 5 points. The results are shown in Table 1.

Table 1. The influence of professional farmers' cultivation strategy on farmers' learning enthusiasm

Age group	Homimization	Intellectualization	Emotionalization
Youth	4	5	5
Young and middle-aged	5	4	4
Middle age	4	4	5

Conclusions: After emotional design of smart home products, patients get a good sense of experience. Their anxiety is gradually alleviated and their spirit is relaxed.

INFLUENCE OF COMPUTER COURSE TEACHING REFORM IN COLLEGES AND UNIVERSITIES ON ALLEVIATING STUDENTS' PSYCHOLOGICAL ANXIETY

Quanwei Sheng

School of Information Engineering, Changsha Medical University, Changsha 410219, China

Background: Psychological anxiety refers to an individual's excessive worry about his own life and future, resulting in irritability. Psychological anxiety will be relieved or eliminated with the or solution of things. When individuals have anxiety for a long time, psychological anxiety belongs to abnormal anxiety, which is a manifestation of mental illness. The individual experience of abnormal anxiety has no reason to fear the imminent disaster, worry about his physical condition, and feel that he is suffering from a very serious disease. When abnormal anxiety is serious, the individual will have emotional and emotional disorders. This abnormal anxiety belongs to pathological anxiety, as opposed to realistic anxiety. Individuals with realistic anxiety will make emotional response in the face of potential challenges and threats. This emotional response is called realistic anxiety. The degree of anxiety is related to the degree of threats they face. When the potential threats or potential challenges in real life disappear, realistic anxiety will gradually disappear. This anxiety has timeliness. Pathological anxiety is divided into generalized anxiety disorder and panic disorder. Generalized anxiety disorder is a chronic disorder, which is caused by individuals' excessive worry about some life situations. Anxiety disorder can be divided into three types. The first type is mental anxiety, which is manifested in individuals' excessive anxiety about small things in daily life and fear of some uncontrollable events. For example, worry about family accidents, fear of failure in exams, etc. this type of anxiety has symptoms such as insomnia, dreaminess, irritability and so on.

In the process of computer course learning, college students will have varying degrees of psychological anxiety. This anxiety belongs to generalized anxiety disorder. There are five reasons for psychological anxiety. First, because the computer course contains more contents and the learning progress is relatively fast, there is not much time left for students to learn. Therefore, students need to spend a lot of time in private to keep up with the progress of computer course. Under the pressure of this tension, students will have a kind of psychological anxiety in learning. And the assessment methods of computer courses are different from those of other disciplines. In the process of final examination, computer-based examination

is usually selected. Because students usually don't have much time to operate on the computer and are not very familiar with the functions of the computer, this is a challenge for students. Especially in the exam, the time is relatively tight, and the students' proficiency can't meet the requirements. Students will worry about the unqualified test results because they are afraid of not completing the test contents, resulting in psychological anxiety, even fear. Some students had little contact with computers before college due to family economic conditions, and the curriculum foundation of computers was relatively weak. Therefore, they worked hard in the process of learning computers, and they would be terrified and unskilled in computer operation. Compared with other students who are proficient in computer operation, this part of students will feel inferiority complex and do not want to show their bad side in front of students, which will lead to resistance to computer courses and form a kind of psychological anxiety.

Objective: To analyze the psychological anxiety of college students in computer courses and study the causes. On this basis, reform the computer course. Through reasonable allocation of class hours and full lesson preparation, computer teachers can face possible things in the classroom and record class videos when necessary, so that those students who can't keep up with the progress of class can further study after class, so as to reduce the psychological anxiety of college students. Teachers provide more opportunities for college students to practice and operate. Through many training simulations, college students are gradually familiar with the computer system, make up for their knowledge learning blind spot, improve the computer operation ability and reduce students' psychological anxiety.

Subjects and methods: The subjects were college students, and 200 college students were randomly selected. These college students come from different grades and majors of three colleges and universities to understand their computer learning situation, mental health status and other relevant information. The experimental time is one semester, during which the relevant data are recorded. The influence of computer course teaching on alleviating students' psychological anxiety after the reform through fuzzy evaluation. The quantitative score of relevant influencing factors adopts a grade 1-5 score, and the score has a positive correlation with the degree of influence. SAS software is used to process and analyze the relevant experimental data.

Results: In the process of learning computer courses in colleges and universities, students have varying degrees of psychological anxiety due to tight courses, heavy learning tasks and unskilled computer operation. According to the students' psychological anxiety, the teaching reform of computer course is carried out. After the reform, by recording class videos to students, students can relearn after class, keep up with the learning progress and alleviate students' psychological anxiety. After many computer operations, students' proficiency in computer has increased significantly, students' resistance psychology has gradually disappeared, and their psychological anxiety has been alleviated. In the evaluation of the impact of computer course teaching on alleviating students' psychological anxiety after the reform, recording class videos have the greatest impact on alleviating the psychological anxiety of students majoring in geographic science. The impact score is five points. The results are shown in Table 1.

Table 1. The influence of computer course teaching on alleviating students' psychological anxiety after reform

Major	Record class video	Increase the number of computer practice	Improve information literacy
Geographical science	5	5	4
English major	4	5	5
Financial management	4	5	5

Conclusions: After the reform of computer course teaching in colleges and universities, the learning enthusiasm and initiative of college students are significantly improved, the interest of students in computer operation is significantly increased, the learning efficiency of students is greatly improved, and the psychological anxiety of students is gradually relieved.

INCENTIVE EFFECT OF ENTERPRISE MANAGERS ON EMPLOYEES WITH COMMUNICATION ADAPTATION BARRIERS

Hongsheng Mu

School of Economics and Management, Guizhou University of Engineering Science, Bijie 551700, China

Background: Individuals with communication adaptation disorder cannot communicate effectively in the process of communication, resulting in poor communication and interruption of communication. Stimulated by poor communication for many times, individuals will have timidity, fear and psychological disorders. In serious cases, they will have depression, anxiety, sweaty palms, blank brain, headache and other physiological symptoms. Communication adaptation barriers appear in interpersonal and team opinion exchange and information transmission, showing different barriers such as language barriers, conceptual barriers and temperament barriers. The reason for these barriers is that both sides of communication and communication information transmission channels are different. In the state of language communication adaptation, the integrity of information sending is affected by the personal factors of the information sender. If the information sender is in an angry mood, there will be information errors, information omissions and other situations in the information sent, or because the information sender's expression ability is insufficient, he can't completely express his thoughts, resulting in poor communication and expression a situation of unclear logic. In addition, the age and the degree of communication will affect the character of the person who is educated. For the information receiver, the subjective view and value orientation of the information receiver will have an impact on the information reception, so different information receivers have different information screening criteria and different information. And different information transmission channels will cause different degrees of damage to the information, resulting in incomplete information.

For the employees of the enterprise, in the actual work process, they are limited by their education level, age, experience and expression ability, so the employees cannot express what they want to express in communication. Or due to the imperfect communication channels of employees, employees lack the opportunity to express their work needs, or there are defects in the communication and information dissemination channels, which change the original information. Or enterprise managers do not pay attention to the importance of employee communication, are perfunctory about the needs expressed by employees, or do not understand them in place, so that employees have communication and adaptation barriers, affect their work enthusiasm and initiative, lead to their unsatisfactory work efficiency and lack of motivation to work hard. This negative work attitude will have an impact on other departments at the same time, make the work mood of the department become slack, and then affect the development of the enterprise. In view of this situation, this paper studies the incentive effect of enterprise managers on employees with communication adaptation barriers.

Objective: To analyze the current situation of employees' communication adaptation barriers and study their causes. On this basis, enterprise managers take targeted measures to improve employees' communication and adaptation barriers, alleviate employees' negative emotions such as anxiety, anxiety and slack, mobilize employees' work enthusiasm and initiative under the stimulation of incentive policies, improve work efficiency and promote the improvement of department performance.

Research objects and methods: The research objects were employees with communication adaptation disorder. 160 employees with communication adaptation disorder were randomly selected from a large enterprise. These employees have differences in age, education, experience and personal characteristics. Understand their communication and adaptation barriers, their attitude towards the enterprise, and pay attention to the relevant contents of enterprise management. On this basis, adjust the incentive management of enterprise managers, record relevant data, and use fuzzy evaluation to evaluate the impact of incentive management of enterprise managers on employees' communication adaptation barriers. The relevant impact score adopts a grade 1-5 score, which has a positive correlation with the degree of impact, and uses SAS software for data processing and analysis.

Results: In the process of work, due to the influence of themselves, communicators and communication channels, employees have different degrees of communication adaptation obstacles, which makes them afraid to communicate or unable to communicate. The needs of work cannot be expressed and cannot meet their own work needs. Accumulated over time, a lot of negative emotions have accumulated and the work has become slack. In order to solve this problem, enterprise managers carry out incentive management, advance and retreat with employees, and establish a two-way information mechanism to provide employees with communication channels, release their emotions correctly, and alleviate the obstacles of communication adaptation. Enterprises provide employees with more job opportunities, choose their favorite jobs, improve their enthusiasm, and further alleviate the obstacles of communication and adaptation. In the evaluation of the impact of enterprise managers' incentive management on employees' communication adaptation barriers, the measure of providing more job choices has the greatest impact on young employees' communication adaptation barriers, with an impact score of 5 points. The results are shown in Table 1.

Conclusions: Through a series of incentive management, enterprise managers give employees a channel to express their ideas and suggestions, and employees get more sense of participation. Under the "common advance and retreat", employees are more motivated, their communication and adaptation barriers have

been greatly alleviated, and their work efficiency has been significantly improved.

Table 1. The influence of enterprise managers' incentive management on employees' communication and adaptation barriers

Age group	Advance and retreat with employees	Establish a two-way information sharing mechanism	Respect employees' suggestions	Provide more job options
Youth	4	5	4	5
Young and middle-aged	5	4	5	5
Middle age	5	4	4	4

* * * * *

THE APPLICATION OF COLOR PSYCHOLOGY IN FASHION DESIGN

Na Wei & Chengyi Zhang

College of Textiles & Clothing, Qingdao University, Qingdao 266000, China

Background: Consumer psychology belongs to psychology. Its main research content is the law of psychological and behavioral changes of consumers in relevant consumption activities. In consumer psychology, consumer behavior is affected by many factors, such as consumer income level, individual personality characteristics, age, price, commodity quality and so on. These influencing factors can be divided into internal factors and external factors. Internal factors include consumers' psychological activities in the process of consumption and psychological factors affecting consumer behavior. External factors include social environment, consumer groups, consumption trend, consumer goods and other influencing factors. Consumer psychology is mainly divided into four kinds: conformity psychology, difference-seeking psychology, comparison psychology and truth-seeking psychology. Herd mentality means that consumers tend to buy goods that most people buy. Showing imitation and blindness. The psychology of seeking differences means that the individual pursues being different from the public aesthetics, pursues the uniqueness of the commodity when purchasing the commodity, and has its own unique pursuit in the design, color, material and other aspects of the commodity. The psychology of comparison shows that some consumers will buy more expensive goods to get the envy of others and feel that they are nobler than others after seeing that others have bought some high-value goods. Realistic psychology means that consumers will pay more attention to the practicability, price and quality of goods in the process of commodity purchase, and do not pay attention to the beauty, color matching and sense of goods. This kind of consumption behavior belongs to rational consumption.

In fashion design, different colors have different effects on people's emotions and consciousness. Different colors are used to vent different emotions. There is a close relationship between color and psychology. For example, red will give people a sense of oppression and expansion visually, make people feel vivid, lively and enthusiastic, and stimulate the secretion of adrenaline. This color can represent the characteristics of an extroverted personality. Yellow represents a variety of psychology such as happiness and nobility. When yellow is matched with other colors, it will show different emotional meanings. For example, matching black with yellow will give people a positive and powerful feeling, and matching white with yellow will make people feel tired and powerless. Green stimulates people mildly. It symbolizes life, youth and other meanings. Wearing green clothes gives people a fresh and lively feeling. At the same time, green is also a color often used in environmental protection activities. Blue presents a sense of space and belongs to the cool color system. It will give people a calm and calm feeling in wearing collocation. According to the different meanings and functions of different colors, they are applied in fashion design to meet the different psychological needs of different consumers.

Objective: To understand the clothing requirements of different consumers, study their consumption psychology and consumption needs involved in the process of clothing consumption, select, match and design clothing colors according to these consumption psychological needs, follow the five design principles of balance, rhythm and proportion, and flexibly use the reset method, style method emotional method and other clothing psychological design methods make the designer clothing meet the consumer psychological needs of different groups of consumers.

Research objects and methods: The research objects were consumers. 100 consumers were randomly selected from three large shopping malls to understand their consumption demand, consumption tendency, clothing color selection tendency and consumer personality characteristics, and record relevant data. The

fuzzy evaluation method is used to evaluate the impact of different design elements on consumers' consumption psychology in fashion design. The relevant influencing factors are scored by 1-5 grades. The higher the score, the greater the degree of influence. The relevant data are processed by Excel software and SAS software.

Results: Color belongs to the elements of fashion design and is an important component of fashion design. According to the different emotions represented by different colors and their different effects on people's emotional consciousness, different colors are applied in fashion design to meet the consumer psychological needs of different consumer groups. In the evaluation of the impact of different design elements on consumers' consumption psychology, color has the greatest impact on teenagers' consumption psychology, with a score of 5 points. The results are shown in Table 1.

Table 1. Influence of different design elements on consumers' consumption psychology

Age group	Color	Style	Fabric
Juvenile	5	5	3
Youth	4	4	4
Young and middle-aged	3	4	5

Conclusions: Color plays an important role in the process of people's life. The scope of color application is relatively wide. It shows diversity and multifaceted in color psychology, and people show complexity in clothing color psychology. In the color application of fashion design, we should first understand the consumer psychological needs of different consumer groups, so as to design clothes to meet the consumer needs of different consumer groups.

THE IMPROVEMENT OF COLLEGE AEROBICS TEACHING REFORM ON STUDENTS WITH COMMUNICATION AND ADAPTATION BARRIERS

Min Xue¹, Jingwen Xu² & Pei Sun^{3*}

¹Department of Physical Education, Jiangsu Vocational Institute of Commerce, Nanjing 210000, China

²State Owned Assets Management Office, Jiangsu Vocational Institute of Commerce, Nanjing 210000, China

³Ministry of Sports, China Pharmaceutical University, Nanjing 210000, China

Background: When individuals cannot communicate normally, the expression, transmission and reception of information fail, and individuals show anxiety, anxiety and other psychology, which repels communication. This situation becomes an obstacle to communication adaptation. The scenarios of communication adaptation disorder are the communication between interpersonal relationships, the exchange of opinions among members of the collective and the transmission of information in the process of communication. Interpersonal communication includes many types, such as communication between friends, a conversation between family members, communication with different students, a discussion between students and teachers, etc. Because each individual has his own personality, thought and behavior mode, there are differences in values and family background. The degree to which the communicator wants to send the message will be affected by the incompleteness of the message. There are different emotional changes in the process of communication. These emotional changes will affect the expression and reception of information, lead to incomplete information, misinterpretation of information, obstacles to communication and communication, affect the mood of both parties, so as to make individuals feel angry, wronged, uneasy and other emotions, and then repel communication and form communication adaptation obstacles. Communication adaptation disorder will affect the good physical and mental development of individuals. Long-term exclusion of communication and communication will lead to depression, moderate and severe anxiety, and damage the physical and mental health of individuals.

Aerobics is a kind of sport that runs and jumps with music. When doing aerobics, we will keep up with the rhythm of music, carry out various aerobics' actions with the change of music, stretch the body, alleviate the tension and stiffness symptoms of the body, promote individual metabolism, vent the emotions in the heart, forget all the annoyance, anxiety and anxiety, relax the heart and maintain a positive and active state. Aerobics is a group activity. At present, college students have different degrees of communication

and adaptation barriers due to environmental and personal reasons, with different negative emotions in their hearts, and their mental state is poor. According to the effect of aerobics on body and mind, it can be used in the activities of improving students' physique, alleviating negative emotions and promoting students' normal communication. Therefore, according to the situation of college students' communication and adaptation barriers, this paper reforms the teaching of aerobics in colleges and universities, and studies its improvement effect on students with communication and adaptation barriers.

Objective: To understand the current situation of college students' communication adaptation disorder and study it. On this basis, according to the characteristics of students' communication adaptation disorder, carry out targeted teaching reform of college aerobics course. Through the way of teachers' experience and students' follow-up, let students gradually become familiar with the application of aerobics, and under the practice of progressive superposition cycle. Let students gradually feel the positive emotions transmitted in aerobics, immerse students, enjoy them, release their emotions, improve communication and adaptation barriers, and promote the good development of students' intelligence and psychological quality. In the teaching process, we should select and determine the teaching content according to the situation of students, carry out targeted teaching, show the harmonious unity of music and aerobics in teaching performances, competitions and other activities, let students challenge themselves, realize self-affirmation, reduce psychological pressure, further improve communication and adaptation barriers, and improve interpersonal communication ability.

Research objects and methods: The research objects were college students. 300 college students of different majors and grades were randomly selected from 4 colleges and universities. Understand their physical and mental health status, personal information and their views on aerobics, and carry out the reformed aerobics course teaching for these students for 3 months, practice 60 minutes a week, and record relevant data during the period. Through the fuzzy evaluation method, this paper evaluates the impact of college aerobics teaching reform on improving college students' communication and adaptation barriers, and quantifies the influencing factors. The scoring method is grade 1-5. The higher the score, the greater the impact. SAS software is used to process and analyze the data.

Results: Communication adaptation disorder is a common psychological problem of college students. Students with communication adaptation disorder are unwilling to communicate with others, depressed, accompanied by anxiety and anxiety. According to the physical and mental state of students, carry out the teaching reform of aerobics course in colleges and universities. After the reform, students' emotions become positive, anxiety and uneasiness gradually disappear, and communication adaptation barriers have been improved. In the evaluation of the impact of the teaching reform of aerobics course in colleges and universities on improving the communication and adaptation barriers of college students, the progressive superposition cycle exercise has the greatest impact on improving the communication and adaptation barriers of freshmen, which is 1 point higher than the impact score of teaching performance. The results are shown in Table 1.

Table 1. The influence of aerobics teaching reform in colleges and universities on improving college students' communication and adaptation barriers

Grade	Progressive superposition cycle exercise	Teaching performance	Integration inside and outside class
Freshman	5	4	4
Sophomore	4	4	5
Junior	5	5	5

Conclusions: Aerobics is a sport beneficial to students' physical and mental health. After the teaching reform of aerobics course, college students' communication and adaptation barriers have been improved to varying degrees, their mental health level has been improved, and their interpersonal communication ability has been improved to a certain extent.

MENTAL STRESS RELIEF STRATEGIES OF MUSIC CONDUCTORS

Dan Yang¹ & Tao Chen²

¹College of Music, China West Normal University, Nanchong 637002, China

²Composition Department, Sichuan Conservatory of Music, Chengdu 610021, China

Background: The music conductor is the soul of the chorus or band. He needs to guide the playing rhythm of the whole chorus or band so that the performance of multiple voices can be integrated. Once the action of the music conductor is wrong, it will lead to major mistakes in the performance of the chorus or band and affect the performance effect of the whole stage. Therefore, the music conductor has a great responsibility, bears greater psychological pressure, and the music conductor is more likely to suffer from stage anxiety. When performing on the stage, each music performer will have varying degrees of anxiety. If the degree of anxiety is moderate and the music conductor can make good use of his anxiety psychology, stage anxiety will become the driving force to promote the music conductor to perform better, so that the music conductor can play better on the spot. However, if the anxiety is too serious, and the music conductor cannot control his anxiety well, it will affect the command effect of the music conductor on the stage, resulting in a great reduction in the performance effect of the band or chorus. Therefore, finding a way to alleviate the stage anxiety of music conductors is of great significance to the long-term development of music conductors.

Personality psychology is a branch of psychology, which mainly studies the unique behavior patterns of individuals, including beliefs, self-concept, personality and so on. Personality psychology holds that each individual has unique characteristics, that is, the specificity of behavior characteristics and personality composition characteristics. This uniqueness leads individuals to choose different coping styles when facing the same problem. Based on the theory of personality psychology, in order to dredge the negative emotions of anxiety patients and achieve the effect of treating anxiety, we first need to change the patient's personality traits such as thoughts, ideas and emotions. Therefore, based on personality psychology, this study analyzes the factors leading to excessive mental pressure of music conductors, and puts forward strategies to solve problems, so as to alleviate the stage anxiety of music conductors and make the band or chorus show better stage effect. The research provides a new solution to the stage anxiety of music conductors, and promotes the development of Chinese bands and chorus to a certain extent.

Objective: The music conductor has a great responsibility, bears greater psychological pressure, and is more likely to suffer from stage anxiety. Based on personality psychology, this study analyzes the factors that lead to excessive mental stress of music conductors, and puts forward strategies to solve problems in order to alleviate the stage anxiety of music conductors.

Research objects and methods: In 10 music colleges and universities, music conductors of 10 bands were selected as the research object Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90) were used to evaluate the mental stress of music conductors.

Research design: Using the random number table method, the music conductors of 10 bands were randomly divided into research group and control group, with 5 people in each group. Before the performance, the music conductor of the research group adopted a strategy based on personality psychology to alleviate the mental pressure. Before performing, the music conductor in the control group took traditional methods to relieve mental stress, such as deep breathing, meditation and so on.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: The mental stress of music directors in the study group was significantly lower than that in the control group ($P < 0.05$). The SAS scores of music directors in the two groups are shown in Table 1.

Table 1. SAS scores of two groups of music conductors

	Group		<i>t</i>	<i>P</i>
	Research group	Control group		
SAS Score	47.6±6.4	67.6±8.7	6.425	0.000

Conclusions: The music conductor is the soul of the chorus or band. Once the action of the music conductor is wrong, it will lead to major mistakes in the performance of the chorus or band and affect the performance effect of the whole stage. Therefore, the music conductor has great psychological pressure and is prone to stage anxiety. Based on personality psychology, this study analyzes the factors leading to excessive mental pressure of music conductors, and puts forward strategies to solve the problems, so as to alleviate the stage anxiety of music conductors and make the band or chorus show better stage effect. The experimental results showed that the mental stress of music conductors in the study group was significantly lower than that in the control group ($P < 0.05$). Therefore, the research provides a new solution to the stage anxiety of music conductors, and promotes the development of Chinese bands and chorus to a certain extent.

APPLICATION OF COGNITIVE PSYCHOLOGY IN URBAN LANGUAGE PROMOTION

Ping Zhu¹, Chenming Zhu¹ & Bo Wang²

¹*School of Humanities and Tourism, Yiwu Industrial & Commercial College, Yiwu 322000, China*

²*School of Electro-mechanical and Information Technology, Yiwu Industrial & Commercial College, Yiwu 322000, China*

Background: The promotion of urban languages is an inevitable requirement for the prosperity and development of ethnic minority areas, which is conducive to improving the scientific and cultural quality of local people, casting the awareness of the Chinese national community and enhancing the national identity of all ethnic groups. Therefore, the promotion of urban language is very important. In the process of urban language promotion, due to various reasons, the progress of urban language promotion is not ideal, and some staff have negative emotions, such as anxiety, depression and so on. When these negative emotions are overstocked for a long time and cannot be released or alleviated, it will lead to cognitive impairment. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment, aphasia and so on, which seriously affects the daily life of patients, reduces the quality of life of patients, and also affects the progress of the promotion of urban languages. Therefore, finding an appropriate method to alleviate the negative emotions of staff and then alleviate the degree of cognitive impairment is of positive significance to the personal development of staff and the progress of urban language promotion.

Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception, thinking and language. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition, which is mainly to explain the law of individual psychological changes in the process of cognition. In the theory of cognitive psychology, individual learning process is actually a process of gradual construction and improvement of knowledge, not only the absorption and digestion of knowledge, but also the process of using their own knowledge to build new knowledge. After the environment stimulates the individual to produce information, the individual obtains the ability through the internal cognitive processing of this information, so that the learning and the learning situation are always consistent. Therefore, cognitive psychology believes that the individual cognitive process is essentially the process of individual brain processing symbolic information. The main human activities include three aspects: cognitive activities, emotional activities and will behavior, which can be explained and expounded by the theory of cognitive psychology. Therefore, based on cognitive psychology, the research analyzes the problems existing in urban language promotion, and puts forward strategies to promote the progress of urban language promotion and alleviate the degree of cognitive impairment of staff.

Objective: In the process of urban language promotion, due to various reasons, the progress of urban language promotion is not ideal, and some staff have negative emotions and cognitive impairment. The research proposes strategies based on cognitive psychology to promote the progress of urban language promotion and alleviate the cognitive impairment of staff.

Research objects and methods: 80 staff members engaged in urban language promotion in a city with cognitive impairment were selected as the research objects. The concise Mini-Mental State Examination (MMSE) was used to evaluate the degree of cognitive impairment. Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90) were used to evaluate the mental health status of staff.

Study design: Using random number table method, 80 staff were randomly divided into study group and control group, with 40 people in each group. Among them, the research group adopted the strategy based on cognitive psychology to promote urban language. The control group used the traditional strategy to promote urban language. After a period of time, the degree of cognitive impairment and anxiety of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: Before work, there was no significant difference in SAS score, SCL-90 score and SCL-90 score between the two groups ($P > 0.05$). After working for a period of time, the SAS score and SCL-90 score of the staff in the study group were significantly lower than those in the control group ($P < 0.05$). The MMSE score was significantly higher than that of the control group ($P < 0.05$). The change of MMSE scores of the two groups of workers before and after work is shown in Figure 1.

Note: * $P < 0.05$ compared with that before teaching; # It indicates that compared with the control group, $P < 0.05$.

Figure 1. Changes of MMSE scores of the two groups of workers before and after work

Conclusions: In the process of urban language promotion, due to various reasons, the progress of urban language promotion is not ideal, and some staff have negative emotions, such as anxiety and depression, resulting in cognitive impairment. Based on cognitive psychology, this paper analyzes the problems existing in urban language promotion, and puts forward strategies. The results showed that there was no significant difference in SAS score, SCL-90 score and SCL-90 score between the two groups before work ($P > 0.05$). After working for a period of time, the SAS score and SCL-90 score of the staff in the study group were significantly lower than those in the control group ($P < 0.05$). The MMSE score was significantly higher than that of the control group ($P < 0.05$). Therefore, the application of cognitive psychology in urban language promotion can promote the progress of urban language promotion and alleviate the cognitive impairment of staff.

THE INFLUENCE OF TRADITIONAL PHYSICAL EXERCISE ON COLLEGE STUDENTS' MENTAL HEALTH

Wei Feng

PE Department, Shanxi Institute of Technology, Yangquan 045000, China

Background: When others, society and other external factors produce adverse stress stimulation to individuals, individuals may have more serious psychological pressure. When individuals cannot adapt well to the stress state, there will be the problem of psychological imbalance, resulting in a series of negative emotional performance. Individuals need to vent their negative emotions reasonably and guide them in time, otherwise they are prone to psychological disorders and other psychological diseases, which will affect the level and quality of individual mental health. Nowadays, the world is in an era of high civilization and scientific and technological development. The competition for talents is fierce. College students are facing the social competition of the survival of the fittest. The pressure from family, environment and other aspects leads to the increasingly prominent mental health problems of college students. Under the stimulation of social development, contemporary college students also bear the multiple effects of negative factors in the campus environment and family environmental pressure. They are very prone to mental health problems. The mental health level of college students is not optimistic. On the other hand, the development of college students' psychological quality is not yet mature, and the level of their psychological quality such as psychological pressure resistance is not high. In the face of difficulties and setbacks, some college students may shrink back from difficulties and fall into negative emotions such as

psychological anxiety and panic, which will affect the daily life and study of college students.

The core of traditional physical exercise is the thought of traditional physical health preservation, which is an important development direction of national traditional sports specialty. Traditional physical exercise integrates the thoughts of Confucianism, Taoism and other schools, takes the life view of the unity of heaven and man in Chinese traditional culture as the development basis, and takes the law of human life movement as the starting point to explore the relationship between human life and sports nature. Traditional physical exercise combines various life thoughts such as the theory of correspondence between heaven and man in traditional culture, and creates a set of health preservation exercise mode combining movement and static in sports methods. It emphasizes that through appropriate and moderate human exercise, human life activities are in an orderly state, so as to promote physical and mental health and internal and external harmony. Traditional physical exercise integrates the idea of health preservation on the basis of physical fitness exercise, promotes the dual development of human physical and psychological quality, and integrates traditional physical exercise into college education, which is of great significance and value to improve the mental health level of college students.

Objective: Through the analysis of the mental health level and physical exercise status of college students in China, to understand the mental health level of college students, to master the physical exercise needs and problems of college students, to deeply explore the relationship between physical exercise and mental health quality of college students, and to explore new development ideas for improving the mental health level of college students. This paper makes a comprehensive analysis of China's traditional physical exercise, analyzes the impact of China's traditional physical exercise on improving the mental health level of college students, and hopes to put forward a new exercise and promotion scheme for college students' mental health through traditional physical exercise.

Research design: Using Pearson correlation coefficient to analyze the correlation between college students' mental health level and physical exercise, explore the potential relationship between college students' mental health problems and traditional physical exercise, understand the role of traditional physical exercise in greatly improving the quality of college students' mental health through correlation analysis, and put forward new ideas for improving college students' mental health level. This study uses correlation analysis to explore the relationship between traditional physical exercise and college students' interpersonal sensitivity, psychological pressure resistance and psychological anxiety, and deeply excavate the impact of traditional physical exercise on college students' mental health.

Results: The statistical analysis results of the mental health level of college students are shown in Table 1. The mental health level of college students is generally low.

Table 1. Statistical analysis of mental health level of college students

Survey object	Freshman	Sophomore	Junior	Senior
Fear	2	2	3	2
Anxious	3	4	3	4
Depressed	4	3	3	4

Conclusions: Traditional physical exercise takes the holistic view of life of Chinese traditional culture as the core idea, promotes the all-round development of human body and mind through physical health preservation, and achieves the effect of improving individual mental health level in traditional physical exercise. Traditional physical exercise is mostly aerobic exercise with medium and low intensity, which can effectively promote the improvement of college students' functional level and strengthen the development of college students' physiological quality. Traditional physical exercise can also enhance the self-confidence and self-confidence of college students in organized and regular exercise activities, eliminate the interpersonal sensitivity of college students through interactive physical exercise, help college students eliminate bad emotions such as psychological anxiety, and promote college students to have positive and optimistic emotions.

THE IMPACT OF URBAN LANDSCAPE DESIGN ON CITIZENS' MENTAL HEALTH

Wenyong Qin^{1,2}

¹*School of Art and Design, Changzhou University, Changzhou 213164, China*

²*Department of Agronomy, National Chiayi University, Chiayi 600355, Chinese Taiwan*

Background: In psychology, anxiety, tension, anger, depression, sadness, pain and other emotions are collectively referred to as negative emotions. People’s experience of such emotions is not positive, and they will feel uncomfortable in the body, even affect the smooth progress of work and life, and may cause physical and mental injury. At present, some citizens in China have different degrees of mental diseases. Mental diseases have seriously threatened the lives of citizens, and patients with mental diseases may have suicidal tendencies. Depression and anxiety disorders are common mental disorders. The disease has a very high incidence rate and disability rate, which will bring a great burden to patients and their families. According to statistics, more than 40 million people in China suffer from depression. There are many studies on the mental health of urban residents in China, but there are few studies on the impact of urban landscape design on citizens’ mental health. With the continuous development of society, people begin to pay more and more attention to the impact of the living environment on health and happiness. Healing gardens in urban landscape design evolved from green space, which tends to use green plants to cure people’s mental health problems. Some scholars define a healing garden as a garden with various characteristics, which can help people recover from stress and have a positive impact on people’s mental health. Gardens with this condition need a lot of green plants, water and other natural environments. At the same time, the healing garden can also be a decorative space where people can walk, sit, explore, and participate in positive or negative activities. Some scholars pointed out that the healing garden is a garden that conveys calm, safety, strength, beauty, or sensory stimulation, and transmits the information of life, wishes and periodic changes to residents. In this environment, when people’s feelings are awakened, they can calm their minds, reduce stress, and mobilize their own internal treatment resources to restore mental health. Therefore, the process of reaching a cure.

Objective: On the basis of investigating the working and living pressure level of urban residents, starting from the consensus that “urban landscape design can improve mental health”, urban landscape is regarded as a method and means to alleviate the pressure. This paper discusses how to alleviate the psychological pressure of urban residents and improve the mental health level of citizens through urban landscape design, so as to provide an effective way to solve the mental health problems of urban residents in China, and provide a basis for treating and solving the mental health problems of urban residents.

Research objects and methods: Urban landscape design, as a direct means for citizens to promote mental health, is an effective way to prevent, slow down and treat mental diseases. In this study, 400 citizens with mental health problems in a city were randomly selected by stratified cluster random sampling method to analyze the impact of urban landscape design on citizens’ mental health.

Research design: This study used Symptom Checklist-90 (SCL-90) and Eysenck Personality Questionnaire (EPQ) to evaluate the mental health of 400 citizens in a city, and analyzed the correlation between SCL-90 and EPQ, in order to understand the impact of urban landscape design on citizens’ mental health.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The factor scores and total average scores of SCL-90 were significantly correlated with the scores of EPQ subscales ($P < 0.01$). There was a significant positive correlation between the scores of EPN and Q subscales ($P < 0.01$).

Table 1. Correlation coefficient between EPQ and SCL-90 score of all subjects

Project	P	E	N	L
Somatization	0.530 [#]	-1.384 [#]	0.279 [#]	-0.168 [#]
Force	0.246 [#]	-0.244 [#]	0.613 [#]	-0.271 [#]
Interpersonal sensitivity	0.651 [#]	-0.313 [#]	0.268 [#]	-0.188 [#]
Depressed	0.696 [#]	-0.362 [#]	0.256 [#]	-0.169 [#]
Anxious	0.661 [#]	-0.262 [#]	0.248 [#]	-0.146 [#]
Hostile	0.585 [#]	-0.122 [#]	0.388 [#]	-0.293 [#]
Terror	0.534 [#]	-0.219 [#]	0.189 [#]	-0.152 [#]
Paranoid	0.579 [#]	-0.156 [#]	0.369 [#]	-0.329 [#]
Psychotic	0.617 [#]	-0.273 [#]	0.241 [#]	-2.016 [#]
Other	0.593 [#]	-0.251 [#]	0.223 [#]	-0.127 [#]
Total average	0.728 [#]	-0.294 [#]	0.317 [#]	-0.236 [#]

Note: [#] $P < 0.01$.

Conclusions: Stimulating people’s senses through the natural environment will provide a theoretical basis for evidence-based design for landscape designers. Different people have different psychological pressure and psychological problems, and their use needs are also different. The healing garden must be

tailored to the needs of different groups or patients. Can effectively improve people's mental health problems. Healing the garden is good for people's mental health. However, if people choose not to experience it, or usually do not visit it, it is difficult to cure people's mental health problems. Therefore, only when the healing garden can meet the user needs of different groups at the same time and have more effective landscape design elements to make people feel better can it be more popular.

IMPACT OF BLIND BOX ECONOMY AND CONSUMER REPURCHASE ANXIETY – FROM THE PERSPECTIVE OF CUSTOMER EXPERIENCE

Haijiang Wu^{1,2} & Xiangning Tian^{1,2}

¹*Business School, Henan Normal University, Xinxiang 453007, China*

²*Research Institute for Rural Revitalization and Common Prosperity, Henan Normal University, Xinxiang 453007, China*

Background: In the process of shopping and consumption, consumers may be disturbed by many factors and produce psychological anxiety problems. With the development and progress of economy, the degree of diversification of market goods is increasing, but the speed of improving the quality of goods is not high. When the supply level of the consumer market is difficult to meet the consumer demand, consumers may choose the high-quality goods they want, and consumers may have quality anxiety. In the process of consumption, consumers may also have a variety of anxiety emotions such as price anxiety and channel anxiety. They are worried that the value of goods is falsely high and the value competitiveness is low. Consumers will also have anxiety in the choice of purchase channels and worry about the quality of goods in the purchase channels. After consumers have had a purchase experience in the same business or under the same brand, when consumers have high satisfaction and recognition of products, they may have repurchased intention and behavior.

With the continuous development and progress of economy and society, the psychological and emotional characteristics of consumers are also changing. Under the new economic form, consumers' consumption anxiety also presents diversified characteristics. In recent years, the blind box has appeared in the public's vision. Under the dual role of China's rapid economic growth and the support of national policies for the cultural industry, the blind box economy has begun to take shape and form a certain industrial scale. The development of blind box economy caters to the psychological characteristics of modern young people in pursuit of stimulation. With its high degree of uncertainty and playability, it has won the support and love of contemporary young people, and gradually formed a blind box fever. However, due to the certain uncertainty of the blind box, consumers can not clearly know the product content in the blind box when purchasing the blind box. In the same series of products, consumers will have preference for some products. Therefore, when consumers find that they have not obtained the products they want after purchasing the blind box for the first time, they may repurchase. The blind box purchase does not guarantee that consumers can harvest the products they want in the next purchase. Therefore, consumers may have repurchased consumption anxiety in the blind box purchase and worry that they will never get the products they want after many purchases. On the other hand, the invisibility of the blind box also makes it impossible for consumers to directly observe the appearance quality of the blind box products. At present, the blind box economy is in the early stage of development, the quality control management effect of the blind box market is poor, and the quality of the blind box products is difficult to be guaranteed. Therefore, consumers may also have repurchased anxiety about the quality of goods when they repurchase the blind box.

Objective: To study and analyze the development process of the blind box economy, comprehensively analyze the development characteristics and trend of the studied blind box economy, and analyze the consumers' repurchase consumption anxiety under the blind box economy, understand the consumers' psychological characteristics and change rules in the process of blind box purchase, and explore the characteristics of psychological activities behind consumers' repurchase behavior in blind box consumption. It provides a reference for alleviating the anxiety of repurchase consumption. From the perspective of customer experience, this study analyzes the psychological anxiety of consumers repurchase behavior in the process of blind box purchase, and explores the impact of blind box economy on consumers repurchase anxiety, hoping to provide help to alleviate consumers repurchase anxiety.

Research design: The study uses the method of correlation analysis to understand the impact of the blind box economy on consumers' repurchase consumption anxiety, uses the Spearman correlation coefficient to evaluate the psychological characteristics of consumers' repurchase consumption anxiety

under the blind box economy, and explores the impact of the blind box economy on consumers' repurchase consumption anxiety from the perspectives of quality anxiety, preference anxiety and counterfeiting anxiety. Through the calculation of the correlation coefficient between the blind box economy and consumers repurchase consumption anxiety in different aspects, this paper obtains the influence of the special form of blind box purchase on consumers repurchase consumption anxiety under the new situation of blind box economy. Combined with the analysis of blind box economy and the particularity of blind box products, this study understands the psychological basis of consumers in the process of blind box consumption, analyzes the consumer psychological characteristics of consumers when they have the intention and behavior of blind box repeat purchase, and puts forward solutions and strategies to alleviate the consumer anxiety of blind box repeat purchase.

Results: The analysis results of consumer's repurchase consumption anxiety under the blind box economy are shown in Table 1.

Table 1. Analysis results of consumers repurchase consumption anxiety under blind box economy

Consumption anxiety	Consumer
Quality anxiety	3.45
Preference anxiety	3.83
Counterfeiting anxiety	3.11

Conclusions: In the process of blind box purchase, consumers may have repurchased consumption anxiety such as quality anxiety, preference anxiety and counterfeiting anxiety. Consumers are worried about buying defective products with low quality due to poor quality control in the blind box market. Some consumers are worried that they can't buy the blind box products they want, and they still can't get their favorite products after repeated purchases. On the other hand, consumers may also buy non-genuine blind box products due to the mixture of good and bad people in the blind box market.

ANALYSIS OF THE IMPACT OF IDEOLOGICAL AND POLITICAL EDUCATION INTEGRATED INTO THE NORTHEAST ANTI JAPANESE FEDERATION CULTURE ON COLLEGE STUDENTS' COMMUNICATION AND ADAPTATION BARRIERS

Dongting Zheng

Marxist Institute, Liaoning Institute of Science and Technology, Benxi 117004, China

Background: Communication adaptation is the understanding and grasp of the relationship between individuals. In psychology, communication adaptation can effectively help individuals establish a good relationship network in communication and help people make correct decisions. Communication adaptation barrier is a kind of communication barrier in social communication. In the theoretical system of psychological research, communication is the psychological and psychological distance between people, which is composed of cognition, emotion and behavior. In social communication, people with communication barriers mainly lack harmonious interpersonal relationships and scientific and reasonable cognitive ability. Better communication adaptability can help college students reduce their anxiety level under academic and environmental pressure, and enhance their self-confidence in life so that college students can adapt to the new unfamiliar environment faster. Many empirical studies have confirmed that the emergence of communication adaptation barriers will bring serious negative emotions to college students, and communication adaptation barriers will lead to serious psychological barriers in college students' life and learning. On the other hand, college students with communication adaptation disorder may reduce their contact times with foreign exchanges due to the existence of communication adaptation psychological disorder in their daily study and life, which will lead to college students' cowardice and withdrawal in interpersonal communication, which will worsen the effect of college students' communication and then lead to more serious communication adaptation psychological disorder.

Since the reform and opening up, the reform of ideological and political education in colleges and

universities has been continuously promoted. After continuous adjustment and standardization, the ideological and political education system in colleges and universities has been continuously developed. It has been adjusted in time with the needs of the development of the times. Although the mode of ideological and political education in colleges and universities continues to improve, colleges and universities always put the correct guidance of ideological and political education to students' consciousness in an important position, adhere to the principle of moral education first, and correctly guide students' moral personality and ideological consciousness through ideological and political education. Ideological and political education guides and cultivates students' ideological concepts and value orientation, guides students' psychological trend through ideological and political education, promotes students to establish a good outlook on life, values and world outlook, and helps students realize healthy learning and growth. The Northeast Anti-Japanese Federation culture refers to the red cultural resources left by the northeast people and the Northeast Anti-Japanese Federation soldiers after the September 18th Incident under the leadership of the Communist Party of China, including the red Anti-Japanese Federation spirit, anti-Japanese Federation songs, base site relics and other material and non-material resources. Integrating the Northeast Anti-Japanese Federation culture into the ideological and political education in colleges and universities can effectively deepen the cognitive depth of college students on red culture and history, use the spirit of the Northeast Anti-Japanese Federation to improve the psychological quality of college students, stimulate the inner emotional resonance among college students, and alleviate the communication and adaptation obstacles of college students.

Objective: To study and analyze the mental health status of college students, understand the degree and level of communication adaptation psychological obstacles of college students, obtain the psychological related information of communication adaptation obstacles of college students, and deeply analyze the causes of communication adaptation psychological obstacles of college students, so as to provide a reference for alleviating communication adaptation obstacles of college students. This study analyzes the impact of ideological and political education in colleges and universities integrating the Northeast Anti-Japanese Alliance culture on college students' communication and adaptation barriers, and hopes to put forward new solutions to alleviate college students' communication and adaptation barriers.

Research design: Through the evaluation method of artificial neural network, this paper analyzes the impact of the integration of ideological and political education with the Northeast Anti-Japanese Alliance culture on alleviating the communication and adaptation barriers of college students, constructs the college ideological and political education model combined with BP neural network, and uses the deep learning ability of BP neural network to solve the intervention effects of students' communication and adaptation barriers under different ideological and political teaching modes, explore the impact of ideological and political education in colleges and universities integrating the Northeast Anti-Japanese Federation culture on college students' communication adaptation barriers, and study the data of college students' communication adaptation barriers as the input vector of the model to obtain the changes of students' psychological emotions and communication adaptation barriers in different teaching modes. Based on the evaluation results of the neural network, this study discusses the development and reform direction and strategies of ideological and political education in colleges and universities, so as to provide help for alleviating the communication and adaptation obstacles of college students.

Results: The statistical analysis results of communication adaptation barriers of college students are shown in Table 1.

Table 1. Statistical analysis results of communication adaptation barriers of college students

Survey object	Freshman	Sophomore	Junior	Senior
Psychological barrier of information transmission	4	3	3	3
Loss of information	3	3	2	2
Information overload	4	3	2	2
Psychological acceptance and psychological disorder	4	3	3	2

Conclusions: The values of college students are not mature and are in the establishment stage of life values. Colleges and universities are required to guide the development of students' mental health, help students standardize their moral behavior, cultivate students' personality quality, and achieve real moral education. Integrating the Northeast Anti-Japanese Alliance culture into the ideological and political education of college students can promote the correct establishment of college students' outlook on life, world outlook and values, and lead the ideological concept of college students to develop in a correct and positive direction.

THE INFLUENCE OF THE ADAPTATION OF THE INHERITANCE PATH OF ANCIENT CHINESE LITERATURE ON WRITERS' PSYCHOLOGICAL ANXIETY – TAKING THE LITERATURE OF WEI AND JIN DYNASTIES AS AN EXAMPLE

Wanhong Wang

School of Literature, Journalism & communication, Xihua University, Chengdu 610039, China

Background: Anxiety is a kind of abnormal psychological bad mood, which is mainly due to the irritability formed by excessive worry about the future, fate and life safety, including anxiety, panic, tension, anxiety and other psychological manifestations. Medical psychologists believe that anxiety usually refers to that people's adverse feelings such as risk, pressure and pain exceed their acceptable range, and it is difficult for people to face and solve these problems. Generally speaking, anxiety itself is a very reasonable emotional response. However, long-term anxiety will lead to physiological and emotional diseases. According to different types, anxiety can be divided into pathological anxiety and realistic anxiety. Pathological anxiety is one of the most common types of anxiety. Its clinical manifestations are panic anxiety, generalized anxiety disorder and so on. At present, the main causes of anxiety are increasing pressure, perfection requirements, health concerns, smart phones and so on. At present, the most common intervention measures are personalized psychological intervention, lectures on professional knowledge of mental health and so on. Although these interventions can alleviate psychological anxiety, their application scope is greatly limited, and their implementation is difficult, poor effect and low real-time performance. Therefore, their promotion value is not particularly great.

The latest research of authoritative medical journals points out that the alternative model of the inheritance path of ancient Chinese literature can improve psychological anxiety, which has been confirmed by a large number of scholars. Wei Jin culture plays a very important role in Chinese traditional culture. It can be said that it is a renaissance in the history of Chinese culture. During this period, there were a large number of influential scholars. The culture of Wei and Jin dynasties can promote the integration of nationalities, affect the division of classes, affect the development of China's economy and influence ideology. The adaptation of the inheritance path of ancient Chinese literature mainly includes two aspects: practice and scientific research. Scientific research can make the research of Chinese excellent traditional culture show novelty, including deeply excavating the implied value of literary works in the Wei and Jin dynasties and transforming the scientific research achievements of ancient literature into the necessities of cultural life. Practice can make Chinese traditional culture show its dissemination, including giving full play to the advantages of discipline platform and actively expanding cultural activities. The alternative mode of the inheritance path of ancient Chinese literature can have a positive therapeutic effect on people with psychological anxiety in many fields such as literature, education and architecture, which has been widely concerned by many experts and scholars. However, whether this alternative has a positive intervention effect on the psychological anxiety of literary scholars has not been effectively confirmed.

Objective: This paper analyzes the positive significance of the adaptation of the inheritance path of Chinese ancient literature represented by the Wei and Jin dynasties to alleviate the anxiety of writers, and then fundamentally change the innovation of the inheritance path of Chinese ancient literature, so as to make a great contribution to the inheritance of Chinese traditional literature.

Research objects and methods: According to Hamilton scale, 100 patients with different levels of anxiety were selected as the study subjects, the Density-Based Spatial Clustering of Applications with Noise (GDBSCAN) was used to analyze the anxiety of patients for grade evaluation. The experimental period lasted for 3 months. The scale is divided into mental and physical factors, with a total of 14 items. Each item is measured by a 5-level score, and the total score is 60 points. The higher the score of the scale, the more serious the anxiety of patients. The anxiety level is divided into four levels: no anxiety, possible anxiety, obvious anxiety and serious anxiety.

Methods: Through the latest version of Minitab20 data statistical analysis software, this paper analyzes the impact of the adaptation of the inheritance path of ancient Chinese literature on the writer's psychological anxiety.

Results: Table 1 refers to the improvement rate of writers' psychological anxiety during the whole experimental period. It can be seen from Table 1 that writers' psychological anxiety has been significantly improved after the intervention of the alternative model of the inheritance path of ancient Chinese

literature, and the improvement rate has increased significantly with the continuation of the experimental time, mainly because this model can alleviate writers' psychological anxiety to a certain extent.

Table 1. The improvement rate of writers' psychological anxiety during the whole experiment period

Mental health indicators	Before	After 1 month	After 2 months
Spirituality	72.0	81.0	86.0
Somatization	72.0	82.0	87.0

Conclusions: The research institute proposed that the alternative model of the inheritance path of ancient Chinese literature represented by the Wei and Jin dynasties can improve the psychological anxiety of writers. This model can be popularized in the intervention of writers' anxiety. Later, this model can also be applied to other anxiety patients to increase the scope of application.

THE APPLICATION OF MENTAL HEALTH EDUCATION IN IDEOLOGICAL AND POLITICAL COURSES IN COLLEGES AND UNIVERSITIES

Yakefu Guliyimu

Basic Science Institute, Xinjiang University of Finance & Economics, Urumqi 830012, China

Background: Curriculum ideological and political education is an innovative educational model in recent years. It is an important attempt to improve the ideas and teaching methods of college students' Ideological and political education. As an important part of Ideological and political education, mental health education has important value in college curriculum ideological and political reform. Guided by the thought of socialism with Chinese characteristics, the ideological and political concept of the curriculum combines the traditional ideological and political education resources with the modern education mode, organically integrates various resources inside and outside the school, centralizes and integrates the explicit resources and invisible resources, and realizes the organic unity of subject knowledge learning and value guidance. The concept of curriculum ideological and political education combines ideological and political education courses with various courses to form the synergy of comprehensive education. Taking "Building Morality and Cultivating People" as the educational goal, it highlights the joint educational role of the combination of moral education and professional teaching in higher education, integrates the guidance of psychological value in the teaching process of professional knowledge, and emphasizes the role of knowledge in the cultivation of moral education. The concept of curriculum ideological and political education develops the whole curriculum into the main position of ideological and political education through a new curriculum model integrating professional courses and ideological and political education courses.

With the advancement of social process and the acceleration of social development, the social competition situation is becoming increasingly severe. The fierce social competition makes college students face the pressure from family, society, environment and other aspects. The number of college students with mental health problems is increasing year by year. College students are a high incidence group of psychological problems and trauma. In recent years, the frequency of college students' dropping out and suicide has increased year by year. Modern college students are facing heavy pressure from society, family and other aspects. Intervention and adjustment of college students' mental health problems has become a key issue concerned by the government and colleges and universities. In daily life and study, college students are faced with the pressure of academic performance, interpersonal communication, social practice, employment competition and so on. Some college students have anxiety and fear when facing difficult difficulties or obstacles, which leads to college students falling into a state of psychological anxiety or depression, which seriously affects the normal life of college students and reduces the quality of life of college students. College students are the main force of future national construction and the future hope of national development. Their physical and mental health is directly related to the future development process and speed of the whole society. It is necessary to further strengthen the attention to the mental health of college students, guide students to release psychological pressure and actively adjust their psychological state through various intervention means.

Objective: To analyze the importance and current situation of college students' mental health education

in higher education, explore the value and position of college students' mental health education in college curriculum ideological and political teaching reform, and provide help for further analyzing the application of college students' mental health education in curriculum ideological and political reform. This study makes an in-depth study on the application of college students' mental health education in college curriculum reform, explores the integration development direction and path of mental health education and college curriculum ideological and political education, and promotes the coordinated development of college curriculum ideological and political education and college students' mental health education, hoping to provide reference for improving the mental health level of contemporary college students.

Research design: This study makes a statistical analysis on the mental health level of college students at the present stage, understands the development status of college students' mental health education, and grasps the situation of college curriculum ideological and political reform in combination with the relevant college teaching reform review report, so as to provide reference for further analysis of the application of mental health education in college curriculum ideological and political education. The research uses the method of correlation analysis to explore the relationship between college students' mental health education and college curriculum ideological and political reform, analyzes the internal relationship between college students' mental health education and college curriculum ideological and political reform by constructing a grey correlation model, and calculates the correlation coefficient to explore the direction and path of the coordinated development of college students' mental health education and college curriculum ideological and political reform, so as to provide help for promoting the development of college students' physical and mental health.

Results: The psychological development of college students under the organic integration of mental health education and curriculum thought and politics is shown in Table 1.

Table 1. Psychological development of college students under the organic integration of mental health education and curriculum thought and politics

Grade	Freshman	Sophomore	Junior	Senior	Average
Confidence	5	5	3	4	4.25
Sense of responsibility	3	4	4	4	3.75
Creativity	5	4	4	3	4
Character	4	4	3	4	3.75
Stable personality	5	3	3	3	3.5
Average	4.4	4	3.4	3.6	-

Conclusions: The concept of curriculum ideological and political education is an important attempt to build a socialist university with Chinese characteristics in the new era. The ideological and political education is integrated into the professional education of various disciplines, and through the synergistic effect of professional courses and mental health education, it can help college students cultivate correct values of life and learning. Organically integrate the development of mental health education curriculum with the ideological and political reform of curriculum, promote the transformation of college education mode in the new era, build the ideological and political pattern of colleges and universities based on core values, and take the socialist core values as the basic standard for contemporary college students to judge good and evil and the basic code of conduct of social practice. The coordinated development of college students' mental health education and curriculum ideological and political reform can effectively enhance college students' ideological consciousness, lead college students to build an ideological defense line and promote the healthy development of college students' mental quality.

* * * * *

RESEARCH ON THE APPLICATION OF SOCIAL PSYCHOLOGY IN BUSINESS ADMINISTRATION TEACHING

Caihua Zhang

Vocational College Yongcheng, Yongcheng 476600, China

Background: Social psychology is an interdisciplinary subject based on sociology and psychology, which studies the psychology, emotion and behavior of individuals and organizations in the social environment,

and summarizes the laws used to solve relevant social problems. Compared with traditional psychology, it pays attention to the impact of language, friends, family, living environment and learning environment on itself in the process of individual socialization. It also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. In addition, because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to prevent the introduction of irrelevant variables affecting the results in case study. In order to meet the needs of the development of China's socialist market economy, most comprehensive universities and business universities have set up the major of business administration. The purpose is to cultivate students' economic and management awareness, improve their knowledge structure and ability structure, and meet the needs of the development of modern enterprises. However, in recent years, with the outbreak of the epidemic and the intensification of the conflict between China and the United States, enterprises have higher and higher requirements for the ability of business administration personnel, which has also brought great learning and employment pressure to business administration students. Many students have Employment anxiety under this pressure, which has a serious impact on students' life and study.

Objective: To understand the recruitment requirements of business administration related posts in the job market and the actual demand for talents, as well as the teaching mode, teaching environment, teaching methods, teaching tools, training project content of business administration in colleges and universities, so as to find the weakness in the current business administration course education in colleges and universities. Design and carry out teaching experiments to verify whether the theoretical methods of social psychology can help to improve the employment anxiety of business administration students.

Objects and methods: Study the literature and books on business administration, social psychology and employment anxiety at home and abroad in recent three years, and analyze the main causes of employment anxiety among business administration students in China. Then a teaching experiment was designed and carried out. 300 junior students majoring in business administration who were willing to participate in the experiment were selected from a well-known business university in China. They were investigated by SAS (Self-rating Anxiety Scale). 135 students with test scores greater than 49 were selected as the research objects. These students will be taught the core courses of business administration major for one semester, and teachers are required to use the theoretical methods of social psychology in the teaching process to analyze the core skills required for the employment of this major, analyze the employment skills of professional counterparts, and give timely encouragement and help when students are in employment anxiety. After the end of the teaching task of one semester, SAS survey was conducted on the students again. All measurement type features in the study are displayed in the form of mean \pm standard deviation for *t*-test, and counting type features are displayed in the form of number or proportion of number for Chi-square test. The significance level of difference is taken as 0.05.

Results: The effective data were entered into the computer and statistically analyzed by python programming language, and Table 1 was obtained.

Table 1. Analysis of SAS survey results of business administration students

Data item	Before teaching	After teaching	<i>t</i>	<i>P</i>
Scoring data	63.2 \pm 5.1	51.8 \pm 3.2	0.441	0.006
Overall employment anxiety level	Medium degree	Slight degree	-	-

Note that in this study, students with SAS scores of less than 50, 50-59, 60-69 and more than 70 are classified as no anxiety, mild anxiety, moderate anxiety and severe anxiety. It can be seen from Table 1 that the *t*-test *P* value of the SAS score data of the research objects before and after teaching is less than the significance level, and it is considered that the data difference is significant. Specifically, the average value of the overall score data of students after teaching is 51.8, compared with 63.2 before education, and the former is 18.04% lower than the latter. Before and after teaching, the overall employment level of students decreased from moderate anxiety to mild anxiety.

Conclusions: This study uses the theory and method of social psychology to design a teaching experiment. The selected business administration students with employment anxiety participate in the teaching experiment. The experimental results show that the *t*-test *P* value of the SAS score data of the research objects before and after teaching is less than the significance level, and it is considered that the data difference is significant. Specifically, the average value of the overall score data of students after teaching is 51.8, compared with 63.2 before education, and the former is 18.04% lower than the latter. Before and after teaching, the overall employment level of students decreased from moderate anxiety to mild anxiety. The experimental results show that the application of social psychology to the curriculum teaching of business administration specialty, and the teachers analyze and answer the causes of students' employment

anxiety, will help to reduce the level of employment anxiety of students of this specialty.

* * * * *

THE EFFECTIVE EFFECT OF IDEOLOGICAL AND POLITICAL EDUCATION REFORM IN COLLEGES AND UNIVERSITIES ON RELIEVING COLLEGE STUDENTS' EMPLOYMENT ANXIETY

Xiaohui He, Yanguo Han & Xianfeng Zhang

The Department of Business Administration, Hebei Vocational University of Industry and Technology, Shijiazhuang 050091, China

Background: College students' employment anxiety is an emotional state of anxiety, tension and anxiety under the influence of external employment pressure. With the rapid development of China's commercial economy, China's overall market environment is no longer the blue ocean market just after the reform and opening up. Except for the lifeline industries of the national economy monopolized by a few countries and emerging high-tech industries, the talent competition in most industries is very fierce. Under this background, some college students in China will inevitably have employment anxiety. Appropriate anxiety will help stimulate students' active learning, but excessive employment anxiety will in turn reduce students' learning efficiency and employment enthusiasm, which will have a negative impact on the talent training function of China's higher education system. At present, a large number of colleges and universities in China have noticed the problem of students' employment anxiety and taken various measures to try to solve it. However, most of the methods are to set up elective courses or introduce online mental health courses. Students obviously don't pay enough attention to these courses and can't maximize the effectiveness of the courses. Therefore, this study attempts to analyze the measures to deal with students' employment anxiety and directly integrate them into the compulsory ideological and political education courses for college students.

Objective: To verify the effect of this form of college ideological and political education reform on alleviating students' employment anxiety by carrying out the ideological and political education teaching experiment integrating employment anxiety guidance, and to provide some new ideas and methods to deal with the employment anxiety of college students in China.

Objects and methods: First collect industry on anxiety of university students' employment, college ideological instruction education reform, academic information associated with anxiety, carefully read the data, analysis summed up the deficiencies in China's current employment guidance of anxiety and employment anxiety auxiliary content can be incorporated into college ideological instruction feasibility of education course, and then on this basis to design a political education teaching experiment. Choose a in teaching between domestic scale, teachers, government support has enough representative colleges and universities, and then choose to participate in 300 experiment and with different degree employment anxiety of college students majoring in philosophy as the research object, the students are divided into experimental group and control group on average, compared to two groups of students to the basic information of the first. If the statistical results show significant differences in basic information, it is necessary to adjust the groups of students until the two groups have no significant differences in basic information. The two groups were taught the same ideological and political courses, but in the experimental group, teachers were required to teach some psychological preparation and emotional control skills for employment and interview, and encourage students to speak out their inner thoughts and provide targeted solutions when they showed symptoms of employment anxiety. The educational experiment lasted for one semester. HAMA (Hamilton Anxiety Scale) survey was conducted on the two groups of students before and after the experiment. And that HAMA scores in the "less than 7 points", "7-14 points", "15-21 points", "22-28 points", "greater than 28 points" range of student's employment anxiety grade is "no anxiety", "mild anxiety", "moderate anxiety", "significant anxiety", "severe anxiety". In addition, the characteristics of measurement types in the experiment were presented by means \pm standard deviation, and the *t*-test was carried out. The significance level was set at 0.05.

Results: After the teaching experiment, the experimental data were counted by Excel software, and the results are shown in Table 1.

It can be seen from Table 1 that the *P* value of *t*-difference significance test of HAMA score data of the two groups of students before the experiment is 0.924, which is far greater than the significance level of 0.05, and the data difference is not significant. However, after the experiment, the average HAMA scores of students in the experimental group and the control group were 8.3 and 16.2 respectively. The former was

48.77% lower than the latter, and the data difference was significant.

Table 1. Statistics of HAMA scores of students before and after teaching

Statistical time	Experience group	Control group	<i>t</i>	<i>P</i>
Before teaching	19.5±2.4	19.5±3.1	1.048	0.924
After teaching	8.3±1.5	16.2±2.0	0.317	0.001

Conclusions: In view of the increasingly serious problem of college students' employment anxiety in China, this study collected academic materials related to college students' employment anxiety, college ideological and political education reform and anxiety psychology in the industry, analyzed and summarized the shortcomings of China's current employment anxiety guidance and the feasibility of integrating the auxiliary content of employment anxiety into college ideological and political education curriculum. An ideological and political teaching experiment was carried out. The experimental results showed that after the experiment, the average HAMA scores of students in the experimental group and the control group were 8.3 and 16.2 respectively, and the former was 48.77% lower than the latter. The experimental data show that some psychological preparation and emotion control skills of employment and interview are integrated into the ideological and political education curriculum in colleges and universities, and the causes of students' employment anxiety are answered. It can alleviate the employment anxiety of college students.

COPING STRATEGIES OF EMPLOYEES' PSYCHOLOGICAL PRESSURE IN THE DEVELOPMENT OF CROSS-BORDER E-COMMERCE

Jianghua Feng¹ & Feng Wang²

¹*School of Economics and Management, Shanghai Technical Institute of Electronics and Information, Shanghai 201411, China*

²*School of Nursing and Health Management, Shanghai University of Medicine & Health Sciences, Shanghai 201318, China*

Background: In recent years, the Chinese government has encouraged enterprises to go abroad to operate, and the development of cross-border e-commerce has entered the fast lane. However, behind the rapid development of cross-border e-commerce, there are some industry problems that are not easy to be noticed, among which the more typical is the psychological pressure of cross-border e-commerce practitioners. There are many factors that lead to the psychological problems of employees of cross-border e-commerce. The main factors are heavy workload, confusion of work and rest caused by working across time zones, obstacles to cross-cultural communication, lack of foreign language ability, lack of understanding of local laws and regulations, etc. for most cross-border e-commerce enterprises, these problems have not been well faced and solved. Therefore, many employees have produced many psychological problems under a number of heavy pressures, such as depression, mania slow thinking, anxiety, etc. Alleviating and completely solving the psychological pressure of cross-border e-commerce employees will help to improve the work enthusiasm and subjective initiative of enterprise employees, which is of great significance to improve the operation efficiency and comprehensive competitiveness of cross-border e-commerce enterprises.

Objective: To understand the working mode and main work contents of front-line employees in various departments of cross-border e-commerce enterprises in China, understand the main reasons for employees' psychological pressure, and put forward some useful countermeasures. Carry out a social experiment to verify the effectiveness and reliability of these strategies, and provide some references and suggestions for the sustainable development of China's cross-border e-commerce industry.

Objects and methods: Collect domestic academic research materials and books on the management mode and industry development of cross-border e-commerce talents in recent years, so as to understand the manifestations and causes of psychological stress of employees in cross-border e-commerce enterprises in China. Then combined with the principles and methods of psychology, this paper puts forward some targeted countermeasures. Carry out an enterprise management model reform experiment, select two

enterprises with a certain voice and representation in the cross-border e-commerce industry, reach cooperation with them, and select 132 employees with varying degrees of psychological pressure from the enterprises as the research object. Psychological training was conducted for the personnel of the two enterprises, and after the training, they were required to pay attention to the psychological status of the research objects in the process of enterprise operation, and care for the life of these employees regularly. Once employees were found to have psychological stress problems, they were asked about the source of their psychological stress in time, and then targeted measures were taken, such as comforting and encouraging employees with psychological methods, solving employees' concerns from the company level, Giving employees certain economic compensation, etc. The experiment lasted for 3 months. In addition, before and after the experiment, the subjects were required to self-evaluate the severity of their current psychological stress. The severity of psychological stress was described by five categories: no stress, slight stress, general stress, significant stress and severe stress, and these levels were quantified by using the numbers of 1, 2, 3, 4 and 5.

Results: After the completion of the enterprise reform experiment, the statistical scoring data of the psychological stress severity of the subjects are shown in Table 1 note that the *t*-difference significance test is used for the quantitative data, and the significance level is 0.05.

Table 1. Statistics of psychological stress severity of subjects before and after the experiment

Feedback moment	Quantized score means	Corresponding grade	Standard deviation of quantized score	<i>P</i>
Before experiment	3.24	General pressure	0.21	0.003
After the experiment	2.50	Slight pressure	0.18	-

It can be seen from Table 1 that the overall psychological pressure level of the research object before the experiment is "general pressure", and the overall psychological pressure level of the research object after the experiment is "slight pressure", the average score is reduced from 3.24 to 2.50, and the *P* value of *t*-test is 0.003, which is less than the significance level. It is considered that the data difference is statistically significant.

Conclusions: With the reform and progress of China's e-commerce industry, the business development of cross-border e-commerce is gradually on the right track, but there are still some serious problems behind the prosperity of the industry. For example, some employees have serious psychological pressure due to cross-cultural psychological adaptation, lack of foreign language ability, work and rest confusion caused by cross-time zone work, which has a great negative impact on the normal use of enterprises. Therefore, after understanding the work mode, main work contents and the main reasons for the psychological stress of front-line employees in various departments of cross-border e-commerce enterprises in China, this study puts forward some useful countermeasures, and designs and carries out an enterprise management reform experiment based on these countermeasures. The experimental results show that the overall psychological stress level of employees before the experiment is "general stress". After the experiment, the overall psychological stress level of the subjects was "slight stress", the mean score decreased from 3.24 to 2.50, and the *P* value of *t*-test was 0.003, which was less than the significance level. It was considered that the data difference was statistically significant. The test results show that psychological care and institutional support for employees of cross-border e-commerce can help reduce employees' psychological pressure and improve work efficiency.

INFLUENCE OF PRACTICAL TEACHING APPROACH OF PRESCHOOL EDUCATION COOPERATING WITH COUNTY PRESCHOOL EDUCATION SYSTEM ON STUDENTS' ANXIETY

Huimin Liu

Department of Pre-primary Education, Shaanxi Vocational Academy of Art, Xi'an 710054, China

Background: Anxiety disorder, also known as anxiety neurosis, is the most common kind of neurosis, which is mainly characterized by anxiety emotional experience. It can be divided into chronic anxiety, namely generalized anxiety and acute anxiety, namely panic attack. The main manifestations are: nervousness and anxiety without clear objective objects, restlessness, and autonomic nerve dysfunction

symptoms, such as palpitation, handshaking, sweating, frequent urination, and motor restlessness. Pay attention to distinguish normal anxiety. If the severity of anxiety is obviously inconsistent with objective facts or situations, or the duration is too long, it may be pathological anxiety. This abnormal anxiety is a manifestation of psychosis. Anxiety is the emotional reflection of people's serious deterioration of the value characteristics of reality or future things. On the contrary, the emotional form is expectation, that is, expectation is the emotional reflection of people's obvious positive trend towards the value characteristics of reality or future things. At present, some college students majoring in preschool education have learning anxiety. In addition, in recent two years, preschool education students in all schools have begun to show anxiety, but the reasons need to be further investigated and analyzed. The research shows that the practical teaching of preschool education based on the cooperation of regional preschool education system can effectively alleviate students' anxiety symptoms. The county preschool education development support system is the sum of systems, institutions and resources in the county that can support the development scale, level and quality of preschool education for the purpose of supporting the development of preschool education. In the county preschool education development support system, the government, society, family and preschool education institutions share the responsibility of promoting the development of county preschool education. These four subjects are not isolated, but interrelated and have their own division of power and responsibility. The development of any kind of education is inseparable from the support of certain social factors, but there is little research on preschool education at present. Starting from the product attribute and human capital theory of preschool education, this paper moves the social support theory and system theory into it, which will help to deepen the understanding of the essential attribute and importance of preschool education, and provide a correct cognitive basis and theoretical basis for clarifying the support and integration of the development of preschool education.

Objective: In recent years, under the background of practical teaching of preschool education, the change of social environment of preschool education students leads to the decline of their psychological quality, which leads to some students' anxiety. Therefore, this study proposes a practical teaching approach of preschool education in cooperation with the county preschool education system, and applies this teaching method to improve the anxiety psychology of preschool education students, hoping to provide some reference for relevant research.

Research objects and methods: In order to improve the psychological quality of preschool education students and improve their anxiety symptoms, a questionnaire survey was conducted among preschool education students with anxiety symptoms in many colleges and universities in an area. A total of 400 questionnaires were distributed to test their anxiety psychological characteristics. A total of 372 questionnaires were collected with a recovery rate of 93%. All subjects were equally divided into observation group and control group, with 186 people in each group.

Research design: The observation group was given the practical teaching method of preschool education in cooperation with the county preschool education system, and the experimental duration was 2 months. The control group did not receive special teaching within 2 months, but only routine work teaching. After the experiment, the training effect was evaluated according to the rehabilitation of the subjects. Among them, the significant effect is that cognition, emotional behavior and will are significantly improved, effectively improve cognition, emotion and will, no abnormal or ineffective mood.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The total effective rate of anxiety relief in the observation group was significantly higher than that in the control group ($P < 0.05$).

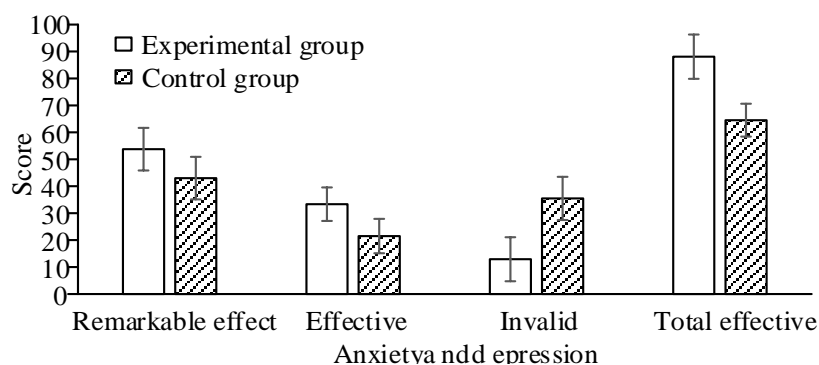

Figure 1. The improvement effects of the two groups after intervention were compared

Conclusions: The national government should speed up the integration of early childhood education into

the universal compulsory education system, and introduce a more clear and strict kindergarten teacher access system to make the team of early childhood teachers balanced and stable. On the other hand, we should strengthen publicity through various media, actively guide public opinion, form a good atmosphere of respecting teachers and valuing education, and let society have a more comprehensive and correct understanding of preschool education. Families, teachers, classmates and friends should more actively care about and understand the professional growth of preschool education college students and actively understand the relevant knowledge of the major, rather than attacking their enthusiasm and self-confidence. On the basis of relying on society to pay attention to the major, encourage the students of the major to develop healthily. Colleges and universities need to set up mental health courses and career planning in freshmen, provide psychological counseling and professional introduction to freshmen, and guide them to actively make career planning. Carry out a series of cultural activities to enhance students' sense of professional belonging, professional awareness and professional belief, and have more confidence and confidence when entering the society.

Acknowledgement: The research is supported by: Education and Teaching Reform Project of Shaanxi Provincial Department of Education in 2019 (Key Project) under Grant No.19GZ020: "Exploration on the Practical Teaching Mode of Higher Vocational Preschool Education with the Coordinated Development of County Preschool Education System".

DESIGN METHOD OF CROSS-BORDER E-COMMERCE WEBSITE COLOR MATCHING FOR PATIENTS WITH ANXIETY DISORDER UNDER COGNITIVE PSYCHOLOGY

Jiyu Liu¹ & Shaopeng Shang^{2*}

¹*School of Economics and Management, Shanghai Technical Institute of Electronics & Information, Shanghai 201411, China*

²*Vocational College, Shanghai Jian Qiao University, Shanghai 201306, China*

Background: Cognitive psychology is a subject that studies the psychological changes and laws of the processing process of collecting information in the brain and the formation process of subsequent thinking. The research objects of cognitive psychology are mainly people's advanced thinking processes, such as perception, attention, memory, language, etc. In contrast to behaviorism psychology, cognitive psychology also studies processes that cannot be directly observed, such as memory processing, storage and extraction. Cognitive psychology pays more attention to the basic psychological causes of human behavior, but the process from psychological state to behavior cannot be directly observed. Therefore, cognitive psychologists can only speculate about this process by analyzing the information received by the object and the behavior generated. Therefore, the research of cognitive psychology often needs to carry out experiments to provide basis and support for speculation. The commonly used experimental methods in this discipline include interview method questionnaire survey, expert consultation, etc. The rapid development of China's cross-border e-commerce is conducive to the employment of the domestic population and commodity export trade. However, due to the rise of cross-border e-commerce, the industry development and operation are not mature enough, and the color matching design of some cross-border e-commerce websites is not reasonable, which will reduce the shopping desire of consumers and affect the performance and income of enterprises. Especially for patients with anxiety disorder, their patience is low, and unreasonable website color matching will further reduce their brand preference for cross-border e-commerce. Moreover, this result is generated through the transformation of color elements into corresponding cognitive and psychological driven behavior. Therefore, it is necessary to use cognitive psychology to optimize the color matching of cross-border e-commerce websites, so as to improve their attraction to patients with anxiety disorder.

Objective: To analyze the relationship between the condition of patients with anxiety disorder and various colors and color combinations, design and carry out experiments, and explore the impact of e-commerce website adjusting color matching scheme on the condition of patients with anxiety disorder.

Objects and methods: Collect relevant data on color matching, website style design and cognitive psychology, and communicate with cross-border e-commerce practitioners to understand the development status of cross-border e-commerce in China and the color matching form of websites. Two leading cross-border e-commerce enterprises with a certain position and market appeal in the industry and 200 patients with anxiety disorder were selected for social experiments. Divide 200 patients into experimental group and control group on average, and verify whether there is no significant difference between the basic

information of the two groups. If the verification fails, the grouping needs to be adjusted or regrouped until the verification passes. Subsequently, the background designers of a cross-border e-commerce website were trained in cognitive psychology, requiring them to optimize the color matching of the website on the premise of considering the cognition of consumers suffering from anxiety about the website, the cognition of commodity layout, the cognition of services and the psychological impact brought by these factors, and let the personnel of the experimental group use this enterprise for shopping without interfering with the web design of another website. The control group was asked to use this page for shopping. Before and after the experiment, the two groups were investigated with SAS (Self-rating Anxiety Scale). In addition, all measurement type features in the study are displayed in the form of mean \pm standard deviation for *t*-test, and counting type features are displayed in the form of number or proportion of number for Chi-square test. The significance level of difference is taken as 0.05.

Results: After the experiment, the SAS survey results of the two groups were counted, and Table 1 was obtained.

Table 1. SAS survey results of two groups of personnel

Statistical time	Experience group	Control group	<i>t</i>	<i>P</i>
Before experiment	65.3 \pm 3.6	65.2 \pm 2.9	1.251	1.336
After the experiment	47.5 \pm 2.7	65.4 \pm 2.8	0.285	0.001
<i>t</i>	0.296	1.129	-	-
<i>P</i>	0.001	1.307	-	-

It can be seen from Table 1 that there is no significant difference between the data of the two groups before the experiment, which proves that the experimental data are comparable. After the experiment, the average SAS survey scores of the experimental group and the control group were 47.5 and 65.4 respectively. The former was significantly lower than the latter, and the *P* value of *t*-test was 0.001, which was far less than the significance level. It was considered that the data difference was significant.

Conclusions: With the rise of cross-border e-commerce in China, more and more foreign consumers begin to use China's cross-border e-commerce websites for online shopping. However, the website color matching design of some cross-border e-commerce websites is not reasonable, resulting in the decline of shopping interest of consumers with anxiety disorder, which will have a negative impact on the business performance of enterprises and is not conducive to the benefits of online shopping for patients with anxiety disorder. Therefore, this study uses the method of cognitive psychology to design an e-commerce website color-matching experiment. The experimental results show that after the experiment, the average SAS survey scores of the experimental group and the control group are 47.5 and 65.4 respectively. The former is significantly lower than the latter, and the *P* value of *t*-test is 0.001, which is far less than the significance level. It is considered that the data difference is significant. The data show that optimizing the color matching design of cross-border e-commerce websites by considering the theoretical methods of cognitive psychology can help reduce the anxiety level of anxiety patients when using websites, so as to promote patient consumption and increase the performance and income of cross-border e-commerce enterprises.

THE INFLUENCE OF FILM AND TELEVISION CULTURE COMMUNICATION MODE BASED ON SOCIAL PSYCHOLOGY ON THE MENTAL HEALTH OF INTERNET USERS

Ximin Zhao

School of Media, Lanzhou City University, Lanzhou 730070, China

Background: Social psychology is an interdisciplinary subject of sociology and psychology. Its main task is to study the psychological and behavioral conditions of individuals and organizations in the social environment, and summarize the laws to solve the corresponding social problems. Compared with traditional psychology, it pays attention to the impact of language, friends, family, living environment and learning environment on itself in the process of individual socialization. It also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. Because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to improve the reliability and accuracy of research results. Since the reform and opening

up, China's restrictions on the content and form of film and television cultural works have been greatly reduced. Many different types of film and television cultural works began to appear in the national vision, and had a great impact on the national mental state and cognitive thought. However, after entering the Internet era, the supervision of film and television cultural works has become difficult, the overall quality of film and television works has declined, and there are even a few works spreading bad ideas in the market. These works will seriously affect the mental health of network users. Therefore, it is necessary to use the theoretical knowledge of social psychology to study the effects of various types of film and television cultural works on the mental health of network users.

Objective: To understand the impact of various film and television cultural communication modes on the mental health of Internet users in the Internet era, and put forward some suggestions on the communication management of film and television cultural works that are conducive to protecting the mental health of Internet users.

Objects and methods: Collect domestic and foreign academic literature on film and television cultural communication, social psychology and the law of spiritual change of Internet users, and extract the main ways of film and television cultural communication in the Internet era. Then design an experiment based on Delphi method, and select 51 experts and scholars from China to form an expert group, which is composed of social psychology experts, film and television industry experts, media experts and heads of relevant government management departments. Send the discovered ways of film and television cultural communication to the expert group, and ask the members to evaluate the impact of these ways on the mental health of Internet users in all aspects. It is stipulated that the degree of impact only includes five types: no impact, slight impact, general impact, obvious impact and full impact, and give five integers of 1, 2, 3, 4 and 5 to quantify in order to improve the reliability of expert consultation results. All measurement type features in the study are displayed in the form of mean \pm standard deviation for *t*-test. Counting type features are displayed in the form of number or proportion of number for Chi-square test. The significance level of difference is taken as 0.05.

Results: After reaching an agreement with the expert group, the final output expert group opinions are counted, as shown in Table 1.

Table 1. Statistical results of final opinions of the expert group

Impact evaluation index	TV play	Variety	Concert	Advertisement	Film
Quantitative score of influence degree	3.17 \pm 0.15	4.62 \pm 0.14	2.77 \pm 0.16	4.08 \pm 0.15	3.90 \pm 0.12
Influence level and scope	General impact-obvious impact	Obvious influence-full influence	Minor impact-general impact	Obvious influence-full influence	General impact-obvious impact

It should be explained that the "influence level range" in Table 1 represents the two influence levels that are closest to the quantitative score of the influence level of the corresponding film and television culture communication mode. It can be seen from Table 1 that the expert group believes that variety shows and advertisements have the most obvious impact on the mental health of Internet users, followed by films and TV dramas, and concerts, the mode of film and television culture communication, have the lowest impact.

Conclusions: In view of the Internet era, the supervision of domestic film and television cultural works is becoming more and more difficult, which leads to the uneven quality of film and television cultural works and affects the mental health of network users. This time, after studying the academic literature at home and abroad on film and television cultural communication, social psychology and the law of spiritual change of network users, we extracted the main film and television cultural communication modes in the Internet era, and carried out an expert consultation experiment to obtain the evaluation data of the impact of these communication modes on the mental health of network users. According to the consulting results, the expert group believes that variety shows and advertisements have the most obvious impact on the mental health of Internet users, followed by films and TV dramas, and concerts, the mode of film and television cultural communication, have the lowest impact. In other words, in order to protect the mental health of China's Internet users, the relevant government departments should focus on supervising and reviewing the film and television cultural works in the form of variety shows and advertisements, and the administrative resources for supervising the film and television work in the form of concerts can be appropriately reduced.

THE POSITIVE INFLUENCE OF COLLEGE PHYSICAL EDUCATION TEACHING METHODS ON ALLEVIATING STUDENTS' PSYCHOLOGICAL ANXIETY IN THE NEW ERA

Siwen Lin

Public Course Department, Physical Education Teaching and Research Department, Hainan Vocational University of Science and Technology, Haikou 571126, China

Background: With the gradual acceleration of the pace of social life in modern urban society, the incidence rate of anxiety disorders is increasing year by year. The pathogenesis and pathogenic factors of anxiety disorder are complex. At present, the common clinical anxiety symptoms are divided into two types: panic disorder anxiety and generalized anxiety. The main clinical manifestations of panic disorder are repeated sweating, palpitation and other autonomic neurological symptoms. Patients often have excessive worry about the unfortunate consequences caused by daily events. It is an acute onset anxiety disorder. Relatively speaking, generalized anxiety symptoms are chronic and persistent. In the process of onset, they are often accompanied by continuous tension. They are usually accompanied by symptoms such as autonomic nerve dysfunction and excessive vigilance. It is a chronic mental disease. Epidemiological studies show that the incidence rate of anxiety disorders in family with anxiety disorders is three times that of the potential group with anxiety disorder, incidence rate is as high as 15%. Some studies believe that patients with anxiety disorder have pathological phenomena of neurotransmitter changes in the brain. The pathological changes of human brain chemical synapses are closely related to the pathogenesis of anxiety disorder. Monoamine neurotransmitter neurons are involved in the regulation of human overall emotion. Therefore, when the concentration of neurotransmitters in this part is abnormal, it will cause human individual emotion out of control, which is often shown in the form of emotional excessive anxiety. The research idea of combining psychogenic and physiological pathogenesis provides an effective path for physical intervention of anxiety disorder. This study uses college physical education in the new era as the starting point to judge the effectiveness of physical intervention on college students' psychological anxiety symptoms by studying whether the physical intervention method of physical education has a positive impact on students' psychological anxiety.

Objective: This study starts with the research idea of physical intervention of anxiety disorder, and studies the effect of sports physical intervention on the psychological state of college students with psychological anxiety by analyzing the impact of college physical education teaching methods on students' psychological anxiety in the new era.

Subjects and methods: This study combines Bayesian principle with logistic regression model, constructs the trajectory model of students' anxiety state change while maintaining the optimal sample size and composition, and analyzes the positive impact of college physical education teaching methods on alleviating students' psychological anxiety in the new era by means of trajectory fitting.

Study design: Based on the Bayesian principle, this study establishes the model basis that the average posterior rate of track group and the number of samples in each group are in the optimal state. On this basis, the logistic regression model is used to establish the track fitting model of the change of physical education teaching time and investigation times. In the model establishment, the anxiety score is used as the main evaluation standard of students' psychological anxiety state.

Methods: Epidata3 was used in this study. Establish the database, and adopt the dual researcher mode for error correction in the process of data entry. One person is responsible for entry and the other person is responsible for review.

Results: The fitting results of anxiety score and survey times under the logistic regression model under the first-order polynomial function, second-order polynomial function and third-order polynomial function are shown in Figure 1.

Figure 1 shows the fitting results of three kinds of anxiety scores, namely the low-level group, the significantly decreased group and the low-level group. The fitting results fully reflect the changes of anxiety scores of the three groups of students with the progress of investigation times under the intervention of physical education teaching. It can be seen that all groups show a downward trend, and the significantly decreased group decreases the most significantly, from the high-level category to the low-level category.

Conclusions: The complex pathological mechanism between the causes of anxiety symptoms and the dual characteristics of psychogenic and psychological. This study starts with the research idea of physical intervention, analyzes the psychological anxiety state of students, establishes an effective intervention way of college physical education in the new era, and studies the intervention effect of a physical intervention on students' psychological anxiety symptoms. Physical intervention in sports can help students improve their overall psychological quality while acting on their nutriregulation and emotional relief. It can

intervene students' anxiety from the dual pathological perspective of physics and psychogenesis, help students get rid of anxiety control and improve their comprehensive physical and mental quality. At the same time, this study also provides a feasible path for the students' mental health management system in the teaching management of colleges and universities, and lays a theoretical foundation for the comprehensiveness of the curriculum system of colleges and universities in the future.

Figure 1. Change track of anxiety score of college students

APPLICATION OF EDUCATIONAL PSYCHOLOGY IN CHEMISTRY TEACHING

Lingju Meng¹, Lianyan Liao¹ & Suyan Zhang²

¹*School of Chemistry and Chemical Industry, Hebei Normal University for Nationalities, Chengde 067000 China*

²*Language Group, Zhulinsi Primary School, Chengde 067000, China*

Background: Educational psychology believes that psychology is practical and not separate research. Psychology plays a role more or less in various fields related to people. This role is most obvious in the relationship between teaching behavior and teaching. Educational psychology also advocates the integrity of psychological function. Therefore, educational psychology opposes the educational behavior of the traditional form of training, because the educational behavior of the traditional form of training is to train students' thinking ability, memory ability and other instinctive behaviors, and each part is separated and independent. This teaching method not only ignores students' psychological function, but also ignores people's unity at the cognitive level. Learning behavior is the overall embodiment of students' psychological function. Through the overall application of their own thinking ability, memory ability, emotional feeling ability and motivation psychology, students can adapt to the learning environment under the guidance of a certain purpose, and achieve their own learning objectives in this adaptation process. In the whole learning process, what should be concerned most is the role of students' learning psychology in the process of environmental adaptability. Therefore, in the process of students' learning, teachers should remove the non-situational and sluggish educational methods, but should explore students' psychological interests according to students' internal psychological needs, and arrange teaching objectives and teaching contents through students' internal interests and habits. Only under this teaching method of organically combining students' psychology can students' psychological enthusiasm be fully mobilized. This study applies the theory of educational psychology to modern chemistry teaching. Through the use of students' psychological laws, it provides guidance for students' chemistry learning strategies. At the same time, it also helps teachers establish a teaching path suitable for students' psychological needs, reshape the role relationship between teachers and students in educational behavior at the psychological level, and provide a new way for modern chemistry teaching. Active teaching method based on students' psychological status.

Objective: This study applies educational psychology to modern chemistry teaching, helps to improve students' chemistry learning cognition by taking students' psychological cognition as a whole for

psychological guidance, and then strengthens the benign relationship between teachers and students in learning behavior, so as to provide teachers with a painful death that can better grasp the basis of students' psychological law in the direction of chemistry teaching. Help students achieve the effect of improving their chemistry scores.

Subjects and methods: This study uses the combination of correlation analysis and random forest algorithm to provide support for the research of chemical teaching methods in educational psychology through two aspects: psychological elements and the correlation between action and psychology.

Study design: This study uses the random forest algorithm to classify the psychological factors of students in the process of learning chemistry, and on this basis, it connects the educational psychology and educational strategies with students' chemistry learning psychology through correlation analysis, so as to finally achieve the effect of driving students' psychology through strategies and changing students' learning behavior through students' psychology.

Methods: In this study, the research data are sorted and analyzed through Excel. In the force analysis, the measurement method of transforming the force into quantitative level is adopted, that is, five levels from level 0 to level 4 are selected to quantify the impact of specific factors, of which level 0 means irrelevant, level 1 means slight impact, level 2 means normal impact, level 3 means obvious impact and level 4 means full impact.

Results: The impact analysis of students' psychological elements is shown in Figure 1.

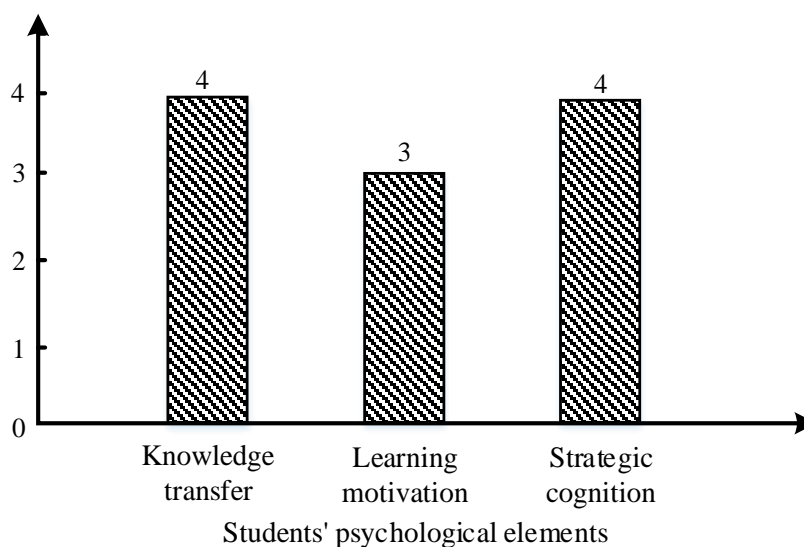

Figure 1. Analysis on the influence of students' psychological factors

In Figure 1, among the three chemical students' psychological elements of knowledge transfer, learning motivation and strategic cognition, the impact of knowledge transfer elements and strategic cognition elements on students' chemical learning results reaches level 4 of the impact level, which is a significant impact, while the learning motivation elements only reach level 3 of the learning level, which is a significant impact. It can be seen that the use of educational psychology can make students understand flexibility, transfer the knowledge or skills learned in other fields to chemistry learning and apply them flexibly. At the same time, it can also provide students with more comprehensive psychological cognition of learning strategies and promote the transformation of students' learning methods.

Conclusions: Educational psychology treats students as a psychological cognitive whole rather than a split instinct module. Therefore, the non-situational teaching method is unreasonable in the view of educational psychology, and students should be psychologically guided as holistic cognitive individuals. This study applies educational psychology to modern chemistry education, and guides students' learning psychology from three important psychological aspects: knowledge transfer, learning motivation and strategic cognition, so as to enhance students' autonomous learning ability, improve their learning enthusiasm and improve their academic performance.

ANALYSIS OF THE INFLUENCE OF IDEOLOGICAL AND POLITICAL EDUCATION ON PSYCHOLOGICAL EDUCATION OF HEALTHY PERSONALITY

Wensi Liu

Faculty of Thought Teaching, Inner Mongolia Vocational and Technical College of Communications, Chifeng 024005, China

Background: The psychological concept of healthy personality was first put forward in the 1920s. The psychological theory of healthy personality holds that human behavior has specific consciousness, and healthy personality is the realization of human self-assertion through rational behavior. This kind of self-realization is an “individualized” person at the psychological level. Such a person with self-realization ability should consciously think and analyze all kinds of imperfect and repressed aspects of his personality, and show these aspects in his normal life as much as possible. That is to say, individuals admit that they are a natural person with certain psychological defects through self-awareness and self-behavior. In this way, they constantly self-alert, constantly abandon past mistakes in this process, and actively choose a new life goal after self-correcting mistakes. However, individual psychology is divided into conscious psychology and unconscious psychology. Conscious psychology can realize and complete personality defects through self-cognition and self-thinking, but unconscious psychology is difficult for individuals and the outside world to detect. Therefore, the personality defects generated in unconscious psychology are difficult to be realized by individuals themselves, so they lack a certain degree of development. At this time, the individual needs to constantly make social contact with the outside world. Through social contact, the outsider can be aware of the individual’s problems before the individual itself, and feedback against this personality defect in social contact, so as to promote the external development of individual personality. This study applies the psychological theory of healthy personality to modern ideological and political education, provides an entry point for ideological and political education by analyzing the personality defects formed by students in the process of growth, and then uses the psychological oriented Ideological and political education strategy to help students improve their emotional control, promote psychological development, improve students’ moral quality, promote the formation of students’ sound personality and maintain students’ mental health.

Objective: This study applies healthy personality psychological education to ideological and political education, helps students establish sound personality psychology by guiding students’ growth psychology, provides methodological guidance for students’ behavior in daily learning and life, protects students’ psychological growth, and helps modern ideological and political education establish educational strategies more in line with students’ growth psychology and personality development. Lay a theoretical foundation for the improvement of the ideological and political education system.

Subjects and methods: This study combines fuzzy evaluation method with factor analysis method, transforms the psychological indicators of students from qualitative evaluation indicators to quantitative evaluation indicators, and analyzes the relationship between factors.

Study design: This study uses the membership theory of fuzzy mathematics to transform the qualitative evaluation indexes in healthy personality psychology and ideological and political education into quantitative evaluation indexes, and makes an overall evaluation of ideological and political psychological personality education in the environment of mutual restriction of various factors.

Methods: This study uses SPSS software as a fuzzy evaluation tool, and the collected data are sorted out through Excel.

Results: The analysis of students’ psychological personality growth factors is shown in Figure 1.

Figure 1 mainly shows the analysis of students’ psychological and personality factors in the process of learning and growth, including emotional control ability, closed psychology, self-cognition and moral quality. It can be seen that under the ideological and political psychological personality education, students’ closed psychology and self-cognition are significantly benign affected, and the force level is level 4. The influence on emotional control ability and moral quality is relatively low, but it still reaches the level of obvious influence, and the force level is level 3. It can be seen that ideological and political psychological personality education can effectively help students solve the problem of closed psychological dilemma, improve students’ self-cognitive ability and help students recognize themselves. In addition, ideological and political psychological personality education can also help students improve their moral quality and emotional control ability to a certain extent. However, because students are in a period of continuous psychological growth and continuous improvement of world outlook, the psychological support that education alone can give is limited.

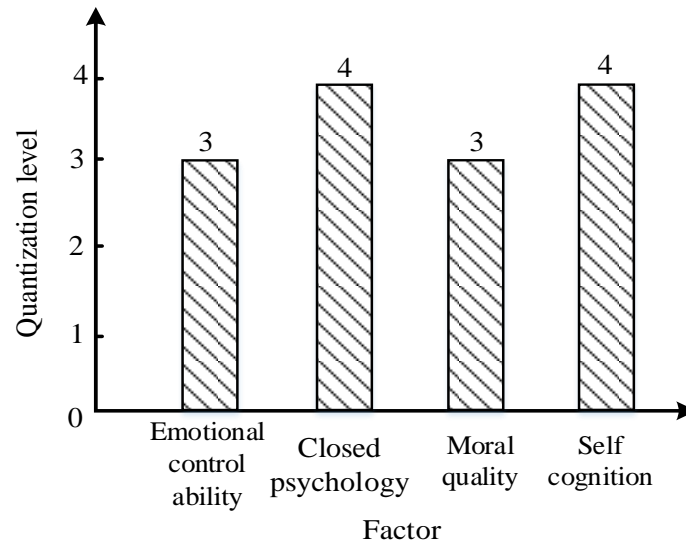

Figure 1. Analysis on the factors of students' psychological personality growth

Conclusions: In the process of personal psychological personality development, students often form psychological personality defects due to growth environment, personal experience, mood changes and other reasons. Based on the theory of sound personality psychology, this study establishes the ideological and political psychological personality education method. Through psychological assistance and emotional guidance to students in the process of education, it helps students establish a positive world outlook and values, provides methodological support for students' behavior, helps students overcome their own psychological personality obstacles, form a sound personality and promote the all-round development of students' body and mind.

A STUDY ON THE ANXIETY OF BUSINESS ENGLISH TRANSLATORS

Nan Gao

Department of Trade and Economics, Miyun Campus of Capital University of Economics and Business, Beijing 101500, China

Background: Anxiety is also known as anxiety psychosis. During the onset of the disease, patients often show persistent excessive worry, tension and even panic, usually accompanied by physiological autonomic nervous system symptoms and motor restlessness symptoms. Anxiety patients are difficult to effectively coordinate their psychological state and social ability, so the quality of life of anxiety patients is generally low. The group of anxiety patients among translators is similar to that of performance anxiety patients in the overall group of anxiety patients. The anxiety symptoms for translators are called "foreign language anxiety". The definition of foreign language anxiety is a kind of anxiety symptom produced in social activities related to foreign language, such as foreign language learning, foreign language translation, foreign language communication and so on. The performance of foreign language anxiety in translators is mainly divided into physical and psychological parts. The physiological part is mainly manifested in blushing, sweating, rapid heartbeat, trembling, pain, etc. It will also show phenomena in individual behavior, such as dull facial expression, disordered intonation and sound, and the increase of inactive modal particles. The psychological part is mainly manifested in the frequent occurrence of interpretation errors, fear and delay of translation, difficulty in paying attention and so on. There are various reasons for the anxiety of economic and trade English translators, partly because the English translation itself needs great knowledge accumulation and training experience. The translators' language foundation is not solid, they cannot deal with the amount of input source information smoothly, and their memory load ability is insufficient, which may lead to the psychological anxiety of translators in the process of translation. In addition, the lack of psychological capital of translators is also one of the main reasons for translators' psychological anxiety. Economic and trade English translation often plays an important role in information transmission in and transnational economic and trade transactions. Once mistakes occur in the work, the losses of enterprises

may be huge. Therefore, it is of certain dual necessity and practical significance for economic and trade translators and transnational economic and trade enterprises to study the translation anxiety of economic and trade English translators and put forward corresponding countermeasures.

Objective: By analyzing the anxiety symptoms of business English translators, this study puts forward anxiety response measures for business English translators, helps relevant industries reduce cross-border communication errors caused by translators' anxiety psychology, and provides a possibility for business English translators to overcome the influence of anxiety and expand their career development.

Subjects and methods: This study uses the methods of correlation analysis and difference test to analyze the correlation and functional relationship between the two factors by combining the characteristics of business English translation and anxiety symptoms.

Study design: This study takes the Self-rating Anxiety Scale and business English translation as the main research horizontal and vertical axis, uses the correlation analysis method to analyze the correlation between them, and tests the differences of anxiety types and anxiety levels of different groups of translators in the process of work according to the difference test method, and puts forward different coping strategies with different emphases according to different anxiety types.

Methods: SPSS17.0 software was used in this study process all research data.

Results: The distribution of subjects with different levels of anxiety is shown in Table 1.

Table 1. Anxiety score

Anxiety level	Anxiety score interval	Number of subjects	Proportion (%)
Low anxiety	<65	24	10.43
Moderate anxiety	65-85	162	70.43
Severe anxiety	>85	44	19.13

Table 1 shows the frequency and ratio of subjects with different levels of anxiety. Among them, the number of subjects with moderate anxiety is the largest, reaching 162, accounting for 70.43% of the overall anxiety. The number of people with low anxiety was the least, only 10.43%. The number of people with severe anxiety was 19.13%, which was slightly higher than that of people with severe anxiety. It can be seen that in business English translation, moderate anxiety is the most likely to occur, and the proportion is higher than the sum of mild anxiety and severe anxiety.

Conclusions: As a job requiring strong practical training and on-the-spot ability, economic and trade English translation often leads to the psychological anxiety of translators due to various psychological factors in the process of work. Starting with the characteristics of business English translation and anxiety symptoms, this study analyzes the correlation and functional relationship between them, so as to study the anxiety status of contemporary business English translators, and take this as the basis to help business English translators effectively overcome the anxiety psychological obstacles encountered in specific work and prevent business English translators from career development problems caused by anxiety. At the same time, it helps economic and trade enterprises reduce information transmission errors caused by the anxiety of translation staff in cross-border transactions, and indirectly improves the success rate of cross-border transactions.

* * * * *

APPLICATION OF HUMANISTIC PSYCHOLOGY IN JOURNALISM TEACHING

Na Zhu

Faculty of Thought Teaching, Inner Mongolia Vocational and Technical College of Communications, Chifeng 024005, China

Background: Humanistic psychology is relative to the study of psychology by means of data statistics. Pay more attention to human subjectivity rather than objectiveness, that is, pay attention to the application of human subjectivity in the development of things. Compared with scientific psychology, it has certain advantages and advantages. The disadvantage of scientific psychology is to treat people as an object, as if they were a thing or a microorganism. Scales and other psychological measurement tools are like their microscope, and ignore the affirmation and understanding of people's own value. Its objective perspective has a kind of "absoluteness". Humanistic psychology does not treat it this way. It is more subjective. For example, the transfer in psychoanalysis is the problem of the relationship between analysts and analysts,

and the problem between two subjects. This psychoanalytic theory is an idea based on the existence of unconsciousness, an investigation method or a treatment method. It belongs to typical humanistic psychology. Humanistic psychology focuses on putting people in the objective environment to explore the relationship between people and things, and comprehensively look at the changes of things with people's subjective consciousness. Humanistic psychology is closely related to our life, and can be used in real life to help us look at and understand the world. For example, analyze the social group psychology and humanistic care shown in the film, connect the contents shown in the details with people's attributes and values, and improve people's cognitive ability and practical ability. In the current news education in colleges and universities, teachers often pay attention to the cultivation of theoretical knowledge and ignore the cultivation of students' practical application ability, which makes the teaching effect not ideal. The study of journalism theoretical knowledge only stays at the surface, ignoring the relationship between it and the real world, and ignoring the research on the "human" value and attribute of the news subject. It is very easy for students to have negative learning emotions and psychological problems in the learning process, affecting people's mental health level.

Objective: To realize the renewal of teaching ideas and the reform of teaching structure, so as to improve the psychological problems of journalism students in the teaching process and improve their mental health level.

Research objects and methods: The research takes the students majoring in journalism in a university as the research object, evaluates their teaching status and students' psychological characteristics, integrates the theory of humanistic psychology into the journalism education curriculum, and constructs a teaching model that can effectively meet the needs of students and improve their psychological status. Then, the improved teaching model will intervene the research objects, explore the application of humanistic psychology in journalism teaching and its alleviation of students' psychological problems, and reduce the negative emotions caused by their professional problems.

Method design: With the help of principal component analysis, the factors affecting the teaching effect are analyzed, and then the news teaching classroom is innovated and optimized. The new model is constructed to collect the change data of learning needs and psychological laws of the experimental objects within three months, and the data are statistically analyzed to obtain the experimental results.

Methods: SPSS22.0 analysis tool to process the experimental data, factor analysis the influencing factors with principal component analysis, and test its intervention mechanism on students' psychological problems with the optimization model of news teaching under humanistic psychology.

Results: The perspective of humanistic psychology can effectively guide teachers to grasp students' psychological laws and emotional changes in the teaching process, and then optimize the teaching curriculum guided by students. And the optimized news teaching is more targeted, practical and information-based, which can effectively improve students' psychological problems. Table 1 shows the statistics of anxiety of news students under different teaching effects.

Table 1. Statistics of accounting employment anxiety of students under different teaching effects

Timing	Employment anxiety	Social anxiety	Academic anxiety	Social anxiety
Before teaching optimization	25.34±1.26	18.17±1.65	22.11±1.06	18.56±1.45
After teaching optimization	12.32±1.16	10.71±1.03	11.58±1.36	8.29±1.09

Conclusions: Humanistic psychology can emphasize people's value and potential, pay attention to individual differences and diversity, and optimize the curriculum of news teaching from this perspective, which can effectively help teachers guide and help students solve their learning and life problems, better take students' learning characteristics and psychological needs into account in the teaching reform, and improve students' psychological tolerance and professional application ability to deal with social changes. Thus, it reduces the generation of negative emotions and bad psychological problems.

* * * * *

MENTAL HEALTH STATUS AND OPTIMIZATION STRATEGIES OF ENGLISH TRANSLATION TALENTS

Xin Wang

School of Foreign Languages, Chongqing College of Humanities Science and Technology, Chongqing 401524,

China

Background: The standard of mental health refers to that all aspects of psychology and its activity process are in a continuous and positive psychological state. In this state, the subject can make good adaptation and give full play to its physical and mental potential. Mental health is one of the evaluation criteria of individual health status. Whether we can correctly deal with the changes and stimuli of the surrounding environment and whether we can have good mental endurance and quality is an important aspect of evaluating the level of mental health. The factors affecting mental health include the influence of objective environment, the level of psychological quality, self-cognition, psychological conflict and so on. The emotional value and psychological attitude of different individuals will affect the normal development of their mental health. Evaluating students' mental health is of great significance in the current educational environment and the background of teaching reform, and students' mental health is easily affected by many factors, such as changes in environmental conditions, academic expectations, interpersonal relationships, family factors and social stress events. Some studies have found that there is a certain negative correlation between people's quality and professional ability and mental health, that is, people with stronger professional ability are more likely to have psychological problems. The reason is that people with higher professional quality pay more attention to the high level of psychological needs. For example, college English translation talents are easily affected by factors such as low practicality of classroom teaching, poor effect of classroom teaching and worrying about employment prospects, such as anxiety, anxiety, fear, resistance, negative emotions and related psychological problems. The mental health of English translation talents is worrying, and their negative emotions and psychological problems have greatly interfered and hindered students' life and learning. Therefore, in this context, it is of great practical significance and guiding value to actively explore the mental health status of English translation talents and put forward optimization strategies.

Objective: To analyze the psychological problems and negative emotions of English translation talents from the perspective of psychology, and actively guide and intervene with the help of mental health means.

Research objects and methods: This study takes the students majoring in English translation in a university as the research object, first evaluates their psychological status, and then carries out targeted psychological intervention on the basis of exploring the causes of their psychological problems, in order to improve the mental health level of English translation talents.

Method design: According to the different psychological problems of the subjects, they were divided into different groups, such as anxiety group, depression group, emotion regulation disorder group, etc. They were actively intervened and relieved by means of psychological counseling, curriculum guidance, emotional interference and so on. The time was six weeks. After the experiment, the mental health status of the subjects was reassessed in order to explore the optimal path to effectively improve the mental health status of translation talents.

Methods: The psychological status and psychological problems of the subjects before and after the experiment were collected and evaluated with the help of mental health test scale, and Excel and SPSS23.0 statistical analysis tool to sort out and analyze the difference data.

Results: The society has high requirements for the comprehensive quality and professional ability of English translation talents, but the high employment standard and narrow employment scope make it difficult for English translation talents to meet the requirements of social development, and they are prone to psychological problems under the influence of a variety of internal and external factors. Effective psychological intervention for their psychological problems can effectively alleviate their negative emotions and improve their mental health level. The results showed that the mental health status of the subjects improved to varying degrees after the experiment, and the incidence of psychological problems decreased significantly. Table 1 shows the statistics of anxiety scores of English translators before and after the experiment. 1-5 scores represent the degree of anxiety from light to heavy.

Table 1. Statistics of anxiety scores of English translators before and after the experiment

Intervention time	Emotional anxiety	Interpersonal anxiety	Academic anxiety	Academic anxiety
Before intervention	4	3	3	4
After intervention	2	2	1	2

Conclusions: Mental health is an important index to evaluate the health status. Students are easy to have psychological problems in the complex social and learning environment, and different degrees of psychological problems will have a great negative impact on their study, life and even society. Targeted psychological intervention for college translation talents will help to improve their mental health and psychological problems.

EFFECT OF PREOPERATIVE PSYCHOLOGICAL INTERVENTION ON ANESTHESIA IN ELDERLY LAPAROSCOPIC ABDOMINAL SURGERY

Mengliang Li¹ & Yu Ji²

¹*Department of Anesthesiology, Qingdao Jiaozhou Central Hospital, Jiaozhou 266300, China*

²*Department of Neurosurgery, Qingdao Jiaozhou Central Hospital, Jiaozhou 266300, China*

Background: Under the guidance of psychological theory, psychological intervention is planned to intervene the psychological activities and personality characteristics of a certain object with the help of language, suggestion and other measures, so as to reduce people's anxiety, fear and other negative emotions. Psychological intervention is to alleviate anxiety and improve psychological problems by adjusting people's emotional value, so as to make people present a more positive and positive attitude to deal with the current difficulties or problems, and effectively intervene in the expected things in the future. Individual differences and psychological characteristics will make them show different application effects and intervention performance when participating in psychological intervention, and the psychological comfort degree of the audience caused by the same psychological intervention is also different. As an effective means of intervention, psychological intervention has been applied and involved in many fields, such as education and teaching, clinical medicine and so on. In the field of education, teachers often use verbal encouragement, psychological presupposition and other means to adjust and enlighten students' psychological change rules and emotions, so as to improve the teaching effect and quality. In the field of clinical medicine, disease acts on the body as a stressor, which will make patients unconsciously produce a certain degree of psychological stress, such as tension, anxiety, fear and so on. Moreover, patients' lack of correct cognition of their own diseases and prejudice against the hospital will amplify negative emotions and increase psychological burden and pressure in the process of treatment. The emotion of patients will affect their treatment process and follow-up rehabilitation effect. The increased probability of illness of the elderly and their lack of understanding of laparoscopic surgery make their resistance and anxiety during abdominal surgery more serious, which is not conducive to the treatment and rehabilitation of their diseases. Therefore, exploring the influence of preoperative psychological intervention on anesthesia in elderly laparoscopic abdominal surgery will help to reduce patients' fear, anxiety and other negative emotions about surgery, and improve their rehabilitation efficacy and psychological tolerance.

Objective: Through psychological intervention, patients can understand the operation related knowledge, establish a positive attitude, guide patients to learn self-regulation, control their emotions, keep them in a psychological best state for treatment, promote the normal operation, and reduce patients' anxiety, fear, anxiety and other negative emotions about instruments and equipment.

Research objects and methods: 126 elderly patients who were going to undergo laparoscopic abdominal surgery in a hospital were selected as the research objects. All the research objects were anesthetized by the same anesthesiologist and operated by the doctor in the ward. On the basis of understanding the psychological status of patients before operation, psychological intervention was carried out to explore the influence of psychological intervention in elderly laparoscopic preoperative anesthesia.

Method design: The subjects were randomly divided into traditional nursing group and psychological intervention group. The patients in the traditional nursing group were cared according to the general nursing routine in the operating room without any intervention measures. In addition to the general nursing routine in the operating room, the patients in the psychological intervention group were given psychological intervention measures, such as preoperative visit, cognitive intervention, emotional intervention and so on. The experiment lasted for three weeks. After the experiment, the psychological and emotional changes of patients and the performance in anesthesia operation were further explored to explore the improvement mechanism of psychological intervention on preoperative patients.

Methods: All data were collected by SPSS23.0 is entered and analyzed, and the data of numerical variables are expressed as mean \pm standard deviation. *t*-test was used for the comparison of numerical variables and Chi-square test was used for the comparison of classified variables.

Results: Patients with abdominal surgery will have anxiety and resistance due to strange environment and lack of relevant medical professional knowledge. After psychological intervention with various forms, they can effectively improve their cognition and sense of security of their own surgery and effectively alleviate their negative emotions. There was significant difference in the scores of negative emotions between the traditional intervention group and the psychological intervention group. Figure 1 shows the statistical difference in anxiety scores between the traditional nursing group and the psychological

intervention group.

Conclusions: With the continuous degradation of the body tissue morphology and organ function of the elderly, it has a high risk of surgery. Laparoscopic surgery is widely used in abdominal surgery of the elderly because of its advantages of less surgical injury and less stress response. However, most of the elderly lack professional medical knowledge and their psychological tolerance is weak. Psychological intervention for the elderly before laparoscopic anesthesia surgery can effectively dredge their negative emotions with the help of cognitive intervention and emotional intervention, and help them improve their psychological level and surgical safety. Therefore, in future clinical treatment, we should pay attention to the psychological intervention of patients.

Figure 1. Statistical difference of anxiety scores between traditional nursing group and psychological intervention group

* * * * *

EVALUATION OF INTERVENTION EFFECT OF ENGLISH ONLINE TEACHING ON STUDENTS' COMMUNICATION ADAPTATION DISORDER

Xuwei Jia

Department of Public Foreign Language Teaching, Henan Finance University, Zhengzhou 451464, China

Background: Communication adaptation barriers refer to different types of obstacles caused by the influence of information sender, information receiver and information transmission channels in the process of information transmission, resulting in problems such as information difference and information delay, which affect people's communication and communication. The expression ability, emotional tendency and thinking logic of the sender of information will affect the integrity and smoothness of information in the process of transmission, and different individual differences make their information screening ability and psychological status level show different behavioral characteristics in the process of information reception. The information media channel can effectively connect its information sender and information receiver, and speed up the circulation and transmission of information. The smoothness of the media channel and the perfection of the mechanism will affect the timeliness of information communication and ensure effective communication between individuals and groups. The differences of thinking mode and cultural background will make people have certain deviations in the logic, fluency and accuracy of language habits when expressing information, and this deviation can be adjusted and improved through independent training and later learning practice. The process of communication adaptation is the process of thinking presentation. Generally, it is a subjective and dynamic process, and it is very vulnerable to the influence of external environmental conditions and the goal of value pursuit. The process of communication adaptation driven by different behavioral motives will deviate from the actual objective information. As a practical and applied language, English course learning not only requires students to master basic theoretical knowledge, but also requires them to have good English expression level and communication ability. However, the traditional offline English teaching ignores the oral expression and communication ability of English majors too much, which makes it more difficult for students to learn English communication ability in the absence of internal

cultural connotation and language background, which makes it easy for students to have communication adaptation obstacles, and then dare not communicate in English, resulting in relevant psychological problems. Online English teaching broadens students' access to English resources and reduces the classroom embarrassment of students' English communication. Therefore, exploring the intervention effect of English online teaching on students' communication adaptation barriers has important practical significance and value.

Objective: Based on the understanding of the characteristics of English teaching and students' communication adaptation barriers, this paper explores the impact mechanism of online teaching on students' learning emotions and psychological problems from the perspective of communication adaptation barriers, and compares it with English online classroom teaching, so as to better alleviate the negative emotions of students with communication adaptation barriers.

Research objects and methods: The research first makes statistics on the current situation of English teaching and psychological problems of 600 English majors in different grades in a university, then selects students with communication adaptation barriers as the research object, and explores the intervention effect of English online teaching on students' communication adaptation barriers.

Method design: Then the subjects were randomly divided into online English teaching group and offline English teaching group to explore the psychological improvement of students with different degrees of communication adaptation disorder after three months, such as semantic ambiguity, correct and wrong use of grammar, and explore the improvement of online teaching on students' communication adaptation disorder with the help of association rule mining algorithm.

Methods: The association rule mining algorithm was used to analyze the correlation between communication adaptation disorder and English online teaching, and the statistical analysis tool was used to process and analyze the data, and the experimental results were obtained.

Results: English online teaching gave the students more autonomy and practical innovation in the search of teaching means and teaching resources, overcome the fear of English communication of students with communication adaptation obstacles, and effectively improved the students' learning effect and mental health level. Table 1 shows the scores of students' communication adaptation barriers before and after online English teaching.

Table 1. Statistics of scores of various dimensions of students' communication adaptation barriers before and after English online teaching

Psychological barrier dimension	Before	After
Barriers to knowledge understanding	26.3±2.4	14.7±2.6
Information cognitive impairment	31.2±2.9	13.1±2.4
Language expression disorder	27.4±2.3	10.4±3.8

Conclusions: Language and cultural differences and the neglect of traditional offline English teaching on students' English practical ability often led to the phenomenon of "language inferiority" or "language embarrassment" in the process of English learning, resulting in communication and adaptation obstacles, which further affect the learning quality and mental health. From the perspective of communication adaptation barriers, exploring the improvement of students' psychological status in English online classroom will help to grasp students' dominant position in teaching, pay attention to their psychological status and level in the teaching process, and improve their communication and expression ability.

* * * * *

THE INFLUENCE OF COMPUTER NETWORK SECURITY DATA ENCRYPTION TECHNOLOGY ON INTERNET ANXIETY PATIENTS

Li Li

*School of Information and Intelligent Engineering, Ningbo City College of Vocational Technology, Ningbo
315100, China*

Background: The development of Internet technology is getting better and better. For patients, various complex and high-tech Internet technologies make them feel novel and enjoy the convenience brought by the Internet, but they are also worried about the hidden dangers on the Internet. Internet fraud occurs frequently. Many people have been cheated a lot of money through the Internet, but people don't know how to prevent it. They are afraid that ill-intentioned people steal their personal information through the

Internet, so that patients have Internet anxiety. Among them, the cause of patients' Internet anxiety is the problems of computer network. These network security problems include illegal intrusion, server information leakage, computer virus and network vulnerability. Hackers illegally obtain IP packets, user names and other information of computer network system through monitoring, control and other ways. After relevant analysis, hackers destroy or tamper with computer network data, causing great losses to users. This situation is called illegal intrusion. Hacker technology is more advanced, which makes it impossible to prevent. This potential threat makes patients feel nervous and worried, resulting in Internet anxiety. There will inevitably be some defects and vulnerabilities in the computer system, and hackers with high-level computer technology will use these vulnerabilities to maliciously attack the computer network, so as to obtain some network data, make the server information leaked, and pose varying degrees of threats to the computer network security. This situation is called server information disclosure. Similarly, because hackers hide under the Internet, it is difficult for people to find their traces. They are not sure when they will attack the server. The hidden threat is difficult to control, which will also make patients anxious about the Internet. Computer viruses have the characteristics of fast propagation, great harm and wide variety. All kinds of computer viruses are hard to prevent. Each component of the computer has a corresponding computer virus, which will pose a great threat to the security of the computer network, and people are always vigilant to prevent being invaded by computer viruses. Because the openness of network technology provides convenience for the spread of network virus, the spread of network virus leads to network paralysis and the disclosure of relevant information of users. The insecurity of this network makes patients worry that their information will also be leaked, which inadvertently brings losses to themselves and makes patients have a certain degree of network anxiety. In recent years, the concept of data encryption technology has been put forward in the computer field. By means of encryption key and other means, the information can be converted into ciphertext to prevent others from reading the information, so as to protect the security of information and data. In the process of information transmission, it will maintain a high degree of concealment. Data encryption technology includes symmetric encryption technology and asymmetric encryption technology. Through these two data encryption technologies, data information can be protected from destruction or theft. According to the characteristics of data encryption technology, it can be used in computer network security protection, and its impact on Internet anxiety patients can be studied.

Objective: To understand the meaning of Internet anxiety and the causes of anxiety of Internet anxiety patients, analyze the problems of computer network security, study the characteristics and types of Internet encryption technology, and explore the impact of computer network security data encryption technology on Internet anxiety patients.

Research objects and methods: The subjects of the study were Internet anxiety patients. They learned about their Internet anxiety, their related activities on the Internet and their views on computer network security, introduced the application and function of computer network security data encryption technology, recorded relevant data, and evaluated the impact of computer network security data encryption technology on Internet anxiety patients through fuzzy evaluation method, grade 1-5 score is adopted. The higher the score, the greater the impact. SAS software is used for data processing and analysis.

Results: In recent years, the continuous development of network technology has made great changes in people's life. All kinds of daily necessities, home appliances and furniture can be purchased through the Internet, which greatly facilitates people's life. However, there are also various security problems in the Internet, leading to some people's Internet anxiety. In order to solve these computer network security problems, data encryption technology is applied to computer network security. Through computer network security data encryption technology, the security of data information is protected and the network security is improved. Among them, the impact score of cryptographic key data technology on young and middle-aged patients with Internet anxiety is 4, and the results are shown in Table 1.

Table 1. Influence of computer network security data encryption technology on Internet anxiety patients

Age group	Cryptographic key data technology	Node data encryption technology	Link data encryption technology
Juvenile	4	4	5
Youth	5	4	4
Young and middle-aged	4	5	4

Conclusions: By using a variety of computer network security data encryption technologies, the computer network security information is significantly improved, the phenomena of data loss and data destruction are significantly reduced, the user information security is guaranteed, and the Internet anxiety of Internet anxiety patients is significantly improved.

THE INFLUENCE OF COLLEGE ENGLISH ONLINE AND OFFLINE MIXED TEACHING ON COLLEGE STUDENTS' ANXIETY

Tiantian Liang

School of Foreign Languages, Shenyang Jianzhu University, Shenyang 110168, China

Background: Anxiety refers to the nervous and uneasy psychology of individuals when they encounter unsolvable problems or threats in the process of achieving goals. This is a special representation of internal psychology. During this period, individual self-esteem will be damaged and self-confidence will be hit. This kind of emotion will also appear in the process of English learning, and you will feel panic because you can't keep up with the progress of teaching. In general, normal anxiety will help students improve their learning attention, students will study more attentively, have a correct learning attitude, students' thinking will become active, students' enthusiasm will be significantly improved, and help students learn English better. When students are in excessive anxiety, their thinking will become chaotic, their thinking activity will be reduced, and students will be nervous. Once they are too nervous, mistakes will inevitably occur in the learning process, which is a great blow to students' learning enthusiasm, so as to further reduce their learning efficiency. In such a vicious circle, students' body and mind have been tortured. In the long run, students may have a psychological resistance to English, do not want to learn English and get tired of English learning. In the process of English learning, students will have varying degrees of anxiety in listening, speaking, reading and writing. English as a foreign language, students have a natural sense of strangeness, differences in different cultures and language habits, which makes students more difficult in the learning process and need to spend a lot of energy on learning and understanding. When students don't understand well and can't turn the content explained by the teacher into their own knowledge and apply it flexibly, students will have anxiety. There are many reasons for English learning anxiety, such as personal factors. There are differences in each student's learning ability, self-emotion regulation ability and competitive consciousness. Students with poor learning ability, weak self-emotion regulation ability and strong competitive consciousness are more likely to have anxiety. Because of the anxiety caused by the form of teaching activities, many students do not like to speak English in public, which will produce tension, uneasiness and cramped expression. When facing unfamiliar problems, it is easier to cause students' anxiety. Aiming at students' anxiety in English learning, this paper reforms the traditional teaching mode, and studies the impact of college English online and offline hybrid teaching on college students' anxiety.

Objective: To understand the anxiety of college students in the process of English learning and analyze its causes. On this basis, reform the traditional English teaching mode and adopt online and offline mixed teaching, so as to improve students' learning enthusiasm. Let students continue to study through offline teaching, improve their English learning level and alleviate students' anxiety imperceptibly.

Research objects and methods: The research objects are college students, randomly selected from three colleges and universities, 320 college students were selected from these schools to understand their problems in the process of English learning, master their relevant personal information, and analyze the causes of their anxiety. These students were taught English online and offline for one semester, and the relevant experimental data were recorded during the experiment. The fuzzy comprehensive evaluation method is used to evaluate the impact of college English online and offline mixed teaching on college students' anxiety, and the relevant influencing factors are quantified. The higher the score is, the greater the degree of influence is. The SAS software is used to process and analyze the relevant experimental data.

Table 1. Students' anxiety scores after the reform of college English teaching model

Grade	Listening anxiety	Writing anxiety	Reading anxiety	Oral anxiety
Freshman	2	1	1	2
Sophomore	1	2	1	1
Junior	2	1	1	1

Results: Anxiety is common in college English learning. There are many reasons for students' anxiety, including personal factors and environmental factors. Among the environmental factors, influenced by the traditional teaching mode, students' learning enthusiasm is not high, and students' anxiety is more obvious. After the reform of the traditional teaching mode, students' anxiety has been significantly alleviated, the relationship between teachers and students has gradually improved, and the learning efficiency has been

significantly improved. Freshmen's English listening anxiety was significantly relieved, and their anxiety score was reduced by 2 points. The results are shown in Table 1.

Conclusions: The cultural differences between China and the West and the limitations of teaching mode led to students' difficulty in the process of English learning, students' enthusiasm is constantly hit, and students' anxiety is becoming more and more obvious. In view of students' anxiety in English learning, the traditional teaching model is reformed. Online and offline hybrid teaching provides students with more learning time, so that they can continue to study online after class, and obtain rich knowledge through the network platform. Students' learning ability is greatly improved, which brings students more self-confidence, and the previous anxiety is slowly relieved or even cured.

Acknowledgement: Project: Innovative Study of Fostering Virtue through Foreign Language Education in Architecture Universities under the Guidance of QITO (Project No. 2021147) supported by Education Research Program of China Association of Construction Education.

RESEARCH ON THE MENTAL HEALTH OF MUSIC STAGE PERFORMERS FROM THE PERSPECTIVE OF POSITIVE PSYCHOLOGY

Nan Dong

College of Art, Puyang Vocational and Technical College, Puyang 457000, China

Background: Positive psychology is not only a revolution in the field of psychology, but also a new milestone in the development history of human society. It is an emerging science that studies the research of traditional psychology from a positive perspective. Positive psychology adopts scientific principles and methods to study happiness and advocates the positive orientation of psychology to study human positive psychological quality and pay attention to human health, happiness and harmonious development. Positive emotion is a major aspect of positive psychology. It advocates the study of individuals' positive experience of the past, present and future. In dealing with the past, it mainly studies positive experiences such as satisfaction and satisfaction. In dealing with the current situation, it mainly studies positive experiences such as happiness and happiness. In dealing with the future, it mainly studies positive experiences such as optimism and hope. Positive psychology studies the formation of self-decisive personality traits from three aspects: innate learning, creativity and curiosity are the basis of its formation. These innate natures must also be combined with certain social values and external life experiences and transformed into their own internal motives and values. The premise of its formation is that psychological needs are fully met, which includes three basic psychological needs: autonomy, competence and communication.

Anxiety is an internal conflict of individual psychology or emotion, which leads to irrational fear or excessive worry. Anxiety has many social manifestations, such as emotional anxiety, post-traumatic stress, obsessive-compulsive disorder and phobia. The mental health problems of music stage performers are mainly reflected in performance anxiety. Performance anxiety is a kind of state anxiety reflected in special scenes. It belongs to a series of physical and mental discomfort feelings or behaviors that individuals show in the process of expected activities. In the performance process, the performer's anxiety usually shows certain symptoms in physiology, psychology and thinking, such as limb trembling, rapid heartbeat, palmar sweating, etc., resulting in the decrease of behavior coordination. As an auxiliary means of teaching, music stage performance helps to improve the skills of music majors, enhance their critical thinking ability, stimulate their learning enthusiasm and improve their stage performance ability. However, many studies have shown that even experienced professional dancers in most music stage performances will show varying degrees of anxiety.

Objective: To carry out classroom teaching practice of mental health for college students majoring in music stage performance from the perspective of positive psychology, in order to eliminate learners' stage performance anxiety and provide targeted guidance, so as to help them improve their stage performance ability.

Research objects and methods: 200 students majoring in music stage performance in a university, including 21 boys and 179 girls, participated in a one semester classroom teaching practice of mental health from the perspective of positive psychology. After one semester, the stage performance ability and the improvement of anxiety symptoms of all subjects were compared before and after teaching practice.

Research design: After teaching, the self-designed "music stage performance anxiety self-rating scale" was used to evaluate the effect before and after teaching. The scale includes 30 questions. Negative items adopt the 5-level scoring method, with a score of 1-5. The lower the score, the more inconsistent with their

own feelings, and the higher the score, the more consistent with their own feelings. Positive items are scored in reverse, with a score of 30-150. The higher the score, the higher the stage performance anxiety.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: Before the experiment, the number of high, medium and low anxiety groups were 75, 75 and 50 respectively. After learner training, the number of people with high anxiety level decreased to 37 and the number of people with low anxiety level increased to 91.

Table 1. Comparison of students' stage performance anxiety before and after the experiment

Anxiety level	Score	Before teaching	After teaching
High	91-150	75	37
Secondary	76-90	75	22
Low	30-75	50	91
General situation		150	150

Conclusions: Stage performers are usually affected by personal and external factors, which often show varying degrees of anxiety and may lead to the failure of the performance. The teaching and training of mental health classroom teaching practice based on the perspective of positive psychology is not a simple stage performance training, nor is it different from the simple intensive training of performance skills. It takes into account the three aspects of stage, dance and psychology, pays attention to students' emotions, strengthens self-concept, especially strengthens the cause analysis and coping strategy training of stage performance anxiety, and gives all-round guidance to the theoretical learning and practical practice of stage performance. The learner training of mental health classroom teaching based on the perspective of positive psychology can help students use stage performance strategies, reduce their stage performance anxiety level and improve their performance effect.

* * * * *

THE APPLICATION OF EDUCATIONAL PSYCHOLOGY IN COLLEGE ENGLISH TEACHING

Hongmei Li

Department of Nursing, Leshan Vocational and Technical College, Leshan 614000, China

Background: Educational psychology is a subject that studies the law and essence of students' psychological activities. Its purpose is to cultivate students' sound personality and healthy psychology. With the gradual improvement of social requirements for students and the gradual improvement of parents' expectations, most students put forward higher requirements for their performance and stress resistance. However, limited by social experience and psychological tolerance, most students will cause a series of psychological problems because they can't bear the huge pressure. Although there are great differences in college students' life experience, growth environment and their own personality, most students feel more irritable and anxious. The main research content of educational psychology is the basic psychological laws of education and teaching in education and teaching situations. Based on psychology, the research involves teaching design, educational technology, special education and classroom management. Educational psychology can improve the level of teachers, improve the quality of education and teaching, and promote the reform of education and teaching. The problems that educational psychology needs to solve are to give full play to learners' subjective initiative, analyze the mechanism in the learning process, explore the impact of situational environment on learning results, diversified and flexible teaching models and so on. The practical significance of this discipline is to assist teachers to complete the problems in teaching work, provide scientific and reasonable theoretical guidance for teachers' teaching work, and assist teachers to analyze in practical teaching work.

Most of the factors in college English teaching, such as work interest, intelligence and so on, are usually ignored in the evaluation of work interest and interest. With the improvement of modern educational ideas, English teaching methods have changed from passive teaching such as disseminating cultural knowledge to new teaching methods that guide students to form initiative and spontaneity, so as to help students improve their body and mind in an all-round way. Data show that about 40% of college students have mental problems, and about 10% of students have major mental disorders, of which the incidence of mental disorders is 20.23%. Therefore, modern education also puts forward higher requirements for teachers'

comprehensive quality. In addition to allowing students to learn professional knowledge, we also need to pay close attention to the changes of students' psychological spirit. Integrating educational psychology into college English teaching can not only improve students' spontaneity of automatic learning, but also improve students' psychological problems to a certain extent. The new teaching model in English classroom not only has rich curriculum resources, but also can fully mobilize students' diversified consciousness. Ensure that the classroom atmosphere is open and active, so that students can have dual interaction. Pay attention to cultivating students' learning interest and stimulating students' learning potential. Use a wide range of knowledge to impress students. Extensive subject knowledge is not limited to English teaching itself, but also includes humanistic knowledge, cultural knowledge and natural science knowledge related to English education. It plays an important role in improving the humanistic atmosphere of English teaching and enhancing the effect of English teaching.

Objective: This paper analyzes the impact of college English teaching combined with educational psychology on students' mental health, in order to provide new ideas for the new teaching model in colleges and universities.

Research objects and methods: 200 students with different degrees of psychological problems in a university were randomly selected as the research object. According to the random grouping method, they were divided into the control group and experimental group. The control group used conventional English teaching methods, and the experimental group used new English teaching methods. The intervention lasted for 3 months. Mental health was assessed by Symptom Checklist-90 (SCL-90), and the evaluation grade was classified by a Clustering Algorithm Based on Random Search (CLARANS). The scale includes 90 items and 10 subscales, of which subscale 10 is not used for these statistics. The nine-factor subscales were somatization, obsessive-compulsive disorder, interpersonal sensitivity, depression, anxiety, hostility, phobia, paranoia and psychosis. The maximum score of each item in each subscale is 4 points. The higher the self-score of each item, the more serious the symptoms. The subjects' self-evaluation of each item is equal to or greater than 3 points, which is used as the standard to determine the degree of moderate and above.

Methods: Through the latest version of Epi Info data statistical analysis software, this paper analyzes the effect of new college English teaching methods on students' mental health.

Results: Table 1 refers to the experimental group in the improvement of mental health in the whole experimental cycle. The psychological problems of the patients in the experimental group were significantly improved, and the degree of improvement was gradually obvious with the increase of the implementation time of the new English teaching method. Therefore, the introduction of English teaching methods combined with educational psychology in the experimental group has an obvious effect on the intervention of patients' psychological problems.

Table 1. The proportion of mental health improvement in the experimental group in the whole experimental cycle (%)

Mental health indicators	After 1 month	After 2 months	After 3 months
Somatization	72.21	81.36	86.29
Obsession	72.36	82.13	87.56
Interpersonal sensitivity	71.28	82.36	84.16
Depressed	74.28	82.48	89.23
Anxious	73.68	82.39	86.34
Hostile	75.21	82.94	86.29
Terror	74.14	82.36	87.56
Paranoid	73.21	83.28	84.16
Psychotic	74.16	83.78	83.25

Conclusions: The new model of English teaching combined with educational psychology can alleviate students' psychological problems, which are embodied in obsessive-compulsive disorder, interpersonal sensitivity, depression, anxiety and so on. In the future, this new teaching model can be applied to other schools for promotion.

THE PENETRATION OF PERSONALITY PSYCHOLOGY IN IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES

Shuo Feng

Office of Student Affairs, Chifeng University, Chifeng 024000, China

Background: College students are facing academic pressure and employment pressure at the same time, with great psychological pressure. However, college students' mind is not yet fully mature, and they cannot well control and face negative emotions under pressure, which will produce anxiety symptoms. At the psychological level, anxiety belongs to a kind of negative emotion. It is a dangerous state in which individuals are unable to achieve their goals or overcome obstacles, which leads to the frustration of individual self-confidence and self-esteem, increases the sense of frustration and frustration, and then forms a state of tension, anxiety and fear. Usually, anxiety will lead to physiological reactions such as rapid heartbeat, elevated blood pressure, trembling, sweating, dizziness and so on. Therefore, long-term excessive anxiety will not only affect students' mental health, but also damage students' physical health, affect students' daily life and learning, and have a negative impact on students' academic and long-term development.

Personality psychology is a branch of psychology, which mainly studies the unique behavior patterns of individuals, including beliefs, self-concept, personality and so on. Personality psychology holds that each individual has unique characteristics, that is, the specificity of behavior characteristics and personality composition characteristics. This uniqueness leads individuals to choose different coping styles when facing the same problem. Ideological and political education is the main way to improve students' psychological quality and alleviate students' anxiety. However, the traditional ideological and political education in colleges and universities ignores the uniqueness and differences of students. Students have little interest in ideological and political education courses, so it is difficult to play its role in improving students' psychological quality. The research integrates personality psychology into ideological and political education, analyzes the relationship between students' behavior patterns, psychological changes and personality characteristics in ideological and political education, so as to innovate and improve the teaching mode of ideological and political education, so as to better alleviate students' anxiety and improve students' psychological quality.

Objective: College students are faced with academic pressure and employment pressure at the same time, which is easy to produce anxiety symptoms. Based on personality psychology, the research improves and innovates the traditional teaching mode of ideological and political education in colleges and universities, so as to alleviate students' anxiety and improve students' psychological quality.

Research objects and methods: Two classes were randomly selected in a university as the research objects, and the anxiety degree of the research objects was evaluated by the Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90).

Research design: One class was selected as the research group (68 people), and the improved teaching mode of Ideological and political education in colleges and universities based on personality psychology was adopted for teaching. The other class is the control group (71 people), which adopts the traditional teaching mode of ideological and political education in colleges and universities. After teaching for a period of time, compare the SAS score and SCL-90 score of students in the two classes.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: Before teaching, there was no significant difference in SAS score and SCL-90 score between the two groups ($P > 0.05$). After a period of teaching, the SAS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P > 0.05$). Among them, the changes of SAS scores of the two groups of students before and after teaching are shown in Table 1.

Table 1. Changes of SAS scores of two groups of students before and after teaching

Timing	Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	68.7±3.8	68.6±2.9	0.246	0.752
After teaching	42.1±1.3	57.4±3.8	6.537	0.013
<i>t</i>	8.462	4.453	-	-
<i>P</i>	0.000	0.012	-	-

Conclusions: College students are facing academic pressure and employment pressure at the same time, and their psychological pressure is large. However, college students' mind is not yet fully mature, and they

cannot well control and face the negative emotions under pressure, which will produce anxiety symptoms. Ideological and political education is not only an important way to strengthen the ideological construction of educational objects, but also the main method to guide educational objects to cultivate correct outlook on life and values. It plays an important role in establishing the self-confidence of educational objects, cultivating good moral concepts and strengthening the ideals and beliefs of educational objects. It is of great significance to the moral quality level, mental health construction and future development of educational objects. Based on personality psychology, the research improves and innovates the traditional teaching mode of ideological and political education in colleges and universities. The results showed that there was no significant difference in SAS score and SCL-90 score between the two groups before teaching ($P > 0.05$). After a period of teaching, the SAS score and SCL-90 score of the students in the research group were significantly lower than those in the control group ($P > 0.05$). Therefore, improving the teaching mode of ideological and political education in colleges and universities based on personality psychology can effectively alleviate students' anxiety and improve students' psychological quality.

THE IMPACT OF “RURAL REVITALIZATION +” SPORTS CULTURE TOURISM INDUSTRY DEVELOPMENT ON TOURISTS’ PSYCHOLOGICAL BARRIERS BASED ON SOCIAL PSYCHOLOGY

Yuantong Zhang

Department of Physical Education, Zhengzhou Business University, Zhengzhou 451200, China

Background: Social psychology refers to the study of the occurrence and change law of psychology and behavior of individuals and groups in social interaction. Social psychology discusses interpersonal relationships at the individual level and social group level. The research contents at the individual level include: individual socialization process, communication, speech development, partners, the impact of family and living environment and school on individuals. The research contents at the social group level include: group communication structure, group norms, attitudes, racial prejudice, aggressive behavior, customs and culture, etc. Psychoanalytic theory was founded by Austrian psychiatrist Freud at the end of 19th century and the beginning of 20th century. Early theories believed that all human behavior motives were related to sexual instinct and impulse; Behind sex is a sexual potential called “Libido”, which often drives people to pursue pleasure. The later theory holds that people have sexual instinct and self-instinct pointing to the growth and promotion of life, that is, survival instinct, but also death instinct expressed as the desire to kill. Over the past decade, the mortality rate of middle-aged people aged about 50 has increased the fastest, of which 70% is directly due to mental fatigue, work pressure, mental tension, psychological burden, emotional instability, too fast pace of life, too fierce competition and so on. The reasons for this situation are: First, the awareness of physical fitness is relatively weak; Second, it is easy to ignore the combination of work and rest, resulting in long-term mental fatigue; Third, lack of sleep. Therefore, mental fatigue, mental stress and continuous tension will seriously endanger physical and mental health. This kind of harm is multi-link and multi-level, which is difficult to be antagonized by general drugs.

In recent years, China has accelerated the revitalization of rural areas. The pace of development, especially the development of sports and cultural tourism industry, attaches great importance to the development of rural tourism, and has formulated many corresponding measures in terms of policies to promote the development of rural sports and cultural tourism industry. Under this background, many rural villages and mountainous areas with tourism resources have begun to vigorously develop sports and cultural tourism, but due to lack of experience in the development process and insufficient supporting infrastructure and funds, there are many problems in the process of tourism development, such as blind development in pursuit of economic benefits, which has an impact on the development level, competitiveness and environment, which is very unfavorable to the sustainable development of China's tourism development. From the demand level theory, balance theory and conformity theory of social psychology, we can analyze the internal deep-seated reasons for the development of “rural revitalization” sports culture tourism industry. Its essence is to take sports culture as the core connotation, express this culture through tourism forms, and realize the in-depth understanding and specific practice of sports culture in the process of tourism.

Objective: In modern civilized society, people's pace of life is faster and faster, and the pressure of work is also greater and greater. It is very easy to have all kinds of psychological obstacles in life and work. This

paper investigates and analyzes the psychological obstacles and influencing factors of rural sports and cultural tourism participants by studying the ways and methods to promote the development of rural sports and cultural tourism from the perspective of psychology.

Research objects and methods: Using stratified cluster random sampling method, five rural areas were randomly selected for field survey, and 200 tourists of different ages and genders were randomly selected. A total of 200 questionnaires were distributed, and 200 valid questionnaires were recovered, with a recovery rate of 100%.

Research design: Hamilton Anxiety Scale (HAMA) was used to judge the development of rural sports and cultural tourism, and the psychology of tourists was analyzed. The scale can reflect the severity of the disease, including physical anxiety and mental anxiety. If the score is lower than 6, there is no depression; if the score is between 7 and 17, there may be anxiety; if the score is between 14 and 21, there is anxiety; if the score is more than 21, there is significant anxiety.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: The total HAMA score of tourists after the tour was significantly lower than that before the tour ($P < 0.05$), and the factors of mental anxiety and physical anxiety were significantly lower ($P < 0.05$).

Table1. Improvement of tourists' anxiety before and after tourism

Score	Factor		t	P
	Before tourism	After tourism		
HAMA total score	19.16	9.68	2.476	<0.05
Mental anxiety	10.79	5.23	3.401	<0.05
Somatic anxiety	8.27	4.60	3.390	<0.05

Conclusions: Actively cultivate the awareness of sports cultural tourism and improve the information system of sports cultural tourism. The improvement of information system is one of the effective ways to expand the social benefits of sports cultural tourism and improve personal expectations. Only by improving the social benefits and social expectations of sports cultural tourism can we better promote the development of sports cultural tourism. In view of the low popularity and attraction of sports cultural resources in some rural areas, as well as the lack of tourists' understanding of sports cultural tourism, we can strengthen publicity, coordinate the relationship between all aspects, and comprehensively, systematically, deeply and persistently publicize sports cultural tourism. For example, enrich the content and types of sports and cultural tourism projects, develop more tourism projects with both leisure value and economic value, and create different tourism projects according to the needs of tourists of different genders and ages. Only by improving the perceived value of sports culture tourists can we enhance the popularity of sports culture tourism and promote the development of sports culture tourism industry.

THE INFLUENCE OF COLLEGE ENGLISH TRANSLATION AND INFORMATION TEACHING INNOVATION ON COLLEGE STUDENTS' THINKING LOGIC OBSTACLES

Yanhua Ma

School of English Language, Zhejiang Yuexiu University, Shaoxing 312000, China

Background: Thinking is the reflection of human brain's indirect generalization of objective things and the highest form of human cognitive activities. The materials obtained from perception form concepts through brain analysis, comparison, synthesis, abstraction and generalization. The whole process is called thinking. Thinking is a pathological state that lacks its inherent logical connection and cannot be understood by normal people, which is called thinking logic disorder. There are many different classifications of thinking disorders, including thinking speed disorder, thinking form disorder, lack of purpose orientation, pathological symbolic thinking and so on. Patients occasionally feel that their thinking does not belong to them, that their thinking activities lose their autonomy, or that they are controlled by external forces, such

as thinking deprivation, thinking insertion, thinking dissemination and other experiences. This classification is suitable for clinical diagnosis, but it focuses on the research of schizophrenic thinking disorder, and pays less attention to organic encephalopathy or other mental thinking disorders. Generally, thinking disorder refers to the abnormality in the amount and speed of thinking association activity. The clinical manifestations of thinking disorder include thinking runaway, thinking slow, thinking poor, thinking broken, thinking loose, thinking interrupted, thinking incoherent, pathological restatement and so on. From the perspective of psychology, thinking obstacles are generally divided into four categories: process obstacles, thinking motivation obstacles, thinking motivation components obstacles and thinking content obstacles.

With the increasing pressure of college students in study, life and employment, there are more and more negative emotions. As a practical subject, college English aims to cultivate students' language communication ability and language application ability, so that students can have a certain understanding of western culture, so as to successfully complete cross-cultural communication. In the past teaching process, teachers used the content of teaching materials as the main carrier to transmit simple theoretical knowledge to students, ignoring students' psychological problems, resulting in the teaching effect not reaching the expectation. In order to meet the requirements of modern teaching, teaching methods must keep pace with the times, integrate practical skill education and quality education, change the traditional concept of training translation talents through advanced educational methods, and cultivate translation talents with cross-cultural communication ability, professional ability, innovation ability and social adaptability, in order to meet the needs of society for high-quality compound applied English translation talents. Teaching innovation in the context of informatization and the application of project teaching methods to classroom practice can improve the problems existing in the traditional teaching mode, bring the richer learning experience to students, improve students' psychological problems, and finally realize the continuous improvement of college students' comprehensive language ability. College students should get rid of their own logical thinking obstacles, such as the inability to accurately grasp the connotation of concepts, the misjudgment of reasoning premise, the inversion of cause and effect and so on. Therefore, it is particularly urgent to analyze the current situation of college students' thinking logic obstacles, find problems in time and take appropriate measures to solve psychological obstacles. This study discusses the methods of college English translation and information-based teaching innovation based on the obstacles of thinking logic. Based on the empirical investigation of college students, this paper analyzes the existing problems and targeted solutions.

Objective: In the process of college English translation and information-based teaching, colleges and universities must focus on the thinking logic obstacles of college students in the process of the English translation. Therefore, this study aims to explore the innovative methods of college English translation and information teaching based on the obstacles of thinking logic.

Research objects and methods: In order to verify the effectiveness of the innovative model of college English translation and information-based teaching, 372 college students were randomly selected for a questionnaire survey. The subjects were randomly divided into experimental group and control group, with 186 people in each group. The experimental group was given the innovative mode of translation and information teaching, and the control group was given the conventional teaching mode. This paper analyzes the effect of innovative teaching of college English translation and information technology on improving students' thinking logical obstacles.

Research design: Taking the thinking logic disorder of college students in English learning as the research direction, the self-designed thinking disorder diagnosis scale is used to evaluate the situation of students' thinking logic disorder. The scale is divided into qualitative and quantitative, with a full score of 10. The qualitative score accounts for 30% of the items on this scale. It mainly evaluates the presence or absence of symptoms. 0 means no data, 1 means no, 2 means suspicious, and 3 means yes. The quantitative score accounts for 70% of the items on this scale. 0 indicates no data, 1 indicates no or normal, 2 indicates suspicious, 3 indicates light, 4 indicates medium, 5 indicates heavy, 6 indicates heavy, and 7 indicates extremely heavy.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Table 1. Changes in the total score of college students' thinking disorders before and after intervention ($\bar{x} \pm s$)

Time	Total score of thinking disorder		t	P
	Experience group	Control group		
Before teaching	3.15±1.22	3.11±1.29	0.284	0.796
After teaching	2.64±1.16*	3.12±1.24	2.752	0.018

Note: Comparison of this group, * $P < 0.05$.

Results: It can be seen from Table 1 that before the application of the innovative teaching mode of college English translation and information teaching, the total score of thinking disorder between the two groups of college students was not statistically significant ($P < 0.01$). After application, the total score of thinking disorder in the experimental group decreased significantly ($P < 0.01$), while there was no significant change in the control group ($P > 0.05$).

Conclusions: More and more colleges and universities will regard the innovation of teaching and training ideas, the construction of translation technology courses and the reform of translation teaching methods as an essential part of translation teaching innovation. Students' mental health problems should be included in the professional curriculum system, which can also effectively change the teaching ideas of translation teachers and improve the translation ability of college students. In the process of project research and operation, students can continuously improve their language expression ability and application ability, complete the training of highly skilled and high-quality English talents, and improve students' mental health problems.

THE ROLE OF PROJECT-BASED AND INFORMATION-BASED ENGLISH TEACHING IN IMPROVING STUDENTS' COGNITIVE IMPAIRMENT

Jingning Li

Department of Basic Courses, Yangzhou Polytechnic Institute, Yangzhou 225127, China

Background: Cognition is a process in which the human brain receives external information, processes it and transforms it into internal psychological activities, so as to obtain knowledge or apply knowledge. Cognition includes memory, language, visual space, execution, calculation, understanding and judgment. When one or more of the above cognitive functions are damaged, it can be identified as cognitive impairment. If it further affects the individual's daily or social ability, it can be diagnosed as dementia. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder, senile dementia, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression and so on. Cognitive impairment mainly includes perceptual impairment, memory impairment and thinking impairment. The causes of the above cognitive impairment are various. In addition to organic diseases, most of them are caused by mental disorders. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder, senile dementia, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression and so on. With the increasing pressure of college students in study, life and employment, there are more and more negative emotions. According to the data, there were 50 million patients with cognitive impairment worldwide in 2018, and it is predicted that it will increase to more than 80 million in 2030. In the era of information technology, it is an important task for colleges and universities to deepen the reform of English teaching how to use information technology for teaching design of higher vocational English courses with project-based teaching. Some scholars put forward that information-based teaching design is to use systematic methods, take learning as the center, make full use of modern information technology and information resources, and scientifically arrange all links and elements of the teaching process, so as to realize the optimization of the teaching process. Apply information technology to build an information environment, obtain and use information resources, support students' independent inquiry learning, cultivate students' information literacy and improve students' learning interest, so as to optimize the teaching effect. However, there are no effective drugs to improve the symptoms of patients with cognitive impairment. Research shows that physics and cognitive stimulation teaching can effectively alleviate the process of college students' cognitive impairment. Therefore, if the college students' psychological quality is relatively good, it is easy to solve the current college students' psychological problems if the college students' psychological quality is in place and other college students' psychological quality is relatively good. On contrary, it will induce many other psychological problems. Therefore, it is particularly urgent to analyze the current self-awareness of college students, find problems in time and take appropriate measures to solve psychological obstacles. In recent years, the direction of teaching innovation in colleges and universities began to focus on improving students' mental health problems, especially students' cognitive impairment. The purpose of this study is to explore the impact of college English project-based and information-based teaching innovation model on college students' cognitive impairment, and to provide some reference for the rehabilitation treatment of college students

with cognitive impairment.

Objective: Based on psychological theory, to break the original college English teaching material system, integrate and innovate the teaching content, and implement the innovative teaching mode of college English project-based and information-based teaching. It not only meets the needs of students' daily communication, but also improves their interest in learning English, but also effectively improves students' cognitive and psychological problems.

Subjects and methods: 180 college students with cognitive impairment were randomly selected, including 81 girls and 99 boys, with an average age of 20.9±1.4. The subjects were divided into experimental group and control group, with 90 students in each group.

Research design: The experimental group was given the innovative education model of college English project-based and information-based teaching. The control group was given the conventional college English teaching mode. After teaching, the cognitive impairment of the two groups of college students before and after teaching is compared. MMSE scale and ADAS cog scale are mainly used to judge the cognitive impairment of college students before and after teaching innovation education mode education.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: Before teaching, the MMSE scores of the two groups increased significantly and the ADAS cog scores decreased significantly ($P < 0.05$). After teaching, there were significant differences in MMSE and ADAS cog scores between the two groups ($P < 0.05$). As shown in Table 1.

Table 1. Comparison of MMSE and ADAS cog scores between the two groups in different periods

	Group	Experience group	Control group	<i>P</i>
MMSE	Before teaching	20.08±2.51	20.28±2.14	0.585
	After teaching	25.31±2.71*	22.19±3.18*	0.030
ADAS-cog	Before teaching	19.94±2.58	19.85±2.47	0.368
	After teaching	13.46±1.84*	17.67±2.25*	0.022

Note: Compared with the baseline MMSE or ADAS cog score of this group, * indicates $P < 0.05$.

Conclusions: English teaching reform in higher vocational colleges is a long-term project, which needs the cooperation and support of teachers and students. In the context of informatization, using a project-based teaching method to carry out English teaching requires teachers to continuously improve their informatization teaching level and set up projects closely combined with teaching contents for students on the basis of fully understanding students' psychological status and learning needs. In the process of project research and operation, students can continuously improve their language expression ability and application ability, complete the training of high-skilled and high-quality English talents, and improve students' mental health problems, especially students' cognitive impairment.

Acknowledgement: The research is supported by: 2020 Jiangsu Social Science Application Project-Foreign Language Project "Higher Vocational English Project-Based Learning Practice" (No. 20SWC-49); "PBL Based Research on Public English Teaching Model in Vocational Colleges" (No. 2020SJB1311), 2020; 2020 YPI Educational and Teaching Reform Project", the Application of Higher Vocational English Project-Based Learning" (No. 2020XJG55).

THE INTEGRATION OF MODERN ART DESIGN AND FOLK ART IN THE CONTEXT OF COGNITIVE IMPAIRMENT

Qiwen Guan

Fine Arts College, Hubei University of Arts and Science, Xiangyang 441053, China

Background: Cognitive impairment belongs to mental disorders, mental diseases, cognitive defects or abnormalities. The first is sensory impairment, such as sensory allergy, sensory retardation, internal discomfort, sensory deterioration, sensory deprivation, pathological illusion, hallucination and sensory comprehensive disorder. Second, memory impairment, such as strong memory, memory defect and memory error. The third is thinking obstacles, such as abstract generalization process obstacles, association process obstacles, thinking logic obstacles, delusions and so on. There are many reasons for the above cognitive impairment, most of which are caused by mental disorders, except for organic diseases. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder,

senile dementia, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression and so on. Modern art design has an important relationship with the development of the times, especially after China's reform and opening up, foreign art ideas follow, and cultural exchanges have been formed, which has also created the style of modern art design. Folk art is not only an integral part of China's folk culture, but also the root and foundation of modern art design style creation. Therefore, folk art also affects the development of modern art design. The integration between the two can form a new artistic style, which not only retains the development characteristics of the times, but also reflects the connotation of folk culture. Although there are some differences between the two, they can also be organically integrated, show the unique charm of folk art, promote the development of modern art design, pursue the ultimate beauty, and add some philosophical ideas. To continuously improve the development of modern art design, we must integrate with folk art. With the help of the role and value of folk art, we can not only retain the characteristics of modern art design, but also increase its practicality and artistry, convey more humanistic spirit and highlight China's traditional history and culture. Research shows that the integration of modern art design and folk art can make patients with cognitive impairment relax physically and mentally and bring them unique feelings. Some scholars predict that the number of patients with cognitive impairment will increase to more than 80 million in 2030. Although there is no effective drug to improve the symptoms of patients with cognitive impairment, the symptoms of cognitive impairment can be alleviated through art forms. In the process of cultural tourism, people enjoy their hearts through the aesthetics of modern art and folk art, so as to reduce the psychological pressure of transformation to a great extent, especially the problem of cognitive impairment. People can make conventional empirical judgment on the benefits of art to mental health. However, there are still few research materials on the impact of the integration of modern art design and folk art on the elements of cognitive impairment.

Objective: There are some differences between modern art design and folk art, with strong internal relations. It can even be said that folk art has brought inspiration to modern art. Therefore, the full integration between the two can be realized. The purpose of this study is to explore the impact of the integration of modern art design and folk art on patients with cognitive impairment, and to provide some reference for the rehabilitation treatment of patients with cognitive impairment.

Research objects and methods: This study mainly analyzes the changes of patients with cognitive impairment under the integration and development of modern art design and folk-art connotation. 200 patients with cognitive impairment were divided into control group (100 cases) and observation group (100 cases). The observation group was given the treatment scheme of the integration mode of modern art design and folk-art connotation, and the control group was given the routine treatment scheme.

Research design: Before and after the integration of modern art design and folk art, the simple mental state examination scale (MMSE) was used for evaluation, including memory, attention, understanding and time orientation, with a total score of 0-30, which is directly proportional to ability. The ability of daily living is used for evaluation, which involves eating, dressing, grooming, toilet and other dimensions. The total score is 0-100, and the score is directly proportional to the ability. Judge the effect of the integration of modern art design and folk art on patients with psychological cognitive impairment.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: There was no significant difference in MMSE score and ADL score between the two groups before intervention ($P > 0.05$). However, after the intervention, the score of the observation group was significantly higher than that of the control group ($P < 0.05$). As shown in Figure 1.

Figure 1. The improvement effects of the two groups after intervention were compared

Conclusions: Mental health is not only an issue that we must pay attention to, but also a factor that designers must focus on. Although any design will always leave regrets and it is difficult to be comprehensive, by studying the essence of the interaction between design and mental health, we can realize and meet people's needs for the health of the first element of survival as much as possible. There are some differences between modern art design and folk art, with strong internal relations. It can even be said that folk art has brought inspiration to modern art, and the two can be fully integrated. Folk art can provide sufficient inspiration or creative resources for modern art design, which is also the important role and value of folk art. It can constantly expand the thinking of modern art design, create a design style with both modern sense and folk innocence, and inherit the connotation of folk art.

RESEARCH ON THE CONSTRUCTION OF DISCOURSE POWER OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Jiangfeng Lei

Institute of Marxism Studies, Chongqing Technology and Business, Chongqing 400052, China

Background: Educational psychology belongs to pedagogy. It mainly studies various psychological phenomena and their changes in the process of educators learning and mastering knowledge and skills under the influence of education and teaching. Educational psychology can be applied to designing courses, improving teaching methods, promoting motivation and helping students face the difficulties and challenges they face in the process of growth, with special attention to students with special educational needs. Such as the first response effect, so that students can leave a good first impression and stimulate students' interest in learning when receiving ideological and political education. Secondly, positive psychology in educational psychology can enable students to overcome difficulties with an optimistic and positive attitude when facing difficulties and challenges in life. Educational psychology is a science that studies the basic psychological laws of teaching and learning in education and teaching situations. It mainly studies the psychological process of the interaction between teachers and students and the psychological phenomenon in the process of teaching and learning. Educational psychology should focus on studying various psychological phenomena and their development laws under the influence of education and teaching, and establish its own theoretical system in combination with reality, so as to directly promote the reform of education and teaching, improve the quality, and achieve the most ideal development level of students with the best effect. In addition, there are many viewpoints in educational psychology that can be applied to ideological and political education and can play a good role. Ideological and political education is a basic course for teaching and educating people, moral construction and cultivating excellent talents in colleges and universities. Its main purpose is to cultivate students' moral quality and correct students' wrong ideological understanding, so as to improve students' comprehensive quality as a whole. With the continuous progress of science and technology, the way of ideological and political education in colleges and universities is also changing. It is necessary to constantly adapt to the changes of the times, solve the problems faced at present, ensure the effectiveness of education, innovate the mode in line with the current ideological and political education work, and improve the educational methods, which are the topics of the times faced by the ideological and political education in colleges and universities. It is necessary to study the related problems and promotion paths of the discourse power of ideological and political education in colleges and universities from the perspective of educational psychology, and analyze the problems faced from the two aspects of educators and student. At present, many viewpoints in educational psychology have been used in ideological and political education and have played a great role.

Objective: With the development of society and the state's attention to ideological and political education, the development of ideological and political education in colleges and universities has attracted more and more attention from all aspects. How to find a practical way the development of ideological and political education in colleges and universities is a problem we need to pay attention to and explore. This study integrates psychology into ideological and political education in order to improve the discourse power of ideological and political education.

Research objects and methods: 400 questionnaires were randomly sent to college students in a university through the synchronous distribution of questionnaires online and offline. The content of the

questionnaire is how to view the discourse power of ideological and political education from the perspective of educational psychology. The final valid questionnaire is 350. The 350 students were randomly divided into the control group and experimental group, with 175 students in each group. The control group was given routine ideological and political teaching, and the experimental group was given the education method after the reconstruction of the discourse right of ideological and political education.

Research design: Before and after teaching, all subjects were investigated with the Index of Well-Being (IWB) questionnaire, which was mainly used to investigate the happiness experienced by students before and after class. All items adopt the 7-level scoring method. The weight of the emotion index is 1 and the score is 1-7. The higher the score, the more hopeful it is. On the contrary, the more hopeless it is.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: Before teaching, the total scores of emotion index, life satisfaction and subjective well-being index between the two groups were not statistically significant ($P > 0.05$). After teaching, the total scores of emotion index, life satisfaction and subjective well-being index in the experimental group were significantly higher than those in the control group ($P < 0.001$). It shows that colleges and universities have higher effect and application value than conventional teaching after applying the education mode reconstructed by the discourse power of ideological and political education.

Table 1. Comparison of indicators between the two groups before and after teaching

Score		Experience group	Control group	<i>t</i>	<i>P</i>
Affective index score	Before teaching	5.18±0.89	5.22±0.89	0.774	0.467
	After teaching	5.87±0.42	5.14±1.08	14.492	<0.001
Life satisfaction score	Before teaching	4.85±1.23	4.95±1.22	1.238	0.238
	After teaching	5.82±0.83	5.16±1.24	8.619	<0.001
Total score of happiness index	Before teaching	10.14±2.15	10.65±1.98	0.117	0.227
	After teaching	12.41±0.95	10.71±2.37	12.116	<0.001

Conclusions: Educational psychology can provide teachers with a powerful weapon. Using the theory of educational psychology, we can have insight into students' psychology, design teaching methods in line with students' cognitive style, teach students according to their aptitude, carry out targeted teaching, cultivate students' interest and enthusiasm in class, so that students can better absorb classroom knowledge and improve classroom performance. The full application of educational psychology in ideological and political education in colleges and universities can respond to the call of national ideology, better improve the teaching quality of colleges and universities, drive the school to educate people with culture, psychology and moral education, and cultivate talents with all-round development of morality, intelligence, physique, beauty and labor from a higher level.

Acknowledgement: The research is supported by: National Social Science Fund Project "Research on Ideological Security Governance in Colleges and Universities in the Era of Big Data" (No.20BKS144); Phased Achievements of the Humanities and Social Sciences Planning Fund Project of the Ministry of Education "Research on the Construction of the Discourse Power of China's Mainstream Ideology in the New Media Era" (No.19XJA71006).

THE INFLUENCE OF TEACHING REFORM PRACTICE OF IDEOLOGICAL AND POLITICAL CONSTRUCTION IN COLLEGES AND UNIVERSITIES ON COLLEGE STUDENTS' COGNITIVE IMPAIRMENT

Bo Li

Department of Biological & Chemical Engineering, Shandong Vocational College of Science and Technology, Weifang 261053, China

Background: Cognition is a process in which the human brain receives external information, processes it and transforms it into internal psychological activities, so as to obtain knowledge or apply knowledge. It includes memory, language, visual space, execution, calculation, understanding and judgment. Cognitive impairment refers to the impairment of one or more of the above cognitive functions and affects the individual's daily or social ability, which can be diagnosed as dementia. The human brain involves a wide range of cognitive functions, including learning, memory, language, movement, thinking, creation, spirit,

emotion, etc. Therefore, the manifestations of cognitive impairment are also diverse. These manifestations can exist alone, but they often appear together. Rehabilitation of cognitive function. Clinically, cognitive impairment is classified, such as executive dysfunction, memory impairment, visuospatial disorder, etc. targeted and repeated training is adopted, and attention is paid to purpose and interest in training, so as to make it easier for patients to accept. Research shows that the integration of ideological and political education into teaching mode in college curriculum can effectively improve the symptoms of patients with cognitive impairment and bring unique feelings.

Ideological and political education in the curriculum is to integrate ideological and political education into curriculum teaching, find the relationship between professional knowledge and ideological and political education content, realize the introduction of ideological and political education-related content in the process of curriculum development, and realize the educational purpose through the infiltration of various disciplines. In 2016, the national conference on ideological and political work in colleges and universities stressed the need to make all kinds of courses go hand in hand with ideological and political theory courses to form synergy. At present, many domestic colleges and universities are still in the exploratory stage for the integration of ideological and political education and various disciplines, and do not make effective use of teaching resources. Some teachers still only pay attention to students' professional knowledge and practical skills, and their understanding of ideological and political education is still limited. Some scholars pointed out that it is very necessary to integrate ideological and political education into college courses and find the internal relationship between them, so as to better help students learn engineering courses and improve students' bad negative emotions at the same time. Research shows that the integration of ideological and political education into teaching mode in the college curriculum can effectively improve the symptoms of patients with cognitive impairment and bring unique feelings. According to the requirements of the Ministry of education, colleges and universities should take Marxism as the teaching position, cultivate students' scientific cognition in engineering majors such as circuits, and improve students' ability to analyze and understand problems. In the process of learning, college students integrate ideological and political education into the teaching of college courses to delight their hearts, so as to reduce the psychological pressure of transformation to a great extent, especially the problem of cognitive impairment.

Objective: In order to better integrate ideological and political education into college curriculum teaching, aiming at the symptoms of college students' cognitive impairment, this study integrates ideological and political education into conventional curriculum teaching, and constructs a college curriculum ideological and political integration teaching model, hoping that this teaching model can improve college students' cognitive impairment.

Subjects and methods: In a regional university, 100 students with anxiety disorder were randomly selected, regardless of gender, age and major. 100 subjects were randomly divided into the control group and experimental group, with 50 people in each group. The experimental group was given the teaching mode of integrating ideological and political education into the curriculum, and the control group was given conventional traditional teaching. In the teaching process, teachers treat all subjects objectively and equally.

Research design: The intervention time was 2 months. The cognitive impairment of college students before and after the intervention was compared. The cognitive impairment of college students before and after the intervention was judged by using the Neuropsychiatric Inventory Questionnaire (NPI-Q) and Alzheimer's Disease Cooperative Study ADL Scale (ACDS-ADL).

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: The baseline scores of ACDS-ADL in the experimental group and the control group decreased significantly in the first and second months ($P < 0.05$). The ACDS-ADL scores of the experimental group at the first and second months were significantly lower than those of the control group ($P < 0.05$).

Table 1. Comparison of ACDS-ADL scores between the two groups in different periods

Group	Baseline	Month 1	Month 2
Experience group	64.59±7.54	56.24±7.56*	54.75±8.13*
Control group	66.37±8.47	60.17±9.20*	57.16±10.35*
<i>t</i>	2.092	4.048	0.039
<i>P</i>	0.529	5.168	0.034

Note: Compared with the baseline ACDS-ADL score of this group, * $P < 0.05$.

Conclusions: Improve psychological adjustment, let students understand their psychological state through the teaching of the course, master the methods of self-regulation, and improve the ability to deal with setbacks, so as to enhance the ability of social adaptation. Train students to adjust their mental state, provide students with methods to maintain their mental health, and help students establish correct

communication psychology. The integration of ideological and political education into teaching helps college students establish a correct world outlook, outlook on life and values. After freshmen enter the school, we use the freshmen survey to focus on students with family changes, emotional frustration and abnormal emotions. Through the integration of ideological and political education into teaching, we can correctly guide freshmen to correctly treat setbacks and pressures. Regularly carry out campus activities conducive to students' physical and mental health, guide students to actively pay attention to their own mental health, and lay a solid psychological foundation for the all-round development of students.

* * * * *

THE INFLUENCE OF THE FORMULATION OF LAWS AND REGULATIONS AND LEGAL SANCTIONS ON PATIENTS WITH COGNITIVE IMPAIRMENT

Juan Li

Xinlian College, Henan Normal University, Xinxiang 453000, China

Background: It is a series of processes involving the acquisition of knowledge, emotion and cognition of the body. Cognitive impairment refers to the pathological process of abnormal brain advanced intelligent processing related to the above learning, memory and thinking judgment, resulting in serious learning and memory impairment, accompanied by aphasia or apraxia, or agnosia or anorexia. The basis of cognition is the normal function of cerebral cortex. Any factor that causes the abnormal function and structure of cerebral cortex can lead to cognitive impairment. Because the function of the brain is complex and different types of cognitive impairment are interrelated, that is, cognitive problems in one aspect can cause cognitive abnormalities in another or more aspects. Therefore, cognitive impairment is one of the most difficult problems in the diagnosis and treatment of brain diseases. There are many reasons for cognitive impairment, most of which are caused by mental disorders, except for organic diseases. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder, senile dementia, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression and so on. Perceptual disorders, such as hypersensitivity, hypoesthesia, internal discomfort, sensory deterioration, sensory deprivation, pathological illusion, hallucination and perceptual comprehensive disorder. Memory impairment, such as strong memory, memory defect and memory error. Thinking obstacles, such as abstract generalization process obstacles, association process obstacles, thinking logic obstacles, delusions, etc.

The direct purpose of creating law is the implementation of law, which requires people to abide by the law. The formulation of laws and regulations and legal sanctions complement each other, which can be seen as the relationship between legal responsibility and legal sanctions. Both belong to the basic category of law. They are also concepts that must be fully grasped and highly valued in the operation of law. They are an extremely important issue in legal theory and legal practice. There are both connections and differences between legal liability and legal sanctions, which are different in concept, basis, and the two are not - corresponding, but complement each other. Legal responsibility is the transformation of the subject role of the corresponding content of legal obligations. The "primary legal obligations" undertaken by the obligor to others correspond to state power. Because the formulation of laws and regulations and legal sanctions complement each other, people in law related fields can work better and improve their mental health problems. Studies have shown that the formulation of laws and regulations and legal sanctions complement each other, can bring unique feelings to patients with cognitive impairment, and can effectively alleviate the symptoms of patients. Some scholars predict that the number of patients with cognitive impairment will increase to more than 80 million in 2030. Although there are no effective drugs to improve the symptoms of patients with cognitive impairment, they can alleviate the symptoms of cognitive impairment through other forms, so as to reduce the pressure of transformation to a great extent, especially the problem of cognitive impairment.

Objective: At present, the formulation of relevant laws and regulations and legal sanctions at home and abroad have less reports on patients with cognitive impairment, and the two can be fully integrated. The purpose of this study is to explore the impact of the formulation of laws and regulations and legal sanctions on patients with cognitive impairment, and to provide some reference for the rehabilitation treatment of patients with cognitive impairment.

Research objects and methods: This study adopts the way of questionnaire to analyze the changes under the complementary of laws and regulations and legal sanctions. The 400 patients with cognitive impairment in a detention center were divided into the control group (200 cases) and the observation group (200 cases). The observation group was given the complementary treatment scheme of the formulation of

laws and regulations and legal sanctions, and the control group was given the routine treatment scheme.

Study design: The intervention time was 2 months. The cognitive impairment before and after the intervention was compared. The cognitive impairment of all subjects was judged by Neuropsychiatric Inventory Questionnaire (NPI-Q) and Alzheimer's Disease Cooperative Study-Activity of Daily Living scale (ADCS-ADL).

Methods: The relevant data were analyzed by Excel and SPSS20.0 for calculation and statistics.

Results: The ACDS-ADL scores of the observation group at the first and second months were significantly lower than those of the control group ($P < 0.05$).

Table 1. Comparison of ACDS-ADL scores between the two groups in different periods

Group	Experience group	Control group	<i>t</i>	<i>P</i>	
ADCS-ADL	Baseline	64.58±7.53	66.36±8.46	2.081	0.518
	Month 1	56.23±7.54	60.15±9.18	4.037	0.037
	Month 2	54.74±8.12	57.15±10.34	0.041	0.036

Conclusions: Legal responsibility is different from political responsibility and moral responsibility. It is stipulated by law and investigated by certain state organs according to law. When necessary, it is guaranteed to be implemented by national coercive force. Legal liability can be divided into the following four types according to the different nature of the act: civil liability, criminal liability, administrative liability and unconstitutional liability. Generally speaking, legal liability arises from illegal acts, but in terms of administrative liability and civil liability, in addition to the legal liability arising from illegal acts, there is no fault liability. Civil liability also includes liability arising from breach of contract.

INNOVATIVE EXPLORATION ON THE PRACTICE OF IDEOLOGICAL AND POLITICAL EDUCATION OF COLLEGE STUDENTS FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Ling Lin

School of Marxism, Chongqing City Management College, Chongqing 401331, China

Background: Educational psychology belongs to the category of social psychology, which mainly studies human learning, the effect of educational intervention, teachers' teaching psychology and so on. Educational psychology applies psychological theory and teaching practice results in the process of education. This theory can be applied to curriculum design and improve learning motivation to help students overcome various difficulties in the process of learning. Educational psychology is a social psychology that studies human learning, the effect of educational intervention, teaching psychology and school organization in the educational context. The focus of educational psychology is to apply the theory or research results of psychology to education. Educational psychology can be applied to designing courses, improving teaching methods, promoting learning motivation and helping students face various difficulties and challenges in the process of growth. The terms "educational psychology" and "school psychology" are often used interchangeably, but usually those engaged in theoretical work and research tend to be called educational psychologists, while those engaged in practical work in schools or school related places are classified as school psychologists. Educational psychology pays attention to how students learn and develop, and pays special attention to students with special educational needs in practical work. Through the relationship with other disciplines, it is also helpful to understand educational psychology. First of all, educational psychology is based on psychology. The relationship between the two disciplines is like the

relationship between medicine and biology, or engineering and physics. Then, from educational psychology, many special fields can be developed to study educational problems, including instructional design, educational technology, curriculum development, organizational learning, special education and classroom management.

The purpose of cultivating students in colleges and universities is to enable students to get all-round development, learn relevant professional knowledge and operating skills, and have innovative consciousness and professional ethics. Based on the theory of educational psychology, the practice of ideological and political education for college students will help to improve the professional ability of college students. Through the study of this theory, we can more clearly understand our professional knowledge structure, promote the study of professional knowledge and promote the development of the rationality of teaching practice. Ideological and political education is a basic course for teaching and educating people, moral construction and cultivating excellent talents in colleges and universities. Its main purpose is to cultivate students' moral quality and correct students' wrong ideological understanding, so as to improve students' comprehensive quality as a whole. With the continuous progress of science and technology, the way of ideological and political education in colleges and universities is also changing. It is necessary to constantly adapt to the changes of the times, solve the problems faced at present, ensure the effectiveness of education, innovate the mode in line with the current ideological and political education work, and improve the educational methods, which are the topics of the times faced by the ideological and political education in colleges and universities. College teachers can promote the all-round development of students by integrating educational psychology into ideological and political education. In the process of teaching, teachers should pay attention to the psychological quality of students, learn to transpose thinking, analyze students' psychology, learning situation and life needs through educational psychology, dredge students' psychological problems, and work out better solutions at the same time.

Research objects and methods: 400 college students with communication adaptation disorder in 10 schools in an area were randomly selected to conduct a questionnaire survey. The students were randomly divided into experimental group and control group, with 200 students in each group. The experimental group was given ideological and political education based on educational psychology for 2 months. The control group received routine education within 2 months.

Research design: The organic combination of mental health education and ideological and political education can establish a positive, healthy and optimistic life consciousness for students. Under the joint action of the two, students can actively use their own wisdom and knowledge to build a harmonious value, outlook on life and world outlook. In addition, the combination of mental health education and ideological and political education is also conducive to help students understand and correct their own mistakes, and can effectively play the positive role of ideological and political education.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: Before teaching, the scores of the two groups were not statistically significant ($P > 0.05$), which reflected that the two groups were comparable before teaching. After teaching, the scores of the experimental group were significantly higher than those before the experiment ($P < 0.05$). After teaching, the scores of all indexes in the experimental group were significantly higher than those in the control group ($P < 0.05$). It shows that colleges and universities have higher effect and application value than conventional teaching after applying the education mode reconstructed by the discourse power of ideological and political education.

Table 1. Comparison of the total score of happiness index between the two groups ($\bar{x} \pm s$)

Score		Experience group	Control group	<i>t</i>	<i>P</i>
Total score of happiness index	Before teaching	10.34±2.19	10.76±1.91	0.271	0.308
	After teaching	12.51±1.05	10.53±2.33	11.857	0.000

Conclusions: Ideological and political teachers in higher vocational colleges should actively guide college students in the process of self-moral cultivation and social practice, adhere to the unity of moral code theory and their own practical actions, adhere to the unity of inheriting glorious traditions and carrying forward the spirit of the times, adhere to the unity of transforming the objective world and the subjective world, and adhere to the unity of strengthening personal moral cultivation and receiving education guidance. Internalize the power of example into the driving force of their own practical actions, consciously practice moral norms, make moral norms become personal moral quality and value standard, constantly improve their moral cultivation, and become a person with noble moral quality.

RESEARCH ON TEACHING INNOVATION TEAM OF TEACHERS IN HIGHER VOCATIONAL COLLEGES FROM THE PERSPECTIVE OF RECONSTRUCTION OF GRASS-ROOTS TEACHING ORGANIZATION UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Liyun Pan¹ & Xingguo He²

¹*Business and Tourism Institute, Hangzhou Vocational and Technical College, Hangzhou 310018, China*

²*Development Research Center, Hangzhou Vocational and Technical College, Hangzhou 310018, China*

Background: Cognitive impairment theory refers to the abnormal state of thinking and memory in the brain, which will lead to serious memory and learning disabilities, and even develop into aphasia, apraxia, cognitive loss, disability and other problems. The mental status of patients with cognitive impairment is closely related to their attitudes, values, beliefs, concepts and other factors in their cognitive system. Cognitive impairment will have a very significant impact on people's learning and work. In the process of teachers' teaching team construction in higher vocational colleges, cognitive impairment is manifested in insufficient organizational construction measures, unreasonable formulation of organizational objectives, unreasonable organizational construction logic and so on. The teaching team of teachers' teaching innovation team in higher vocational colleges still cannot meet the requirements, full-time teachers do not make cross-border choices according to the value chain and industrial chain, and part-time teachers are mostly managers at the level of enterprise managers. The lack of organizational objectives is mainly reflected in the lack of in-depth understanding of the internal attributes of grass-roots teaching organizations, and the lack of awareness in building a high-level school enterprise community with a shared future. The construction of teachers' teaching innovation team in higher vocational colleges focuses on the performance evaluation and external incentive of teachers by schools or upper-level organizations.

The goal of teachers' teaching innovation team in higher vocational colleges is to cultivate technical and skilled talents. The construction platform is a professional group, and the members are teachers with complementary skills, shared responsibilities and division of labor and cooperation. Compared with the traditional professional teacher team, the teaching innovation team of teachers in higher vocational colleges is reconstructed from the perspective of grass-roots teaching organization in combination with the types of vocational education. The teaching innovation team of teachers in higher vocational colleges has the following characteristics: a community of high-level schools and enterprises, a community of high-efficiency teachers' professional development, and a community of high-quality technical and skilled talents. The importance of teachers' teaching innovation team in higher vocational colleges is embodied in the following aspects. First, teachers' teaching innovation team can become an important organizational guarantee for the implementation of vocational education reform strategy in the new era. Through a reasonable grass-roots teaching organization, we can reasonably optimize the allocation of resources, which can not only stimulate the enthusiasm of teachers, but also give play to the effect of teaching team. Second, teachers' teaching innovation team is the internal demand of teaching organization construction in higher vocational colleges. The principle of teachers' teaching innovation team in higher vocational colleges is the combination of full-time and part-time and school enterprise cooperation. It deepens the integration of industry and education and constructs the division and cooperation mechanism of modular teaching, which is conducive to cultivating students' comprehensive professional ability and implementing action-oriented teaching system. Thirdly, teachers' teaching innovation team has become an important strategy for teachers' professional development in higher vocational colleges. The construction of teachers' teaching innovation team is conducive to the formation of full-time and part-time teachers.

Objective: This paper analyzes the role of higher vocational college teachers' teaching innovation team construction on cognitive impairment from the perspective of grass-roots teaching organization reconstruction under the background of cognitive impairment, in order to improve the quality of higher vocational college teachers' teaching innovation team construction and provide effective theoretical basis

and practical path for the construction of higher vocational college teachers' teaching innovation team.

Research objects and methods: Teachers with different degrees of cognitive impairment in two higher vocational colleges in a certain region are selected as the research object. The role of teachers' teaching innovation team construction in higher vocational colleges on teachers' cognitive impairment is analyzed through the algorithm of ordering points to identify the clustering structure (options). The number of teachers selected in each school is 30. Select researchers, including grade directors, teaching directors, secretaries, vice-principals, principals and other personnel, and evaluate the results through the degree of improvement. The evaluation contents include language ability, attention, memory ability and memory ability. The final result is the average score of all participants in the two schools. The improvement level is divided into five levels: obvious improvement, better improvement, improvement, little improvement and no improvement. The corresponding scores of the five levels are 0-20, 21-40, 41-60, 61-80 and 81-100.

Methods: This paper uses Excel statistical software to analyze the role of teachers' teaching innovation construction in higher vocational colleges on cognitive impairment from the perspective of the reconstruction of grass-roots teaching organizations under the background of cognitive impairment.

Results: Table 1 refers to the role of the innovative construction of teachers' teaching teams in higher vocational colleges on cognitive impairment from the perspective of the reconstruction of grass-roots teaching organizations. It can be seen from Table 1 that the innovative construction scheme of teachers' teaching team in higher vocational colleges has a very high improvement effect on the cognitive impairment of teachers in both schools. The satisfaction of language ability, attention, memory ability and memory ability are 76.67%, 13.30%, 70.00% and 86.67% respectively.

Table 1. The effect of innovative construction of teachers' teaching team in higher vocational colleges on cognitive impairment from the perspective of reconstruction of teaching organization

Attribute	Language ability	Attention	Memory ability	Recall ability
Significant improvement	12	13	14	13
Better improvement	6	5	3	6
Improve	5	4	4	7
A little improvement	4	4	3	2
No improvement	3	4	6	2

Conclusions: The innovative construction scheme of teachers' teaching team in higher vocational colleges from the perspective of the reconstruction of grass-roots teaching organization has an obvious improvement effect on cognitive impairment. The scheme can be applied to the innovative construction of follow-up teachers' teaching team and improve the level of team innovation construction.

Acknowledgement: The research is supported by: In 2020, Hangzhou Philosophy and Social Sciences Planning Project "Research on Teachers' Teaching Innovation Team in Higher Vocational Colleges from the Perspective of Grass-Roots Teaching Organization Reconstruction" (No. z21jc058).

DISCUSSION ON THE DEVELOPMENT DIRECTION AND ENERGY SUPPLY MODE OF ELECTRIC VEHICLES UNDER COGNITIVE IMPAIRMENT

Zilei Tang

Department of Transport and Municipal Engineering, Sichuan College of Architectural Technology, Deyang 618000, China

Background: Cognitive impairment refers to the abnormal knowledge processing of the human brain in the process of thinking, judgment and learning. The body is usually characterized by memory function and learning dysfunction, and even pathological behaviors such as loss of line, recognition and use. The causes of cognitive impairment can be summarized into three aspects: chronic brain injury, chronic systemic diseases, mental and psychological abnormalities. Cognitive impairment can be divided into thinking disorder, memory disorder and perception disorder. Thinking obstacles are manifested in delusions, thinking logic obstacles, association process obstacles, abstract generalization stage obstacles, etc. Memory impairment can be manifested as memory error, memory fragment loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. At present, there are very serious problems in the development direction and energy

supply mode of electric vehicles, which is closely related to cognitive impairment. The development stage of electric vehicle is determined by the characteristics of energy supply, construction scale and technical level. It can be divided into demonstration application stage and promotion maturity stage. At present, the main problems existing in the development of electric vehicles are low performance of power batteries, weak energy supply infrastructure, insufficient perfection of market mechanism and lack of relevant policies for the development of electric vehicles.

When the relevant leaders in the automotive energy industry are in the context of cognitive impairment, it will seriously hinder the development of electric vehicles and restrict the innovation of energy supply mode. At present, the low performance of power batteries in the electric vehicle industry will seriously limit the development of electric vehicles. There are great differences in the performance of battery cells, which will not significantly improve the cycle life of the assembled battery. The construction of energy supply infrastructure is not enough, and the relevant standard system has not been strongly supported by the government. In terms of market development mechanism, the development of designated areas of public service electric vehicles highly depends on government financial support, and there is no corresponding business model, while the development of micro electric vehicles has great difficulties in organization and management. The policy for the development of electric vehicles has not been improved, and only pilot operations have been carried out in several cities. In the context of the bottleneck in the development of the electric vehicle industry, relevant leaders need to strive to improve their level of cognitive impairment, and the energy supply mode of electric vehicles needs to be improved in a large range, as follows. The single cycle life of lithium-ion battery reaches more than 1000 times, but its performance still needs to be further improved. In the mature stage of promotion, the dominant force of the development mode of electric vehicles is the market. The use of electric vehicles has increased significantly, and the corresponding energy supply facilities are gradually improved, mainly to solve the intelligent interaction between power grid and electric vehicles and the combination of power grid and electric vehicle energy storage.

Objective: This paper discusses the development direction of electric vehicles and the role of energy supply mode on the cognitive impairment of relevant personnel in the electric vehicle industry, in order to provide new ideas and directions for the future development of electric vehicles and energy supply mode.

Research objects and methods: Select the relevant personnel in the electric vehicle industry with different cognitive impairment as the research object, and analyze the effect of the constructed electric vehicle energy supply mode on the population with cognitive impairment through the representative clustering using representative (cure) algorithm. The modes include the energy supply mode of micro electric vehicles and the energy supply mode of public service vehicles, and the number of relevant people is 50. The evaluation content includes four aspects: language ability, attention, memory ability and memory ability. The evaluation results are expressed by improvement degree and membership degree. Any number whose membership degree is [0,1]. The closer the value is to 1, the higher the membership degree is. The degree of improvement is divided into three levels: very improved, improved and non-improved.

Methods: This study uses Excel statistical software to analyze the development direction of electric vehicles and the impact of energy supply mode on cognitive impairment.

Results: Table 1 refers to the impact of energy supply mode of micro electric vehicles on cognitive impairment. It can be seen from Table 1 that the energy supply mode of micro electric vehicles has high recognition in four aspects: language ability, attention, memory ability and memory ability of relevant personnel in the electric vehicle industry. This shows that the energy supply mode of the micro electric vehicle can maximize the service life of the battery.

Table 1. Influence of energy supply mode of micro electric vehicle on cognitive impairment

Attribute	Language ability	Attention	Memory ability	Recall ability
Very improved	18	20	19	22
Improve	21	21	20	19
No improvement	11	9	11	9

Conclusions: The energy supply mode of electric vehicle constructed by the research has a good improvement effect on cognitive impairment. In the future, the two energy supply modes can be applied to the reform and optimization of electric vehicle industry.

RESEARCH ON THE INNOVATION OF TRAINING PATH SYSTEM OF PRESCHOOL TEACHERS IN COLLEGES AND UNIVERSITIES UNDER THE OBSTACLE OF COMMUNICATION AND ADAPTATION

Lirong Yin

First Branch of Preschool Education College, Yancheng Kindergarten Teachers College, Yancheng 224005, China

Background: Communication disorder is a common psychological problem, which can lead to people's mental tension, anxiety and other bad emotions. In the field of psychology, the counselor's financial ability, language expression ability and communication ability can usually be tested through social function. According to different types of communication barriers, communication barriers can be divided into physical barriers, psychological barriers, language barriers, cultural barriers, environmental barriers, status barriers and number barriers. Physical disorder refers to that the information transmitted by the body information expresses the wrong point of view. Most people will have different degrees of physical obstacles, which can pass the thematic apperception test. Psychological disorder is an obstacle in the process of communication caused by poor expression. This kind of communication disorder can be divided into two types: long-term persistent psychological disorder and stress psychological disorder. Language barrier refers to the communication barrier caused by local language, which needs continuous adaptation and learning to overcome. Cultural barriers refer to the customs and cultural differences arising from different regions and countries, which exist and cannot be eliminated. Environmental barriers refer to the fixed habits and behaviors caused by different environments, and then the communication barriers. The influence of professionals is limited by their status. The number barrier refers to the different states produced in different occasions. Efficient communication needs continuous learning and efforts, which is of great significance in the education and training of preschool teachers in colleges and universities.

The teaching level of preschool teachers in colleges and universities is closely related to the current situation of national education development. It is not only the concentrated expression of a country's comprehensive quality, but also the embodiment of international politics and economy. At present, there are the following problems in the team of preschool teachers in colleges and universities. First, there are great differences in the quality level of preschool teachers' team. Teachers have limited cultural knowledge, few professional ethics training courses, weak language expression ability and lack of patience in the teaching process. Second, preschool teachers have no sense of belonging and social identity. At present, the professional training of individualized education, five intelligences, hygiene, pedagogy and psychology is ignored in the training process of preschool teachers. Teachers' posts lack corresponding staffing, they cannot become formal teachers, and their work mobility and instability are very high. Third, the social welfare and status of preschool teachers are low. Compared with primary school teachers, the educational background of preschool teachers is no different from that of primary school teachers, but there are great differences in professional title, social status and salary. In such an environment, how to enrich their inner world and give children a healthy and happy environment is a matter of concern. Fourth, the job burnout of preschool teachers is serious and the pressure of work is large. Preschool teachers face heavy curriculum pressure, and they also need to actively communicate with their parents, facing great psychological pressure.

Objective: This paper explores and puts forward a new path system for the cultivation and training of preschool teachers in colleges and universities, and analyzes its impact on the obstacles of communication and adaptation, in order to provide new ideas and directions for the cultivation and training of preschool teachers in colleges and universities.

Research objects and methods: The preschool teachers of five universities were selected as the research object. The traditional and new preschool teachers' training path system was evaluated through the Balanced Iterative Reducing and Clustering using Hierarchies (BIRCH). The evaluation content included five aspects: communication fear, language, emotion, information overload and selective intuition. The research evaluated the results through the degree of improvement. The improvement degree is obtained through the calculation formula of consensus improvement degree. Any number whose membership degree is $[0,1]$. The closer the value is to 1, the higher the membership degree is. The degree of improvement is divided into three levels: obvious improvement, improvement and no improvement. The average value of the research object is selected as the final result, and the number of evaluators is 60.

Methods: This study analyzes the impact of the new college preschool teacher training path system on communication adaptation barriers through Excel data analysis software.

Results: Table 1 refers to the impact of the new college preschool teacher training path system on communication adaptation barriers. It can be seen from Table 1 that the training path system of preschool

teachers to school preschool teachers has a high degree of improvement in communication fear, language, emotion, information overload and selective intuition. The follow-up research can be improved in the other three aspects to improve the applicability of preschool teachers to the training path system of school preschool teachers.

Table 1. The influence of the new college preschool teacher training path system on communication adaptation barriers

Attribute	Communication fear	Language	Emotion	Information overload	Selective intuition
Significant improvement	28	23	18	17	27
Improve	26	21	17	19	24
No improvement	6	16	15	14	9

Conclusions: The new college preschool teacher cultivation and training path system constructed by the Institute has a high degree of improvement on communication adaptation barriers, which can make corresponding contributions to the subsequent college preschool teacher cultivation and training, and give a specific implementation plan for the overall improvement of the national education level.

RESEARCH ON ENGLISH TRANSLATION AND INFORMATION COMMUNICATION OF SPORTS PLATFORM UNDER EDUCATIONAL PSYCHOLOGY

Xiaowei Yuan^{1,2} & Usarov Ibrohim¹

¹*Department of Foreign Language and Literature, The National University of Uzbekistan, Toshkent 999033, Uzbekistan*

²*The School of Foreign Languages, Jining Normal University, Jining 012000, China*

Background: Educational psychology can be analyzed from two aspects: narrow educational psychology and broad psychology. Narrow educational psychology refers to school educational psychology, and broad psychology is the science of various psychological and behavioral laws in the process of educational practice. As an important type of applied psychology, educational psychology mainly studies how to teach, how to learn, and the interaction between learning and teaching. At present, there has been a trend of differentiation in educational psychology, and the research focus has changed from laboratory to school, and then to society. The research focus of future educational psychology is to analyze in combination with social psychology. The research trends are mainly learners' initiative, initiative, learning process and mechanism, the impact of social environment, the role of cultural background, effective teaching mode and learning environment design, and the application of information technology. The research of psychological development and education has always been closely related, including the concept of cognitive development and education, the general law and education of psychological development, the theory and education of personality development, the difference of psychological development and education.

With the continuous development of educational psychology, college sports platform is facing great challenges. English translation and information dissemination of college sports platform is an important performance of keeping pace with the times. The main problems faced by college sports platform English translation are as follows: English translation has no subjectivity, the translation process has not realized the construction of the real ecological environment, and the dominant thinking of translation is the traditional teaching concept, which can be embodied in the deviation of word understanding, the wrong division of English long sentences, colloquial words, inconsistent context terms, and the language organization does not conform to the language habits. Based on the analysis of the problems of English translation and information communication of sports platform, it is of positive significance to construct the English translation and information communication scheme of sports platform from the perspective of educational psychology. The new information communication mode of sports platform needs to combine the characteristics of educational psychology to ensure that the audience can obtain correct sports information, and also make the transmitted content conform to the psychological and emotional changes of the audience. The new information communication mode of sports platform can be embodied in timeliness, interactivity, globality, accuracy and characteristics. It can complete effective communication through efficient data technology, which is also the most basic requirement of English translation of sports platform.

Objective: This paper analyzes the new model of English translation and information dissemination of sports platform from the perspective of educational psychology, which aims to provide basic technical support for the vigorous development of sports platform and provide new development ideas for the dissemination of sports information.

Research objects and methods: The staff of three sports platforms were selected as the research object. Through a Clustering Algorithm based on Random Search (CLARANS), the effects of the original and new sports platform information communication modes on the staff's educational psychology were analyzed. The evaluation contents were quality, will, cognition, emotion and interpersonal relationship. The research evaluates the results through the influence value, and sets the score range as 0-100 points. The higher the score, the higher the degree of influence. The average value of the research object is selected as the final result, and the number of sports work platforms is 60.

Methods: Through Excel statistical software, this paper analyzes the effect of the information communication mode of sports platform on the educational psychology of staff before and after the reform. In order to ensure the reliability of the research results, the survey objects selected by the research institute are staff who have worked for more than three years.

Results: The effect of the new sports platform information communication mode on the educational psychology of staff is shown in Table 1. On average, the improvement of sports communication platform and interpersonal quality has a great impact on the overall score of about 85. Therefore, the construction of a new sports platform information communication model is of great value. This model can be applied to the improvement of sports platform in the future.

Table 1. The effect of new sports platform information communication mode on staff's educational psychology

Platform	Quality	Will	Cognition	Emotion	Interpersonal relationship
Platform 1	85.36±7.68	87.58±8.69	86.35±9.68	87.32±7.98	85.32±8.67
Platform 2	86.35±9.35	84.57±8.68	86.36±8.76	85.63±7.89	85.36±8.69
Platform 3	86.58±9.98	84.67±9.23	86.58±7.86	86.58±8.65	84.67±10.03

Conclusions: From the perspective of educational psychology, the new model of English translation and information communication of sports platform proposed by the research can improve the educational psychological level of staff, which is reflected in the five fields of quality, will, cognition, emotion and interpersonal relationship, which is conducive to the sustainable development of sports platform and enable listeners to obtain sports information in a timely and efficient manner.

RESEARCH ON IDEOLOGICAL SECURITY GOVERNANCE OF COLLEGES AND UNIVERSITIES IN THE AGE OF BIG DATA UNDER COGNITIVE DISORDERS

Xunchun Zhu^{1*} & Xiang Meng²

¹*School of Marxism Studies, Chongqing Open University, Chongqing 400052, China*

²*Library, Chongqing Open University, Chongqing 400052, China*

Background: Cognitive impairment is a state between normal aging and dementia. It is mainly characterized by mild memory and intellectual impairment, but it remains intact in life ability and cognitive function. It can be manifested in functional impairment such as understanding, judgment, calculation, execution, visual space, language and memory. According to different cognitive problems, cognitive impairment can be divided into three types: perception impairment, memory impairment and thinking impairment. Perceptual disorders include perceptual synthesis disorder, hallucination and so on. Memory impairment includes memory error, memory defect and strong memory. Thinking obstacles include delusion, thinking logic obstacle, association process obstacle and abstract generalization process obstacle. The manifestations of cognitive impairment are emotion, spirit, creation, thinking, movement, language, memory, learning and so on. There are many modes and Innovation Paths of university ideology in the era of big data. Under the background of cognitive impairment, the ideological security of universities in the era of big data shows great difficulties, which is related to the long-term social stability and national political security.

The ideological security of colleges and universities in the era of big data is facing very big problems,

mainly in terms of target object, implementation subject, implementation method, implementation specification and so on. For the target object, college students are easily affected by external uncertain factors because of their unique personality and thought, and then they are instilled with wrong ideology. At the same time, the energy of most students will be affected in the era of big data, so that students really spend less time on learning. The integration of cyberspace will lead to information without barrier, which will affect the mainstream values of students and increase the difficulty of ideological security management in colleges and universities. For the implementation subject, as an important implementation subject of big data technology, colleges and universities lack relevant practical experience in the initial application stage, and the initiative and effectiveness of ideological work are low, which is specifically reflected in the weak awareness of building a continuous and overall data platform, the poor quality of internal staff, and the incomplete stimulation of data awareness. In terms of implementation methods, college teachers are deeply affected by the traditional teaching mode, it is difficult to make use of a large number of resources in the era of big data in the process of disseminating knowledge, and it is difficult to mobilize students' enthusiasm and enthusiasm for learning. In terms of implementation norms, big data technology will also hide some problems on the premise of bringing convenient and fast life and learning. Based on the analysis of these problems, ideological security governance in colleges and universities will inevitably realize management in combination with big data technology, which can be divided into three levels: overall grasp, new carrier, new method and strategic support. The implementation path of the modernization of ideological security governance in colleges and universities is to grasp the leadership of ideological work in colleges and universities, update data thinking, and improve the application and standardization level of big data.

Objective: Exploring the implementation path of ideological security governance modernization in colleges and universities in the era of big data aims to help colleges and universities improve their ideological security management level, improve students' recognition of socialist core values, and ensure the teaching quality of different classroom teaching modes.

Research objects and methods: Select 20 professional college ideological security practitioners with different cognitive barriers as the research object, analyze the modernization path of college ideological security governance in the era of big data through the expectation maximization algorithm, and evaluate the improvement of cognitive barriers. The evaluation content includes three aspects: memory ability, memory ability and orientation. There are 20-81 employees in colleges and universities who can be improved, and 60-81 employees who cannot be improved. The corresponding score is 20-81. The score of one professional improvement is 20-81, and the score of one professional improvement is 20-81. The improvement degree is the ratio of the number of people with obvious improvement, better improvement and improvement to the total number of people.

Methods: This study analyzes the role of ideological security governance scheme in colleges and universities on employees with cognitive impairment in the era of big data through Excel data analysis software.

Results: Table 1 shows the improvement of the ideological security governance scheme of colleges and universities on cognitive impairment in the new big data era. It can be seen from Table 1 that the ideological security governance scheme of colleges and universities has a high degree of improvement on the memory ability, memory ability and orientation of college 2 employees, with values of 90%, 95% and 95% respectively. The improvement results of cognitive impairment of ideological security evaluators in colleges and universities show that the implementation scheme of modernization of ideological security governance in colleges and universities in the era of big data in all schools can alleviate the cognitive impairment of employees.

Table 1. Improvement of college ideological security governance scheme on cognitive impairment in the new big data era

University	Memory ability	Recall ability	Directional force
University 1	85	90	85
University 2	90	95	95
University 3	85	85	85
University 4	80	90	85

Conclusions: The modernization program of ideological security governance in colleges and universities in the era of big data under cognitive barriers constructed by the Institute has a high degree of improvement on cognitive barriers. This model can be applied to ideological security management in other colleges and universities and has positive value.

RISK ANALYSIS AND COUNTERMEASURES OF AGRICULTURAL PRODUCTS SUPPLY CHAIN UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT OF RURAL REVITALIZATION

Lin He

School of Economy and Management, Mianyang City College, Mianyang 621000, China

Background: The theory of cognitive impairment puts forward the abnormal conditions of the brain in the process of thinking and memory, which will lead to serious memory and learning disabilities. The mental status of patients with cognitive impairment is closely related to their attitudes, values, beliefs, concepts and other factors in their cognitive system. Cognitive impairment is due to the obstacles in executive ability, visual space, language, memory, orientation and other cognitive fields. The main causes of cognitive impairment are education, diet, living habits and so on. Cognitive impairment can be divided into three types: perception impairment, memory impairment and thinking impairment. Perceptual disorder includes perceptual complex disorder, hallucination, etc. Memory impairment includes memory error, memory defect and strong memory. Thinking obstacles include delusion, thinking logic obstacle, association process obstacle and abstract generalization process obstacle. The manifestations of cognitive impairment are abnormalities in emotion, spirit, creation, thinking, movement, language, memory and learning. In serious cases, it may develop into cognitive loss, apraxia and aphasia. With the prevalence of cognitive impairment, rural revitalization strategy shows many problems. rural revitalization is one of the seven strategies put forward by the 19th CPC National Congress. It is not only an important policy for the work of “agriculture, rural areas and farmers” in the new era, but also a major goal for socialist countries to achieve modernization. The main problems of rural revitalization strategy are as follows: there are deviations in practice and theory, difficulties in farmers’ own development, imperfect land system, shortage of rural talents and problems in urban-rural integration.

In the context of cognitive barriers to rural revitalization, the supply chain of aquatic products, meat, fruits, vegetables and other agricultural products faces great risks, which are as follows: the spatial and temporal conflict of agricultural products, the decentralized production place of agricultural products, too many intermediate links in the supply chain, information asymmetry, low sense of trust among supply chain members, inability to meet the diversity of customer needs. The core competence of supply chain enterprises is limited, there is no professional logistics management, and the interests of farmers cannot be guaranteed. Agricultural products supply chain shows a very serious problem of information asymmetry in production, circulation, sales and other links. To solve these problems, the agricultural product supply chain needs to be improved from the following aspects. The core of enterprises is to support each other’s development. Through diversified, multi-form and multi-channel methods, focus on the development of agricultural product processing and distribution enterprises and agricultural product production bases, take the core enterprise as the center, improve the construction of supply chain, and efficiently complete the information transmission of various organizations in the supply chain nodes. Second, improve the construction of logistics infrastructure and ensure the logistics capacity of agricultural product supply chain. Agricultural products have the characteristics of easy deterioration and short preservation time, and higher requirements are required in logistics, transportation, preservation and circulation. Relevant enterprises need to improve the standardization system of infrastructure equipment and corresponding infrastructure, such as storage facilities, logistics center, distribution center, etc. Third, improve the agricultural product information management system. The information platform can complete the accurate transmission of information among consumers, retailers and distributors. In addition, it can also provide an information supervision platform for market supervision institutions, quarantine institutions and agricultural product production supervision structure. Fourth, improve the quality and safety management level of agricultural products. Supervise the source of agricultural products through a perfect supply chain security system of agricultural products to improve the quality level of agricultural products. Fifth, protect the interests of all parties in the agricultural supply chain. The person in charge of the market not only needs to convey the channel for agricultural products to enter the market to farmers, but also needs to provide market information to processing plants and maintain close cooperation between suppliers and processing

manufacturers.

Objective: This paper analyzes the risk of agricultural product supply chain under the background of cognitive impairment of rural revitalization, puts forward the measures of agricultural product supply management, and analyzes the role of agricultural product supply management measures on cognitive impairment, in order to improve the management level of agricultural product supply chain and protect the fundamental interests of all parties in the supply chain.

Research objects and methods: Select the relevant personnel of supply chain consumers, retailers and distributors in two regions as the research object, and analyze the cognitive effect of supply chain management scheme through naive Bayesian classification algorithm. The number of respondents in each region is 100. The survey contents include language ability, attention, memory ability, memory ability and orientation. The final result is the average score of all participants. The evaluation result is the degree of improvement. There are five grades: very improvement, comparative improvement, improvement, little improvement and no improvement. The corresponding scores of the five grades are 0-20, 21-40, 41-60, 61-80 and 81-100.

Methods: This study uses Excel statistical software to analyze the impact of agricultural product supply chain risk management scheme on cognitive impairment under the background of cognitive impairment.

Results: Table 1 improvement degree of rural revitalization of agricultural products supply chain management program on group cognitive impairment. It can be seen from Table 1 that group cognitive impairment has a very high improvement rate in five aspects: language ability, attention, memory ability, memory ability and orientation.

Table 1. Improvement degree of rural revitalization agricultural products supply chain management program on group cognitive impairment

Attribute	Language ability	Attention	Memory ability	Recall ability	Directional force
Very satisfied	26	27	26	24	25
General satisfaction	24	23	24	23	22
Satisfied	21	20	23	24	21
Dissatisfied	28	22	21	18	18
Very dissatisfied	11	8	6	11	14

Conclusions: The rural revitalization agricultural products supply chain management scheme constructed by the Institute has a great improvement on cognitive impairment. The scheme has a certain promotion value in agricultural products supply chain risk management.

Acknowledgement: The research is supported by: Project of Sichuan Research Center of Electronic Commerce and Modern Logistics in 2021 (DSWL21-23): Research on Risk Identification and Control of Fresh Agricultural Products Supply Chain in Sichuan Province under the Background of Rural Revitalization.

LIBRARY PERSONALIZED SERVICE AND ITS FUTURE PROSPECT FROM THE PERSPECTIVE OF COGNITIVE IMPAIRMENT

Weiying Zheng & Linglin Wu

Library, Zhejiang Yuexiu University, Shaoxing 312000, China

Background: Cognitive impairment refers to the abnormal condition of the brain in the process of thinking and memory, which will lead to the impairment of memory and learning function, and even develop into aphasia, apraxia, cognitive loss and other problems in serious cases. According to different cognitive impairment, cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment. Thinking disorder is embodied in delusion, thinking logic disorder, association process disorder, etc. Memory impairment can be manifested as memory loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. The thinking situation and memory function of patients with cognitive impairment are closely related to their attitudes, values, beliefs, concepts and other factors in their cognitive system. The personalized service and management of library are also facing great challenges, which are embodied in the following aspects. First, there is no perfect personalized information resources. At present, the capital and manpower of most libraries cannot meet the needs. There are many problems in

digital resource management, such as diversity and dispersion, which makes reading users obtain book related information. The correlation between book resources and user needs is low, and the utilization rate of resources is very limited. Second, the lack of service evaluation and supervision system. Most libraries have not built the supervision and evaluation mechanism of personalized information service, and there are no corresponding evaluation indicators. The overall personalized service lacks goals and standards. Third, there is no user demand analysis. The quality of library personalized service is determined by users. At present, most libraries do not conduct demand analysis through data, including group characteristic analysis and users' habit of obtaining information. The separation between users' demand and personalized service demand will not only reduce users' satisfaction, but also waste resources. Fourth, information retrieval services are relatively backward. At present, the efficiency of information retrieval is relatively low, and it is difficult to find the information of real interest in a short time. In view of these phenomena, the construction of a new model of library personalized service is imminent. The improvement strategies of the new model are mainly to reconstruct the information service system, enhance the personalized information source channels, deeply analyze the basic information of users, enhance the information security of users, improve the information retrieval methods, and optimize the personalized recommendation technology.

Objective: The purpose of exploring the role of the new model of library personalized service on cognitive impairment is to provide constructive ideas for university library management and help students and teachers obtain high-quality services.

Research objects and methods: Teachers and students from two universities are selected to analyze the effect of the new model of library personalized service on cognitive impairment through K-Nearest Neighbor (KNN) classification algorithm. The total number of students and teachers is 500. The evaluation content includes five aspects: language ability, attention, memory ability, memory ability and orientation. The evaluation results are expressed by the degree of recognition. The recognition level is divided into five levels: very recognition, comparative recognition, recognition, little recognition and non-recognition. The corresponding scores of the five levels are 0-20, 21-40, 41-60, 61-80 and 81-100. Recognition is the ratio of the number of people and the total number of people at three levels: very recognition, comparative recognition and recognition.

Methods: This paper analyzes the recognition of the new model of library personalized service to the cognitive impairment of students and teachers through Excel data analysis software.

Results: Table 1 refers to the recognition of teachers of the new model of library personalized service for the improvement of cognitive impairment. It can be seen from Table 1 that college 1 has high recognition of language ability, attention, memory ability, memory ability and orientation, with values of 89.0%, 91.0%, 93.0%, 92.0% and 93.0% respectively. The new model of library personalized service can alleviate the cognitive impairment of teachers.

Table 1. Teachers' recognition of the improvement of cognitive impairment in the new model of library personalized service

University	Language ability	Attention	Memory ability	Recall ability	Directional force
University 1	89	91	93	92	93
University 2	87	90	89	89	86
University 3	88	89	87	87	89
University 4	87	87	85	85	86
University 5	88	85	89	84	87

Conclusions: The new model of library personalized service constructed by the research institute has a high degree of recognition for the improvement of cognitive impairment. Subsequent research can apply this model to the personalized service of libraries in other colleges and universities, and has a certain promotion value.

* * * * *

ON THE COGNITIVE OBSTACLES AND REFORM IDEAS OF COLLEGE TEACHERS TO THE TRANSFORMATION OF TEACHERS' ACHIEVEMENTS

Zhuo Wang¹ & Pengfei Shi²

¹Personnel Department, Xuzhou Medical University, Xuzhou 221004, China

²*Department of Student Affairs, Xuhai College, China University of Mining and Technology, Xuzhou 221008, China*

Background: As an important place for talent cultivation, colleges and universities are an important source of scientific and technological innovation and achievements. Some data show that at present, the transformation rate of scientific and technological achievements in colleges and universities is 25%, while the proportion of projects that can be successfully realized is only 5%. Cognitive impairment refers to the abnormal processing of human brain advanced intelligent knowledge in the process of thinking judgment and learning. In most cases, the body can have the decline of memory function and learning function, and even serious behavioral disorders such as loss of line, recognition and use. According to different types, cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment. Cognitive impairment is a psychological disorder developed from the perspective of cognitive psychological disorder. Patients mainly have psychological disorders in problem solving, perception, memory, learning and so on. In the field of medicine, psychological cognitive impairment is defined as six cognitive impairments: social cognition, complex attention, language, perceptual motor function, learning and memory, and executive function. Individuals usually have a decline in these cognitive abilities, and in severe cases, they can have a brain decline. According to different types of psychological cognitive impairment, it can be divided into three types in the field of psychology: insanity, mild neurocognitive impairment and severe neurocognitive impairment.

The main problems of college teachers' transformation of teachers' achievements are as follows: first, there is no perfect incubation ecosystem of science and technology transformation. This is mainly reflected in the lack of accurately invested resources, the failure to maximize value driven resources, and the lack of efficient and professional intermediaries. According to the survey data, the investment ratio of university project research, pilot test and industrialization is 1:1:10, which is very different from the data of developed countries. At the same time, in the process of transformation of scientific and technological achievements in colleges and universities, the probability of risks due to the imperfect scientific and technological financial support system is very high. Second, the transformation mechanism of high-tech achievements has limitations. The main driving force for the transformation of scientific and technological achievements in colleges and universities is the driving force of government functional departments, business activities and production activities of enterprises. However, generally, there are great differences in the objectives of the three aspects, which will lead to problems in the transformation of scientific and technological achievements. Third, the lack of close cooperation between colleges and universities and enterprises. The main driving force in the transformation of scientific and technological achievements in colleges and universities is the effective demand of enterprises, but at present, there is no long-term and deep cooperative relationship between colleges and universities and enterprises, which will limit the transformation of scientific and technological achievements in colleges and universities to a great extent. In addition, during the transformation of scientific and technological achievements in colleges and universities, enterprises have not formulated relevant supervision mechanisms to timely supervise the scientific research achievements of colleges and universities. If there is a conflict between the needs of enterprises and the scientific research achievements of colleges and universities, enterprises will have a great probability to terminate the cooperation with colleges and universities. In this context, the reform measures for the transformation of scientific and technological achievements in colleges and universities are of great value. The reform measures can be optimized from three aspects: the transformation mechanism of science and technology, the transformation intermediary of scientific and technological achievements, and the cooperation between enterprises and colleges and universities, so as to avoid the problem of college teachers' transformation of teachers' achievements to the greatest extent.

Objective: This paper analyzes the problems of college teachers' transformation of teachers' achievements, puts forward corresponding reform ideas for the transformation of scientific research achievements according to the existing problems, and discusses the role of reform measures on teachers' cognitive impairment, in order to provide constructive suggestions for the transformation of teachers' achievements in colleges and universities, so as to enhance the social service value of schools.

Research objects and methods: This paper selects college teachers with mild cognitive impairment in two colleges and universities as the research object, and analyzes the impact of achievement transformation measures of college teachers on cognitive impairment through the Improved Decision Tree Algorithm (ID3). The evaluation contents include language ability, attention and memory ability. Set the score range of influence value to 0-100 points. The higher the score, the higher the degree of influence. The average value of the research object is selected as the final result, and the number of evaluators in each school is 60.

Methods: Through Excel statistical software, this paper analyzes the impact of college teachers' achievement transformation measures on cognitive impairment. In order to ensure the reliability of the

results, the survey objects selected by the Institute are freshmen, sophomores, juniors and seniors.

Results: Table 1 refers to the effect of the reform measures for the transformation of teachers' achievements in colleges and universities on teachers' cognitive impairment. It can be seen from Table 1 that the reform measures for the transformation of teachers' achievements have a high impact on teachers' language ability, attention and memory ability. Therefore, the construction of the transformation measures of teachers' achievements in colleges and universities is of great value. This scheme can be applied to the transformation of teachers' achievements in colleges and universities in the future.

Table 1. The effect of reform measures of teachers' Achievement transformation in colleges and universities on teachers' cognitive impairment

Psychological factor	Freshman	Sophomore	Junior	Senior
Language ability	82.36±6.35	86.35±7.52	86.35±8.25	86.32±7.51
Attention	83.65±7.12	83.65±9.36	85.36±2.36	82.36±7.26
Memory ability	85.63±7.26	86.36±9.23	87.63±8.02	82.36±9.64

Conclusions: The transformation measures of college teachers' achievements constructed by the Institute have high promotion value. Research can actively promote the transformation of high-tech achievements through positive reform measures, which can not only help to realize the social service function of colleges and universities, but also complete the effective link between economy and science and technology, improve teachers' cognitive level and contribute to the rapid development of social productivity.

RESEARCH ON THE PATH OF INTEGRATING TRADITIONAL CULTURAL ELEMENTS INTO MODERN INTERIOR DESIGN UNDER COGNITIVE IMPAIRMENT

Guosheng Wang

School of Design Art, Wuxi Institute of Technology, Wuxi 214121, China

Background: Cognitive impairment refers to the abnormal processing of human brain advanced intelligent knowledge in the process of thinking judgment and learning. In most cases, the body will show memory function and learning dysfunction, and even appear pathological behaviors such as loss of line, recognition and use. The causes of cognitive impairment are as follows: chronic brain injury, chronic systemic diseases, mental and psychological abnormalities, among which mental and psychological abnormalities are the most important reasons. According to different types, cognitive impairment can be divided into thinking impairment, memory impairment and perception impairment. The clinical manifestations of thinking disorder include delusion, thinking logic disorder, association process disorder, abstract generalization stage disorder and so on; In clinical practice, memory impairment mainly includes memory error, memory fragment loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive disorder, sensory sensitivity, sensory retardation and so on. Under the background of cognitive impairment, modern interior design combined with traditional cultural elements will encounter many difficulties. Applying traditional culture to interior design helps to show the cultures of different regions and nationalities. It can not only show the charm of different cultures, but also play a role in inheriting culture.

Interior design combined with traditional culture shall comply with the following conditions. First, designers add traditional culture to meet people's psychological needs and create a natural, harmonious and quiet environment. Second, modern interior design adopts furnishings, colors and materials combined with traditional cultural elements, which makes man and nature achieve the purpose of harmonious coexistence. Third, designers should pay attention to the uniqueness, inheritance and mobility of interior space. At present, the problems of interior design combined with traditional cultural elements are as follows. Designers follow the characteristics of personalization and pay attention to the precipitation of national culture. Designers can not complete the professional design of traditional culture. Therefore, the basic concepts to be followed in integrating traditional culture into room design are as follows. First, advocate the concept of nature. Interior design combined with traditional culture should pay attention to nature, emphasize the harmony and unity of natural environment and living environment, express the content that the building wants to convey with the help of external design elements, and meet the inner

needs of building users by effectively integrating traditional culture. Second, pay attention to the combination of deficiency and reality. The interior design combined with Chinese traditional culture should pay attention to the reasonable collocation of design elements, and try to show the design style of simple and complex integration and difficult and easy combination in a complex environment. Pay attention to the effective combination of cultural elements and basic environment, and show unique cultural attributes in the nuances of buildings. Third, pay attention to the integration of local cultural elements. Interior design needs to explore the unique design elements of different regions and places, such as plants, paintings, ornaments, totems, etc. on the basis of displaying the elements of Chinese traditional culture.

Objective: Explore the innovative path of integrating traditional cultural elements into modern interior design, in order to provide the possibility for the realization of traditional cultural elements in modern interior design and help designers design works that meet the inner needs of users.

Research objects and methods: 1000 designers are selected to analyze the effect of the innovative path of integrating traditional cultural elements into modern interior design on cognitive impairment by using analytic hierarchy process and grey comprehensive evaluation method. The evaluation content includes five aspects: language ability, attention, memory ability, memory ability and thinking ability. The final result is the average score of all designers. The evaluation result is the promotion rate. The promotion grades are divided into five grades: obvious promotion, large promotion, promotion, little promotion and no promotion. The corresponding scores of the five grades are 0-20, 21-40, 41-60, 61-80 and 81-100. The promotion degree is the ratio of the number of people in the three promotion levels of extraordinary promotion, comparative promotion and promotion to the total number of people.

Methods: This study analyzes the impact of traditional cultural elements integrated into modern indoor innovative design on cognitive impairment through Excel data analysis software.

Results: Table 1 refers to the impact of the integration of traditional cultural elements into modern interior innovative design on cognitive impairment. It can be seen from Table 1 that designers have a high improvement rate in language ability, attention, memory ability, memory ability and thinking ability, especially in memory ability and thinking ability. The follow-up research can be improved in the other three aspects to improve the applicability of preschool teachers to the training path system of school preschool teachers.

Table 1. The influence of traditional cultural elements into modern interior innovative design on cognitive impairment

Attribute	Language ability	Attention	Memory ability	Recall ability	Thinking ability
Significantly improved	363	386	398	386	375
Greater improvement	258	247	246	268	265
Promote	268	249	234	246	247
A little improvement	65	61	72	67	59
No promotion	46	57	50	33	54

Conclusions: The integration of traditional cultural elements into modern interior innovation path created by the Institute has a very high improvement effect on designers' cognitive impairment, especially in memory ability and thinking ability. The follow-up research can optimize the path of modern indoor innovation in three aspects: language ability, attention and memory ability.

* * * * *

ON TRANSLATION TEACHING THEORY AND TRANSLATION SKILLS IN COLLEGE ENGLISH BASED ON COGNITIVE IMPAIRMENT

Tong He

Department of Basic Course Teaching, Jiangsu University Jingjiang College, Zhenjiang 212013, China

Background: Cognitive impairment refers to the abnormal condition of the brain in the process of thinking and memory, which will lead to the impairment of memory and learning function, and even develop into aphasia, apraxia, cognitive loss and other problems in serious cases. Cognitive impairment and cognitive impairment can be divided into three conditions. Thinking disorder is embodied in delusion, thinking logic disorder, association process disorder, etc. Memory impairment can be manifested as memory loss, memory enhancement and so on. Perceptual disorder can be manifested as perceptual comprehensive

disorder, sensory sensitivity, sensory retardation and so on. The thinking situation and memory function of patients with cognitive impairment are closely related to their attitudes, values, beliefs, concepts and other factors in their cognitive system.

Under the background of cognitive impairment, college English translation teaching theory and translation skills face great problems, which are embodied in the following aspects. First, college English textbooks and tests are limited. College English textbooks do not have the basic theory and skills of translation. After class exercises are mostly comprehensive exercises of words, phrases, grammar and sentence patterns. CET-4 and CET-6 also do not have translation questions. Many students do not have the ability to apply the actual language. Second, the transfer of translation theoretical knowledge is limited. The school does not pay attention to imparting translation theoretical knowledge to students, ignoring the objective fact that students need to have a good translation theoretical foundation to do a good job in translation. Teachers usually only teach students literal translation, which leads to the content translated by students without emotion and very stiff. Third, the teaching mode is relatively backward. College students have relatively few English class hours. Most of the translation learning comes from the classroom. The classroom teaching mode is teacher-centered. Teachers often assign students translation homework divorced from the actual situation, which has no effect on improving students' translation ability. Fourth, the pertinence of translation is not strong enough. According to the final desired translation effect, translation teaching can be divided into three levels: level 4, being able to translate professional English literature and materials, and being able to translate professional literature and materials. Fifth, ignore the differences between English and Chinese expression habits and word order. There are great differences between Chinese and Western languages and cultures, and there are obvious differences in the way of expression. Students are used to using Chinese format in the process of translation, which leads to inconsistency with logic in the process of translation.

Objective: This paper explores the role of college English translation teaching theory and translation skills in cognitive impairment, in order to provide innovative ideas for students' English translation learning and solve the translation problems of college students.

Research objects and methods: This paper selects teachers and students with mild cognitive impairment in two schools as the research object, and analyzes the improvement of college English translation teaching theory and translation skills on cognitive impairment under the promotion of cognitive impairment through grey comprehensive evaluation method. The number of students and teachers is 100 and 200 respectively. The evaluation content includes five aspects: language ability, attention, memory ability, memory ability and orientation. The final result is the average score of all participants in the two schools. The evaluation results are expressed by the improvement grade, which is divided into five grades: very improvement, comparative improvement, improvement, little improvement and no improvement. The corresponding scores of the five grades are 0-20, 21-40, 41-60, 61-80 and 81-100. The improvement rate is the ratio of the number of people and the total number of people in the three improvement levels of extraordinary improvement, comparative improvement and improvement.

Methods: This paper analyzes the effect of translation skills on cognitive impairment in college English translation teaching through Excel statistical software.

Results: Table 1 shows the effects of translation teaching theories and translation skills on cognitive impairment in colleges and universities. It can be seen from Table 1 that the school teachers believe that the translation skills in college English translation teaching have a high improvement rate on cognitive impairment. The satisfaction of language ability, attention, memory ability, recall ability and orientation are 87.00%, 87.00%, 85.5%, 86.5% and 84.5% respectively. Therefore, the influence of cognitive impairment should be considered in the development of college English translation teaching theory and translation skills.

Table 1. The effect of translation teaching theory and translation skills on cognitive impairment in colleges and universities

Attribute	Language ability	Attention	Memory ability	Recall ability	Directional force
Very improvement	68	65	67	69	71
General improvement	65	69	66	66	62
Improvement	41	40	38	38	36
A little improvement	12	13	13	17	18
No improvement	14	13	16	10	13

Conclusions: The translation skills of the new college English translation teaching have a very high

improvement rate in five aspects: language ability, attention, memory ability, memory ability and orientation. The follow-up research can apply the proposed English translation skills to college students' English teaching.

ANALYSIS OF PSYCHOLOGICAL STATUS OF MARITIME WIRELESS COMMUNICATION TECHNICIANS UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Xia Liu

Merchant Marine College, Shanghai Maritime University, 201306 Shanghai, China

Background: Cognitive impairment is an abnormal manifestation in the process of brain advanced intelligent processing. Cognitive impairment has a great influence on patients, mainly including learning impairment, memory impairment, executive dysfunction, visuospatial disorder, agnosia, apraxia and other related symptoms. The causes of cognitive impairment are diverse, including craniocerebral trauma, cerebrovascular disease, chronic systemic disease, environmental factors, mental and psychological state and so on. Maritime wireless communication technology depends on the technical support of maritime wireless communication technicians. However, this kind of people are very vulnerable to the negative impact of external factors in the process of maritime operation, such as working at sea for a long time and breaking away from normal society, resulting in negative psychological emotions, and the difficult and dangerous working environment is very likely to lead to the injury or physical function problems of maritime wireless communication technicians, Various external factors may lead to cognitive impairment of maritime wireless communication technicians.

Since the 20th century, land communication technology has shown earth shaking changes, realizing the breakthrough and renewal from wired to wireless and from 1G to 5G. However, due to the limitations of geographical conditions and natural environment, the advantages and characteristics of land communication technology are difficult to be applied to maritime wireless communication. The ocean is vast and the environment is complex and changeable. It is very difficult to establish the signal base station required for communication in the vast sea. Therefore, compared with land communication technology, maritime wireless communication technology shows an obvious lag phenomenon. Different from terrestrial wireless communication technology and base station system, maritime communication nodes are relatively few and scattered. Each node has a very long communication distance and is very sparse in space. Moreover, the marine meteorological conditions are harsh and changeable, and the overall environment presents the characteristics of high humidity and salt fog, great temperature difference between day and night and so on. In this environment, the marine wireless transmission medium presents obvious non-uniform distribution and complex electromagnetic environment, which have a great negative impact on the design and application of high-performance and reliable marine wireless communication system. In terms of cost, it is difficult for the maritime wireless communication system to build a centralized information management network similar to the terrestrial cellular network, and the diversified business needs of different types of communication nodes are difficult to be managed efficiently and uniformly. Therefore, the maritime wireless communication faces challenges such as complex and changeable space media, long communication distance and large differences in business needs. When there are problems in the application of maritime wireless communication technology, maritime wireless communication technicians will bear great work pressure and psychological burden, and even produce certain cognitive impairment symptoms. In order to eliminate the cognitive impairment of maritime wireless communication technicians and ensure the smooth development of their maritime wireless communication work, it is bound to thoroughly analyze the causes and effects of their cognitive impairment.

Objective: The existing maritime wireless communication system has some problems, such as backward technical means, complex communication equipment and unstable communication link, which has a certain negative impact on the normal work and positive psychological state of marine wireless communication technicians, making them suffer from cognitive impairment. From the perspective of cognitive impairment, this study will explore the potential disadvantages of maritime wireless communication technology and its impact on maritime wireless communication technicians, in order to optimize maritime wireless communication technology and eliminate the cognitive impairment of maritime wireless communication technicians.

Research objects and methods: Taking 85 maritime wireless communication technicians with cognitive impairment as the research object, this paper uses Support Vector Machine (SVM) to explore their influence

under the challenge of maritime wireless communication technology, and compares and analyzes the severity of cognitive impairment of staff after the optimization of maritime wireless communication technology.

Research design: SVM is used to classify the challenges faced by maritime wireless communication technology, and the influence of maritime wireless communication technicians under different technical challenges is compared and analyzed. Optimize and upgrade the maritime wireless communication technology, use the Mini Mental State Examination (MMSE) to evaluate the degree of cognitive impairment of maritime wireless communication technicians, and explore their changes before and after the optimization of maritime wireless communication technology. MMSE mainly includes five levels: orientation, memory, attention and calculation, memory and language ability. The scores of each level are 10, 3, 5, 3 and 9 respectively, with a total of 30 points. In MMSE's judgment criteria for cognitive impairment, if the score is less than 27, it indicates cognitive impairment, and the smaller the score, the more serious the cognitive impairment; If the score is in the range of 27-30 points, it means normal.

Methods: The relevant data of maritime wireless communication technicians with cognitive impairment are counted and analyzed by MATLAB software.

Results: Table 1 shows the comparison of MMSE scores of relevant technicians before and after the optimization of offshore wireless communication technology. According to Table 1, the scores of MMSE evaluation items of maritime wireless communication technicians before optimization are low, indicating that they have serious cognitive impairment. After optimization, all MMSE scores were improved, and the growth rate of memory ability MMSE reached 245.21%. This shows that the cognitive impairment of maritime wireless communication technicians has been significantly improved.

Table 1. Comparison of MMSE scores of wireless communication technicians with cognitive impairment before and after optimization of maritime wireless communication technology

Evaluation time	Directional force	Memory	Attention and computational power	Recall ability	Language ability	Total score
Before optimization	5.19	0.73	2.47	1.13	4.79	14.37
After optimization	9.23	2.52	4.92	2.89	8.25	27.64
Growth rate (%)	77.84	245.21	99.19	155.75	72.23	92.35

Conclusions: From the background of cognitive impairment, the optimization of maritime wireless communication technology based on the relevant knowledge theory of cognitive psychology can effectively alleviate the cognitive impairment of maritime wireless communication technicians and improve their mental health level.

STUDY ON COGNITIVE BARRIERS AND MOTIVATIONAL FACTORS OF TOURISM DEVELOPMENT OF CHINESE EXCELLENT TRADITIONAL CULTURE - TAKING HORSE CULTURE IN INNER MONGOLIA AS AN EXAMPLE

Jingya Hou

School of Tourism and Business, Guangzhou Panyu Polytechnic, Guangzhou 511483, China

Background: Cognition is a kind of human psychological activity, which refers to the psychological process of individual cognition and understanding of things. The normal functions of the brain are mainly to perceive and process information, process and store processing results, that is, memory, maintain a normal state of consciousness and control emotions. Cognitive function belongs to the high-level activity category of cerebral cortex, including attention, memory, orientation, language ability, visual space orientation, executive function, organization and management ability, etc. In short, cognition is a complex process with multiple factors, levels and dimensions. Cognitive disorder is a psychological disorder developed from the perspective of cognitive psychological disorder. Psychological cognitive disorder can be called a neurocognitive disorder. Patients mainly have psychological disorders in problem solving, perception, memory, learning and so on. In the field of medicine, psychological cognitive impairment is defined as six cognitive impairments: social cognition, complex attention, language, perceptual motor function, learning

and memory, and executive function. Patients usually have a decline in these cognitive abilities, and in severe cases, they can have a brain decline. According to different types of psychological cognitive impairment, the field of psychology includes: mild neurocognitive impairment, mild neurocognitive impairment and severe neurocognitive impairment. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further deterioration of cognitive ability. Patients are characterized by large emotional fluctuations, paranoia, anxiety, reduced ability of understanding and language expression, and reduced resolution of objective things such as time. Severe cognitive impairment developed further from moderate cognition. Patients show a decline in overall function and develop dementia, which will lead to delusion, indifference, lack of self-care ability and so on. However, cognitive impairment is not only a concept of clinical psychology, but also has rich cultural attributes. In other words, cognitive impairment involves all areas of life and plays an important role in analyzing and solving problems in the field. Relevant studies have pointed out that exploring the cognitive barriers and motivational factors of cultural tourism development has significant benefits for improving cultural tourism development.

The spiritual culture of horse refers to the concept, attitude, aesthetic interest, worship, respect and love of horse formed by human beings through long-term cultivation in social practice and consciousness activities. It is the core of horse culture. For example, in Mongolian culture, horses are regarded as "gods". In other words, horses are very important in the life and national development of Mongols. Since ancient times, Mongolian people have special feelings for horses no matter what occupation they are engaged in. In the production and labor, marching and fighting, social life, sacrificial customs, literature and art of the people of Inner Mongolia, almost all are accompanied by horse tracks and the sound of horse hoofs. In view of this, this study takes the horse culture in Inner Mongolia as an example to study the cognitive barrier motivation factors of the development of Chinese excellent traditional culture tourism, in order to explore the cognitive barrier problems that may be encountered in the development of traditional culture tourism, so as to provide theoretical guidance for the better development of traditional culture tourism.

Objective: Taking the horse culture in Inner Mongolia as an example, this study analyzes the cognitive obstacles and motivational factors of the development of Chinese excellent traditional culture tourism, so as to provide corresponding suggestions for the development of traditional culture tourism, so that the development and construction of traditional culture tourism can develop in a more ideal direction.

Research objects and methods: Using the methods of interview and analysis, 50 Inner Mongolia horse cultural workers, cultural tourism development workers and local residents were interviewed for 20-30 minutes. Then, carry out the intervention of cognitive impairment, and compare and analyze the improvement of the cognitive status of Inner Mongolia horse culture in the development of local cultural tourism by 50 people of different identities and occupations before and after the intervention of cognitive impairment. The evaluation indicators include: spiritual value, cultural value, economic value, practical value and communication value.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the cognitive barrier factors of horse culture tourism development in Inner Mongolia. Overall, after the implementation of cognitive impairment intervention, 50 people with different identities and occupations improved their cognition of the importance of Inner Mongolia horse culture in the development of local cultural tourism, with statistical differences.

Table 1. Cognitive barrier factors of horse culture tourism development in Inner Mongolia

Motivational factors of cognitive impairment	Cognitive impairment before intervention	Cognitive impairment after intervention	<i>p</i>
Economic value	56	86	<0.001
Pragmatic value	62	85	<0.001
Spiritual value	51	90	<0.001
Cultural value	49	86	<0.001
Communication value	60	82	<0.001

Conclusions: Horses are very important in Mongolian life and national development. However, people with different identities and professions have insufficient cognition of the importance of Inner Mongolia horse culture in the development of traditional cultural tourism. After cognitive intervention, they can significantly improve the cognition of Inner Mongolia horse culture, then it ensures the importance of Inner Mongolia horse culture in the sustainable and benign development of traditional cultural tourism development.

* * * * *

THE INFLUENCE OF WEAK COMMUNICATION THEORY BASED ON PSYCHOLOGICAL ANALYSIS ON THE PSYCHOLOGICAL ANXIETY OF UNIVERSITY LIBRARY INFORMATION WORKERS

Junping Wang

School of Physical Education, Xuchang University, Xuchang 461000, China

Background: Anxiety is an emotional state of tension and fear caused by failing to achieve goals or threatening human beings to overcome these obstacles, self-esteem and self-confidence, or increasing the sense of failure and guilt. It includes three main parts: emotional experience, threat, uncertainty, cognitive expression of fear and physiological arousal. From the perspective of psychology, the increase of anxiety value will lead to distraction and block of attention, disturb the results of brain memory and thinking, and make people show anxiety, tension, indecision and disturbing emotional changes. Anxiety can lead to neurological dysfunction and mental illness or abnormal anxiety, which is particularly prominent in employees' mental health problems. However, if these manifestations are excessive, they will evolve into anxiety disorders, even physical and language stiffness, mental breakdown, or common mental diseases in medicine, which will bring great inconvenience to people's body and mind, work or study. With the increasing awareness of market competition pressure, more and more employees are troubled by anxiety, which directly affects their work efficiency, life law and physical and mental health. Relevant studies have pointed out that the direct object of anxiety problems not only stays at the human level, but also can produce anxiety problems through the difficulties of external factors. In other words, in today's society, due to social development and rapid changes in the social environment, anxiety has also spread rapidly and penetrated into all areas of social life. In short, the understanding of anxiety should attract people's attention.

The research of weak communication theory is not only restricted by the internal law of knowledge production, but also affected by some external factors. The most important factor is the change of the media itself. The transformation of contemporary communication has brought a series of problems, but it has not been effectively responded. The attention of the theoretical circle has turned to the research on new media, but it is obviously conservative and backward in the understanding, communication concept and theoretical construction of new media, and lacks substantive innovation. Facing this situation, the lack of social value of vulnerable communication theory leads to the ultimate anxiety of researchers. At the same time, in the process of historical development, the development of radio technology makes the transmission of information break through the limitations of time and space, and information can be transmitted over a long distance. The development of Internet technology has realized the two-way interactive development of information dissemination, and the information carrying capacity has been further improved. Under the background of digital information, the library and information work has also undergone profound changes. In particular, the digital information platform for library and information work has realized the liberation and development of human information dissemination. In view of this, in order to better promote the in-depth development of library and information work, this study analyzes the innovative development of weak communication theory in the library and information work of university library from the perspective of psychology, in order to solve the ultimate anxiety of weak communication theory in the library and information work of university library, so as to promote the development and progress of university library.

Objective: Based on the perspective of psychology, this paper analyzes the anxiety caused by weak communication theory in the library and information work of university library, and combined with the specific situation of anxiety, constructs an innovative development system in the library and information work of university library, so as to promote the sustainable and healthy development of university library.

Research objects and methods: 300 information workers were randomly selected from 30 university libraries as the research objects. Combined with the diagnostic test of anxiety tendency, the psychological anxiety of information workers in university libraries based on weak communication theory was measured. The scale contains 100 questions, including learning anxiety tendency, anxiety tendency towards others, loneliness tendency, self-blame tendency allergic tendency, physical symptoms, phobic tendency and impulsive tendency are eight dimensions, yes is recorded as 1 point, and no is recorded as 0 point. The score of good mental health is below 35, the score of moderate anxiety level is between 35 and 65, and the score of more than 65 belongs to mental unhealthy state.

Methods: Use Excel software for statistical data analysis.

Results: Table 1 shows the detection rate of psychological anxiety of university library information workers based on weak communication theory. On the whole, there are 60 university library information workers with anxiety score ≥ 35 under the weak communication theory, accounting for 20%. This shows that the weak communication theory is an important factor affecting the anxiety of university library

information workers, which should be paid enough attention.

Table 1. Detection rate of psychological anxiety of information workers in university library based on weak communication theory (*n*)

Factor	≥35 score	≥65 score
Anxious learning	5	5
Communication anxiety	15	5
Loneliness tendency	5	3
Self-reproach tendency	10	2
Sensitive tendency	5	5
Physical symptoms	10	5
Terrorist tendency	5	3
Impulsive tendency	5	2
Total score	60	30

Conclusions: This paper analyzes the psychological anxiety of university library information workers under the weak communication theory from the perspective of psychology. The results show that 20% of university library information workers have psychological anxiety, which should be paid enough attention to. In other words, in the process of innovation and development of university library information work, we should include psychological content, actively respond to the defects of weak communication theory, and do a good job in the psychological assistance of intelligence personnel, so as to promote the development and progress of university library.

* * * * *

RESEARCH ON PUBLIC POLICY OF CHINA'S LOW-CARBON ECONOMIC DEVELOPMENT FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Xing Li* & Fuzhou Luo

School of Management, Xi'an University of Architecture and Technology, Xi'an 710055, China

Background: The so-called social psychology is committed to understanding and explaining how individual thoughts, emotions and behaviors are affected by reality, imagination and implicit social existence. On this basis, it traces the historical evolution of social philosophical speculation and social Empiricism on the social essence of human nature, as the pre-rational history and origin of social psychology. Therefore, we can construct the "birth myth" of social psychology. In other words, social psychology is an experimental study on social promotion or social encouragement. Only by introducing the experimental process into the research of human social psychology and social behavior can it mark the formal birth of modern social psychology. At this time, the discipline definition, combing, expression and demonstration of social psychology can truly obtain orthodoxy and authority in the individualism of logical positivism and methodology, and then legalize the continuity of discipline rational progress and the reproduction of discipline knowledge. During this period, after the establishment and development of the society of experimental social psychology, it became a substantive multinational discipline community, completing the shaping of discipline identity and discipline construction. It can be said that the emergence of the independent discipline consciousness of social psychology gave birth to the discipline system of social psychology, and the establishment and improvement of its discipline system promoted the development and growth of social psychology. So far, European social psychology has achieved its goal and entered a new stage of development with confidence. In short, social psychology is a subject that studies the psychological and behavioral development and changes of individuals and groups in social communication. Social psychology mainly explores interpersonal relationships at the individual and social group levels. At the individual level, the research contents include: individual socialization process, communication, speech development, partnership, and the impact of family or social environment on individuals. At the social group level, the research contents include: group communication structure, group norms, attitudes, racial prejudice, aggression, customs and culture. Social psychology is a main branch of psychology, which aims to study the psychological problems related to society.

All social events have human factors, that is, there are psychological problems. The psychology that

studies these disciplines is social psychology. Social psychology studies the development and changes of individual psychological activities from the perspective of individual and social interaction. Social psychology not only emphasizes the interaction between society and individual, but also involves the research of individual and social interaction guided by humanities and social sciences. The connotation of low-carbon economy public policy is to adjust or influence the market subjects through laws, prices, planning, taxation, finance, insurance, credit, charges, emission trading and other means according to the requirements of the law of market economy, so as to realize the public policy of coordination between economic construction and climate protection, and take the externality internalization of carbon emission behavior as the principle. Based on the benefits of carbon emissions, adjust the market players, and then establish the restraint and incentive mechanism for the sustainable utilization of resources and environment. In short, effective public policy is the guarantee to achieve the development goal of low-carbon economy. Relevant studies have pointed out that social psychology plays an important role in the public policy of China's low-carbon economic development, which can not only ensure the rationality of public policy, but also ensure the effectiveness of public policy. In view of this, this study constructs a public policy for the development of low-carbon economy based on social psychology, in order to promote the sustainable development of low-carbon economy in China.

Objective: To explore the specific situation of the development of China's low-carbon economy, and build a public policy for the sustainable development of low-carbon economy based on social psychology, in order to establish a circular resource system and a stable economic model for China's low-carbon economy.

Research objects and methods: 100 volunteers in various fields were selected as the research object to carry out the psychological intervention of low-carbon economy public policy based on social psychology. Comparative analysis: the changes of 100 volunteers' satisfaction with public policies of low-carbon economy before and after the intervention. Public policy evaluation indicators include: the principle of low-carbon and development, the principle of target feasibility, the principle of resource positioning, the principle of cost-benefit balance and the principle of public participation.

Methods: The data are analyzed by Minitab20 latest version of data statistics software.

Results: Table 1 shows the changes of volunteers' satisfaction with China's low-carbon economy public policies before and after the intervention based on social psychology. It can be seen from Table 1 that after the implementation of social psychology intervention, 100 volunteers' satisfaction with China's low-carbon economy public policy increased significantly, with statistical difference ($P < 0.05$).

Table 1. Based on the changes of volunteers' satisfaction with China's low-carbon economy public policy before and after social psychology intervention

Category	Satisfaction		P
	Before intervention	After intervention	
Principle of low carbon and development	50	80	<0.05
Objective feasibility principle	65	88	<0.05
Resource positioning principle	43	84	<0.05
Cost benefit balance principle	60	86	<0.05
Principle of public participation	55	83	<0.05

Conclusions: The public policy of low-carbon economic development based on social psychology can fully respect and adopt the suggestions of all parties, and then significantly improve the satisfaction of all parties with the public policy of low-carbon economic development, which is of great value to the promotion and application of public policy of low-carbon economic development in China.

APPLICATION OF FINE MANAGEMENT IN CONSTRUCTION PROJECT MANAGEMENT UNDER COGNITIVE IMPAIRMENT

Zesong Zhu

College of Architectural Engineering, Chuzhou Polytechnic, Chuzhou 239000, China

Background: Cognitive function refers to the advanced functions of the brain, including perception, memory, speech and abstract thinking. It can also be simply understood as human activities to understand objective things. Cognitive function includes many cognitive fields, including memory, calculation, space-time orientation, structural ability, executive ability, planning, starting, sequence, operation, feedback, abstraction, decision-making and judgment, language understanding, expression and application. In the process of normal aging, cognitive function will decline, but in the process of abnormal aging, cognitive function will decline excessively in some aspects and gradually develop into pathological cognitive impairment. Cognitive impairment generally refers to the clinical syndrome of cognitive impairment in varying degrees caused by various reasons, such as physiological aging to disturbance of consciousness. Similar names include cognitive decline, cognitive impairment, or cognitive impairment. Cognitive impairment mainly includes memory impairment, which is usually considered as early symptoms, such as memory impairment of recent events, personal experience memory, memory impairment of major life events, orientation impairment, including time, place and character orientation impairment, language impairment, including difficulty in finding words, reading, writing and understanding, impaired visuospatial ability and decreased computing ability. Poor judgment and problem-solving skills. Dysfunctional state refers in particular to similar, progressive memory impairment. Because there is no impairment and functional impairment in other cognitive fields, it is not dementia, but a clinical state between normal aging and mild dementia. The most important clinical significance lies in early detection and early intervention to delay or prevent the occurrence and development of dementia. At the same time, under the background of cognitive impairment, construction project managers will have a series of problems, mainly manifested in inadequate construction project management, inadequate implementation of construction project management system, insufficient attention to construction project management, insufficient preparation in the construction preparation stage, lack of perfectly fine management mechanism and so on.

There are still many loopholes in the field of construction project management. Most enterprises rely too much on government functional departments due to imperfect project management, which leads to poor management effect. In view of the problem that the construction project management system is not in place, although the competent departments at all levels have formulated the supervision and management norms of the construction industry, they still cannot achieve satisfactory results in the specific implementation process. In view of the importance of construction project management, the construction unit advocates the principle of interests first at this stage. There are many deficiencies in the implementation of project management, the project quality cannot be effectively guaranteed, and the construction enterprises cannot develop well. The problem of insufficient construction preparation stage is mainly reflected in the low rationality of prefabrication construction and the low professional technical level and ability of construction enterprises. Finally, the lack of fine management mechanism makes it difficult to quantify the work standards. This paper analyzes the influencing factors affecting the efficiency of construction project management, combined with the fine management under cognitive impairment, in order to strengthen the construction technology management, innovate the management of construction engineering and optimize the construction management process.

Objective: In order to analyze the current situation of construction project management, combined with the fine management under cognitive impairment, improve the application value of construction project management, so as to provide new ideas and directions for future construction project management.

Research objects and methods: 100 construction related personnel in two regions are selected as the research object for cognitive impairment intervention, and then the fuzzy comprehensive evaluation method is used to evaluate the application status of fine management in construction project management, so as to determine the evaluation indicators: construction preparation, construction technology management, construction innovation management and construction process management. Then, the specific application effect of fine management in construction project management before and after cognitive impairment intervention is compared and analyzed.

Methods: Obtain the management effect of construction projects before and after fine management under cognitive impairment through SPSS18.00 data statistical analysis software.

Results: Table 1 shows the specific application effect of fine management in construction project management before and after cognitive impairment intervention. It can be seen from Table 1 that after the cognitive impairment intervention, the construction preparation, construction technology management, construction innovation management and construction process management have been significantly

improved, and there is a statistical difference before and after the intervention ($P < 0.05$).

Table 1. Specific application effect of fine management in construction project management before and after cognitive impairment intervention

Category	Cognitive impairment before intervention	Cognitive impairment after intervention	P
Preparation for construction	50	87	<0.05
Construction technology management	49	85	<0.05
Construction innovation management	55	86	<0.05
Construction process management	52	86	<0.05

Conclusions: After the fine management under cognitive impairment, the construction project management has achieved good results. Compared with before the cognitive impairment intervention, after the cognitive impairment intervention, the construction preparation, construction technology management, construction innovation management and construction process management have been significantly improved, which is worth popularizing and applying in the construction project management.

UNIPUS AND SPOC PLATFORM INTERACTIVE “SMART” CROSS-CULTURAL COMMUNICATION COURSE FLIPPED CLASSROOM TEACHING MODE

Li Li

Department of Foreign Language Teaching, Hebei University of Economics and Business, Shijiazhuang 050061, China

Background: Cognitive impairment is a perceptual disorder caused by mental disorders. In psychiatry, cognitive impairment seriously affects the individual’s judgment of external things. The generation of cognitive impairment is the brain injury caused by the stimulation of the external environment. The brain is the part that controls human activities. The damage of brain cognitive function will make adults unable to accurately judge the external information they receive. In psychiatry, cognitive impairment is a very serious mental disorder. Generally speaking, patients with cognitive impairment cannot accurately recognize external things due to cognitive psychological defects in daily life. Therefore, when individuals suffer from cognitive impairment, the resulting mental disorders are also increasing. Mental disorders lead to patients’ emotional control, and in serious cases, patients will have behaviors that harm themselves and others. The existing psychotherapy of cognitive impairment generally promotes the recovery of cognitive function of patients with cognitive impairment through psychological intervention of psychologists, but the method of psychological intervention can only achieve one-to-one remission at the same time, which is inefficient. Therefore, in the social development, education and teaching programs have been proposed for the cognitive impairment of mental patients, especially in colleges and universities. In college English teaching, students are more likely to have cognitive impairment because the complex environment of English teaching will affect students’ basic cognition.

In college English teaching, with the development of information technology, intelligent flipped classroom is more and more loved by teachers and students. The main reason is that intelligent flipped classroom can bring more novel teaching experience to students, in which cross-cultural communication greatly improves students’ interest in school. In college teaching, students’ cognitive impairment seriously hinders students’ learning. Therefore, colleges and universities continue to try to carry out teaching reform under the background of students’ cognitive impairment. The “smart” flipped classroom interactive between u campus and SPOC platform is the main teaching mode in colleges and universities at present. Therefore, how to reform the teaching mode based on students’ cognitive impairment will determine the teaching level of colleges and universities. Therefore, the research tries to start with the mitigation strategy of cognitive impairment, build a “smart” cross-cultural communication course flipped classroom teaching mode for the interaction between u campus and SPOC platform, in order to improve the teaching level of colleges and universities and alleviate students’ cognitive barriers at the same time.

Objective: This paper discusses the impact of cognitive impairment on the teaching quality of colleges and universities, and explores the “smart” cross-cultural communication course interactive between u

campus and SPOC platform under the background of cognitive impairment, so as to provide a reference direction for the teaching reform of colleges and universities.

Study design: Taking the students of Grade A and B in the hierarchical teaching of college English major of grade 21 in a university as the teaching language, the students are taught the course of cross-cultural communication, and the students' basic theoretical knowledge is sorted out before class. In the teaching process, teachers rely on the U campus and SPOC platform to build an exchange of visits between teachers and students, requiring students to provide learning results at the end of the course.

Result: A total of 150 students of grade B will evaluate the awareness, knowledge and skills of students' cross-cultural communication after the course teaching, judge the learning effect of students, and analyze the impact of students' cognitive impairment on the above three levels, as shown in Table 1. The degree of impact is represented by 0-4 levels, in which 0 represents no impact, 1 represents slight impact, 2 represents general impact, 3 represents obvious impact and 4 represents complete impact. It can be seen from Table 1 that the cognitive impairment of Grade A and B students has a significant impact on the awareness, knowledge and skills of cross-cultural communication.

Table 1. The influence of cognitive impairment on students' intercultural communicative competence

Student	Consciousness level	Knowledge level	Skill level
A	3	3	3
B	4	3	3

Conclusions: College students will have different degrees of cognitive impairment in English learning. Therefore, students' cognitive impairment should be fully considered in the reform of college teaching model. In the reform of the flipped classroom teaching mode of the "smart" cross-cultural communication course interactive between u campus and SPOC platform, the reform is based on students' cognitive impairment, with the main purpose of alleviating students' cognitive impairment and improving students' performance. The results show that the "smart" cross-cultural communication course flipped classroom teaching mode of u campus interacting with SPOC platform under cognitive impairment is more likely to be loved by students, and the effect of alleviating students' cognitive impairment is more obvious. In the teaching reform of colleges and universities, the current situation of students' cognitive impairment cannot be ignored. The teaching mode of colleges and universities needs to always pay attention to students' mental status and ensure the development of students' comprehensive quality.

APPLICATION OF NATIONAL CULTURAL ELEMENTS IN FASHION DESIGN FROM THE PERSPECTIVE OF AESTHETIC PSYCHOLOGY

Songli Yang

College of Fashion and Design, Donghua University, Shanghai 200051, China

Background: Aesthetic psychology is a kind of human psychological type. The emergence of aesthetic psychology is affected by human general psychology, which includes cognition, emotion and will. Under the influence of three psychological activities: cognition, emotion and will, people will have the ability to identify beauty and ugliness, which is also called aesthetic psychology. Aesthetic psychology is a collection of individual aesthetic cognitive, emotional and will processes. In aesthetic psychological activities, emotional processes account for a large proportion. In emotional psychological activities, people's cognitive and will activities be also ongoing. However, aesthetic psychology believes that there are essential differences between aesthetic psychology and general psychology. Under the influence of aesthetic psychology, individuals have higher spiritual needs and stronger individual cognitive ability. Aesthetic psychology includes intuition, individuality, emotion, self-cultivation and creativity. Intuition is the object perception in aesthetic psychology and a kind of subconscious rational content. The individuality in aesthetic psychology shows the individual freedom, that is, the freedom of personal interests and hobbies. Emotion is the most obvious psychological activity in aesthetic psychology. Emotion is the basis of aesthetic occurrence, and the external expression of aesthetic psychology is emotional catharsis. In addition, the

pursuit of self-supporting in aesthetic psychology is psychological satisfaction. In the aesthetic process, the individual's psychological trend will gradually realize self-supporting, and creativity is the way of emotional expression after aesthetic perception.

In fashion design, using consumers' aesthetic psychology for design optimization is the main way advocated in the current fashion field. At the same time, with the improvement of China's attention to the inheritance of national culture, abdominal distension enterprises also began to apply national cultural elements to fashion design. The cultural spirit contained in different nationalities is different, and different national cultural elements have created the unique aesthetic habits of all nationalities. In the fashion design of fashion design enterprises, national elements have become the main source of their design inspiration. By adding national elements to fashion design to improve the overall cultural connotation of clothing, the volume of clothing transactions has been increased to a certain extent. Under life psychology, the national cultural elements in fashion design should meet the aesthetic psychological set, that is, in fashion design, we need to start from the uniqueness of national culture and design clothing shapes, patterns, colors and materials that meet different aesthetic psychology according to cultural differences. The research takes aesthetic psychology as the theoretical basis, and puts forward the application measures of national cultural elements in fashion design, in order to provide direction for the development of fashion design enterprises and the inheritance of national culture.

Objective: This paper discusses the influence of aesthetic psychology on fashion design, analyzes the application of national cultural elements in fashion design under aesthetic psychology, and puts forward the development path of fashion design and the protection measures of national cultural inheritance.

Study design: Taking the students majoring in fashion design in a university as the research object, 80 students were selected for test and analysis, and the aesthetic psychology of all students was counted before the experiment. In the experiment, the students were divided into groups according to their different aesthetic psychology, and the differences of fashion design effects combined with national cultural elements under the influence of different aesthetic psychology were analyzed.

Results: Conduct quantitative evaluation on the effect of students' clothing design, and use the 0-5 scale to evaluate, which indicates that it is poor to very good in turn. It is concluded that the effect of students' clothing design under the influence of intuition, individuality, emotion, self-support and creativity is shown in Table 1. Table 1 shows that under the influence of intuition, individuality, emotion, self-cultivation and creativity in aesthetic psychology, students have a high evaluation of the effect they can achieve in fashion design, and the integration degree of national cultural elements in fashion design is also high.

Table 1. The influence of aesthetic psychology on fashion design

Aesthetic psychology	Intuition	Individuality	Emotionality	Autotropism	Creativity
Fashion design effect	5	4	5	5	4
National cultural integration	5	5	5	4	5

Conclusions: In the fashion design combined with national cultural elements, the designer's aesthetic psychology has a significant impact on the effect of fashion design. From the perspective of aesthetic psychology, this paper analyzes the application of national cultural elements in fashion design, and discusses the influence of different aesthetic psychology on fashion design and the combination degree of national cultural elements in fashion design. The results show that the aesthetic psychology of students majoring in fashion design can affect the design results to a great extent, and we can know that the integration effect of national culture in fashion design is different due to different aesthetic psychology of students. Better aesthetic psychology can improve the overall effect of fashion design and the application effect of national culture in fashion design. Therefore, the use of aesthetic psychology for design optimization can not only improve the development of fashion design industry, but also protect the inheritance of national culture.

THE INFLUENCE OF COLLEGE ENGLISH TRANSLATION AND MULTIMEDIA INTERACTIVE TEACHING INNOVATION ON STUDENTS WITH COGNITIVE IMPAIRMENT

Shuangshuang Li

School of Foreign Languages, Wuchang Shouyi University, Wuhan 430064, China

Background: Medically speaking, cognitive impairment is a cognitive impairment caused by a brain defect. Patients with cognitive impairment need to take drugs for a long time in the follow-up treatment. In psychiatry, cognitive impairment is classified as a kind of mental disorder. This kind of mental disorder is that patients have cognitive impairment of understanding external things, and also have cognitive impairment of understanding their own specific situation. In psychiatry, it is considered that patients with cognitive impairment are mental disorders obtained after being impacted by thought or emotion. When patients suffer from cognitive impairment, they will have cognitive ambiguity, cognitive deviation and other symptoms. Patients' cognitive ambiguity refers to the occurrence of difficulty to recognize things in normal cognition, which leads to patients' inability to distinguish the authenticity and safety of things, which will lead to psychological cognitive problems, which will seriously lead to patients' mania. The cognitive deviation of patients refers to the deviation of patients' cognition of different things or events from that of ordinary people, that is, the cognition of external things of patients with cognitive impairment violates common sense. When the cognitive deviation of patients is serious, there will be serious mental disorders, and finally hallucinations and other deterioration phenomena. Therefore, in the current research, we are constantly looking for effective methods to treat patients with cognitive impairment. Gradually, some studies suggest that education and teaching can alleviate patients' cognitive impairment to a certain extent.

In college education, students' cognitive impairment is inevitable, especially in college English teaching. When students face the unfamiliar language teaching of English, cognitive deviation and cognitive ambiguity will lead to obvious cognitive impairment. In college English teaching, English translation teaching is one of the important teaching contents. English translation requires students to have strong language ability and logic ability, and the existence of students' cognitive impairment will seriously affect students' language ability and logic ability, which will lead to the poor effect of college English translation teaching. In multimedia interactive teaching, some studies have proved that it can effectively help students improve their translation ability. At the same time, the research also puts forward that it can alleviate students' cognitive impairment. With the development of society and the continuous improvement of information technology, college English teaching began to try to apply multimedia to curriculum interactive teaching. On the one hand, it is to improve teachers' comprehensive teaching ability, on the other hand, it is to stimulate students' learning emotion and alleviate students' cognitive impairment. Therefore, from the perspective of students' cognitive impairment, this study analyzes the impact of multimedia interactive teaching innovation on college English translation teaching and analyzes the changes of students' cognitive impairment, so as to provide a reference for college teaching.

Objective: This paper discusses the current situation of students' cognitive impairment in college English translation teaching, discusses the application status and role of multimedia interactive teaching in teaching practice, and analyzes the impact of college English teaching combined with multimedia interactive teaching on students' achievement and the mitigation effect of students' cognitive impairment.

Study design: 150 English majors in a university were selected, including 40 freshmen, 40 sophomores, 35 junior students, and 35 senior students. The number of cognitive impairments among all students was counted. Group discussion is conducted according to whether students have serious barriers, and the innovative teaching mode of English translation and multimedia interaction is adopted for students' teaching intervention. The teaching duration is 8 months. The changes in the professional achievement level of all students in 8 months are counted, and the changes in the cognitive ability of students with cognitive impairment are analyzed. All data were collected by SPSS24.0 software for statistical analysis, $P < 0.05$ indicates that the difference is statistically significant.

Table 1. Changes of students in the teaching process

		0 month	2 months	4 months	6 months	8 months
Professional achievement	Normal	61.4	67.8	70.3	74.9	77.6
	Cognitive impairment	34.7	39.8	45.6	55.4	68.9
	Cognitive ability	1	1	2	3	3

Results: The number of students with cognitive impairment among 150 students is 31. The teaching comparison between students with cognitive impairment and normal students is shown in Table 1. As can be seen from Table 1, the English translation scores of normal students show an increasing trend, while the scores of students with cognitive impairment also show an increasing trend. The scores of the two groups of students at the time of the test results are statistically significant compared with those before the test. In

the process of teaching, students with cognitive impairment evaluate their cognitive ability according to grades 0-5, indicating that it is poor to very good. The results show that the overall cognitive ability of students shows an improvement trend.

Conclusions: As one of the main subjects in college English teaching, how to deal with students' cognitive barriers in English learning is the key. Based on the analysis of the current situation of students' cognitive impairment in college English translation teaching, this paper puts forward an innovative model of multimedia interactive teaching, so as to improve the teaching quality of teachers in English translation teaching, so as to alleviate students' cognitive impairment. The results show that the multimedia interactive teaching model based on students' cognitive impairment can effectively improve the English translation performance of students with cognitive impairment, and the students' cognitive ability has also been significantly improved. Therefore, when facing students with cognitive impairment, colleges and universities should fully consider students' psychological thoughts, build a curriculum teaching model with cognitive understanding teaching, improve students' cognitive ability and promote students' healthy growth.

* * * * *

DYNAMIC MODELING AND ANALYSIS OF COLLEGE TEACHING QUALITY EVALUATION SYSTEM BASED ON COGNITIVE PSYCHOLOGY

Lisheng Wang

Teachers College, Shangqiu Polytechnic, Shangqiu 476000, China

Background: Cognitive psychology, a psychological trend of thought and research direction rising in the West in the mid-1950s. In a broad sense, it refers to the study of human advanced psychological processes, mainly cognitive processes, such as attention, perception, representation, memory, creativity, problem solving, speech and thinking. In a narrow sense, it is equivalent to contemporary information processing psychology. Studying cognitive process from the perspective of information processing is the mainstream of modern cognitive psychology. It can be said that cognitive psychology is equivalent to information processing psychology. It regards people as an information processing system, and holds that cognition is the whole process of information processing, including the coding, storage and extraction of inputs such as feeling, memory, creativity and thinking. According to this view, cognition can be divided into a series of stages, each stage is a unit that performs some specific operations on the input information, and the reaction is the product of this series of stages and operations. The components of information processing system are interrelated in some way. Teaching quality evaluation is one of the effective ways for teachers to understand the classroom teaching situation, obtain feedback information and improve teaching quality. The quality evaluation of classroom education in colleges and universities is an important means of teaching management in colleges and universities all over the country. Building a reasonable, effective and scientific teaching quality evaluation system model and related operation mechanism is important for improving teaching evaluation. It is of great significance to enrich the management theory of colleges and universities and improve the teaching quality in colleges and universities.

Objective: With the continuous increase of enrollment scale and educational development of colleges and universities in China, the teaching quality of colleges and universities has become the focus of the whole society and the public. However, up to now, classroom teaching is still the main way of higher education. Therefore, the quality evaluation system of classroom teaching is the main part of the whole teaching quality monitoring system in colleges and universities. Based on the fact that teaching is for declarative knowledge, the main teaching strategy is to teach students to process knowledge finely, so as to establish a close relationship between new knowledge and original knowledge, and then guide students to organize their learning in an orderly way. In teaching, teachers need to point out the principle of new knowledge to students, help students mark the key content, and inspire students to memorize knowledge by mnemonic method. At the same time, teachers also need to ask students to strengthen their memory. This teaching process involves cognitive psychology and has a wide range of applications. Therefore, using cognitive psychology to establish and design a fair, scientific and reasonable classroom teaching quality evaluation system is of great significance to improve the teaching level of teachers, students' learning effect and teaching management in China.

Subjects and methods: In the dynamic modeling analysis of college teaching quality evaluation system under the background of cognitive psychology, it is of great significance to improve teaching quality, promote students' personality development, improve students' interest in learning, promote the

coordinated development of students' cognition and emotion, and cultivate good personality. This paper applies cognitive psychology to college teaching and evaluates the teaching quality after application. The application effect of cognitive psychology can be improved from three aspects: student-oriented, teacher-oriented, improving class quality and adapting teaching to students' cognitive development. The detailed measures are mainly to establish the "people-oriented, student-oriented" teaching concept. In the teaching process of secondary vocational classes, teachers should establish reasonable classroom question time and let students express what they do not understand, or use pictures instead of words when displaying multimedia teaching. It can effectively avoid students' secondary processing of text information in the process of transformation and improve the quality of classroom teaching. According to the students' easy to accept teaching methods, the selection of appropriate teaching methods and teaching means, in the teaching process of continuous exploration, looking for students to accept the knowledge of the fastest teaching method. This study carries out a questionnaire survey from the following four points: first, make a horizontal comparison between teachers, so that teachers can obtain vitality and motivation in the increasingly fierce competition, and stimulate their own potential. Second, it can guide teachers to strive to meet the teaching objectives set at the beginning and improve their teaching quality in the teaching process. The third teaching quality evaluation system gives sufficient appraisal and scoring to teachers' daily teaching work, so that the teaching management department of colleges and universities can better master their teachers' teaching quality and teaching level, take it as an important basis for teachers' promotion, evaluation and distribution, prevent teachers from doing badly, and do a good job A level of unreasonable treatment. Fourth, teachers' teaching work must provide accurate feedback materials, so as to help teachers improve their teaching methods and teaching quality.

Study design: 300 groups of different ages, genders and occupations were investigated by stratified cluster random sampling. 100 students, teachers and parents were randomly selected for questionnaire survey. A total of 300 questionnaires were distributed, 286 were recovered, and the number of valid copies was 279. If there are blank answers to class I questions in 7 of the answers, it shall be deemed invalid.

Methods: The effect of dynamic modeling of college teaching quality evaluation system based on cognitive psychology is statistically analyzed by Excel.

Results: There are many factors affecting the teaching quality, and the relationship between the influencing factors is complex constructing a reasonable, effective and scientific teaching quality evaluation system model and related operation mechanism is of great significance to improve college teaching evaluation, expand college management theory and improve college classroom teaching quality.

In this survey, the influence values of specific factors are quantified in five grades of 0-4. 0 means irrelevant, 1 means slight influence, 2 means general influence, 3 means obvious influence and 4 means full influence. In order to reduce the large error caused by individual subjectivity in the evaluation, the evaluation values of 300 social groups are taken as the average and the results are rounded, the specific statistical table is shown in Table 1.

Table 1. Effect of dynamic modeling of college teaching quality evaluation system based on cognitive psychology

Factor	Incentive effect	Guiding function	Feedback function	Management function
Student group	4	3	3	3
Teacher group	4	4	3	4
Parent group	3	3	4	3

Conclusions: The teaching quality evaluation of college teachers is of great practical significance to improve the quality of national higher education. However, college teaching involves a lot of cognitive psychology content. Therefore, based on cognitive psychology, and the establishment and design of a scientific, fair and reasonable classroom teaching quality evaluation system is the guarantee to improve the quality of the whole higher education. The research on the classroom teaching quality evaluation system can also promote colleges and universities to quickly update their educational ideas, speed up the reform of the whole higher education and improve the quality of the whole higher education.

REFORM AND PRACTICE OF MUSIC TEACHING IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yi Shang

Music and Dance College, Jiangnan Vocational College of Media Arts, Wuxi 214153, China

Background: With the continuous progress of the times, the requirements for college students are becoming higher and higher. Nowadays, how to strengthen the moral, intellectual, physical, aesthetic and labor development of college students has become a concern of the whole society. In the education system of colleges and universities, music education in colleges and universities is one of the main ways to improve students' aesthetics, alleviate students' negative emotions and improve students' mental health. Therefore, with the promotion and popularization of quality education, college music teaching plays a more and more important role in the college education system, and people from all walks of life pay more and more attention to college music teaching. However, the current college music classroom teaching mode is relatively traditional and single, which cannot meet the needs of the times. Therefore, the current college music teaching mode still needs to be improved and optimized.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. In order to improve students' interest in music course learning, improve music performance, and then improve artistic aesthetics, based on educational psychology, this paper analyzes students' learning psychology and learning behavior in the process of music teaching in colleges and universities, and puts forward strategies to reform music teaching in colleges and universities. Based on the teaching design theory in teaching psychology, strengthen the practicability of music skills and apply what you have learned. Using the classroom management theory and organizational learning theory in educational psychology to cultivate students' teamwork spirit and ability, so as to make them complement each other and make common progress. According to the cognitive science theory and curriculum development theory in educational psychology, pay attention to learning evaluation and reflection, let students understand their learning effect, establish students' confidence and improve students' interest in learning. The reform of music teaching mode in colleges and universities based on educational psychology can effectively improve the effect of classroom teaching, improve students' music literacy, and provide high-quality talents for the society, which is of great significance to the healthy growth and long-term development of college students.

Objective: The current music classroom teaching mode in colleges and universities is relatively traditional and single, which cannot meet the needs of the times. Therefore, the current music teaching mode in colleges and universities still needs to be improved and optimized. Based on educational psychology, this study analyzes the learning psychology and learning behavior of students in the process of music teaching in colleges and universities, and puts forward strategies to reform music teaching in colleges and universities, hoping to effectively improve the effect of classroom teaching, improve students' music literacy, and provide high-quality talents for the society.

Research objects and methods: 80 students majoring in music in a university were selected as the research object, and the teaching effect of music teaching mode was evaluated by students' examination results.

Research design: The students were randomly divided into the research group and the control group, with 40 people in each group. Among them, the research group adopted the improved college music teaching mode for music teaching. The control group used the traditional college music teaching mode for music teaching. Three months later, the music test scores of the two groups were compared.

Methods: The software SPSS17.0 and excel were used to count and analyze the relevant data.

Results: After three months of teaching, the music test scores of the students in the research group were significantly higher than those in the control group ($P < 0.05$), as shown in Table 1.

Table 1. Music test scores of two groups of students

Timing	Music test scores		t	P
	Research group	Control group		
Before teaching	61.9±12.3	62.1±13.1	0.403	0.762
After teaching	82.6±6.2	75.3±10.1	4.354	0.022
t	8.019	2.431	-	-
P	0.001	0.037	-	-

Conclusions: With the promotion and popularization of quality education, music teaching in colleges and universities plays a more and more important role in the college education system, and people from all

walks of life pay more and more attention to music teaching in colleges and universities. Based on educational psychology, this paper analyzes the learning psychology and learning behavior of middle school students in the process of music teaching in colleges and universities, and puts forward strategies to reform music teaching in colleges and universities. The results showed that after three months of teaching, the music test scores of the students in the research group were significantly higher than those in the control group ($P < 0.05$). Therefore, the reform of college music teaching mode based on educational psychology can effectively improve the effect of classroom teaching, improve students' music literacy, and provide high-quality talents for the society, which is of great significance to the healthy growth and long-term development of college students.

APPLICATION OF TRADITIONAL AESTHETICS IN GRAPHIC DESIGN FROM THE PERSPECTIVE OF MULTICULTURALISM

Yaxiang Ding

College of Art and Design, Jiangsu Vocational Institute of Commerce, Nanjing 211168, China

Background: Graphic design, namely visual communication design, takes vision as the form of communication and expression, transmits visual information to the audience, and then makes the audience meet the visual needs of the audience after receiving this visual information. In visual communication design, color design is one of the most common design forms, and it is also the way to make the audience feel the artistic value and aesthetic value of the design products most intuitively. However, due to congenital or acquired reasons, some people have different degrees of obstacles to some visual organs, resulting in color vision impairment. Patients with color vision impairment have a weak perception of color, which are generally divided into total color blindness, red blindness, green blindness and blue-yellow blindness. In visual design, we can't fully understand the aesthetic needs of color in graphic design. Therefore, it is necessary to carry out graphic design for people with color vision impairment, meet the visual needs of people with color vision impairment, reflect humanistic care and jointly build a harmonious society.

Under the multicultural background, traditional aesthetics has also been used in graphic design. Design psychology can analyze people's psychological state and psychological needs, and apply the analysis results to art design. In addition, design psychology also studies the psychological changes of designers in the design process and the psychological impact of design works on social groups and social individuals, and applies these to art design, so that art design can more intuitively and appropriately reflect the psychology and emotion of the audience, so as to meet the psychological and aesthetic needs of the audience. Design psychology contains many contents, including visual design, color psychology, consumer psychology, product design, environmental design, personality tendency, hierarchical demand, etc., it also involves perceptual texture and psychological effect. Among them, product design is based on visual design, color psychology and consumer psychology. Based on design psychology, the research puts forward suggestions on graphic design for people with color vision impairment to meet the visual needs of people with color vision impairment. Based on the theory of color psychology, select the color with high visibility for graphic design. According to the theory of perceptual texture, improve the color texture performance of the graphic design. Finally, through the theory of consumer psychology and personality tendency, China's traditional aesthetics is applied to graphic design, such as ink painting. Based on design psychology, the improvement of graphic design mode for people with color vision impairment can better meet the visual aesthetic needs of people with color vision impairment, reflect humanistic care and promote the construction and development of a harmonious society.

Objective: To improve the graphic design mode for people with color vision impairment based on design psychology, so as to better meet the visual aesthetic needs of people with color vision impairment, reflect humanistic care and promote the construction and development of a harmonious society.

Research objects and methods: 100 patients with color vision impairment were selected from a third-class hospital as the research object, and the satisfaction of patients with graphic design works was evaluated according to the evaluation value of patients. The evaluation value ranges from 1 to 5. The higher the score, the higher the patient's satisfaction with the work.

Research and design: Invite a designer to carry out graphic design. One of the graphic design works adopts the improved graphic design mode based on design psychology, which is recorded as work A. Another graphic design work adopts the traditional graphic design mode for design, which is recorded as work B.

Record the patient's evaluation values of the two works.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: The evaluation value of 100 patients with color vision impairment on work A was significantly higher than that of work B ($P < 0.05$), as shown in Figure 1.

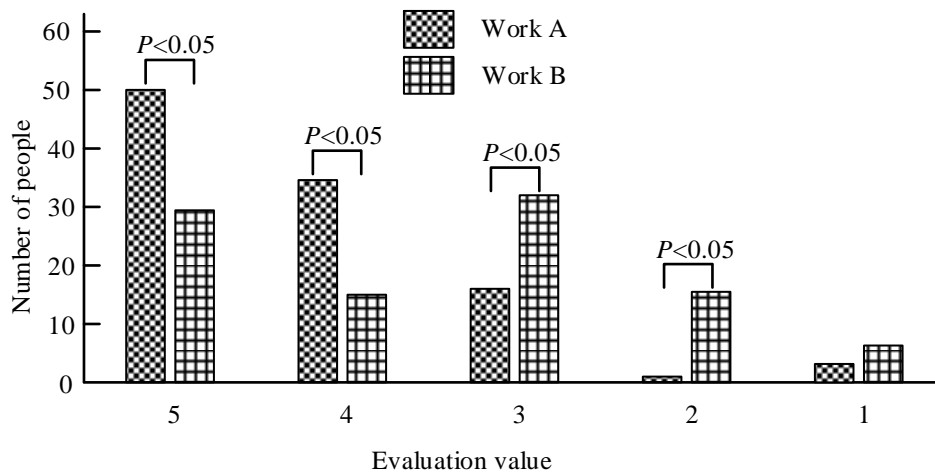

Figure 1. Evaluation value of works by patients with color visual impairment

Conclusions: Due to congenital or acquired reasons, some people have different degrees of visual impairment, resulting in color vision impairment. Patients with color vision impairment have a weak perception of color and color design in graphic design, which is difficult to meet the visual needs. Based on design psychology, this study applies Chinese traditional aesthetics to graphic design. The experimental results showed that the evaluation value of 100 patients with color vision impairment on work a was significantly higher than that of work B ($P < 0.05$). The above results show that based on design psychology, the improvement of graphic design mode for people with color vision impairment can better meet the visual aesthetic needs of people with color vision impairment, reflect humanistic care and promote the construction and development of a harmonious society.

ON THE PRACTICE OF INHERITING EXCELLENT CULTURE IN ANCIENT CHINESE LITERATURE FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Zenghui Qiao

Zhengzhou Vocational College of Finance and Taxation, Zhengzhou 450048, China

Background: Educational psychology takes the psychological changes of objects in the process of education and teaching as the main research content, and takes psychological theory as the guidance to provide help for the development of educational activities. Educational psychology is mainly divided into behaviorism and cognitivism. Behaviorism believes that learning is a process of strengthening habits. Learning in the teaching process is a complex of stimulation and reflection. Teachers stimulate students repeatedly to form a habit of knowledge. The school of cognitivism believes that education is a process of cognitive internalization. Learning is not only the memory of knowledge, but also the subjective consciousness processing of students on the basis of knowledge. Compared with behaviorism, cognitivism puts more emphasis on the main role of students in teaching activities and advocates giving full play to students' autonomous ability in learning. The role of teachers is more inclined to guide and assist.

The course of ancient Chinese literature is an important basic course in colleges and universities. The teaching of ancient Chinese classic literature includes many contents of Chinese traditional culture. It is a feasible way to inherit Chinese excellent traditional culture. In the teaching process of ancient Chinese literature, students can not only understand the literary development process of Chinese traditional society from the perspective of literature, but also receive the edification of Chinese excellent traditional culture

and national spirit, so as to realize the double improvement of humanistic quality of academic knowledge. However, the traditional teaching mode of ancient Chinese literature course is relatively old-fashioned and stereotyped. In the teaching process, students' learning enthusiasm is not high, so it is difficult to give full play to the role of ancient Chinese literature course in promoting Chinese excellent culture. Therefore, it is necessary to adjust and reform the course of ancient Chinese Literature under the guidance of the theory of teaching psychology, so that the course of ancient Chinese literature in colleges and universities can undertake the responsibility of inheriting Chinese excellent culture.

Objective: This paper discusses the role and practice of college Chinese ancient literature curriculum in the inheritance of Chinese excellent traditional culture from the perspective of educational psychology, analyzes the inheritance responsibilities and practice paths of college Chinese ancient literature curriculum under the guidance of educational psychology theory, develops new ways to carry forward Chinese excellent traditional culture and national spirit, and widens the coverage of Chinese excellent traditional culture in college curriculum. Through the reform and adjustment of the course of ancient Chinese literature and kindness in colleges and universities, we can promote the combination of the course of ancient Chinese literature and the inheritance of Chinese excellent traditional culture. We hope to use new teaching modes and means to enhance the educational psychological enthusiasm of college students and help students improve their participation in the teaching activities of ancient Chinese literature.

Research design: This study uses the method of comparative experiment to understand the role and effect of college Chinese ancient literature curriculum in the inheritance of Chinese excellent traditional culture, and analyzes the differences in the inheritance effect of Chinese ancient literature curriculum under the traditional teaching mode and the new teaching mode guided by educational psychology. Using the method of stratified cluster random sampling, two classes were selected from each of the four grades for comparative experiments, and they were divided into experimental group and control group. The students in the experimental group studied the course of ancient Chinese literature under the new teaching mode guided by educational psychology, while the students in the control group used the traditional teaching mode. The comparative experiment lasted for 3 months. The experimental group and the control group carried out the course of ancient Chinese literature twice a week, and each class hour was 90 minutes. Through the course test and traditional culture knowledge competition results of the students in the experimental group and the control group, this paper analyzes the role of the new teaching mode guided by educational psychology in the inheritance of Chinese excellent traditional culture.

Results: Obtain the level of educational positive psychology of the students in the experimental group before and after the experiment, and analyze the impact of the curriculum reform of ancient Chinese literature integrated with excellent cultural inheritance on the students' educational positive psychology under the guidance of educational psychology. The comparison results of the scores of students in different grades before and after the experiment are shown in Table 1. The students' educational psychological enthusiasm is significantly improved under the new teaching mode.

Table 1. Comparison of scores of educational positive psychologies of students in different grades before and after the experiment

Experimental object	Before experiment	After the experiment
Freshman	1.98±0.34	3.77±0.26
Sophomore	2.06±0.29	3.84±0.27
Junior	2.04±0.33	3.85±0.31
Senior	1.91±0.38	3.76±0.33

Conclusions: Starting from the psychological activities in the teaching process, educational psychology has important guiding significance for the development of educational activities and the improvement of teaching effect. Educational psychology can effectively improve the harmony between teachers and students, stimulate students' learning enthusiasm and learning potential from a scientific point of view, and help colleges and universities improve the teaching quality of ancient Chinese literature. From an academic perspective, it opens up a new communication path for the inheritance of Chinese excellent traditional culture. Based on the theory of educational psychology, we should break the old-fashioned teaching mode of the traditional Chinese ancient literature curriculum, so that the Chinese ancient literature curriculum can adapt to the development process of the new era and provide help for carrying forward the national spirit.

ON EMPLOYEE CAREER MANAGEMENT IN HUMAN RESOURCE MANAGEMENT UNDER THE BACKGROUND OF COGNITIVE PSYCHOLOGY

Guiqing Liu

The Economics & Management School, Zhongyuan University of Technology, Zhengzhou 450007, China

Background: Based on human behavior activities, cognitive psychology studies and analyzes human internal psychological activities, and studies the psychological processes of human cognitive behaviors such as memory, perception and reasoning. Different from behaviorist psychology, cognitive psychology studies the mechanism of human internal psychological activities that are difficult to be observed directly, and analyzes human memory processing, extraction and other change activities. Information processing is the mainstream view of cognitive psychology. Cognitive psychology believes that man is an information processing system, and human cognitive activity is the process of information processing such as coding, input, storage and extraction of perceptual information. Cognitive psychology takes human input and output activities as the research object, analyzes the internal psychological changes between human input and output activities, infers the psychological activities behind them from the observable input and output phenomena, and probes into human cognitive psychological process from the outside and inside.

In today's social situation, social competition is becoming increasingly fierce. Both enterprises and employees need to find their core competitiveness in order to occupy a place in the fierce competition. In order to improve their comprehensive strength, enterprises expect to cultivate a group of employees with high working ability and loyalty in the process of human resource management and guided by the direction of enterprise development, so as to improve the comprehensive level of the enterprise. Employee career management is an important part of human resource management. Through planning and guiding the career development of employees, establish scientific and reasonable employee work objectives and performance appraisal system, and combine active employee skill training and guidance to promote the development and growth of employees. In order to promote the development of enterprise human resource management, this paper introduces cognitive psychology into employee career management, explores the problems of employee career management in human resource management under the guidance of cognitive psychology theory, and improves the level of enterprise human resource management from the perspective of employee cognition.

Objective: From the perspective of cognitive psychology, this paper analyzes the problems existing in employee career management in enterprise human resource management, and explores the optimization strategy of enterprise employee career management suitable for the current social and economic development situation. Under the guidance of cognitive psychology theory, the research analyzes the development direction of enterprise employee career management, helps enterprise human resource specialists take the enterprise development goal as the guidance, and improves employee cohesion and work level through human resource management, so as to achieve the purpose of common development of enterprises and employees.

Research design: This study uses analytic hierarchy process to construct the evaluation index system, analyzes the impact of employee career management factors on employees' work enthusiasm in enterprise human resource management, decomposes the employee career management problem into multiple target levels, and calculates and sorts the weight of indicators at each level by means of fuzzy quantification of qualitative indicators. Explore the importance of all levels of employee career management in improving employees' work enthusiasm.

Use the expert consultation method to preliminarily analyze the various levels of indicators of employee career management, and construct the employee career management index system. The standard level indicators of the index system are enterprise attention, salary system, career development, performance appraisal and work distribution.

Table 1. Changes of enterprise cognitive psychological characteristics of enterprise employees after reform

Test dimension	Before reform	After reform
Work enthusiasm	1.54±0.28	3.99±0.25
Corporate culture identity	1.35±0.26	3.83±0.42
Organizational open cognition	1.21±0.34	3.87±0.31
Organizational development cognition	1.43±0.32	3.95±0.26

Results: After the adjustment and reform of employee career planning, the changes of enterprise cognitive psychological characteristics of enterprise employees are shown in Table 1. Through the reform

and optimization of enterprise employee career planning, the work enthusiasm, corporate cultural identity, organizational openness and organizational development of enterprise employees have been significantly improved.

Conclusions: In the highly competitive social market situation, if enterprises want to seek long-term development and upgrading in the market, they must improve their human resource management level and make long-term enterprise development planning and design under the guidance of enterprise development objectives. In order to attract more high-quality talents, enterprises also need to strengthen the career management of employees and do a good job in the construction of corporate culture, so that employees can make common progress and development with enterprises in scientific and reasonable career planning, so as to achieve a win-win situation between enterprises and employees. Enterprises should enhance their awareness of human resource management, pay more attention to employees' career management, adjust the rationality of the overall salary system, establish a scientific and smooth channel for employees' career development, improve relevant performance appraisal system and allocation of work tasks, optimize employees' working environment and atmosphere, and stimulate employees' enthusiasm, Promote the common development and progress of employees and enterprises.

RESEARCH ON THE APPLICATION OF OFFLINE ONLINE AND OFFLINE HYBRID PHYSICAL EDUCATION TEACHING MODEL FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Fuyang He

School of Physical Education, Xichang University, Xichang 615000, China

Background: There are certain individual differences among different students. Different students have different abilities and methods of accepting knowledge, but students often have certain internal laws and characteristics in the process of learning. Based on psychological theory, educational psychology analyzes the internal law of psychological changes of students and teachers in educational activities, deeply excavates the psychological characteristics and changes of students in the process of teaching, and provides psychological theoretical basis for improving teaching quality. The theoretical basis of educational psychology can effectively help teachers comprehensively use a variety of teaching methods in the teaching process, design scientific, reasonable and targeted teaching programs based on students' individual characteristics, and help students improve their learning ability. Educational psychology theory can also effectively improve teachers' sensitivity to students' psychological changes, help teachers grasp the laws and opportunities of students' psychological changes, and promote students' mental health development.

In recent years, colleges and universities and the government have gradually realized the importance of students' physical education, the height of college physical education curriculum has been continuously improved, and the reform of college physical education curriculum has been gradually promoted and implemented. With the development of modern information technology and the integration of fields, the organic combination of information technology and higher education, online teaching mode has become a new educational means. The online and offline mixed education mode is also gradually applied in college physical education. Colleges and universities begin to use Internet technology and equipment to assist physical education, combined with advanced information technology means to improve students' enthusiasm for physical exercise and promote the all-round development of students' physical quality, knowledge and technology.

Objective: Based on the theory of educational psychology, the research deeply analyzes the learning psychological characteristics and change law of middle school students in the process of physical education teaching, analyzes the application of online and offline hybrid physical education teaching mode, excavates the effect of online and offline hybrid new teaching mode in actual college physical education teaching, and discusses the new path of college physical education curriculum reform, so as to provide reference for promoting the improvement of college physical education teaching quality. Under the guidance of educational psychology theory, the research deeply analyzes the advantages and existing problems of online and offline hybrid physical education teaching mode, understands the current situation of physical education teaching mode in colleges and universities, and expects to put forward reflection and suggestions on the development of physical education teaching mode.

Research design: The research adopts the method of comparative experiment to understand the differences between the new online and offline hybrid physical education teaching mode and the traditional

physical education teaching mode, analyze the advantages and problems of the online and offline hybrid physical education teaching mode, and put forward the optimization strategies and suggestions for the reform of college physical education curriculum on this basis. The research adopts the method of random cluster stratified sampling, and 120 college students are selected for comparative experiment. The experimental objects are randomly divided into offline teaching group, online teaching group and mixed teaching group. The offline teaching group adopts the traditional face-to-face teaching form, while the online teaching group adopts the combination of online class and video teaching, The mixed teaching group adopts the online and offline mixed physical education teaching mode for physical education. The comparative experiment lasts for 3 months. During the experiment, students conduct physical education once a week, and each teaching time is 2 hours. After the experiment, collect the evaluation scores of the experimental objects on different physical education teaching modes. The experimental objects score the three physical education teaching modes from four aspects: teaching concept, curriculum, classroom mode and information management.

Results: The changes of the students' psychological enthusiasm for physical education teaching in the experimental group before and after the experiment are shown in Table 1. After a three-month experiment, the students' psychological enthusiasm for physical education teaching in the experimental group has increased significantly under the new mode of online and offline hybrid physical education teaching, and the students' learning enthusiasm for physical education knowledge learning, physical skills learning and physical psychological quality training has increased significantly.

Table 1. Changes of students' psychological enthusiasm for physical education teaching in the experimental group before and after the experiment

Test dimension	Before reform	After reform
Sports knowledge learning	1.24±0.38	3.95±0.34
Sports skill learning	1.37±0.32	3.81±0.37
Cultivation of sports psychological quality	1.15±0.37	3.79±0.32

Conclusions: The online and offline hybrid physical education teaching mode breaks the time and space constraints of the traditional teaching mode and has a higher degree of freedom, which is convenient for teachers and students to arrange physical education teaching time freely. And online and offline hybrid physical education teaching mode, relying on advanced Internet information technology and equipment, students can watch and study the live broadcast and playback of courses online anytime and anywhere. Students have enough time to preview and review the sports theory and skills taught by teachers, which can effectively meet the personalized needs of students for physical education learning. Under the new online and offline mixed teaching mode, rich and free teaching mode and time arrangement can effectively enhance students' psychological enthusiasm for physical education teaching and promote students to actively and independently carry out physical education learning and exercise.

Acknowledgement: The research is supported by: Liangshan Prefecture Ethnic Culture Research Fund Planning Project in 2021: Study on the Sports Culture Path of Promoting Liangshan Ethnic Minorities to Adapt to Modern Social Civilization from the Perspective of Cultural Integration (fund No. 20201102).

RESEARCH ON THE DECONSTRUCTION AND INTEGRATION PATH OF WISDOM EDUCATION SYSTEM TECHNOLOGY UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Xingbo Yang

*The Department of Information Technology, Guangdong Teachers College of Foreign Language and Arts,
Guangzhou 510640, China*

Background: Educational psychology analyzes the changes and internal laws of the psychological activities of educators and educates in the process of education and teaching. It is a new branch of psychology and became an independent psychological discipline at the end of the 19th century. Educational psychology is a marginal interdisciplinary subject, which organically integrates educational science and psychology, deeply analyzes the psychological state of educational subjects in educational practice, and deeply excavates the laws and characteristics of psychological changes behind it from the behavior in

educational activities. With the advancement of social development, the task of educational psychology is also increasing. Educational psychology expands from the basic study of psychology to the cultivation of object behavior and emotional aesthetics in teaching activities. From various angles, this paper studies the psychology and thinking of educational subjects in teaching practice, so as to provide psychological support for the improvement of educational quality.

With the continuous improvement of social informatization, the integration of education and information technology has gradually deepened. Wisdom education has become a new path for the development of national education and an inevitable choice under the situation of the times. In recent years, the state has paid more and more attention to education, actively promoted education reform at different levels, increased educational economic expenditure and policy preference, and put forward an important strategic goal of the integration of science and education. Smart education takes big data, cloud computing and other information technologies as the realistic basis and technical support, constructs a modern social smart education system, expands the depth and quality of education driven by technology, and puts forward new possibilities for the development of modern education in China.

Objective: Based on the theory of educational psychology and the educational psychological characteristics and change law of middle school students in wisdom education, the research deconstructs the system and technology of wisdom education, clarifies the internal context and relationship between wisdom education system and technology, and systematically combs the relationship and development map of education and information technology in wisdom education. Under the guidance of educational psychology theory, this paper studies the system and technical structure of intelligent education, analyzes the psychological relationship between students and intelligent education mode, puts forward the integration path of intelligent education, and explores the collaborative development mechanism of intelligent education and information technology, hoping to provide help for the progress and development of modern education in China.

Research objects and methods: The research adopts the combination of questionnaire survey and in-depth interview to deconstruct the system and technology of intelligent education. Taking 100 students, 20 teachers and 10 technicians related to intelligent education as the survey objects, we understand the intelligent education system and technology from different perspectives of students, teachers and technicians. Through in-depth one-on-one interviews, the research explores the integrated development path of intelligent education and information technology from the perspective of three different roles, and collects the suggestions and opinions of teachers and technicians on the coordinated development of the two.

Study design: Through the form of questionnaire survey, the research understands the intelligent education system from the perspective of students, teachers and technicians related to intelligent education, carries out the system technical structure of intelligent education from three angles, compares intelligent education with other traditional education methods, and realizes the multi angle modeling of intelligent education technology system. Combined with the way of interview, this paper deeply excavates the application of smart education technology system in the three dimensions of students, teachers and technicians, understands the path thinking of different subjects on the technology integration of smart education system, comprehensively considers the situation of smart education from three angles, and puts forward the development path of the integration of smart education and information technology. And use the way of pilot experiment to understand the impact of the intelligent education mode on students' learning effect and learning psychology, and explore the rationality of the path reform of the new intelligent education mode integrating information technology.

Results: A pilot experiment was conducted on the intelligent education system integrating information technology to verify the feasibility and effectiveness of the intelligent education system in actual education and teaching. The changes in the number of subjects' positive and negative educational psychology before and after the pilot experiment are shown in Table 1.

Table 1. Changes in the number of positive and negative educational psychology before and after the pilot experiment

Statistical items	Before the pilot		After the pilot	
	Number of educational positive psychology	Number of educational negative psychology	Number of educational positive psychology	Number of educational negative psychology
Research object	241	286	429	71

Conclusions: Smart education is a high-end form of traditional education under the development of

information technology. The construction of smart education is a long-term and complex systematic project. The research and promotion of intelligent education need to deeply explore the application effect of intelligent education from the perspective of technology and system, and deconstruct the technical system of intelligent education, so as to help us comprehensively examine the application of intelligent education in educational practice from the perspective of technology and system, and deeply analyze the essence and root of intelligent education system, It provides a reference for the upgrading and development of modern education.

RESEARCH ON THE THEORY AND NEW MODEL OF NEW MEDIA HEALTH COMMUNICATION STRATEGY TO GUIDE PUBLIC OPINION BASED ON SOCIAL PSYCHOLOGY

Xiaojie Yang

School of Culture and Communication, Liaoning Institute of Science and Engineering, Jinzhou 121010, China

Background: Social psychology analyzes the psychological phenomena of individuals and groups in the social environment, deeply excavates the emotional, ideological or behavioral characteristics of individuals under the restriction of others or groups, and understands the internal rules of the characteristics of individual interpersonal relationship, social inhibition and social promotion in the social environment. In terms of groups, social psychology excavates the unique psychological characteristics of social groups, and analyzes the characteristics of group cohesion, group decision-making and group psychological atmosphere of different social groups. Social psychology is based on social classification. Through social classification, individuals with common characteristics are psychologically classified as a whole, so as to make an overall psychological analysis of social groups with the same characteristics and deeply understand the psychological characteristics of social groups.

In recent years, the development of information technology has greatly changed people's daily life. The emergence of new media has shortened the communication distance between people and the world, enabling people to quickly collect social information and understand social hot events. However, on the other hand, new media has also brought many challenges to the healthy communication of information. Especially in the face of social emergencies, new media has the important functions of public opinion guidance and information communication. It is required that new media adhere to the guiding principle of the core issue of health communication under the guidance of social psychology, closely follow the problems of actual events, and correctly and healthily guide social public opinion. Starting from the public opinion guidance law and healthy communication strategy of emergencies, grasping the key of public opinion guidance and management of emergencies in the new media environment can effectively reduce the public opinion response errors when emergencies occur and realize the correct management of social public opinion.

Objective: Guided by the theory of social psychology, the research explores the role of public opinion guidance of new media under the healthy communication strategy of new media, analyzes the development trend of public opinion guidance management when emergencies occur, and deeply excavates the potential law of public opinion guidance of emergencies. Starting from the healthy communication strategy of new media, this paper analyzes the theoretical basis of new media in public opinion guidance and management, and puts forward corresponding suggestions on public opinion guidance and management mode of new media, hoping to improve the public opinion guidance and management ability of modern new media in the event of emergencies and reduce the mistakes in the process of social public opinion guidance.

Research design: From the perspective of social psychology, the research uses the theory of social psychology to analyze the psychological characteristics of social individuals and groups in the process of social public opinion communication, excavates the social psychological basis of the guidance of new media to social public opinion when public emergencies occur, and analyzes the mode improvement strategy and path of new media public opinion management and guidance based on the concept of new media healthy communication and combined with analytic hierarchy process. The research uses analytic hierarchy process to explore the mode improvement strategy of new media public opinion management guidance when emergencies occur, and explore the new path of using new media means to guide the public opinion communication of the public from the six perspectives of rule of law guarantee, function coverage, subject status, environmental adaptation, unified planning and right division, based on the analysis of the problems faced by the public opinion guidance management of emergencies in the new media environment. Through

the analysis of the current situation of social public opinion communication, the research deeply excavates the guiding role of new media in the psychology of social public opinion, and establishes the guiding index system of new media public opinion management when public emergencies occur. The analytic hierarchy process is used to weight the indicators, analyze the functionality and application of the scheme indicators at all levels, and sort the index weights by means of fuzzy quantification of qualitative indicators, so as to provide decision-making assistance for the optimization of the mode of public opinion guidance and management of new media.

Results: The evaluation and comparison results of the psychological guidance effect of public opinion before and after the intervention of new media are shown in Table 1. After the introduction of the concept of new media health communication strategy, the psychological guidance effect of the public in terms of public opinion reception, public opinion communication and psychological recognition in the face of public emergencies is significantly improved.

Table 1. Comparison of evaluation results of public opinion psychological guidance effect before and after new media intervention

Survey object	Before new media intervention	After the intervention of new media
Public opinion reception	1	3
Public opinion communication	2	4
Public psychological recognition	-	-
Public opinion reception	-	-
Public opinion communication	-	-
Public psychological recognition	1	4

Conclusions: From the perspective of social psychology and new media health communication strategy, the research analyzes the social psychological phenomenon in the process of social public opinion communication, which can provide effective help for the establishment of a new model of public opinion guidance and management. The theory of social psychology and the healthy communication strategy of new media require that on the basis of combining the psychological characteristics of social groups and individuals, a new mechanism of public opinion guidance of new media for public emergencies should be constructed, and the new media should be able to guide the public opinion of emergencies in time, so as to strengthen the response and management ability of new media when emergencies occur. Give full play to the role of new media in social information dissemination. New media should make scientific and rational use of social information, change the traditional perspective of information control, give full play to the social mobilization of new media, and unite social groups to deal with emergencies.

Acknowledgement: This work is supported by Educational Science Project of the 13th Five-Year Plan in Liaoning Province in 2020 “Research on the Reform of College Teachers’ Education Mode for Online Teaching” (No. 285).

ANALYSIS OF INNOVATIVE TEACHING REFORM OF ACCOUNTING EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Dong Qiu¹ & Siying Huang²

¹*Institute of Finance and Economics, Guangzhou International Economics College, Guangzhou 510540, China*

²*School of Foreign Languages, Guangdong Business and Technology University, Zhaoqing 526020, China*

Background: From the perspective of psychology, educational psychology combines educational practice with psychological theory to deeply explore the psychological law of pedagogy in the process of education. Educational psychology analyzes the learning and intervention effects and psychological factors of educational subjects under the educational environment, and studies the influence of various psychological factors in the process of educational practice on the educational process and educational effect. Educational psychology is a marginal interdisciplinary subject of pedagogy and psychology, which has a short development time, but the proposal of educational psychology theory is of great significance to the

development and progress of pedagogy and psychology. Educational psychology applies the theoretical content of psychology to practical educational activities, which can promote the development of education, apply the influence of psychological factors to the improvement of curriculum design and teaching methods, and help students deal with the difficulties and challenges faced in the learning process.

With the advent of the era of information and big data, the speed of social development is accelerating, which puts forward higher requirements for accounting students and brings more opportunities. Under the new social situation, accounting students have a large development space and good prospects for future development. At the same time, with the reform and improvement of the education system, the number of accounting students with professional skills is increasing, which makes the employment competition among accounting students increasingly fierce. The severe employment situation requires colleges and universities to improve and optimize the accounting courses, so that the accounting education in colleges and universities can keep pace with the development of the times and meet the needs of the employment market. Through the reform of accounting education system in colleges and universities, we should innovate and enhance the comprehensive ability and professional skill level of accounting graduates, so as to improve the employment competitiveness of accounting students.

Objective: Based on the theory of educational psychology, this study deeply analyzes the change law of educational psychological activities of college accounting students in professional teaching, explores the learning psychological basis of accounting students, and studies and analyzes the reform of accounting education system in colleges and universities. This paper studies and analyzes the problems existing in the teaching of accounting major in colleges and universities, obtains the employment market demand of accounting major students, and puts forward the corresponding strategies and suggestions for the reform of accounting major teaching system in colleges and universities. The research analyzes the problems existing in the innovative education reform of accounting specialty in colleges and universities, and puts forward the direction of accounting specialty education reform in colleges and universities, hoping to improve the quality of accounting specialty education in colleges and universities, transport more high-quality accounting professionals for national construction and development, and alleviate the employment pressure of accounting graduates in colleges and universities.

Research design: The research adopts the method of stratified cluster random sampling, and randomly selects two accounting classes from each of the four grades of a university to conduct a comparative experiment to verify the pilot implementation effect of the innovation and entrepreneurship teaching reform of accounting specialty. Before the implementation of the experiment, first understand the current situation of college accounting education from the perspective of college accounting students, excavate the problems existing in the innovative education reform of college accounting, and collect the opinions and suggestions of college accounting students on professional education. During the comparative experiment, the students in the experimental group taught with the new teaching mode of innovation and entrepreneurship education reform under the guidance of educational psychology, optimized the existing teaching concept and teaching curriculum arrangement of accounting specialty, strengthened the construction of practice platform of accounting specialty, and improved the teaching quality and professional level of teachers through various training and guidance activities. The students in the control group were taught according to the traditional teaching mode of accounting specialty, maintaining the original teaching arrangement and progress. The experiment lasts for 3 months. The experimental reform course includes all compulsory and elective courses related to accounting.

Results: The changes of the educational psychological enthusiasm of the students in the experimental group and the control group before and after the experiment are shown in Table 1. After the experiment, the psychological enthusiasm of the students in the experimental group has increased significantly, and the learning enthusiasm of the students in the experimental group for accounting education has increased significantly, while there is little difference between before and after the traditional education mode.

Table 1. Changes of educational psychological enthusiasm of students in the experimental group and the control group before and after the experiment

Investigation time		Educational psychological enthusiasm
Before experiment	Experience group	1.25±0.32
	control group	1.27±0.28
After the experiment	Experience group	3.41±0.36
	control group	1.34±0.27

Conclusions: Under the new social situation, accounting students are facing opportunities and challenges. Accounting students are required to seize employment opportunities and improve their self-worth. Colleges and universities should also create a good innovative education environment for

accounting students, optimize the innovation education reform of accounting majors in colleges and universities based on educational psychology, pay attention to the organic integration of accounting curriculum content and innovation and entrepreneurship, and help accounting students in colleges and universities realize the development of innovation and entrepreneurship. starting from the psychological factors of accounting students, exploring the reform and development path of innovation and entrepreneurship education in accounting teaching is of great value to promote the development of students' mental health and the progress of professional education.

FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY, THE LOGIC, DILEMMA AND PATH OF HIGH-QUALITY SERVICE OF LOCAL COLLEGES AND UNIVERSITIES TO THE NATIONAL RURAL REVITALIZATION STRATEGY

Wei Zhao

School of Accountancy, Shandong Youth University of Political Science, Jinan 250103, China

Background: Social psychology is an interdisciplinary subject of psychology and sociology. It combines psychological theory with sociology to analyze the phenomenon and change characteristics of individual and group psychological activities under the background of social environment. Compared with the general psychology of analyzing natural individuals and social individuals respectively, social psychology discusses the internal special relationship between the research subject and social objects, analyzes the relationship between individuals and individuals and between individuals and groups, and studies the change law of psychological activities of individuals and groups from the perspective of sociology. From the individual level, social psychology analyzes the formation and development law of individual characteristics, studies individual psychological characteristics and performance, and deeply excavates the interaction between social situations and individuals. From the perspective of social groups, social psychology discusses the differences of psychological characteristics between different social groups, and analyzes the influence between social groups and individuals.

The proposal of rural revitalization strategy meets the needs of urban-rural integrated development, meets the requirements of reducing the development gap between urban and rural areas under the new situation, and has important practical significance for establishing the mutual supply and feedback mechanism between rural and urban areas. On the other hand, local colleges and universities serving the national rural revitalization strategy also has important value for the development of colleges and universities and the cultivation of college students. While delivering high-quality talents to rural areas through local colleges and universities serving the national rural revitalization strategy and promoting the revitalization of rural industries, colleges and universities serving the rural revitalization can also solve the problem of difficult employment of college graduates. From the perspective of social psychology, analyzing the social and humanistic phenomena in the process of promoting the rural revitalization strategy and understanding the psychological change law behind them can effectively improve the quality level of local colleges and universities serving the national rural revitalization strategy.

Objective: Under the guidance of social psychology theory, through the analysis of the psychological characteristics of social groups in the process of rural revitalization, this study explores the psychological characteristics of various subjects in the process of local colleges and universities serving the national rural revitalization strategy, analyzes the logic and ideas of local colleges and universities serving the national rural revitalization strategy with high quality, and discusses the significance and importance of local colleges and universities serving the rural revitalization strategy. It provides a reference for local colleges and universities to serve the promotion of the national rural revitalization strategy and policy. This paper deeply excavates the current situation of local colleges and universities serving the national rural revitalization strategy, analyzes the difficulties and challenges faced by local colleges and universities serving the rural revitalization, and puts forward corresponding countermeasures and solutions on this basis, hoping to protect the ship for promoting the modern development of rural industry.

Research design: Using Delphi method to analyze the efficiency value of the service scheme of colleges and universities serving the national rural revitalization strategy, analyze the internal logic and dilemma of colleges and universities serving the national rural revitalization strategy with high quality, and obtain the feasible path of colleges and universities serving the national rural revitalization strategy with high quality. Firstly, combined with the theory of social psychology, this paper combs the internal logic and path ideas of colleges and universities serving the national rural revitalization strategy, sorts out the ideas of different

service schemes of colleges and universities serving the national rural revitalization strategy, and establishes the service index system. The research then uses Delphi method to evaluate the efficiency of service construction indicators and analyze the weight of various service indicators, so as to provide reference for local colleges and universities to provide high-quality services for the national rural revitalization strategy. The research takes university managers and rural grass-roots managers as the consultation object, revises and arranges the index system through three rounds of consultation, empowers the indicators at all levels, and deeply excavates the difficulties faced by local university high-quality service national rural revitalization strategy from the perspective of university managers and rural grass-roots managers. Collect the suggestions of people from different angles on local colleges and universities serving the national rural revitalization strategy, and put forward the implementation path to improve the service quality on this basis.

Results: The analysis results of college managers and rural grass-roots managers on the dilemma of local colleges and universities serving the national rural revitalization strategy with high quality are shown in Table 1. At present, there are some problems in local colleges and universities serving the national rural revitalization strategy, such as insufficient service awareness of colleges and universities, insufficient internal development power of villages, loss of local talents in villages and lack of environmental supporting facilities.

Table 1. The analysis results of university managers and rural grass-roots managers on the dilemma of local universities' high-quality service and national rural revitalization strategy

Survey object	University administrators	Rural grass-roots managers
Insufficient service awareness of colleges and universities	4	3
Lack of internal driving force for rural development	3	4
Rural local brain drains	4	4
Lack of supporting environment	4	3

Conclusions: In order to improve the service quality of local colleges and universities serving the national rural revitalization strategy, the government should strengthen the relevant policy support for college graduates to return home and start businesses, attract more college graduates to return home and start businesses through the method of policy preference, and promote the promotion of rural revitalization strategy. rural areas should strengthen the docking service with colleges and universities, make use of the knowledge and technological advantages of colleges and universities, build service industrial parks, establish characteristic rural industries, give full play to the collective overall planning ability of rural areas, and realize the revitalization of rural industries. In the process of promoting the psychological challenges faced by rural colleges and universities, we should fully consider the psychological linkage between rural colleges and universities and local personnel in the process of promoting the strategic revitalization of rural colleges and universities.

RESEARCH ON COLLEGE ENGLISH TRANSLATION TEACHING THEORY AND TRANSLATION SKILLS FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Siying Huang¹ & Dong Qiu²

¹*School of Foreign Languages, Guangdong Business and Technology University, Zhaoqing 526020, China*

²*Institute of Finance and Economics, Guangzhou International Economics College, Guangzhou 510540, China*

Background: Educational psychology organically integrates pedagogy and psychological theory, studies the basic psychological change characteristics and laws of teaching and learning in educational situations, analyzes the psychological phenomena of teachers and students in educational practice, and discusses the interaction between the psychological characteristics of teachers and students. Educational psychology is the result of the expansion of psychological theory to the field of pedagogy. The fundamental purpose of educational psychology is to apply the theoretical knowledge or research results of psychology to practical educational activities, provide guidance for educational practice, and help teachers carry out curriculum design and teaching method reform in teaching activities. Using the theory of educational psychology as the basis to innovate and reform the educational model can effectively help teachers use positive educational

psychological factors, promote the improvement of students' learning ability and enthusiasm, and help students cultivate good learning habits.

English translation is an important part of English learning. It has high requirements for students' comprehensive English application ability and grammar knowledge level. Under the traditional college English translation teaching mode, the teaching concept and curriculum of English translation are relatively backward, which is difficult to meet the needs of the English application market in the new era, and lack of scientific and overall planning. Moreover, the English translation teaching materials used in the traditional English teaching mode are relatively backward, the content of the teaching materials is single, and they lack the combination with the real English application scene, which cannot provide guidance for the improvement of students' English practical application ability. The backwardness of efficient English translation teaching theory and model makes the status of college English translation teaching in English learning in China show the characteristics of marginalization. Colleges and universities are required to actively explore a new teaching model of college English translation theory and skills to help college students improve their English translation skills.

Objective: Based on the theory of educational psychology, this paper analyzes the problems existing in college English translation teaching, understands the current situation of college English translation theory and skill teaching, deeply excavates the places that can be optimized and improved in college English translation teaching, and promotes the improvement of college English translation teaching quality. Guided by the theory of educational psychology, this study analyzes the value and function of college English translation theory and skill teaching from the perspective of pragmatics, hoping to provide help to improve college students' English translation level.

Research design: From the perspective of educational psychology, this study analyzes the psychological change characteristics and laws of college students in the process of college English translation theory and skill teaching, understands the psychological factors in college English translation theory and skill teaching, explores the problems existing in college English translation theory and skill teaching, and analyzes the optimization direction of college English translation theory and skill teaching. The research combines the problems of college English translation teaching and teaching psychological analysis, constructs the college English translation theory and skill teaching system, and explores the development direction and path of college English translation theory and skill teaching through multi-level index analysis. Combined with the principal component analysis method, this paper makes a weighting analysis on the college English translation theory and skill teaching system, and analyzes the best way to optimize and adjust the college English translation theory and skill teaching system through the weight ranking of various characteristic indexes. The study uses a pilot experiment to verify the feasibility and effectiveness of the proposed optimization path of college English translation theory and skills teaching system. Taking a college English major as the pilot experimental object and four grades of English majors as the experimental object, the experiment lasts for three months. During the experiment, the optimized and adjusted college English translation theory and skills teaching system is used for teaching.

Results: Before and after the experiment, the changes of the learning psychological enthusiasm and psychological identity of the experimental subjects to the teaching of English translation theories and skills are shown in Table 1. With the adjusted teaching mode of college English translation theories and skills, the learning psychological enthusiasm and psychological identity of college students have increased significantly.

Table 1. Before and after the experiment, the changes of subjects' learning psychological enthusiasm and psychological identity

Survey items		Freshman	Sophomore	Junior	Senior
Before experiment	Psychological enthusiasm	1	1	2	1
	Psychological identity	2	1	1	2
After the experiment	Psychological enthusiasm	3	4	3	3
	Psychological identity	4	3	3	3

Conclusions: Under the guidance of educational psychology theory, this study analyzes the psychological characteristics of students in the process of college English translation theory and skill teaching, and explores the development direction and path of college English translation theory and skill teaching. The study found that in order to improve the teaching quality of English translation theories and skills in colleges and universities, teachers should integrate pragmatic and contextual theories into English translation teaching, establish translation teaching objectives and teaching ideas that keep up with the times, and help college students correctly understand, learn and use English translation skills. In the process of English translation teaching, teachers can adopt appropriate interactive methods to deepen college students'

understanding and mastery of English translation skills and knowledge, help college students deeply understand the concept of English translation, and deepen college students' understanding of the corresponding relationship between English original text and translation. College students should also maintain high learning enthusiasm and initiative in the process of English translation learning, independently summarize the knowledge of English translation skills and improve their English translation skills. The experimental results show that the adjusted college English translation theory and skills teaching model can effectively improve college students' learning psychological enthusiasm and psychological identity, and is of great value to promote college students' English learning.

COLLABORATIVE INNOVATION OF DIGITAL ECONOMY AND RURAL TOURISM FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Shufen Cui & Yinyin Zhang*

Business School, Lishui University, Lishui 323000, China

Background: Social psychology studies the psychological phenomena of society and groups under the background of social environment, analyzes the psychological restriction thoughts and behaviors of individuals and groups, and analyzes the behavior characteristics of individuals under the inhibition of others or groups, including individual interpersonal attraction, social promotion, social obedience, interpersonal perception and other psychological representations. Social psychology organically integrates psychological theory and sociological theory. It is a marginal interdisciplinary subject between psychology and sociology, which is deeply influenced by the two disciplines. Therefore, there are always two theoretical viewpoints in different directions in social psychology. The two theoretical viewpoints have different emphases, which are divided into sociological direction and psychological direction. The two theoretical viewpoints analyze the phenomenon of social psychology from different angles, and explore the characteristics and laws of psychological changes of individuals and groups in social situations.

In recent years, digital economy has sprung up. With the progress and development of Internet technology, Internet digital economy has become an emerging economic model. The 13th Five-Year Plan puts forward the goal and task of vigorously developing tourism to promote the transformation of national economic structure. As an emerging business form of the tourism industry, rural tourism is an important opportunity to drive the transformation and upgrading of the rural economy. However, in recent years, the supply-demand balance of rural tourism has been broken and encountered the development bottleneck of business homogenization. Rural tourism is required to grasp the vent and reality of the rise of digital economy, organically integrate rural tourism and digital economy, and promote the coordinated and innovative development of rural tourism and digital economy, so as to improve the service quality and development level of rural tourism.

Objective: Under the guidance of social psychology theory, this paper analyzes the development status of digital economy and rural tourism, understands the problems and challenges faced by rural tourism in the development process, and puts forward new ideas and paths for the development and upgrading of rural tourism. The research discusses the significance and value of the coordinated development of digital economy and rural tourism, and analyzes the industrial efficiency of the coordinated development of digital economy and rural tourism, hoping to provide reference for the transformation of national economic structure and the development of rural tourism.

Research design: Using the theory of social psychology, this paper analyzes the individual psychological activities in the development of digital economy and rural tourism, analyzes the psychological characteristics and change laws of social individuals and groups, deeply excavates the potential social psychological background of the collaborative innovation of digital economy and rural tourism, and explores the direction and path of the collaborative innovation of digital economy and rural tourism. Based on the analysis of social and psychological factors, this study analyzes the problems and limitations existing in the development of digital economy and rural tourism, explores the entry point of the collaborative innovation development of digital economy and rural tourism, and constructs the hierarchical index system of the collaborative innovation development of digital economy and rural tourism. The research uses analytic hierarchy process to analyze the collaborative innovation development strategy and path of digital economy and rural tourism from the perspectives of resource integration, digital integration, employee quality training and brand influence construction, and makes auxiliary decision-making through index qualitative analysis, so as to provide direction reference for the collaborative innovation development of digital

economy and rural tourism. And through the pilot implementation of the collaborative development model, verify the feasibility and effectiveness of the collaborative innovation development model of digital economy and rural tourism.

Results: By comparing the psychological characteristics of tourists under the collaborative innovation mode of digital economy and rural tourism with the traditional rural economic development mode, the changes of tourists' psychological recognition and psychological tendency enthusiasm for rural tourism are shown in Table 1. The rural tourism development model under the collaborative and innovative development of digital economy can effectively improve the psychological enthusiasm and identity of tourists to participate in rural tourism, which is of great significance to promote the rapid development of rural tourism.

Table 1. Recognition of rural tourists and psychological changes

Survey object	Traditional development model	Collaborative innovation model
Psychological recognition	1.26±0.21	3.58±0.26
Psychological enthusiasm	1.13±0.26	3.47±0.31

Conclusions: Based on the theory of social psychology, this paper analyzes the social-psychological factors in the process of collaborative innovation development of digital economy and rural tourism, and explores the direction and path of collaborative innovation development of digital economy and rural tourism. The study found that in order to promote the further development of rural tourism and realize the transformation of rural economic structure, rural tourism should be organically integrated with digital economy, inject elements of the digital era, and improve the digital and networked development level of rural tourism. Rural tourism should strengthen industrial integration, expand the development dimension of rural tourism, realize the extension and interaction of rural tourism industry with the help of digital economy, grasp the guidance of market hot spots, and give full play to the characteristic advantages of rural tourism. Rural tourism should also maintain its natural characteristics according to local conditions, strengthen local geographical indications, launch tourism brands with local characteristics, and fully reflect the charm of rural tourism culture in combination with digital economy.

ON THE EXPRESSION OF JAPANESE AND CHINESE PSYCHOLOGICAL CAUSATIVE STRUCTURES OF LANGUAGE MAJORS FROM THE PERSPECTIVE OF PSYCHOLOGICAL TYPICALITY UNDER COGNITIVE IMPAIRMENT

Man Xu

Department of International Studies, Shandong Vocational College of Science and Technology, Weifang 261053, China

Background: Cognitive impairment refers to the obstacles in the construction and cognition of individual knowledge structure. Individual's existing knowledge hinders the construction of new knowledge structure, or forms incomplete knowledge structure. Cognitive impairment is a conceptual meaning, and its cognitive scope is not limited to the cognition and construction of concepts and skills. The cognitive consciousness of the cognitive subject is directly related to its cognition and description of things. In the process of teaching, the cognitive subject has cognitive obstacles, which may come from the social, environmental, cultural and other factors of the cognitive subject. The two languages often show a state of separation. The two languages have different language characteristics and internal meanings. Therefore, there are often differences in the learning modes of the two languages, and this difference may lead to learners' cognitive obstacles to the two languages. Cognitive impairment patients lack the cognition of the common points between languages in the process of language learning, which leads to cognitive impairment of language learning.

The typical perspective of psychology originates from anthropologists' reference and cognition of color. People take the representative color as the positioning reference of focus color. From color to psychological

theory, focus color has changed into focus cognition. In the process of people's cognition of the world, things with the same phenomenon are built around the prototype, which is people's cognitive reference point. In the process of language learning, people's language cognitive process also has the characteristics of prototype. The typical perspective of psychology in linguistics is to learn other language structures from the cognitive prototype through the characteristics of language prototype structure and meaning. The psychological causative structure in language is in an independent language framework. The expression of psychological causative structure exists in both Chinese and Japanese. Therefore, the study analyzes the expression of psychological causative structure in Japanese and Chinese through the cross-language typical language prototype pair equation and the psychological typical transformation method of linguistics.

Objective: Based on the psychological typical theory of cognitive linguistics, this study explores the differences and similarities between the expression of psychological causative structures in Japanese and Chinese under cognitive impairment, analyzes the learning status of language majors with cognitive impairment on psychological causative structures in Japanese and Chinese, and provides help for language majors with cognitive impairment in the learning process of English and Japanese psychological causative structures, it is hoped to provide a new thinking perspective for the learning and transformation of the meaning structure of Japanese and Chinese psychological history, and promote the development of Japanese and Chinese translation teaching.

Research design: Through the statistical analysis, this study understands the learning situation of students with cognitive impairment on the expression of Japanese and Chinese psychological causative structures, and analyzes the difficulties and challenges faced by students with cognitive impairment in the process of learning the expression of Japanese and Chinese psychological causative structures. Starting from the theory of psychological typicality, this study discusses the expression differences and similarities of psychological causative structures in Japanese and Chinese. Starting from the causative verbs in Japanese and Chinese, taking the psychological causative verbs in Chinese as the reference point, this paper analyzes the characteristics of psychological causative verbs in Japanese and Chinese, and excavates the mutual transformation mode between Japanese and Chinese psychological causative verbs, establish a learning model of the causative structure in Chinese and Japanese based on the typical theory of linguistic psychology. The study takes 200 Chinese students majoring in Japanese with cognitive impairment as the research object, and uses the way of comparative experiment to analyze the application effect of linguistic psychological typical theory in the mutual conversion of Japanese and Chinese psychological causative verbs. The research subjects were divided into an experimental group and a control group. The students in the experimental group adopted the new causative structure learning model based on the typical theory of linguistic psychology, while the students in the control group adopted the traditional basic learning model to study the expression of Japanese and Chinese psychological causative structure. The experiment lasted for one month. During the experiment, the subjects studied for 2.5 h a week.

Results: The evaluation results of the students in the experimental group and the control group on the learning difficulty of the conversion of Japanese and Chinese psychological causative verbs are shown in Table 1. With the help of psychological typicality theory, the students in the experimental group have a lower evaluation of the learning difficulty. They believe that the learning difficulty of Chinese and Japanese as causative structures is lower, which proves that psychological typicality theory can effectively help students with cognitive impairment learn language expression.

Table 1. The evaluation results of the students in the experimental group and the control group on the learning difficulty of the conversion of psychological causative verbs in Japanese and Chinese

Survey object	Experience group	Control group
Expressive learning of Chinese psychological causative structure	1.25±0.35	2.66±0.34
Japanese psychological causative structure expression learning	1.56±0.27	3.09±0.27
Conversion of psychological causative verbs in Japanese and Chinese	1.74±0.31	3.52±0.29

Conclusions: The theory of psychological typicality in linguistics can effectively help students with cognitive impairment improve the learning efficiency of language syntactic expression and lexical expression, enhance the integration of syntactic expression and lexical expression between different languages, and promote the learning of psychological causative structure expression in Japanese and Chinese.

THE PROTECTION AND INHERITANCE OF MANCHU EMBROIDERY IN HEILONGJIANG PROVINCE IN THE PAST 40 YEARS OF REFORM AND OPENING UP UNDER COGNITIVE IMPAIRMENT

Zhiling Han

Fine Arts College, Harbin Normal University, Harbin 150025, China

Background: The high-frequency symptoms of cognitive impairment are the abnormalities of human brain advanced functions such as emotion, memory, logic and thinking, and the cognitive impairment of patients in one aspect is likely to cause cognitive impairment in other aspects. The causes of cognitive impairment diseases are mostly the abnormal activity of human cerebral cortex, which is generally treated with antioxidants Glutamate receptor antagonists and other drugs or surgical treatment. At present, the Manchu embroidery culture and art located in Heilongjiang Province of China, some Manchu embroidery inheritors suffer from varying degrees of cognitive impairment due to their general age, low level of education, insufficient intake of nutrition in their childhood and other reasons. Manchu embroidery belongs to a minority culture, and the number of people who appreciate and inherit Manchu embroidery is significantly less than that of popular literature and art such as Peking Opera. In addition, some inheritors also suffer from cognitive impairment, and they lack or cannot accurately express some production methods and concepts of Manchu embroidery, which affects the inheritors to share the technical and cultural core of Manchu embroidery with others. Further reduce the transmission and inheritance efficiency of Manchu embroidery, and increase the difficulty of the protection of this intangible cultural inheritance. Therefore, in order to protect Manchu embroidery, a characteristic folk art in Northeast China, it is necessary to study the cognitive impairment of Manchu embroidery inheritors.

Objective: To explore the communication status, inheritance status and protection status of Manchu embroidery intangible cultural heritage in Northeast China, and analyze the main psychological reasons and influence degree of cognitive impairment of Manchu embroidery inheritors, so as to provide some basis for the government to optimize the system and policy of protecting Manchu embroidery.

Participants and methods: This study selected 35 Manchu embroidery inheritors with different degrees of cognitive impairment from Heilongjiang Province, and conducted semi-structured interviews with these Manchu embroidery inheritors to understand the causes and severity of cognitive impairment. Then 42 psychological experts and masters of man embroidery art were selected from China to form an expert group. They consulted the expert group on the psychological causes of the cognitive impairment of the inheritors of man embroidery in recent decades, and asked them to evaluate the impact of various causes on the cognitive impairment. After taking back the expert feedback, they sorted out the opinions and sent them to the members of the expert group again for feedback until the members of the expert group reached an agreement. In addition, the influence degree is divided into five grades: no influence, slight influence, general influence, obvious influence and full influence. In order to further improve the accuracy of statistics, these grades are given to integers 1, 2, 3, 4 and 5 in turn.

Results: After the expert group reached a consensus, the influence psychology and degree of cognitive impairment of Manchu embroidery inheritors were counted, as shown in Table 1.

Table 1. Statistics of psychological factors and influence degree affecting cognitive impairment of Manchu embroidery inheritors

Reason	No effect	Slight impact	General impact	Obvious influence	Full impact
Demanding perfection psychology	0	3	21	13	5
The audience does not recognize the value of full embroidery	2	8	11	17	4
Feudal thought and cultural psychology in man embroidery	5	12	17	5	3

The numbers in each cell in Table 1 mean the number of people in the expert group who believe that the corresponding psychology will cause the cognitive impairment of the inheritors of man embroidery. It can be seen from Table 1 that the expert group believes that the psychology of “the audience does not recognize the value of man embroidery” has the most significant impact on the cognitive impairment of the inheritor, followed by the “demanding perfection psychology of the inheritor”. Among the three psychological reasons, “feudal thought and cultural psychology in man embroidery” has a relatively low impact on the cognitive impairment of the inheritor, but the degree of impact cannot be ignored. Specifically, for these three reasons, the number of people who choose the impact level as “full impact” and “obvious impact” are 4, 5, 3 and 17, 13 and 5 respectively.

Conclusions: In view of the negative impact of cognitive impairment of embroidery inheritors on the protection and inheritance of Manchu embroidery in Heilongjiang Province, this study understands the psychological causes of cognitive impairment of Manchu embroidery inheritors through semi-structured interviews, and designs an expert investigation experiment to verify the reliability and impact level of these factors. The consultation results show that the expert group believes that the psychology of “the audience does not recognize the value of man embroidery” has the most significant impact on the cognitive impairment of the inheritor, followed by the “demanding perfection psychology of the inheritor”. Among the three psychological reasons, “feudal thought and cultural psychology in man embroidery” has a relatively low impact on the cognitive impairment of the inheritor, but the degree of impact cannot be ignored. This is because if any art cannot be appreciated and psychologically accepted by the audience, the inheritance value of the art and the craftsmanship value of the successor will be greatly reduced, which will virtually affect the psychology and cognition of the successor. The analysis results show that some negative psychology of the inheritors and the audience will significantly affect the cognitive impairment symptoms of the inheritors of Manchu embroidery. Therefore, it is suggested that the relevant departments of the local government take measures to treat the cognitive impairment of this group, and change some wrong perceptions of the audience about Manchu embroidery through some mass media, so as to ensure that Manchu embroidery can be inherited more safely and stably.

Acknowledgement: The research is supported by: Heilongjiang Provincial Academy of Social Science Planning Project, No.19YSB100; Research on the Inheritance and Protection of Manchu Embroidery in Heilongjiang Province during the Forty-year Period of Reform and Opening-up.

INFLUENCE OF DIGITAL TECHNOLOGY ON THE INHERITANCE OF CERAMIC INTANGIBLE CULTURAL HERITAGE IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF COGNITIVE PSYCHOLOGY

Juqing Deng

Communication and Art Design, Wuxi Vocational Institute of Arts and Technology, Yixing 214206, China

Background: From a narrow perspective, cognitive psychology can be understood as information processing psychology, that is, a discipline that studies the psychological changes and laws of the processing process of collecting information in the brain and the formation process of subsequent thinking. The research objects of cognitive psychology are mainly people’s advanced thinking processes, such as perception, attention, memory, language, etc. In contrast to behaviorism psychology, cognitive psychology also studies processes that cannot be directly observed, such as memory processing, storage and extraction. Cognitive psychology pays more attention to the basic psychological causes of human behavior, but the process from psychological state to behavior cannot be directly observed. Therefore, cognitive psychologists can only speculate about this process by analyzing the information received by the object and the behavior generated. Therefore, the research of cognitive psychology often needs to carry out experiments to provide basis and support for speculation.

Most of China’s intangible cultural heritage has the characteristics of high learning difficulty and poor quantifiability. Among them, the representative object is the ceramic technology major. These characteristics make the communication efficiency of teaching contents of relevant majors in colleges and universities often limited, and even seriously affect the learning efficiency of students with cognitive impairment to a certain extent, resulting in some students’ employment anxiety. In recent years, digital technology has been more and more applied to the teaching process of intangible culture and technology specialty in colleges and universities, which alleviates the above problems to a certain extent. However, teachers still pay limited attention to students’ psychological state during and after class. If students’

cognitive psychological state is taken into account when applying digital technology, it is possible to further improve the teaching quality of ceramic technology specialty.

Objective: Based on the analysis of the current application status and main application forms of digital technology in the teaching of ceramic technology specialty in colleges and universities, this paper studies how to integrate the methods and theories of cognitive psychology into these application processes, so as to more accurately understand the psychological situation of educates and alleviate the cognitive obstacles and employment anxiety of students in the specialty. So as to improve the inheritance stability and security of China's ceramics and other intangible cultural heritage.

Objects and methods: Four universities with sufficient representation in teaching scale, teaching content, teaching staff and teaching auxiliary facilities of ceramic specialty were selected from domestic universities for nationalities and arts, and then 200 college students majoring in ceramic specialty were selected as the research objects. They were divided into experimental group and control group, with 100 people in each group. Firstly, the basic data of the two groups of students are statistically compared. After confirming that there is no significant difference in the basic information of the two groups of students, the ceramic technology teaching experiment is carried out for the two groups of students. The teaching contents of the two groups are the same, but various digital technology teaching methods are integrated into the teaching process of the experimental group, such as obtaining and disclosing the digital form files of teaching materials and making ceramic technology teaching animation using digital animation technology. Teach students to use 3D software to design ceramic works, etc. Before and after the experiment, teachers are required to interview the subjects to understand their cognitive impairment and employment anxiety. The degree of the two problems is scored by teachers. 1, 2, 3, 4 and 5 represent "asymptomatic", "mild", "moderate", "severe" and "extremely serious" respectively.

Results: The statistical results obtained after the experiment are shown in Table 1.

Table 1. Scores of students' cognitive impairment and employment anxiety after teaching

Statistical items	Experience group	Control group	Change value (%)	P
Cognitive impairment	2.28±0.11	2.67±0.12	-14.61	0.012
Employment anxiety	2.47±0.25	3.19±0.24	-22.57	0.007

Note that all measurement data in the experiment are displayed in the form of mean ± standard deviation, and *t*-test is conducted. The significance level of the difference is taken as 0.05. The column of "change value" in the table shows the change range of the mean value of each score of the experimental group relative to the control group. According to Table 1, the average scores of cognitive impairment and employment anxiety in the experimental group after teaching are 14.61% and 22.57% lower than those in the control group respectively, and the differences are statistically significant.

Conclusions: In order to alleviate the cognitive impairment and employment anxiety of ceramic students in colleges and universities in China, this study attempts to integrate various digital technology teaching methods into ceramic courses, so that teachers can consider students' educational psychology and cognitive level as much as possible when using digital teaching aids, and adjust the use mode and frequency of digital teaching tools on this basis. Then a teaching experiment is designed and carried out according to this idea. The experimental results show that the average scores of cognitive impairment and employment anxiety in the experimental group after teaching are 14.61% and 22.57% lower than those in the control group respectively, and the differences are statistically significant. Therefore, it can be seen that the use of digital teaching technology tools in accordance with the principles of cognitive psychology can improve the learning effect of ceramic students.

RESEARCH ON SAFETY MANAGEMENT OF COLLEGE STUDENTS' CHEMICAL LABORATORY FROM THE PERSPECTIVE OF PSYCHOLOGY

Sining Qin

Normal College, Shenyang University, Shenyang 110044, China

Background: Safety psychology is a subject that studies the psychological state and psychological activity law of producers from the perspective of preventing accidents, reducing personal and property damage and ensuring production safety. Different people may have different psychological states even in the same work and production. The research purpose of safety psychology is to find and summarize the behavior mode of producers from this complex and diverse psychological and behavioral performance, so as to effectively reduce safety accidents and reduce the loss of safety accidents. As a place with high frequency of safety accidents, college chemical laboratory should be given more attention. Moreover, by observing the safety accidents of college chemical laboratory at home and abroad in history, it can be seen that most of the accidents are closely related to human factors. Therefore, if the safety psychology analysis is not carried out for the personnel who use the university chemistry laboratory, they cannot accurately grasp and understand their psychological activities and behavior reasons, which is not conducive to the safety work of the domestic university chemistry laboratory.

Objective: This paper explores the occurrence process of college chemical laboratory safety accidents in China in recent years, and analyzes the direct and root causes from the psychological perspective of the responsible person, so as to provide suggestions for improving the safety management of college chemicals laboratories in China.

Objects and methods: Collect the accident data of university chemistry laboratories in China in recent 20 years from the relevant domestic public databases, analyze the direct and root causes of the accidents from the perspective of the relevant responsible persons, and then select 20 experts in the field of laboratory safety management and safety psychology from China to consult the expert group on the psychological causes of the responsible persons of university chemistry laboratory safety accidents in recent decades, and evaluate the impact of various reasons on the accident. After taking back the expert feedback, sort out the opinions and send them to the members of the expert group again for feedback until the members of the expert group reach an agreement. In addition, the impact degree is divided into five levels: no impact, slight impact, general impact, obvious impact and full impact. In order to further improve the accuracy of statistics, these levels are given to integers 1, 2, 3, 4 and 5 in turn.

Results: Combined with the accident data of chemical laboratories in colleges and universities in China in the recent 20 years and the final results of expert group consultation, Table 1 is obtained.

Table 1. Statistics of accident data of university chemistry laboratory and consultation results of expert group

Quantitative score statistics	Fluke mentality	Careless psychology	Weak sense of responsibility	Escape psychology
Mean	4.12	3.93	4.37	4.58
Standard deviation	0.17	0.16	0.20	0.19
Grade range corresponding to the score	Obvious-sufficient	General-obvious	Obvious-sufficient	Obvious-sufficient

In Table 1, “grade range corresponding to scores” means the two influence levels closest to the mean value of quantitative scores. It can be seen from Table 1 that the expert group believes that fluke psychology, carelessness, weak sense of responsibility and avoidance psychology are the main responsible factors affecting the accidents in the university chemistry laboratory. Moreover, the influence caused by evasion psychology is the most significant, followed by weak sense of responsibility and fluke psychology, and the second is carelessness psychology. The average scores of quantitative influence degree of these four psychological factors are 4.58, 4.37, 4.12 and 3.93 respectively, and the corresponding influence degree ranges are obvious-sufficient, obvious-sufficient, obvious-sufficient and general-obvious respectively from the perspective of standard deviation, the expert group has the smallest standard deviation in terms of carelessness psychology, that is, the expert group has the most unified opinions on the impact of this psychology.

Conclusions: In view of the problem that university chemistry laboratories are prone to safety accidents in China, the data of university chemistry laboratory safety accidents in recent 20 years are collected from a domestic public database, and the direct and root causes are analyzed from the perspective of the relevant responsible person. And set up an expert group to analyze the impact of various psychological reasons. The consultation results show that the expert group believes that fluke psychology, carelessness psychology, weak sense of responsibility and evasion psychology are the main factors affecting the psychology of the person responsible for the accident in the university chemistry laboratory. Moreover, the influence caused by evasion psychology is the most significant, followed by a weak sense of responsibility and fluke psychology, and the second is carelessness psychology. The average scores of quantitative

influence degree of these four psychological factors were 4.58, 4.37, 4.12 and 3.93 respectively. In view of this common psychological problem of the person in charge of safety management, we can deal with it by strengthening regular safety management education, linking the results of safety management with the salary of personnel, and stimulating the sense of responsibility and responsibility of the person in charge, so as to reduce the probability of accidents and financial losses caused by psychological factors in the university chemistry laboratory.

RESEARCH ON THE DEVELOPMENT PATH OF FOREST RESOURCES MANAGEMENT AND ECOLOGICAL FORESTRY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Jun Wang

APFNet Kunming Training Center, Southwest Forestry University, Kunming 650224, China

Background: Social psychology is a subject that focuses on the psychological status and change law of individuals and organizations in social activities. It is an interdisciplinary subject of sociology and psychology. The research contents of social psychology at the individual level mainly include individual behavior mode, language, social process, etc., while the research contents of social psychology at the organizational level are different, specifically the expression forms of collective thinking such as organizational attitude, organizational behavior mode, organizational values and so on. Social psychology emphasizes the interaction between society and individuals, and also pays attention to the role of social situations and the internal psychological state of individuals.

With the awakening of people's awareness of environmental protection, people's enthusiasm for managing forest resources is higher and higher. Scientific management of forest land, trees, wild animals and plants in forest areas, such as forest cultivation measures, will not only help to maintain the balance of ecosystem, but also help to realize the healthy and sustainable development of forest resources and ecological environment. At the same time, the ecological forestry industry mainly develops forestry products with commercial value through existing natural resources, so as to diversify the functions of the forest, and coordinate the development with the surrounding environment and other industries to ensure that the whole forest ecology is in a balanced state. However, there are some significant problems in the current management of forest resources. For example, some criminals will drill the loopholes of relevant laws and regulations, but the illegal collection of forest resources cannot be punished by the law. Besides, some managers and front-line employees of forestry and forest scenic spots overexploit forest resources in pursuit of short-term commercial interests, resulting in irreparable damage to the forest area. It can be seen that the current forest ecological problems are mainly caused by human excessive demand or improper development. In essence, this problem is closely related to human behavior and psychology. Therefore, in terms of ecological environment improvement, it is more important to study human psychology and behavior from the perspective of social psychology than from the perspective of natural science.

Objective: To understand the current situation of China's forest resources management and forestry development path, so as to find the deficiencies in the current forest resources management, and then combined with the method of social psychology to analyze the psychological status of forest managers, workers and tourists, and put forward the countermeasures to improve the effect of forest resources management, so as to provide some references for adjusting and optimizing China's ecological forestry development path and improving the sustainable development ability of ecological industry in the future.

Objects and methods: Ten 5A forest scenic spots were randomly selected from China and artificially divided into experimental group and control group according to business scale, forest geographical environment, forest area, number of tourists and management mode, with 5 scenic spots in each group. After ensuring that there is no significant difference in basic information between the two groups of scenic spots, the managers of the experimental group shall be trained in the analysis of tourists' social and psychological state during tourism, and on this basis, the managers shall be required to formulate relevant management measures. However, the control group did not make any management intervention. In addition, the managers of scenic spots are required to randomly select 20 tourists from their respective scenic spots before training and half a year after training to conduct SAS (Self-rating Anxiety Scale) and SDS (Self-rating Depressed Scale) surveys to understand the impact of the reform of management mode combined with social psychology on the psychological experience of tourists.

Results: After all the experimental steps are completed, the SAS and SDS data of tourists are shown in Table 1.

The measurement data in the study are displayed in the form of mean \pm standard deviation, using *t*-test, and the significance level of difference is set to 0.05. The scores of the two groups were significantly lower than that of the control group ($P < 0.05$).

Table 1. Statistics of SAS and SDS scores of tourists

Index	Experience group	Control group	<i>t</i>	<i>P</i>
SAS score	41.6 \pm 3.5	52.4 \pm 4.8	0.481	0.000
SDS score	48.7 \pm 4.0	56.9 \pm 4.2	0.124	0.002

Conclusions: In order to solve the problem of ecological environment deterioration of forest scenic spots in China, after collecting and analyzing a large number of academic literatures on ecology and scenic spot management, this study carried out a scenic spot management experiment. In the experiment, the scenic spot managers of the experimental group need to be trained. The training content is the social and psychological state and characteristics of tourists when traveling in the scenic spot and their coping methods. The experimental results show that after the training intervention, the average SAS scores and SDS scores of tourists in a single scenic spot in the experimental group are significantly lower than those in the control group, and the *t*-test output *P* values of various scores between the two groups are far less than the significance level of 0.05, which shows that the data difference is significant. The experimental results show that taking into account the social and psychological characteristics of tourists and taking targeted measures can improve some bad psychological states of tourists. The research results will provide some data support and useful suggestions for optimizing the development route of ecological forestry in China.

ON THE APPLICATION OF TRADITIONAL LANDSCAPE PAINTING FROM THE PERSPECTIVE OF ART DESIGN PSYCHOLOGY

Qiong Cai

Hefei University of Economics, Hefei 230011, China

Background: Art design psychology is a subject that studies the creative process of art, the feelings of the audience, and the psychological activities and laws of art works. It is an interdisciplinary subject produced by the combination of literature and art, psychology and other related majors. The main research contents of art design psychology include: how artists accumulate and refine materials through observation, experience and analysis of real-life; how to imagine the material creatively on the basis of perception and memory; the artist's interests, hobbies, abilities and personality; temperament and its influence on creation; how do people feel and understand literary works and produce emotional resonance in the process of appreciating literary works; how to enrich spiritual life through literary works and artistic activities, inspire people's will and enthusiasm, and how to cultivate teenagers' literary interest, appreciation and creative ability. In the field of traditional landscape painting, some painters agree that integrating graphical elements into landscape painting can improve the artistic value of landscape painting. However, how to integrate graphical elements into landscape painting is a problem perplexing for a painter in the industry. This study analyzes the psychological impact of different elements of traditional landscape painting on viewers from the Perspective of art design psychology, so as to explore how to skillfully integrate graphical elements into paintings.

Objective: To understand the drawing process of Chinese traditional landscape painting and the aesthetic methods and mainstream aesthetics of this kind of artwork, and consult the expert group to get their methods of integrating graphical elements into traditional landscape painting and the impact of these methods on the positive psychology of viewers, so as to provide some ideas for improving the beauty of Chinese landscape painting and innovating traditional culture and art.

Objects and methods: Collect the research materials of art design psychology and the teaching materials of traditional landscape painting, and summarize the functions and methods of applying graphical elements to traditional landscape painting. Using the Delphi method, 30 traditional landscape painting masters and teachers who are willing to participate in the research are selected from China to form an expert group to share the proposed methods with experts and ask them to provide feedback. Specifically, it is to provide the methods of integrating graphical elements into traditional landscape painting and the impact of these methods on stimulating the positive psychology of admirers. Then adjust and integrate the

methods according to the feedback, and then send them to experts again to seek feedback. The feedback cycle will not stop until the expert group reaches an agreement. In addition, the degree of impact is divided into five categories: no impact, slight impact, medium impact, obvious impact and full impact.

Results: After the experiment, the opinions of the statistical expert group are shown in Table 1. Note that since there are few members of the expert group selected in this study, the distribution of opinions of the expert group is not in the form of percentage, but in the form of the number of people.

Table 1. Feedback of the expert group on the impact of various ways of integrating graphical elements into traditional landscape painting on stimulating the positive psychology of the audience

Proposal	No effect	Slight impact	Medium impact	Obvious influence	Full impact
Graphic the main part of the painting	0	6	15	8	1
Graphic the minor part of the painting	6	8	9	5	2
Graphic characters in painting	3	14	9	3	1
Add graphical elements to enhance the sense of spatial hierarchy	1	3	9	11	6

The values in the columns in Table 1 mean the number of people who believe that the impact of a proposal on stimulating the positive psychology of traditional landscape painting is the corresponding level. The consultation results show that the expert group believes that the strategy of “adding graphical elements to enhance the sense of spatial hierarchy” has the greatest impact on stimulating the positive psychology of the audience, followed by “graphing the main part of the painting” and “graphing the secondary part of the painting”. The application method with the lowest impact is “graphing the text in the painting”. The number of people who believe that the impact level of these suggestions is above the “general impact” are 17, 9, 7 and 4 respectively.

Conclusions: Among the various schools of traditional landscape painting innovation, one school pays more attention, that is to integrate the western modern graphical elements into the traditional landscape painting, so that the traditional landscape painting has more levels of appreciation artistic conception. From the perspective of the aesthetic methods of landscape painting, the experts are invited to analyze the potential changes of landscape painting from the perspective of the aesthetic methods of landscape painting and the aesthetic methods of landscape painting, and put forward some suggestions from the perspective of the aesthetic methods of landscape painting. The results of consulting experts show that the expert group believes that the strategy of “adding graphical elements to enhance the sense of spatial hierarchy” has the greatest impact on stimulating the positive psychology of the audience, followed by “graphing the main part of the painting” and “graphing the secondary part of the painting”. The application method with the lowest impact is “graphing the text in the painting”, is because “adding graphical elements to enhance the sense of spatial hierarchy” can make the artistic conception of traditional landscape painting more far-reaching, the picture contains richer elements after human brain processing, and it is easier for people to produce emotions such as comfort, tranquility and joy, so as to drive the viewer’s positive psychology.

Acknowledgement: The research is supported by: Provincial Key Scientific Research Projects of Natural Science “Research on the Graphic Application of Traditional Landscape Painting from the Perspective of Chinese Animation Film” (No. KJ2020A1181).

RULES OF COMPANY LAW ON EQUITY TRANSFER OF LIMITED COMPANIES: THE IMPACT OF LEGISLATIVE EXPRESSION AND JUDICIAL APPLICATION ON SHAREHOLDERS WITH COGNITIVE IMPAIRMENT

Tao Ma

Business College, Jiangsu University of Technology, Changzhou 213001, China

Background: Cognitive impairment is a kind of mental disease that leads to the dysfunction of individual memory and learning due to the abnormality of high-level brain activities related to human learning, memory and thinking. People with cognitive impairment are often accompanied by pathological symptoms such as aphasia, apraxia and agnosia. In principle, the normal operation of the cerebral cortex is the basis

for human cognitive ability. Any factor that will cause the abnormal operation of the cerebral cortex may lead to cognitive impairment. There are three main methods for clinical treatment of cognitive impairment: drug treatment, non-drug treatment and surgical treatment. At present, the most commonly used treatment method is drug treatment. Generally, surgical treatment is only used for individuals with particularly serious symptoms.

At present, the provisions on equity transfer in China's company law are too rigid to meet the needs of judicial cases, which has a certain hindering effect on enterprise shareholders to carry out equity transfer affairs, especially for shareholders with different degrees of cognitive impairment, the obscure equity transfer system in the company law will greatly affect their transfer or acceptance of transferred shares. Therefore, under the condition of analyzing the cognitive impairment psychology of shareholders, this study explores ways to reduce their losses in the process of equity transfer or increase the income of equity transfer.

Objective: To analyze the income of shareholders with cognitive impairment in the process of equity transfer in China in recent years, so as to put forward countermeasures to reduce their losses in combination with the company law and the psychological characteristics of shareholders with cognitive impairment, hoping to make some contributions to protecting the legitimate rights and interests of these shareholders.

Objects and methods: Purchase the data of equity transfer judicial cases in China in recent 10 years from a domestic professional data service provider, select the data samples with cognitive impairment in at least one of the plaintiffs and the defendant as the research object, clean the data, and reasonably fill in the missing data. Then, the degree of cognitive impairment of patients is divided into three categories: mild cognitive impairment, moderate cognitive impairment and severe cognitive impairment. The income of shareholders with cognitive impairment in equity transfer cases is "loss greater than 20%", "loss less than 20%", "loss 0%", "income less than 20%", according to the percentage of his equity loss "income greater than 20%" is classified into five categories: serious loss, slight loss, no loss, no income, slight profit and substantial profit. Analyze the profits and losses of shareholders with different degrees of cognitive impairment in the process of equity transfer.

Results: The profits and losses of shareholders with different degrees of cognitive impairment in the process of equity transfer are shown in Table 1.

Table 1. Statistics of profits and losses of shareholders with different degrees of cognitive impairment in the process of equity transfer

Severity of cognitive impairment	Serious loss (%)	Slight loss (%)	No loss, no gain (%)	Slight profit (%)	Substantial profit (%)
Light	9.5	26.3	34.7	25.2	4.3
Moderate	18.6	39.2	24.0	13.7	4.5
Severe	27.3	41.2	19.2	9.5	2.8

The percentage in each cell in Table 1 means the proportion of shareholders with the corresponding level of profit and loss in the process of equity transfer. It can be seen from Table 1 that the higher the severity of cognitive impairment of shareholders, the worse their profit and loss level in the process of equity transfer. Specifically, the proportion of shareholders with mild, moderate and moderate cognitive impairment causing serious losses in equity transfer is 9.5%, 18.6% and 27.3% respectively. According to the research results, analyzing the performance of these shareholders in equity transfer judicial cases, it is found that most of their losses are due to their insufficient understanding of relevant concepts, the forgetting of key information in the process of case handling, and the negative emotions brought by the two.

Conclusions: Cognitive impairment disease will interfere with human thinking activities. In the process of equity transfer, due to the difficulties in the judicial implementation of the relevant provisions of the company law, equity transfer is easy to produce disputes, and shareholders with cognitive impairment are in a weak position in the process of equity transfer. This study collected relevant data and used various methods of data analysis to analyze the relationship between the severity of shareholders' cognitive impairment and their profits and losses in equity transfer judicial cases. The results show that the higher the severity of cognitive impairment, the worse the profit and loss level in the process of equity transfer. According to the research results, analyzing the performance of these shareholders in equity transfer judicial cases, it is found that most of their losses are due to their insufficient understanding of relevant concepts, the forgetting of key information in the process of case handling, and the negative emotions brought by the two. It is expected that some suggestions on the application of the equity Guarantee Law in China should be made to reduce the difficulty of the application of the equity Guarantee Law.

THE TEACHING MODE OF VOCATIONAL EDUCATION DOUBLE HIGH PLAN SPECIALTY GROUP TAKING INTO ACCOUNT THE STUDENTS WITH COGNITIVE IMPAIRMENT

Jun Lin

Department of Human Resources, Wuxi City College of Vocational Technology, Wuxi 214153, China

Background: Cognitive impairment is a kind of disease in which thinking lacks internal logical connection, which makes patients unable to understand others' words and deeds smoothly or makes others unable to understand patients' words and deeds. Cognitive impairment is mainly divided into cognitive form disorder and cognitive content disorder. Their main manifestations are slow thinking, too fast-thinking, loose thinking, thinking rupture, thinking interruption, thinking diffusion, irrelevant symbolic thinking, new words and delusions (relationship delusion, victim delusion, exaggeration delusion, jealousy delusion, etc.), obsessive-compulsive concept and overpriced concept.

Vocational education double high plan refers to the plan proposed by the state to build a number of high-quality vocational colleges and high-quality vocational colleges. The professional cluster refers to a professional cluster composed of several disciplines with high similarity in basic or technical practice. Students in the professional cluster can enjoy relevant teaching services and practical teaching support of multiple majors. At present, some vocational schools in China have adopted the method of a professional group to carry out comprehensive training and teaching for students, but there are still many problems in the teaching mode of professional group in some colleges and universities, such as confusion of teaching objectives, too many teaching contents, the great difficulty of students' learning and so on. Partly due to heredity, family education and childhood experience, students with cognitive impairment are more difficult to adapt to this teaching model. Therefore, it is necessary to analyze the psychological status and learning needs of students with cognitive impairment in order to improve the actual teaching quality of the vocational education model of professional groups.

Objective: To analyze the current situation of the construction of professional group teaching mode under the double high program of vocational education in China, and analyze the psychological characteristics of students with cognitive impairment under this teaching mode, so as to put forward targeted improvement measures to improve the teaching quality of China's vocational education system and the implementation effect of the double high program.

Objects and methods: Collect and analyze the literature at home and abroad on the impact of cognitive impairment on students' learning process and the domestic double high program of vocational education, confirm the psychological characteristics and emotional situation of students with cognitive impairment in vocational education, so as to design feasible and targeted countermeasures, and then select 35 pedagogical experts and backbone teachers in the vocational education system from home to form an expert group. Send the countermeasures to the members of the expert group for review, ask them to provide feedback, improve the countermeasures according to the feedback and return them to the expert group for review again. When the expert group reaches an agreement, the inquiry is ended. The inquiry also includes the expert group's evaluation of the impact of each strategy on the learning effect of students with cognitive impairment. The impact level is divided into five types: no impact, slight impact, general impact, obvious impact and full impact.

Results: After the opinions of the expert group were unified, the opinions of the statistical expert group are shown in Table 1.

Table 1. Statistical results of the opinions of the expert group

Opinion	No effect	Slight impact	General impact	Obvious influence	Full impact
Teachers with psychological foundation	1	8	17	7	2
Targeted teaching for students with cognitive impairment	0	5	8	14	8
Encourage students with cognitive impairment	3	9	13	7	3
Appropriately increase the teaching time for students with cognitive impairment	2	8	11	10	4

The numbers in each cell in Table 1 represent the number of people who believe that an opinion has an impact on improving the learning effect of students with cognitive impairment under the professional group education mode, and the level is the corresponding level. It can be seen from Table 1 that the expert group believes that the strategy of “targeted teaching for students with cognitive impairment” has the greatest impact, the second is the strategy of “appropriately increasing the teaching time for students with cognitive impairment”, and the strategies with the least impact are “encouraging more students with cognitive impairment” and “configuring teachers with psychological basis”. Among the above strategies, the number of people with obvious influence and full influence is 22, 14, 10 and 9 respectively.

Conclusions: The pace of development and reform of China’s manufacturing industry has accelerated, and there are more and more vocational schools adopting the professional group teaching mode based on the double high plan in China. However, due to the integration of more professional syllabus contents, this teaching model is bound to be more difficult for students to learn. Especially for students with a certain degree of cognitive impairment, their ability to think, understand and remember is weaker than their peers, and they will have an inferiority complex and negative psychology due to this difference, which will further reduce their learning efficiency. Based on the analysis of relevant data, this study puts forward some methods to improve the learning effect of students with cognitive impairment, and asks the expert group to revise and evaluate them. The consultation results show that the expert group believes that the strategy of “targeted teaching for students with cognitive impairment” has the greatest effect on improving the school effect of students, followed by the strategy of “appropriately increasing the teaching time for students with cognitive impairment”, and the strategy with the least effect is “more encouraging students with cognitive impairment” and “allocating teachers with psychological basis”. The results of Delphi analysis show that paying attention to the psychological situation of students’ cognitive impairment is helpful to improve their learning effect in the professional group education model.

THE SOCIAL PSYCHOLOGICAL IMPACT OF INNOVATION TIME-SPACE EFFECT OF FACTOR RESOURCE MISMATCH ON THE PUBLIC

Hui Wang¹ & Min Fan²

¹*School of Economics and Management, Sichuan Vocational College of Chemical Technology, Luzhou 646005, China*

²*School of Civil Engineering, Southwest Jiaotong University, Chengdu 610031, China*

Background: Social psychology focuses on the psychological interaction and interaction relationship between individuals and groups in a specific social environment. From the perspective of social psychology, the psychological interaction and interaction relationship between individuals and groups often presents a network form, which is also one of the reasons for the network of social factor resource allocation and circulation. Modern society can be regarded as a network resource society. If social network is regarded as a resource allocation network, social psychology can play an important guiding role in factor resource allocation and circulation path innovation. People in the social network, a resource allocation network, produce social-psychological power through identity, cognitive management and emotional management, and affect the behavior of resource allocation. Resource allocation is presented as the result of social-psychological power. In this kind of social resource allocation network based on social psychological power, the psychological mechanism of the social identity of the network is very important. From the perspective of social psychology, social network is a social psychological group. This group achieves self-group domestication through some identity mechanism, and then produces a sense of belonging and self-psychological discrimination for its own group. Once through this social identity, it means becoming a member of the group. In the eyes of other individuals, it is a trusted symbol and an individual who can give priority to the allocation of resources within the group. Based on this identity mechanism and social group psychology, the distribution of social element resources is lack of fairness, which will inevitably lead to resource mismatch. The mismatch of social factor resources is aimed at the effective allocation of factor resources. The mismatch is the deviation from the most effective allocation, which is manifested in the way of unequal marginal product value between different industries and even enterprises. The distribution of social factor resources can be divided into two categories: the distribution of labor resources and the

distribution of capital resources. The dependence of these resource distribution methods on the group's social-psychological path will also lead to the lack of innovation and diversity of resource circulation, and finally lead to the wrong path of extreme distribution. Therefore, it is necessary to reform the distribution mechanism of contemporary social factor resources according to the theory of social psychology. Reducing the mismatch of factor resources can effectively promote social equity, and the circulation innovation of resource path can break the old circulation path with social source layer and effectively improve the efficiency of social operation.

Objective: The main purpose of this study is to reduce the mismatch of social factor resources, analyze the main causes of factor resource mismatch by using the theory of social psychology, innovate the resource circulation path in combination with relevant theories, and analyze the innovation effect and influencing factors of resource allocation path from the perspective of time and space.

Subjects and methods: This study mainly adopts the combination of model simulation and index measurement to analyze the temporal and spatial effect of element resource mismatch.

Study design: In this study, TFPQ (Physical Total Factor Productivity) and TFPR (Revenue Total Factor Productivity) are used as the main indicators to measure the causes of regional mismatch, and analytic hierarchy process and model simulation are used to analyze the temporal and spatial effects of factor resource mismatch and circulation innovation.

Methods: After the model simulation, the comparative analysis is carried out by means of factor analysis and index analysis.

Results: The degree to which the allocation factors of different resource elements are affected by social and psychological factors is shown in Figure 1.

Figure 1. Influencing factors of social group psychology, the benefits of traditional culture in Chinese teaching

Among the four elements of fairness psychology, expectation psychology, cognitive psychology of resource allocation and cognitive psychology of group division in Figure 1, fairness psychology is the most significantly affected, reaching level 4. The relationship between expectation psychology and cognitive psychology of group division is relatively obvious, reaching level 3. The impact of cognitive psychology on resource allocation is only level 2, and the impact is general.

Conclusions: With the continuous changes of the global economic situation, the mode of social resource allocation is gradually changing its form of expression, but until today, social resource allocation still cannot escape the essence of focusing on resource allocation caused by social group psychology, resulting in many resource mismatches. Social psychology plays a role in providing access conditions for resource-rich groups in group distribution. Under the current situation of continuous modernization of transportation, this social-psychological group crossing time and space obstacles have formed a larger scale of resource distribution access group, which has become an obstacle to the rational distribution of resources to a certain extent. Through the innovation of circulation path, we can start from the different aspects of the distribution of social resource elements, and provide methods for the rational distribution, scientific distribution and effective distribution across resource distribution access groups, so as to fundamentally reduce the mismatch of resource elements and improve the utilization rate of social resources.

THE IMPACT OF CURRICULUM TEACHING MODEL REFORM ON STUDENTS' LEARNING PSYCHOLOGY UNDER THE NEW MEDIA ENVIRONMENT

Jie Zhang

School of Humanities, Xuzhou University of Technology, Xuzhou 221018, China

Background: According to the theory of educational psychology, the psychological state of middle school students is closely related to their learning behavior, and the psychological elements further affect students' learning results through behavioral elements. Therefore, in educational psychology, the concern about students' learning results and personal comprehensive growth is transformed into the concern about individual psychological status and incentive psychological factors. Contemporary college students have unique characteristics in line with the current situation of contemporary development. Firstly, contemporary college students were born in the era of rapid national economic development and the application of scientific and technological level to people's livelihood. They have the characteristics of radical and avant-garde thinking, self-confidence and optimism in psychology. Secondly, in the external information environment, contemporary college students are affected by a large amount of external information in their early adulthood, with a high level of self-awareness development and strong personality. Therefore, there are often obvious conflicts between individuals and groups, and improper integration between individuals and groups. Finally, the competitive environment in the growth process of contemporary college students has resulted in their strong competitive psychology. With the gradual opening of the era's attitude towards individualism, some individuals have gradually accepted the psychological preference and value orientation deviating from the mainstream at the psychological level. In the process of education, these psychological conditions and psychological growth of contemporary college students cannot be ignored. In view of the above psychological characteristics of college students in the process of education, the traditional offline classroom teaching has been unable to provide students with a teaching environment more suitable for their psychological state. We should adopt the way of integrating online teaching and offline teaching to provide students with a new teaching mode combining theory and experience. Under the new teaching mode, teaching is mainly based on experiential teaching and basic teaching, which helps students lay a good knowledge foundation, help students generate full interest in learning in experiential teaching, and help students form incentive psychology. Online teaching is more personalized teaching auxiliary means. Through students' free allocation of self-time and space to complete learning tasks, help students form a psychological sense of learning dominance, and then cultivate their psychological enthusiasm.

Objective: In order to improve the quality of contemporary teaching, this study analyzes the psychological state and personal psychological characteristics of middle school students in the process of education, reforms the old teaching mode, and designs more modern and personalized teaching methods to help students achieve better learning results.

Subjects and methods: This study provides college students with a combination of online and offline teaching methods by means of classroom experiments, and collects and analyzes data in the teaching process. In this process, the factor analysis method is used to analyze the impact of the reformed teaching methods on students and students' psychological experience.

Study design: The research selected sophomores under the mental health course of a university as the research object, and distributed the designed online teaching platform app in the form of two-dimensional code. In the teaching process, students can reflect their learning situation and psychological experience in the online teaching platform in real-time. The researchers took this as the experimental basis. The factor analysis method is used to analyze the correlation degree and influence degree between different factors.

Methods: The results obtained in this study will be generated through app background sorting, and further manual sorting and summary analysis will be carried out after export.

Results: The statistics of students' satisfaction with different modules in online and offline teaching mode are shown in Table 1.

Table 1 middle school students have the highest satisfaction with the interactive learning platform, accounting for 47% of the total, followed by the students of online Q & A courses, accounting for 43% of the total. The proportion of students dissatisfied with each module is relatively small, which is maintained at about 10%.

Table 1. Student satisfaction evaluation form

Degree of satisfaction	Perfect contentment (%)	Relatively satisfied (%)	Commonly (%)	Dissatisfied (%)
Online Q & A course	43	27	21	9
Offline experience course	38	35	16	11
Curriculum evaluation system	29	31	34	6
Interactive learning platform	47	24	19	10

Conclusions: The rapid development of the Internet and new media technology provides a new path for information-based teaching reform. The traditional teaching form of the offline classroom is no longer suitable for contemporary college students. The combination of online and offline is more suitable for students' daily learning, life and psychological state, and it is easier to form a student-centered teaching mode. Through the information-based teaching reform, we can effectively improve the comprehensive physical and mental quality of students and improve the teaching quality, so that students do not have to worry about many disadvantages of the big classroom. At the same time, it is also conducive for teachers to understand the learning status of students from all angles anytime and anywhere, grasp the teaching progress, and achieve the effect of coordination between teachers and students.

THE INFLUENCE OF FARMERS' SOCIAL PSYCHOLOGICAL TRANSFORMATION FACING GREEN CONCEPT ON RURAL ECONOMIC DEVELOPMENT

Chao Lu¹, Shidong Han², Xuejiao Sun² & Lichuang Cao³

¹Law School, Shandong University of Technology, Zibo 255000, China

²School of Economics, Shandong University of Technology, Zibo 255000, China

³School of Economics, Hebei University, Baoding 071002, China

Background: As an important branch of psychology, social psychology mainly studies the psychological law of the interaction between individuals or groups in the social environment. Starting from the interaction between society and individual, social psychology emphasizes individual psychological phenomena and social psychological problems in specific social situations. Just because there are two thinking systems in social psychology, there have always been two directions in the research. One is the research direction with sociology as the main body, using psychological theory as the auxiliary of sociological research. The second is the research direction with psychology as the main body, and the research content is mainly the individual or group psychological phenomena in the social environment. With the popularization of the times, the two disciplines gradually become one, but with the development of psychology. In social psychology, the psychological theory of collective action can be divided into three orientations: instrumental rationality, social identity psychology and collective anger psychology. Instrumental rationality theory holds that each individual's participation in collective action is an opportunity to change the current situation of the group above the affordable cost. In the case of collective motivation and social motivation, the cost of participating in collective action matches the expected income. As a group motivation before collective action, social psychological identity theory believes that all individual self-evaluation can be divided into two kinds: one is personal identity psychology and the other is social identity psychology. Under the definition of group membership, this sense of identity can be transformed into the power of action. Another motivation for collective action is the group anger psychology, which often takes the deprivation of certain resources or unequal distribution as the main source. Therefore, from the perspective of social psychology, the psychological concept of rural residents as a collective action community on the social element of rural green ecological effect will have a certain impact on rural economic development. The attitude and psychological effect of rural residents towards the development of rural green economy are largely affected by collective action factors. Based on the specific social environment of rural ecological economic development, this study analyzes the impact of green ecological effect and concept on rural economic development from the psychological perspective of rural residents. Through the study of relevant factors, we can explore the relevance and find the action point, so as to provide assistance for rural economic development.

Objective: By analyzing the social psychology behind the collective actions of rural residents, this study explores whether the concept of green social psychology can promote farmers' actions, and further analyzes whether actions can affect the situation of rural economic development.

Subjects and methods: By analyzing the psychological concept behind the collective action of rural residents, this study explores whether the green ecological effect and concept can promote farmers' action, and further analyzes whether the action can affect the situation of rural economic development.

Study design: This study takes the concept of green ecological effect of rural residents – collective action – rural economic development as the basic chain, collects the concepts of rural residents through interview, connects them with the elements of rural green economic development, and establishes a correlation analysis model.

Methods: This study collects rural residents' ideas about green ecological economy in the form of simple interviews.

Results: The correlation analysis results between farmers' collective green psychological effect and rural green economic development are shown in Figure 1.

Figure 1. Correlation analysis

As can be seen in Figure 1, there is a nonlinear correlation between farmers' collective social psychology and rural green economic development. In the early stage, with farmers accepting the green concept at the social psychological level, the score of rural economic development also increased, but after reaching the peak, the two began to show a negative correlation.

Conclusions: The development of rural green economy is closely related to the psychological concept of rural residents. By analyzing rural residents' psychological concept of green ecological effect, we can find out the path to drive rural residents' collective action. In the actual social environment, we should not blindly focus on hard construction and ignore the concept development of rural residents. Social psychology takes the psychological concept in the social environment as the main behavior motivation. Therefore, we should start from the concept before promoting the infrastructure construction. Once the residents' concept cannot keep up with the infrastructure construction, it will only lead to the abandonment of the infrastructure construction and it is difficult to fundamentally solve the problem. Therefore, before developing the economy, we should first develop the concept of residents, organically combine hard construction with concept construction, and take knowledge construction such as popular science lectures and professional training as the main means to help rural residents abandon old thinking and embrace new ideas, improve rural residents' cognition of green ecological effect, and promote collective action with social cognition, so as to provide assistance for rural economic development.

THE INTERVENTION EFFECT OF INNOVATIVE EDUCATION OF FINANCIAL ACCOUNTING IN COLLEGES AND UNIVERSITIES ON STUDENTS WITH COGNITIVE IMPAIRMENT

Hua Lu

Dexing Zhihua School of Accountancy, Haikou University of Economics, Haikou 571127, China

Background: In the teaching process of financial accounting in colleges and universities, the cognitive impairment of middle school students is mainly divided into three types: speech information impairment, intellectual skill impairment and cognitive strategy impairment. Among them, the speech information barrier refers to the language information transmitted by teachers to students in the process of teaching. Students cannot understand and acquire normally, or there are major deviations contrary to common habits in the process of understanding and acquisition. This cognitive barrier is not only reflected in the process of language transmission, but also in all the process of information transmission. Sometimes students' essential metacognitive barrier will affect students' understanding of problem representation, resulting in information omission, information misunderstanding, metaphor interference and so on. Intellectual skill barrier refers to students' inability to acquire intellectual skills normally due to bad thinking set, common sense contrary to common sense, wrong way of thinking and other problems. The cause of this type of obstacle is often difficult to judge, because human beings need to go through a long cognitive stage to learn an intelligent skill. In this process, the cognitive problems of any factor may lead to the final difficulty for students to acquire intelligent skills. Cognitive strategy disorder refers to students' weak ability to grasp and dominate their psychological state and thinking state in life and learning, resulting in deviation in the cognitive process. Cognitive strategy disorder can be simply divided into two types: weak metacognitive ability and weak cognitive transferability. Weak metacognitive ability refers to the lack of basic cognition of the outside world. These basic cognitions include self-cognition, emotional experience cognition, self-state cognition in action and so on. The weak ability of cognitive transfer refers to the lack of ability to apply the existing cognitive experience to new things. The above cognitive barriers may lead to the phenomenon of teaching failure in the process of financial accounting education in colleges and universities. In the process of innovative teaching reform of financial accounting education in colleges and universities, we should actively consider the learning status of students with cognitive impairment, formulate methods more suitable for students with cognitive impairment in teaching systems and methods, and help them reduce the nonprofessional difficulties encountered in the learning process, so as to make students with cognitive impairment pay more attention to their professional fields. Through the analysis of students' cognitive impairment, we can provide a new and effective way for the reform of financial accounting education in colleges and universities.

Objective: This study classifies the cognitive impairment of college students majoring in financial accounting, so as to provide an entry point for the teaching reform of students' cognitive impairment.

Subjects and methods: This study combines single factor analysis with serial substitution method to analyze the relationship between teaching methods and students' cognitive impairment by measuring the relationship between factors.

Study design: In this study, the indicators are divided into measurable factors. Firstly, the single factor analysis method is used to analyze the relationship between factors, and then the serial substitution method is used to replace variables to measure the impact of changes in teaching factors on students' cognitive impairment.

Methods: The data of this study are sorted and provided by the majors of economic management in colleges and universities, and some data are drawn from the school background system.

Results: The influence of students' cognitive impairment on different teaching factors is shown in Figure 1.

Figure 1 shows that the cognitive impairment of middle school students has a great impact on the operation rules and concept understanding of financial teaching in colleges and universities, while it has a relatively small impact on the original voucher and practical operation cognition. This is because some knowledge in the original voucher and practical operation cognition can be assisted by memory without in-depth understanding.

Conclusions: The education of financial accounting in colleges and universities is still lacked of targeted measures for students with cognitive impairment. The three main cognitive impairment types of speech information impairment, intellectual skill impairment and cognitive strategy impairment will have a great impact on the professional education of financial accounting in colleges and universities. Therefore, this study starts with these three cognitive impairment types, disassembles the different modules of professional education of financial accounting in colleges and universities, and associates them with

cognitive impairment factors for impact analysis. Through the targeted education reform, we can find the difficulties of students with cognitive impairment in the learning process from the perspective of practical coping strategies, and solve them in a systematic way. This reform can help teachers understand the actual situation of students with cognitive impairment in the learning process, and provide a way to solve practical problems.

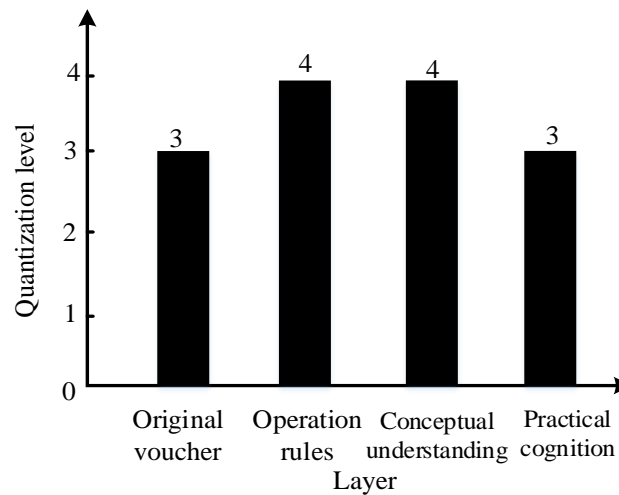

Figure 1. Analysis of teaching elements

OPTIMIZATION OF MULTI-ROBOT DYNAMIC COLLISION INTELLIGENT DETECTION SYSTEM OF COGNITIVE IMPROVEMENT MECHANISM

Yang Zhang

School of Artificial Intelligence Application, Shanghai Urban Construction Vocational College, Shanghai 201415, China

Background: Cognitive impairment refers to the reduction or impairment of brain function in memory, calculation, orientation, structural ability, executive ability, language understanding, expression and application process efficiency due to the influence of internal and external environmental conditions when people recognize the information. Different degrees of cognitive impairment will have different effects on people's overall function and survival function, making the brain advanced intelligent processing process related to learning, memory and thinking judgment abnormal, resulting in learning, memory impairment, visuospatial impairment and executive dysfunction. When patients with cognitive impairment perceive information, they have a deviation in understanding and perception of the form and content of information, which leads to the functional imbalance of neural information in the process of activity, resulting in the conflict between the information sense obtained by the information person and the original cognition, making judgments and behaviors inconsistent with the reality, which increases the difficulty of information extraction. Mild cognitive impairment mainly refers to mild memory or other cognitive impairment beyond the allowable range of their age, with the normal ability of daily living. However, in the field of epidemiological research, scholars have found that the proportion of mild cognitive impairment has increased year by year. Effective early intervention for cognitive impairment can effectively improve the cognitive level of patients, improve their attention and understanding, and help them make better cognitive judgment and decision-making. When people with cognitive impairment background carry out system detection and method design, they often consider the problems and needs of patients with cognitive impairment in information cognition and decision-making judgment, to promote the optimization and improvement of the intelligent detection system.

With the continuous progress of science and technology and the vigorous development of the digital economy, the application scope of 3D vision technology has been gradually expanded, which makes 3D vision technology play an important role in the terminal recognition, induction and transmission of information of artificial intelligence devices, and the related vision technology products have also greatly improved people's quality of life and level. Collision detection technology refers to intervening before or during the

collision of geometry, and issuing instructions, to reduce a lot of time consumed in detection. The intelligent detection system of dynamic collision between multi robots under 3D vision technology is to collect the three-dimensional coordinate information of spatial points in the field of view with the help of a 3D camera head, and obtain the three-dimensional imaging of the information with the help of an algorithm intelligence, to enable multi robots to carry out collision detection with a certain relationship distribution and movement in a specific range. Then improve the accuracy of intelligent system detection and the application efficiency of related products. The design of a multi-robot dynamic collision intelligent detection system will affect the performance and demand satisfaction of consumers.

Objective: In order to meet the cognitive needs of patients with cognitive impairment and improve their cognitive level and ability, the intelligent detection system for dynamic collision between multiple robots is optimized and improved, such as information extraction, technical function satisfaction and so on. The improved system model is used to test its impact on patients with cognitive impairment and product use.

Research objects and methods: Some patients with cognitive impairment were selected as the research object. At the same time, the design of the detection system was optimized when the multi-robot dynamic collision intelligent detection designer understood the psychological demands and cognitive degree of patients with cognitive impairment, such as information extraction, instruction discrimination, etc. The optimized model was applied to patients with cognitive impairment to test the application effect of the model and the cognitive improvement mechanism of patients.

Method design: Learning the background knowledge of cognitive impairment for intelligent detection designers, making them optimize and improve the detection system model on the basis of understanding the cognitive situation of patients with cognitive impairment, and applying the improved system model to patients with cognitive impairment, collecting the remission of cognitive impairment of the subjects before and after the experiment, and obtaining the experimental results.

Methods: The association rule algorithm was used to explore the relationship between the background of cognitive impairment and system optimization, and the data before and after the experiment were sorted and analyzed with statistical analysis tools.

Results: The application of computer systems and the development of data technology can effectively improve the cognitive level of patients with cognitive impairment. The design optimization and improvement of 3D vision multi-robot dynamic collision intelligent detection system from the perspective of cognitive impairment are studied. The results show that the improved system model can reduce the error of information extraction of patients with cognitive impairment. Improve their cognitive level and mental health. Table 1 shows the satisfaction scores of people with cognitive impairment on the intelligent detection system for dynamic collision between multiple robots before and after the experiment.

Table 1. Before and after the experiment, the satisfaction scores of people with cognitive impairment on the intelligent detection system of the multi-robot dynamic collision were statistically analyzed

Index	Product satisfaction	Convenience of information extraction	Language comprehension
Before the experiment	9.25±2.17	7.25±2.13	11.35±1.67
After the experiment	15.23±2.05	19.23±1.43	15.24±1.12

Conclusions: Reducing the area requiring dynamic collision detection between multiple robots can effectively realize the accuracy and efficiency of dynamic collision detection between multiple robots. At the same time, the introduction of cognitive impairment learning background to designers deepens the grasp of the depth of people's needs, realizes the optimization and improvement of the detection system model, and effectively improves the cognitive level and product satisfaction of patients with cognitive impairment.

THE RELATIONSHIP BETWEEN TECHNOLOGICAL INNOVATION AND INDUSTRIAL ECONOMIC DEVELOPMENT BASED ON SOCIAL PSYCHOLOGY

Lili Guan

School of Economics and Management, Zhengzhou Normal University, Zhengzhou 450044, China

Background: Social psychology is a science that studies people's social behavior and psychological basis in social communication. Different individuals and groups usually show different psychological and

behavioral changes in society. Therefore, the main research objects of social psychology are divided into individual level and group level. Individual social psychological phenomenon refers to individual thoughts, feelings and behaviors restricted by others and groups, that is, individual socialization process and speech development. The group level covers a wide range, including the communication structure of the group and racial prejudice. It is a conscious consensus and criterion jointly expressed by individuals. Social psychology includes micro level, meso level and macro level. Looking at individual development and social changes from the perspective of social psychology can effectively link the close relationship between individuals and social groups. Individual person is an important part of society, with the dual attributes of "individual person" and "social person". Using social psychology to guide individual behavior and decision-making can significantly enhance people's cognition of their own ability and the importance evaluation of their social status, realize individual development, and then promote social progress. The relationship between technological innovation and industrial economic development is the relationship between individual behavior and social organization. The improvement of unit technological capacity can reduce social production time and accelerate the technological innovation and economic development of the whole industry at the social level. Technological innovation is the embodiment of individual "economic" behavior. It is an innovation aimed at creating new technology in order to improve economic benefits and reduce production time, or an innovation based on scientific and technological knowledge and its created resources. The individual's behavior will have "agglomeration effect" and "scale effect" on society and collective. Individual technological innovation can effectively promote industrial innovation, improve production efficiency, and then accelerate the economic development of the whole industry. Therefore, analyzing the correlation between technological innovation and industrial economic development from the perspective of social psychology can effectively explore the chain effect between individual behavior and social behavior, and then help enterprise operators better grasp the correlation between technological innovation and industrial economic development, break through the limitations of traditional inherent thinking, avoid emotional difficulties and negative psychological problems, and promote economic development.

Objective: In order to better grasp the correlation between individual technological innovation and industrial economic development, so as to promote the innovation and reform of social industries and improve the mental health of individual enterprise managers. The technological innovation of individual enterprises will affect the schedule of social, industrial and economic development. Therefore, from the perspective of social psychology, the research helps to improve the overall thinking of individual enterprises, help them better carry out enterprise restructuring and industrial development, improve their thinking mode and emotional control ability in production and operation, and avoid complacency affecting their mental health and the speed of their industrial process.

Research objects and methods: Based on the development relationship theory between individuals and groups in social psychology, this study selects some local enterprises as the research object, and uses multiple regression and VAR model to make an empirical analysis on the relationship between technological innovation and industrial economic development, in order to better strengthen the cultivation of holistic thinking for enterprise operators in industrial layout and strategic planning, timely adjust psychological problems and promote their all-round and healthy development.

Research design: Mainly investigate the individual technological innovation strength based on the share and weight of the tertiary industry in the enterprise, and determine the control variables affecting the industrial economic development. The experimental data are from the regional economic database, and the missing data are supplemented from the statistical yearbook network. By investigating the innovative utilization of resources or the innovation of technical knowledge, this paper explores the relationship between technological innovation and industrial economic development, and it also provides guidance and suggestions for the thinking layout and psychological adjustment ability of enterprise managers. The influence of enterprise technological innovation on macro-economy is graded, and 1-5 respectively represent the influence size and severity of individual psychology.

Methods: Using Excel software and SPSS22.0 software for statistics and analysis of experimental data.

Results: There is a strong correlation between the technological innovation ability of individual enterprises and the technological development of social industries. Social psychology believes that the relationship between individual socio-economic development will affect the social demand and the speed and degree of development and reform. The relationship between explanatory variables and explained variables is tested with the help of a panel model, and the results are shown in Table 1. It can be seen from Table 1 that the coefficient of technological innovation accounting for 10% of the tertiary industry is 0.5146, and the significance is positive, indicating that technological innovation can significantly promote the development of the tertiary industry economy.

Conclusions: There is a significant positive correlation between the technological innovation of individual enterprises and the development of industrial economy. Therefore, regions and individuals should pay attention to the investment in technological innovation and stimulate the vitality of innovation. At the

same time, for individual enterprises, they should deeply understand the connection between individuals and society, pay attention to the improvement of their own ability and the cultivation of holistic thinking, and play a greater scale effect.

Table 1. Panel test results of the relationship between explanatory variables and explained variables

Explained variable	Explanatory variable	Coefficient	Z
Industrial economic development	Industrial economic development	1.0845***	14.13
	Technological innovation	0.5146*	1.82
Technological innovation	Industrial economic development	0.8945***	1.53
	Technological innovation	0.0086***	2.78
Controlling factors	Industrial economic development	1.9128	0.49
	Technological innovation	1.0273***	19.41

Note: “***”, “**” and “*” are significant at 1%, 5% and 10% respectively.

Table 2. Improvement of psychological status of enterprise self-employed managers before and after the experiment

Dimension	Thinking set	Holistic thinking	Emotion regulation level	Negative psychological problems
Before improvement	4	2	1	4
After improvement	2	5	3	2

* * * * *

NATIONAL CULTURAL CONNOTATION AND POETIC CHARM OF IMAGE OIL PAINTING UNDER THE BACKGROUND OF COLOR COGNITIVE IMPAIRMENT

Dongguo Zhang

Institute of Management, Sichuan Institute of Industrial Technology, Deyang 618500, China

Background: Color cognition is a certain color psychological feeling and inner activity formed by people’s perception of the color of objective things through light, combined with people’s own experience and cognition, and acting on people’s psychology through color perception. Through the observation of color, people can form the first impression of oil paintings at the first time, and with the deepening of cognition, people will gradually form aesthetic cognitive feelings. Color cognitive impairment refers to that people are affected by internal and external environmental conditions when recognizing color information, which reduces the efficiency or function of memory, calculation, orientation, structural ability, execution ability, language understanding, expression and application process in brain function, resulting in abnormal brain function processing related to thinking judgment. Different degrees of color cognitive impairment will have a deviation in understanding and perception of the color of things, as well as the form and content of information, which will affect the ability of color information extraction and cognitive level. Patients with color cognitive impairment have great differences and difficulties in grasping the color law, extracting color information and perceiving color emotion. Without timely and effective intervention, the cognitive impairment will have a negative impact on their life and work. Oil painting is an art form based on color presentation. It is the carrier of object form and the author’s emotion. Its color includes solid color, light source color and environmental color. As a product of the integration of Chinese and Western art, image oil painting pays more attention to freehand brushwork in expression form. It is a representation of the metaphysical spiritual image, which requires people to have better perception and understanding. In the process of oil painting appreciation, patients with color cognitive impairment are difficult to get a better understanding of their artistry and value, and then it is difficult to grasp the regularity of color and the visual cognition of works, which will have a direct negative impact on people’s mood and mood. Therefore, under the background of color cognitive impairment, exploring the national cultural connotation and poetic charm of image oil painting will help to improve the perception and understanding of oil paintings, and improve their cognitive ability and judgment ability.

Objective: In order to solve the dilemma of color cognitive impairment patients’ appreciation of image oil paintings, this paper studies how to help cognitive impairment patients better understand the national cultural connotation and poetic charm of image oil paintings, and improve their cognitive level and ability.

Research objects and methods: Patients with color cognitive impairment were selected as the research

object. The problems existing in the appreciation of image oil paintings were collected, and through their feedback information, they were consciously guided and intervened in the form of dialogue, game activities and practice, in order to improve their understanding and cognition of the connotation and charm of image oil paintings.

Method design: Under the condition of collecting the basic information of patients with color cognitive impairment, different intervention methods were carried out according to their different degrees of cognitive impairment. The experimental time was 6 weeks. After the experiment, the data on the improvement of cognitive impairment were collected and processed, and the experimental results were obtained with the help of experimental intervention.

Methods: With the help of SPSS22.0 statistical analysis tools to process and analyze data.

Results: The national cultural connotation and poetic charm of intentional oil painting are mainly reflected in freehand brushwork, that is, emphasizing the author's subjective perception and the presentation of the natural state. From the perspective of color cognitive impairment, guide color cognitive patients to pay attention to their own value and surrounding changes, and improve the understanding ability and cognitive level of the author's emotion and work value in image oil painting from the perspective of self-promotion and others. The experimental results show that appropriate intervention for patients with color cognitive impairment can effectively help them appreciate image oil paintings and improve their cognitive judgment and appreciation ability. Table 1 shows the statistical difference of cognitive ability of image oil painting in patients with mild color cognitive impairment before and after the experiment. The score level represents the level of cognitive ability.

Table 1. Statistical difference of cognitive level and ability of image oil painting in patients with mild color cognitive impairment before and after the experiment

Timing	Perception of color information	Grasp the connotation of works	Understanding of works' emotion	Affirmation of self-worth ability
Before the experiment	2.31	2.54	1.29	2.16
After the experiment	3.86	3.96	4.12	3.77

Conclusions: Color is a visual effect of light waves acting on human eyes and the human brain to form life color experience. Patients with color cognitive impairment still have some cognitive difficulties in extracting color information and grasping the emotion of oil paintings. Effective intervention can improve their cognitive level. Therefore, in the future oil painting teaching, teachers should pay attention to the cultivation of students' color cognitive ability.

RESEARCH ON THE CORE COMPETENCE REQUIRED BY TUMOR SPECIALTY NURSING FROM THE PERSPECTIVE OF THINKING LOGIC DISORDER

Hongliang Xu, Rongfang Xu, Yan Lu, Jianping Zhou, Xiaomei Zhou, Hongxia Ni & Yanfei Xu

Nursing Department, Tumor Hospital Affiliated to Nantong University, Nantong 226361, China

Background: Thinking obstacle refers to the process of objective things acting on the human brain. Due to the confusion of the starting point of thinking, the fuzziness of thinking image, the deviation of thinking direction, the confusion of thinking logic and the interference of thinking, it is difficult for the human brain to show the normal thinking results of objective things, so that the content range and speed range exceed the normal standard. Thinking obstacle is a kind of psychological obstacle positioning and an error in thinking habits. It can be divided into abnormal thinking process and abnormal thinking content. It is specifically reflected in the lack of due logic in the connection of semantics. Among them, logical obstacle is a more common form of thinking obstacle. Thinking logic disorder mostly has the symptoms of poor thinking, slowness, mandatory thinking, pathological restatement and delusion. It is often manifested in pathological symbolic thinking, new words, logical fallacy thinking and sophistry thinking. Its essence is that thinking deviates from ordinary people's thinking process in the process of information processing and processing. Thinking logic disorder will not only affect people's thinking ability and cognitive ability, lead to their easy to fall into the inherent thinking set, and then lack of comprehensiveness and objectivity in the analysis and treatment of problems, affect the depth and breadth of people's views on things, but also

cause certain physical and mental damage. There are subjective and objective factors that cause the obstacles of thinking logic. If the thinking logic with deviation for a long time is not corrected, it will cause its logical obstacles, and then doubt and deny its own behavior judgment, fall into emotional obstacles, and affect its life and work. In the oncology department, most tumor patients will have psychological and emotional problems due to their own diseases. Most of them fall into thinking dilemma and misunderstanding due to the denial of their own value. Therefore, it is also very important to carry out appropriate psychological intervention.

Tumor specialist nurses play an important role in tumor prevention, nursing, rehabilitation, health education and other fields, and the core ability is the key ability required by tumor specialist nurses to provide high-quality and efficient nursing ability for tumor patients, which reflects the ability level of their specialist fields. Improving the core competence of tumor nurses is conducive to the construction and development of tumor nursing specialization, and promote the increase of their self-identity and efficacy while improving the quality of nursing service and patient satisfaction. The objectivity, comprehensiveness and particularity of things evaluation are the thinking perspective that nurses need to have when carrying out nursing ability. The difference of thinking logic will affect the professional nurses' guidance of patients' psychological problems and the standard of their own professional level. In the context of thinking logic disorder, guiding tumor nurses to strengthen the learning, training and practical training of professional knowledge in this field will help nurses improve their core knowledge and skills and dredge the psychological problems of some patients with thinking logic disorder, so as to ensure that they have better professional skills and literacy.

Objective: From the perspective of thinking logic disorder, to speed up the learning of knowledge related to thinking logic disorder among cancer nurses, so as to improve the psychological counseling and emotional guidance of patients with thinking disorders, and improve their psychological status.

Research objects and methods: Taking the cancer nurses of three hospitals as the research object, the research carried out professional knowledge training and practical training on thinking logic disorders, then, with the help of the Oncology Nursing Competency Self-rating Scale (ONCSS) and professional quality, the data of the ability improvement of the research objects before and after the experiment were sorted and processed, and apply its learning contents and effects to patients with thinking disorders, so as to improve the psychological intervention ability of specialized psychological nurses and improve the mental health of patients.

Method design: The study first collected the nursing status and existing problems of tumor nurses with the help of the meta-analysis method, and then the subjects were randomly divided into theory group (group A), practice group (group B) and nonintervention group (group C). The learning content of theory group and practice group was related to thinking logic disorder. The experiment lasted for three months. The changes of core competence and literacy of the subjects after the experiment were analyzed with the help of SPSS21.0 statistical analysis tools to sort out and analyze the data and obtain the experimental results.

Methods: The nursing status and core professional competence of cancer nurses were evaluated by meta-analysis method and core competence scale, and the ability change data of the subjects before and after the experiment were collected, processed and analyzed by comparative experiment and statistical analysis tools.

Results: From the perspective of thinking logic disorder, experimental intervention was carried out on cancer nurses to help them improve their professional nursing skills, consultation ability, coordination ability, research ability, educational ability and professional attitude, so as to improve their thinking logic to a great extent. The experimental results show that allowing tumor nurses to learn thinking background knowledge and practical training operation can greatly improve their core ability, help them better deal with mental diseases and thinking misunderstandings of patients with thinking disorders, reduce thinking deviation, and effectively improve the mental health level of patients. Table 1 shows the cognitive improvement of tumor nurses' core competence on patients with thinking disorder before and after the experiment.

Table 1. Changes of core competence of tumor nurses before and after the experiment

Psychological barrier dimension	Before	After
Pathological thinking	25.14±2.34	11.74±2.56
Logical fallacy thinking	31.22±2.89	13.21±2.45
Sophistry thinking	27.46±2.32	7.24±3.28
Self-cognition and negative thinking	22.93±2.01	9.18±2.31

Conclusions: The factors affecting the core competence of cancer nurses include general personal

factors, personality characteristics, self-efficacy, professional interest and organizational team atmosphere. The individual differences of cancer nurses will make them have different performance in work processing, mainly manifested in thinking differences. The intervention of tumor nurses with the background of thinking logic disorder can effectively improve their professional ability and literacy, and it provides more targeted psychological intervention measures for tumor patients with thinking logic disorder, effectively improves their thinking misunderstanding, and improves their cognitive level and mental health.

²*School of Economics and Trade, Shandong Management University, Jinan 250357, China*

³*School of Accounting, Shandong Management University, Jinan 250357, China*

Background: Cognitive impairment is defined as a kind of clinical dysfunction disease in the early stage. With the continuous development of society, the research on individual psychiatry is more and more in-depth, so the understanding of serious disorder is clearer. Research began to classify cognitive impairment as a serious disease in psychiatry. Generally speaking, cognitive impairment is the main symptom of schizophrenia. In the explanation of the condition of schizophrenia, it is considered that schizophrenic patients suffer from multiple personality disorders, that is, the psychological cognition of schizophrenic patients is diverse. In general psychology, this kind of multi cognition is not correctly evaluated as cognitive impairment. In psychiatric research, the treatment of cognitive impairment mainly depends on the long-term efficacy of drugs. The treatment brought by drugs is limited, which can only alleviate individual cognitive impairment to a certain extent, and drugs have side effects. Long-term use will bring all kinds of unpredictable consequences. However, some psychiatrists have suggested that cognitive impairment, as an ideological disorder, can effectively cultivate the cognitive ability of patients with cognitive impairment through thinking and cognitive reconstruction. In psychology, cognitive impairment is identified as a cognitive psychological defect, that is, the psychological cognition of patients with cognitive impairment is incomplete, and the emergence of cognitive impairment seriously hinders the healthy growth of patients. With the development of society, the number of cognitive impairments is also increasing. The increase of the number of cognitive impairments will lead to the slowdown of social and economic development, and then hinder social development. Therefore, it is of great significance to study the current situation of cognitive impairment in social development and find the way to alleviate cognitive impairment.

In the process of social development, China began to explore marine resources, and therefore established a modern marine industry system based on marine industry. In order to promote the development of modern marine industry, China’s policies began to change, and put forward the concept of blue finance. The concept of blue finance was born in the development of marine economy. In the early stage, blue finance was considered as a transaction behavior serving the marine economy. With the development of society, the marine industry is also expanding. Blue finance is considered to be closely related to the marine industry and an internal transaction activity of the financial industry that plays a role in the marine economic environment. With the support of blue finance, the marine industrial system has been continuously improved and the industrial structure has been gradually clarified. However, with the massive changes of information brought by social development, a large number of people with cognitive impairment have appeared in the society, which has hindered economic development. Therefore, how to improve the disease status of people with cognitive impairment in economic development is an important topic concerned by all sectors of society. The research analyzes the improvement path of people with cognitive impairment from the construction of China’s modern marine industry system, in order to put forward solutions for the treatment of people with cognitive impairment.

Objective: This paper discusses the current situation of cognitive impairment in the economic market, analyzes the change of the role of blue Finance on economic development under the influence of cognitive

impairment, analyzes the correlation between the construction of China's modern marine industry system and cognitive impairment, and put forward the improvement strategies for people with cognitive impairment in the construction of China's modern marine industry system.

Study design: Collect the development of cognitive impairment in China's social development through literature search, analyze the correlation between consumer cognitive impairment and economic development by using association rules, find the relevant influencing factors affecting the construction of China's modern marine industrial system by using grey correlation analysis, and evaluate the changes of consumer cognitive impairment in the construction of China's modern marine industry system.

Results: Fifty consumers were randomly selected to analyze the impact of consumers' cognitive impairment on the construction of marine industrial system. The results of the impact of the construction of modern marine industrial system on cognitive impairment are shown in Table 1, with 0-4 indicating the degree of impact. Table 1 shows that the cognitive impairment of consumers is significantly different under the influence of the construction of marine industrial system, and the investment construction, sustainable development construction and emerging industry development construction in the construction of modern marine industrial system have different effects on different degrees of cognitive impairment.

Table 1. The influence of the construction of modern marine industry system on cognitive impairment

Project	Investment behavior of blue Finance	Sustainable development of marine industry system	Development of emerging industries
Mild cognitive impairment	4	4	3
Moderate cognitive impairment	4	4	4
Severe cognitive impairment	4	3	4

Conclusions: The development of China's marine industrial system is related to China's utilization of marine resources, but the cognitive impairment of consumers in the economic market seriously hinders economic development. How to alleviate the cognitive impairment of consumers in the construction of industrial system is of great significance. The research takes the analysis of consumer cognitive impairment as the starting point, discusses the impact of consumer cognitive impairment on the industrial development promoted by blue finance, explores the development path of modern marine industrial system, and analyzes the changes of consumer cognitive impairment in the construction of industrial system. The results show that in the construction of modern marine industry system, consumers with cognitive impairment are significantly affected by the construction of investment behavior, sustainable development and emerging industries. Therefore, in the construction of modern marine industry system, we first need to improve the cognitive impairment of consumers, put forward the improvement path of people with cognitive impairment, and alleviate the degree of cognitive impairment of consumers, so as to promote China's economic growth more comprehensively.

Acknowledgement: The research is supported by: Research on the Countermeasures of Financial Support for the Development of Modern Marine Industry in Shandong Province and Promoting the Transformation of Old and New Economic Energy (No. 2019-JRZZ-08).

THE MOTIVATION AND RISK OF M&A OF INTERNET PLATFORM ENTERPRISES BASED ON SOCIAL PSYCHOLOGY

Yi Kang¹, Rong Xu² & Haiqin Wu³

¹School of Accounting, Zhongnan University of Economics and Law, Wuhan 430000, China

²School of Economics and Management, Fuzhou Vocational Technical College, Fuzhou 344000, China

³School of Information Engineering, Fuzhou Vocational Technical College, Fuzhou 344000, China

Background: The research object of social psychology is individuals or groups to study their psychological changes, behavioral changes and related changes in social interaction. Social psychology discusses and analyzes relevant interpersonal relationships from the perspective of individuals and social groups. At the individual level, the society of social psychology studies the socialization process and communication of individuals. At the social group level, the social psychology society studies the group communication structure, group norms and so on. Social psychology is a kind of psychology, and its research

psychology is closely related to society. The research scope includes individual social psychology and social behavior, and the research direction is humanities and social sciences. The research fields of social psychology are individual process, interpersonal process and group process. In the individual process, it will study the contents of individual perception and self-consciousness, achievement behavior and individual work performance. In the interpersonal process, it includes the interaction between people, such as obedience and conformity, aggression and helping others. In the group process, it studies the relevant psychological behaviors of human beings in the group or macro-environment, such as group process and organization, racial prejudice and ethics.

According to the relevant knowledge of social psychology, starting from the group process, this paper studies the motivation and risk of M&A of Internet platform enterprises. Among them, M&A means that more than two enterprises merge and eventually become one enterprise. Generally speaking, companies with high competitiveness will absorb other enterprises. At this time, the status of legal persons of both parties will change. According to these changes, select the type of enterprise M&A, such as acquisition of holding goods, absorption and merger, etc. In the process of M&A, there will be some risks, which are mainly caused by the activities in the process of M&A. Internet platform enterprises will also have the phenomenon of enterprise M&A. the motivation of enterprise M&A is in three aspects: obtaining synergy effect, obtaining scale effect and realizing the company's development strategy. The risk of M&A of Internet platform enterprises will change due to different stages of the M&A process.

Objective: From the perspective of social psychology, this paper studies the motivation and risk of M&A of Internet platform enterprise managers. According to the characteristics of Internet platform M&A, this paper analyzes the motivation of managers' M&A, and finds that there are three motivations of managers' M&A of Internet enterprises, namely, obtaining synergy effect, obtaining scale effect and realizing the company's development strategy. It also puts forward the M&A risks faced in each stage of the M&A process, and carries out risk control for these M&A risks. Relevant risk control measures will change due to different stages of the M&A development process. For example, in the risk control before M&A, the probability of risk before M&A is reduced through strategic risk control and information asymmetry risk control. In addition, it can also control the risks in M&A, such as financial risk control, scientifically and reasonably evaluate the risks, and accurately understand the relevant situation of the enterprise development process.

Research object and methods: The research object is the leaders of Internet enterprises. 35 Internet enterprise leaders are randomly selected from two Internet enterprises to understand the personal information and professional experience of these Internet enterprise leaders and record relevant data. Through fuzzy evaluation, this paper evaluates the impact of M&A risk control measures on the M&A risk of Internet enterprise platform, and the satisfaction of college economics teachers with these risk control measures. Through the relevant data processing of SPSS software, grade 1-5 score is adopted.

Results: Social psychology studies not only individual activity process, but also group process and interpersonal process. Therefore, from the perspective of social psychology, this paper studies the M&A behavior of Internet platform enterprise managers, analyzes the motivation of M&A and the risks of Internet platform enterprise M&A. In the research of M&A related content, it makes a specific analysis according to the different stages of M&A, and puts forward risk control measures. Among them, leaders with graduate education think that financial risk control has a complete impact on enterprise M&A risk, and the score is 5. The specific results are shown in Table 1.

Table 1. The impact of risk control measures of enterprise M & A on the risk of enterprise M&A on the Internet platform

Education	Strategic risk control	Financial risk control	Negotiation risk control
Doctor	4	4	5
Master	5	5	5

Conclusions: With the continuous development of information technology and the increasing number of Internet platform enterprises, the competition among enterprises is becoming more and more fierce. In order to improve the market competitiveness of enterprises and realize the sustainable development of enterprises, the managers of Internet platform enterprises need to expand the development mode of their enterprises accordingly. The probability of managers' M&A behavior is increasing. In this process, there will be different degrees of M&A risks. According to different M&A characteristics, M&A risk prevention and control, so as to promote the stable development of enterprises.

* * * * *

RURAL REVITALIZATION + DEVELOPMENT OF MARINE CULTURAL TOURISM INDUSTRY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Yanping Dai^{1,2} & Gefu Liang¹

¹*School of Economics, Guangxi University, Nanning 530004, China*

²*College of Economics and Management, Beibu Gulf University, Qinzhou 535011, China*

Background: Social psychology studies the changes of individuals or groups in psychological behavior under the action of society and the laws of these changes. Social psychology is generally studied from the perspective of individuals and social groups. From the perspective of social groups, social psychology studies the structure of group communication and its norms. The research field of social psychology mainly includes three aspects: individual, interpersonal and group. Individual process is to study individual perception, self-consciousness and other contents. Interpersonal process is to study the interaction between people. Group process is to study human psychological behavior in group and other environments, such as group process and organizational behavior. Group indicates that people who depend on and influence each other form a collection. The number of people in this collection is more than two, and these members will have face-to-face contact or interaction. The psychological functions of groups mainly include sense of belonging, sense of identity and social support. Social support means that after the behavior and thought of the members of the group meet the requirements of the group, the group will encourage and praise these members to continue these behaviors. The high cohesion of the team can promote the stability of the team, improve the dependence of members on the group, enable members to obtain higher self-confidence and improve the work efficiency of the team. Rural revitalization strategy is a kind of group organization behavior from the perspective of social psychology. In the rural revitalization strategy, we always adhere to the standard of giving priority to the development of agriculture and rural areas. The ultimate goal of the strategy is to achieve industrial prosperity, establish a livable ecological environment, revitalize rural civilization, effectively manage rural construction, enrich the lives of rural residents, promote the process of agricultural and rural modernization, and organically integrate urban and rural areas. For coastal areas, in order to respond to the rural revitalization strategy, we can start with marine culture, develop the rural marine culture tourism industry on the basis of adhering to the harmonious coexistence between man and nature, and actively and effectively use the surrounding natural resources to enable rural residents to achieve wealth and increase income. The essence of marine culture is the relationship and product between human beings and the ocean. For example, Xiamen occupies an important position in China's coastal areas, where marine cultural resources are very rich. Among them, Xiamen fishing village has very unique local characteristics in marine geographical location, material production and culture. In response to the rural revitalization strategy, we can start with the small fishing village with characteristics in Xiamen, make a specific analysis according to the characteristics of the marine geographical location and culture of the small fishing village, and take the "three new" as the guiding ideology to develop the marine cultural tourism industry of the small fishing village, so as to open up a new pattern. Among them, "three new" means new thinking, new path and new measures.

Objective: To analyze the current situation of the development of marine culture industry in Xiaodui fishing village in Xiamen, understand the specific situation of marine culture in fishing village, analyze the specific causes according to the decline and decline of marine folk beliefs, traditional folk houses in Southern Fujian and fishing custom culture in Southern Fujian, and take targeted measures according to these situations. Through the development of cultural and creative products with regional characteristics, promote economic development and upgrading on the basis of cultural development, and inherit and innovate marine folk beliefs. Properly repair and protect the traditional residential buildings in Southern Fujian, and take some measures to promote the large-scale establishment of traditional residential buildings in Southern Fujian, so as to form a neat and characteristic architectural community, make the homestay tourism in the fishing village more distinctive and lasting, and then promote the development of marine cultural industry and tourism industry.

Research objects and methods: The research objects are tourists in coastal areas. 300 tourists are randomly selected from two tourist destinations in coastal areas to understand their tourism hobbies, personal characteristics and other relevant information, investigate the current situation of tourist destinations in coastal areas, and record relevant data, through fuzzy evaluation, tourists' satisfaction with the measures of rural revitalization + marine cultural tourism industry is evaluated. The satisfaction is divided into five grades. The scoring method adopts grades 1-5. The higher the score, the higher the satisfaction. SAS software is used for relevant data processing and analysis.

Results: Social psychology is a kind of psychology that studies group process and organizational behavior. From the perspective of social psychology, we can study the development of marine cultural tourism industry under the strategy of rural revitalization. By analyzing the current situation of marine culture, this

paper summarizes the reasons for its formation. According to these current situations, targeted design and development are carried out. Through the development of cultural and creative products with regional characteristics, marine folk beliefs can be inherited and innovated. With some encouragement and support measures, the traditional folk houses in Southern Fujian have been established on a large scale, and a neat and characteristic architectural community has been formed, through this series of measures, promote the development of rural revitalization + cultural marine cultural tourism industry. The satisfaction of tourists with bachelor's degree on the measures of developing cultural and creative products with regional characteristics is (4.88±0.71), and the satisfaction of repairing traditional residential buildings in Southern Fujian is (4.93±0.48). The relevant results are shown in Table 1.

Table 1. Satisfaction evaluation of tourists with different levels of education on the countermeasures of rural revitalization + cultural marine cultural tourism industry

Education level	Cultural and creative products with regional characteristics	Repair of traditional residential buildings in Southern Fujian	Further industrialization of fishing custom culture
Junior college	4.04±0.56	4.67±0.51	4.23±0.46
Undergraduate	4.88±0.71	4.90±0.08	4.66±0.47
Graduate student	4.84±0.57	4.64±0.73	4.83±0.65

Conclusions: From the perspective of social psychology, this paper studies the development of marine cultural tourism and cultural industry in the strategy of rural revitalization. In the group organization behavior of rural revitalization strategy, the government plays the role of group leadership and encourages local people to actively participate in the development of marine cultural industry. Carry out in-depth analysis from the perspective of marine culture and excavate relevant cultural characteristics to realize the revitalization of fishing villages and villages in Xiamen + the development of marine cultural tourism industry.

* * * * *

ANALYSIS OF INNOVATIVE TEACHING REFORM OF HUMAN RESOURCES EDUCATION IN COLLEGES AND UNIVERSITIES UNDER COGNITIVE IMPAIRMENT

Bin Gu & Qiang Li*

School of Economics and Management, Shanghai Technical Institute of Electronics & Information, Shanghai 201411, China

Background: Cognition is the process of extracting and processing individual knowledge or acquired knowledge. This process involves random, psychological and social behavior. Specifically, it is manifested in learning, memory and thinking. Cognitive impairment indicates that there are abnormalities in the process of information acquisition and processing, resulting in memory impairment and pathological changes in cognition, language, behavior and so on. To keep cognition normal, we must ensure that the function of cerebral cortex is normal. If the cerebral cortex is abnormal, it will lead to cognitive impairment. There is a correlation between different types of cognitive impairment. Problems in one aspect of cognition will affect other aspects of cognition. For example, if an individual's attention and memory are abnormal, there will be obstacles in problem-solving. Cognitive impairment mainly includes three types: perception, memory and thinking. Perceptual disorder refers to perceptual abnormality. The specific manifestations of abnormality include retardation, discomfort, allergy and so on.

At present, the students majoring in human resource management in colleges and universities have a vague understanding of the meaning of human resource management, do not understand the qualities that the professionals need to have, have low awareness, and have a slow perception. Some students filled in their volunteers after the deployment of the school. They didn't know much about the major. Some just understood it literally. They felt that the major should belong to management, and they liked management, so they chose the major. Some students have a preliminary understanding through the network and feel that they can choose. On the whole, many students are at a loss about the employment of this major, do not know the work content of the employment of this major, generally have less understanding of salary, work status and other related contents, and their understanding is very one-sided. Moreover, because the teaching of human resource management specialty is relatively single, the content is boring and does not reflect the changing characteristics of the new era, most students only accept it passively and think less

about the content of professional courses, which aggravates the cognitive barrier of students to the specialty. In terms of professional teaching methods, the evaluation method is affected by the management of traditional teaching system. The examination method of this major is in the form of test paper examination, which is not conducive to the development of students' innovative thinking.

Objective: This paper analyzes the cognitive impairment of college students majoring in human resource management, studies its causes, and carries out targeted human resource management teaching reform according to these causes, so as to reduce students' cognitive impairment and promote students' understanding of human resource management. By updating the teaching content, we can arouse students' attention to the professional courses, form a relatively complete knowledge system, promote the improvement of students' learning enthusiasm and initiative, and broaden the scope of knowledge. By optimizing the teaching process, increasing more opportunities for social practice, strengthening students' perceptual knowledge and improving students' innovative spirit. Through the reform of assessment methods, students' cognitive ability, analytical ability and other abilities are assessed, so as to promote the all-round development of students' cognitive ability, analytical ability and other abilities, and further alleviate students' cognitive obstacles.

Research objects and methods: The research objects were college students with cognitive impairment majoring in human resource management. 300 college students with cognitive impairment were randomly selected from 5 colleges and universities. These college students majored in human resource management. To understand the performance of college students with cognitive impairment in cognitive impairment and the problems existing in the practical teaching of the major before the reform. Through the fuzzy evaluation method, the impact of educational innovation teaching measures on college students with cognitive impairment is evaluated. The evaluation method adopts 0-4 score. The higher the score, the greater the impact. Use SPSS software to process relevant data.

Results: Among the college students majoring in human resource management, some students have cognitive barriers. These students do not conduct detailed research on their majors, their professional quality is not high, their practical ability is weak, and they are more passive in course learning. Relevant courses are unscientific, teaching methods are monotonous, students do not have enough practical opportunities, and do not pay attention to students' cognitive ability, analytical ability and other abilities. According to these conditions, innovative education innovation is carried out, and the teaching reform adheres to the three principles of comprehensiveness of objectives, subjectivity of students and systematic gradualness. After the reform, sophomores with cognitive impairment scored 4 points in updating teaching methods. Table 1 shows the impact of educational innovation and teaching reform measures on students with cognitive impairment.

Table 1. The influence of educational innovation and teaching reform measures on college students with cognitive impairment

Grade	Update teaching methods	Optimize the teaching process	Reform assessment methods
Freshman	4	3	3
Sophomore	4	4	3
Junior	4	3	4

Conclusions: College students majoring in human resources management have cognitive impairment, which is reflected in the lack of knowledge of the major, the lack of professional employment, the lack of perfection of students' knowledge structure and the low practical ability of students. In addition to the influence of China's education system, the teaching mode of this major is more traditional. After the change of teaching concept, we should innovate the teaching of human resource management, strive to improve students' innovation, initiative and enthusiasm, and carry out innovative reform from the three aspects of teaching content, teaching process and assessment methods. After the reform, the comprehensive quality of students has been improved and the cognitive impairment of students has been alleviated.

* * * * *

A CORPUS-BASED COMPARATIVE STUDY OF ACADEMIC ENGLISH RICHNESS FROM THE PERSPECTIVE OF COGNITIVE FUNCTION

Ning Liu & Xiaozhong Song

School of Foreign Language, Huaiyin Normal University, Huai'an 223300, China

Background: Cognition refers to the process in which an individual's brain processes external information after receiving it, and changes it into internal psychological activities to obtain relevant knowledge. Cognitive function is the ability of an individual's brain to extract, process and store external information. It is the degree of an individual's understanding of the composition and performance of things, and mastering the relationship between things and related development laws. This function is the psychological condition for the completion of individual activities and occupies the most important position. This period involves learning, spirit, thinking and so on. From the perspective of cognitive function, the linguistic features of academic English in the corpus should be accurate and clear, and the relevant academic views should be objective and rigorous. However, in reality, the connection of things is not very clear, but with the characteristics of fuzziness and non-determinism. When describing objective things and expressing the thinking results, the relevant elaboration language has a fuzzy form. This situation also exists in academic English. In the in-depth research and thinking expansion of fuzzy language, hedges occupy an important position in the research. It is an important part of fuzzy language and the focus of scholars. Among them, hedges are the most common in fuzzy language and the most typical representative of fuzzy language. Through the expression of these words, the listener will feel like nothing and can't figure out clear information. The study of hedged language has important theoretical and practical significance. It can promote the study of semantics and pragmatics and promote effective communication to a certain extent. According to the characteristics of hedges, this paper focuses on their analysis, analyzes the use characteristics of different modal hedges in different corpora, further discusses the relevant pragmatic functions of these modal hedges, and studies the richness of academic English in different corpora from the perspective of cognitive function.

Objective: To analyze the characteristics of hedges, determine the research value of hedges, find the literature research related to hedges, and summarize the direction of these research, so as to determine the starting point of the article, that is, to make a quantitative and qualitative analysis of hedges. This paper searches modal hedges in three corpora, studies the richness and frequency of modal hedges, as well as the use of these words by college students, and analyzes the results, studies the role of modal hedges in academic English, and the impact of academic English richness of different corpora on college students' cognitive function.

Research objects and methods: The research object is modal hedges, using meta-analysis. Firstly, the semantic classification, word characteristics and pragmatic functions of modal hedges are understood and mastered, and the problems that need to be studied are determined. Through the corpus method, three corpora are selected to retrieve modal hedges. The three corpora are JDEST corpus, brown corpus and lob corpus. The latter two corpora are used as reference corpora. The words of the three corpora are more than one million and have a rich vocabulary. In the retrieval of modal hedges, there are 9 types of modal hedges. After the search, analyze the richness of different modal hedges to understand the students' use of the three corpora, using 1-5 and scoring, using SPSS22.0 software to analyze the data and study the impact of corpus with different academic English richness on college students' cognitive function.

Results: Academic English should have been clear and rigorous, but in practical research and application, there are semantic uncertainty and vague expression. Hedges are representative of fuzzy language. Modal hedges belong to hedges. Modal hedges are searched in three corpora, the use frequency of different modal hedges is counted, and the impact of the richness of academic English on college students' cognitive function is analyzed. The influence of academic English richness of JDEST corpus on college students' memory function is scored as 5 points, and the results are shown in Table 1.

Table 1. The influence of the richness of corpus academic English on college students' cognitive function

Corpus	Perceptive function	Memory function	Learning function
JDEST corpus	4	5	4
Brown corpus	4	4	3
LOB corpus	3	4	4

Conclusions: The cognitive function includes sensory perception, attention, memory and so on. From the perspective of cognitive function, academic English should be clear and serious, but there are special circumstances. Modal hedges will be used in academic English and retrieved in the corpus. There are differences in the frequency of modal hedges in the three corpora, and there is also a certain gap in the

frequency of words. Compared with brown corpus and lob corpus, JDEST corpus has higher academic English richness and plays a greater role in promoting college students' cognitive function.

* * * * *

RESEARCH ON THE DEVELOPMENT STATUS OF CONTEMPORARY CHINESE NETWORK LITERATURE FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Wanhong Wang

School of Literature, Journalism & Communication, Xihua University, Chengdu 610039, China

Background: Network literature is not produced in disputes, but developed in disputes. When people argue about network literature, network literature still develops along its own track. Reviewing people's discussion of network literature, combing the development history of network literature, and understanding the value and research status of network literature are the starting point of network literature research. With the increasing influence of network literature, there are more and more research articles and works of network literature. The emergence and popularization of the Internet has created a new development platform and literary system for literature. Generally speaking, the Internet has brought great changes to Literature and endowed it with rich spiritual connotation, mainly as follows: freedom, equality, non-utilitarian and authenticity. Freedom on the Internet also brings free style of writing, freedom of form, often without scruples; Ridicule is bold and unrestrained. It is gorgeous and diverse in forms. It breaks away from the shackles of traditional literature and soars in a free country. Some literary newcomers post on the forum at the beginning of their creation. The replies, comments and incentives of enthusiastic netizens will give spiritual comfort to the newcomers and encourage them to continue to walk on the road of literary creation. It can be seen that network literature does not focus on the ideological content in traditional literature as the core evaluation standard, but relies on wit, humor and entertainment to attract the majority of netizens and readers. The network has created an open development platform for literature and created the coexistence of network and traditional literature. Literary research from the perspective of social psychology should find theoretical basis outside psychoanalysis. They began to pay attention to the relationship between psychological theories outside psychoanalysis and literature, and explore the application of psychological theories outside psychoanalysis to literary research. Combine personality psychology, family system psychology, developmental psychology, neuropsychology and literary research. Psychology obviously embodies more dimensions, and its contrast is easier to help literary researchers understand the diversity of psychology. When narrative therapy brings literature into psychotherapy and gives psychotherapy a new narrative dimension, we can also look back at literature itself from this perspective and explore the therapeutic nature of literature.

Objective: Social psychology discusses the development of Chinese contemporary network literature at the individual level and social group level. Through the process of individual socialization, communication, speech development, partners, family and living environment, network literature is influenced. Therefore, the development of Chinese contemporary network literature can be discussed based on social psychology.

Subjects and methods: The emergence of network media has further expanded the communication channels of literature, resulting in the emergence of literary works carrying out publishing activities with the network as the carrier. The formation and development of network literature has been controversial and concerned by a wide range of people, and the concept of network literature has also been valued by people. With the increasing popularity of network literature and the gradual expansion of reader market, the research and analysis of social psychology can effectively improve the development of contemporary Chinese network literature.

Study design: This paper uses the method of investigation and analysis to evaluate the contemporary network literature works, selects the network literature with different contents, and analyzes the psychological situation of readers. The higher the influence value, it proves that the audience likes reading. 1000 people of different ages and genders are randomly selected to evaluate the literature works.

Methods: Use Excel to count the influence of social psychology on network literature.

Results: After entering the 20th century, the mainstream of the development of Chinese literature often maintains close contact with social politics. Chinese contemporary literature carries the traditional thought of "carrying the Tao and passing the country" in classical literature. The emergence of network literature has made great contributions to breaking the rigid literary system and promoting the development of popular culture. Network writing promotes the expansion of writing groups to a certain extent. Network writing has the nature of low threshold. It can integrate more writers into it and continuously expand the

writing team, which is conducive to improving the creative atmosphere of network literature and continuously promoting and deepening the reform and development of cultural system. Most of the authors of network literature rely on their own life experience, rely on the phenomenal power of unconstrained nature, and then catch the attention of readers. The rich imagination shown by the authors of network literature is what Chinese contemporary literature lacks. Network literature contributes to the rich development of literary styles, truly realizes the progress of Chinese contemporary literature, and introduces Chinese diversified contemporary literature into the reader population. It is an important product to meet the development needs of modern society.

According to the survey results, the influence values of specific factors are quantified in five grades of 0-4. 0 means irrelevant, 1 means slight influence, 2 means general influence, 3 means obvious influence and 4 means full influence. The specific statistical table is shown in Table 1.

Table 1. Influence of social psychology on network literature

Factor	Popular cultural development	Literature constitution reform	Improvement of writing experience
Romantic novel	3	4	4
Inferential novel	4	3	3
Science fiction	3	4	4
Martial arts novel	4	3	3
Time travel fiction	3	4	3

Conclusions: Social psychology provides new and extremely valuable ideas and methods for literary research. When social psychology continues to learn from and emulate the important resources in network literature, literary research should also continue to do similar things. When we look at the relationship between literature and psychology again, we will find that although psychoanalysis has given literary criticism extremely innovative new ideas, the more and broader intellectual resources of psychology are the hope to revitalize literary criticism from the perspective of psychology.

Acknowledgement: The research is supported by: The study of “Wenxindiaolong” and its contemporary value from the perspective of writing theory (No.17YJA751027).

RESEARCH ON THE DEVELOPMENT COMPETITIVENESS OF TRADITIONAL VILLAGES IN WEST BEIJING BASED ON BIG DATA ANALYSIS FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Tingwan Huang

School of Architecture and Urban Planning, Beijing University of Civil Engineering and Architecture, Beijing 100044, China

Background: In terms of discipline attribute, social psychology is neither a branch of sociology nor a branch of psychology. It is a comprehensive science combining management, economics, politics, behavioral science, cultural anthropology, culturology, psychology and sociology. The main research fields of social psychology are individual process, interpersonal process and group process. Individual process includes achievement behavior and individual work performance, attitude and attitude change, attribution problems, personal perception and self-consciousness, personality and social development, stress and emotional problems. Interpersonal processes include aggression and helping behavior, interpersonal attraction and love, conformity and obedience, gender roles and gender differences, nonverbal communication, social exchange and social influence. Group process includes health psychology, racial prejudice and ethical issues, group process and organizational behavior, crowding and environmental psychology, and cross-cultural comparative research. Social psychology can be divided into behaviorism school, cognitive school and psychoanalysis school. Among behaviorists, imitation theory, social exchange theory, social learning theory and stimulus-response theory are common and perfect theories. For the field theory and the group theory, the field theory is consistent with the cognitive theory and the group theory. For the psychoanalytic school, the three-dimensional theory of interpersonal behavior, the sociological school of new psychoanalysis and psychoanalytic theory are the most common theories.

At present, under the background of big data analysis, the development of traditional villages in West

Beijing is facing very big problems, which are embodied in the fact that the landscape protection and development of traditional villages cannot meet the needs, and the landscape image of traditional villages is facing a crisis. Different from ordinary cities, traditional villages are buildings that live in harmony with nature under the guidance of relevant theories and ideas in ancient China. The concept of West Beijing originated from Wanping County in Beijing, including Haidian, Fengtai, Fangshan, Shijingshan District, today's Mentougou District and other regions. Nowadays, Jingxi refers to Beijing. Broadly speaking, Jingxi refers to Fangshan, Fengtai, Mentougou, Shijingshan, Haidian and other districts. In a narrow sense, Jingxi refers to Mentougou District of Beijing. Traditional villages have different understandings for experts in different fields. At present, the academic circles have a relatively consistent view on the value of traditional villages, pointing out that they are cultural heritage including a variety of material and intangible forms, and they have important values in science and art, social economy, history and culture. The landscape elements of traditional villages include natural landscape elements and cultural landscape image elements. Natural landscape elements include plants, water bodies and mountains; Humanistic environment includes lifestyle, religious belief and customs. The physical environment includes landmarks, nodes, boundaries, areas and roads. From the perspective of social psychology, the competitiveness of the development of traditional villages in West Beijing is mainly reflected in the flexible road system, the village form adapted to local conditions, the core node of road series, and the changing skyline.

Objective: Analyze the impact of the development mode of traditional villages in West Beijing on residents' psychology under the background of social psychology and combined with big data technology, so as to inject new strength into the sustainable development of traditional villages in West Beijing.

Research objects and methods: The residents of traditional villages in West Beijing in two regions are selected as the research object. The development of traditional villages in West Beijing under the background of social psychology combined with big data technology analysis is evaluated by a learning vector quantitative cluster analysis algorithm. The number of residents in each region is 200. The evaluation contents include loneliness, interpersonal communication, gender discrimination and self-recognition. The evaluation index is good degree, and the consensus degree is set as five grades: very good, relatively good, good, generally good and not very good. The corresponding scores of the five grades are 0-2, 3-4, 5-6, 7-8 and 9-10. The research takes the average value of the evaluation results of the research object as the final result, so as to ensure the reliability and effectiveness of the results.

Methods: Through SASD data statistical analysis software, this paper analyzes the impact of the development of traditional villages in West Beijing on residents' mental health under the background of social psychology.

Results: Table 1 refers to the impact of the development model of traditional villages in West Beijing on the psychology of residents in the context of social psychology. It can be seen from Table 1 that the residents of traditional villages in West Beijing in the four regions have a high degree of well-being. Therefore, the development competitiveness of traditional villages in West Beijing needs to be combined with social psychology, which plays an important role in the sustainable development of the region.

Table 1. The influence of the development model of traditional villages in West Beijing on the residents' psychology of traditional villages in West Beijing under the background of social psychology

Psychological indicators	Very good	Quite good	Good	Generally good	Not very good
Lonely	43	47	47	32	31
Interpersonal communication	46	44	39	36	35
Gender discrimination	42	42	45	34	37
Self-recognition	42	43	44	35	36

Conclusions: Combined with the background of social psychology, the development competitiveness of traditional villages in West Beijing has a high degree of good, which plays an important role in the subsequent development and innovation of traditional villages in West Beijing.

ON THE VALUE ORIENTATION OF MARXISM AND E-COMMERCE DEVELOPMENT VIEW FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGICAL CATEGORY

Shuhua Wang

Institute of Information Technology, Nanchang Vocational University, Nanchang 330500, China

Background: Social psychology was first proposed by Irving psychologists. This discipline mainly analyzes the instincts, communication, reactions, habits and other behaviors of groups. As a new category of language marginalization, sociopsycholinguistics follows the guiding principle of human standard, and the research object is people and in society. The research content of social psychology is the behavior occurrence and change law and psychology of groups and individuals in social interaction. Social psychology is an important science closely related to people's daily life. It can not only cover the advantages of all disciplines, but also add vitality to the long-term development of all disciplines. Social psychology explores interpersonal relationships on the basis of social group level and individual level. Individual level includes the influence of school, living environment, family, partners, speech development, communication and individual socialization process on individuals. Social group level refers to culture, customs, racial prejudice, aggressive behavior, attitude, group communication structure, etc. The development process of social psychology can be divided into three stages: the germination of western social psychology, the determination of the discipline system of western social psychology, and the expansion of the research field of western social psychology. Based on the interaction between individual and society, social psychology analyzes the occurrence, development and change law of individual psychological activities under certain social living conditions. Social psychology not only attaches importance to the interaction between individual and society, but also attaches importance to the analysis of individual internal psychological factors and social situations. The research scope of social psychology involves applied psychology, group psychology, social communication psychology and behavior, individual social psychology and social behavior, including the application of social psychology, social influence, attitude and behavior, social individual, theory and method, etc.

Marxism and e-commerce development view need to make great changes under the background of social psychology, which are mainly reflected in the following aspects: the correct values under enterprise ethics, the value evaluation of economic development and government supervision. The correct values under enterprise ethics need to be maintained by enterprises, individuals and organizations. The ethical problems of enterprises are interest problems and identification of e-commerce ethical problems, which are embodied in the inability to guarantee the quality of goods, the proliferation of false information and information fraud, infringement of intellectual property rights, disclosure of personal information, logistics and distribution problems, immoral competition among peers, network crime problems, environmental problems, food safety, consumer fraud, etc. The value evaluation of economic development includes the leap-forward development of e-commerce economy to productivity, freedom and equality in e-commerce economy, fairness and efficiency in e-commerce economy. The supervision of government departments can promote the rapid development of e-commerce. Its responsibility is to increase infrastructure construction, including not only transportation infrastructure such as ports, railways and roads, but also network infrastructure such as mobile Internet. The government should strengthen supervision, especially increase the punishment for unethical competitive enterprises. Unify the construction and rules of e-commerce laws; Establish the guiding role of the government in the field of e-commerce.

Objective: This paper analyzes the role of the value direction of Marxism and e-commerce development concept on the social-psychological level of residents under the background of social psychology, and finds a new model for the development of e-commerce in the future.

Research objects and methods: The residents of two cities are selected as the research object. Through the improved Random Forest algorithm (RF), the effect of the value direction of Marxism and the e-commerce development concept on the social-psychological level of residents under the background of social psychology is studied. The number of people in each city is 200. The evaluation contents include loneliness, interpersonal communication, gender discrimination and self-recognition. The evaluation index is good degree. The consensus degree is set as five grades: very good, relatively good, good, generally good and not very good. The corresponding scores of the five grades are 0-2, 3-4, 5-6, 7-8 and 9-10. The average value of the evaluation results of all research objects is taken as the final result, so as to ensure the reliability and effectiveness of the results.

Methods: Through S-PLUS data statistical analysis software, this paper analyzes the role of the value orientation of Marxism and e-commerce development concept on the social-psychological level of residents.

Results: Table 1 refers to the effect of correct values on social-psychological level under enterprise ethics under Marxism and e-commerce development concept. It can be seen from Table 1 that the good degree of loneliness, interpersonal communication, gender discrimination and self-recognition is high. Therefore, Marxism and e-commerce development view need to be combined with social psychology, which plays an important role in the development of China's e-commerce neighborhood and the realization of globalization.

Table 1. The effect of correct values on social-psychological level under enterprise ethics under Marxism and e-commerce development view

Psychological factor	Very good	Quite good	Good	Generally good	Not very good
Lonely	43	46	48	32	31
Interpersonal communication	46	45	38	36	35
Sexual gender discrimination	47	43	46	30	34
Self-recognition	42	43	46	32	37
Psychological factor	41	45	43	34	37

Conclusions: The analysis of Marxism and e-commerce development concept has extremely important value for the improvement of residents' social psychological level, which plays an important role in the follow-up research on the development and innovation of e-commerce.

* * * * *

CONSTRUCTION AND EXPLORATION OF LEISURE PHYSICAL EDUCATION TEACHING MODEL BASED ON FLIPPED CLASSROOM FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Zhonghua Li

College of Physical Education, Chengdu University, Chengdu 610106, China

Background: In recent years, educational psychology is closely related to psychiatry, medicine, sociology, anthropology, education and other fields. Educational psychology is a subject that studies the law and essence of students' psychological activities. Its goal is to cultivate a sound personality and health psychology. The main research content of educational psychology is the basic psychological laws of education and teaching in the context of education and teaching. It is based on psychology. The research involves teaching design, educational technology, special education and classroom management. Educational psychology can improve the level of teachers, improve the quality of education and teaching, and promote the reform of education and teaching. The characteristics of educational psychology include teachers' characteristics, students' characteristics and teaching methods. Different from psychology, educational psychology focuses on the psychological laws of student groups, and evaluates whether students can learn knowledge and master corresponding skills under normal teaching conditions. The teaching subject of educational psychology theory is the workers engaged in education, and the purpose is to guide teachers to complete teaching work. The future research trend of educational psychology is learners' subjective initiative, the action mechanism in the learning process, the influence of situational environment on learning results, teaching mode and so on. The application of educational psychology in school curriculum teaching has been widely valued by experts in the field of education. A large number of research reports show that the leisure physical education curriculum teaching based on flipped classroom integrating educational psychology has a good teaching effect, especially in the aspect of teaching quality.

The flipped classroom is a classic teaching mode of controlled learning in the current era of big data. This mode breaks through the traditional teaching mode and construction method, pays attention to the central position of learners, and allows learners to master the progress of learning according to their own needs. Flipped classroom needs to have the following characteristics. Students need to have high self-management ability, extracurricular autonomous learning ability, self-exploration ability in class and cooperation ability. Teachers need to change their ideas, not only to preach and get rid of doubts, but also to guide students to learn, individualize and guide students to form the habit of lifelong learning and all-round quality development. The significance of leisure sports course teaching combined with the flipped classroom is mainly as follows: leisure sports majors set up corresponding information technology courses to enable students to have corresponding information technology operation ability. Teachers have strong guidance ability and teamwork ability, and can easily deal with learning guidance, the construction of online teaching content and the application of learning resource platforms. The vast majority of leisure physical education courses are presented in the form of modularization, especially in terms of theoretical curriculum resources and sports skills. Under educational psychology, the teaching mode of leisure physical education combined with flipped classroom not only needs to innovate teaching technology and equipment, but also needs to update the theory and process in time. This model can be called the "three-two-one" leisure

physical education curriculum teaching model, including three stages, two levels, two-way efforts, two positions and one goal. Two key aspects are as follows: an information platform and or activity learning to create a personalized learning environment for students. Collaborative learning in class and independent learning outside class.

Objective: This paper analyzes the teaching model of leisure physical education based on flipped classroom and the effect of development path on educational psychology, in order to provide scientific suggestions for the theoretical innovation of leisure physical education.

Research objects and methods: Students from four schools are selected as the research object. The teaching model of leisure physical education based on the flipped classroom is evaluated by a random forest algorithm (RF). The number of students in each school is 50. The evaluation contents include quality, will, cognition, emotion and interpersonal relationship. The evaluation result is recognition degree. The satisfaction level is set to five levels: very recognition, comparative recognition, recognition, general recognition, little recognition and non-recognition. The corresponding scores of the five levels are 0-20, 21-40, 41-60, 61-80 and 81-100. In order to ensure the reliability of the results, the average value of the evaluation results of all research objects is taken as the final result.

Methods: Through Epi Info data statistical analysis software, this paper analyzes the impact of leisure physical education teaching model based on flipped classroom on students' educational psychology under the background of educational psychology.

Results: Table 1 refers to the impact of leisure physical education curriculum teaching model based on flipped classroom on students' educational psychology. It can be seen from Table 1 that the recognition of quality, will, cognition, emotion and interpersonal relationship is high. Therefore, the teaching model of leisure physical education based on flipped classroom needs to be combined with educational psychology, which is of great significance to the teaching innovation of leisure physical education in colleges and universities in China.

Table 1. Evaluation results of leisure physical education teaching model based on flipped classroom under the educational psychology

Type	College 1	College 2	College 3	College 4
Three stages	88	91	89	92
Two levels	82	93	95	86
Two-way effort	89	87	85	94
Two positions	82	86	86	92
A goal	83	85	91	84

Conclusions: The leisure physical education curriculum teaching model based on flipped classroom proposed by the research has a high degree of recognition for students' educational psychology. In the future, this model can be applied to the leisure physical education curriculum teaching in other colleges and universities.

THE VALUE OF RED ART ARCHIVES IN THE EDUCATION OF PEOPLE IN THE EXHIBITION HALL AND ITS INFLUENCE ON EDUCATIONAL PSYCHOLOGY

Liqiang Ran

Archives, Linyi University, Linyi 276000, China

Background: Educational psychology is an important branch of applied psychology. It is an interdisciplinary subject of pedagogy and psychology. Its main research content is the basic psychological laws of middle school and teaching in the stage of education and teaching. However, there are significant differences in the research focus between educational psychology and college psychology, and most scholars have given a clear identification scope. The focus of educational psychology is to analyze theoretical work, and the focus of school education is to engage in school and related specific affairs. Educational psychology is based on psychology and involves teaching design, educational technology, special education and classroom management. Its purpose is to guide teachers to complete teaching work. The research trend of educational psychology under the continuous development of the times is learners' subjective initiative, the action mechanism in the learning process, the influence of situational environment on learning results,

teaching mode and so on. In a simple understanding, educational psychology is all the sciences involved in the process of learning and teaching, including teaching methods, students' characteristics and teachers' characteristics. According to the type of subject, teachers can adopt different teaching schemes. At present, the relevant research of educational psychology mainly focuses on the active challenges faced by students in the process of growth, learning initiative, the change of teaching methods and the design of teaching courses. Under the background of the development of educational psychology, the Red Art Library has obvious advantages in educating people in the exhibition hall, including some red resources during the new democratic revolution and the war to resist US aggression and aid Korea, which can enhance the patriotic enthusiasm of Chinese people.

The performance of Red Art Library in the field of education in the exhibition hall is as follows. First, the Red Art archives highlights the collection value of red archives in the process of collecting resources. In the work of archives collection, we should refine the workflow of archives resources, and invite experts in many fields such as party history, culture and Museum, provincial and municipal archives to give advice for specific work, which can improve the planning and scientific level of archives collection and expand the participation and awareness of the masses. In addition, the government needs to provide necessary financial support to ensure the data collection of red archives. Second, attention should be paid to the exhibition of archives exhibition hall in the process of archives publicity. Carry out special exhibitions on red memory, such as going into archives to view the Yellow River, ancient city history archives, going into archives to keep the original heart, so as to provide guarantee for the cultivation of people's red memory education system. Third, strengthen the compilation and research and development of archives in the development and utilization of red resources. Look for valuable materials of revolutionary activities in the new democratic period, including picture materials, literature materials, special materials, research materials, etc., specifically including research results of revolutionary history, conference articles of parties or insiders of revolutionary history, historical documents, etc. Fourth, play the role of patriotism education base in the process of building a civilized city. We should actively promote red search archives into schools, schools and offices, and establish platforms such as the WeChat official account and online exhibition hall to provide a deeper understanding of red culture for the public. Fifth, highlight the sense of mission of red archives in the study and education of party history. Carry out publicity and education of citizens through the compilation and research of red archives resources, exhibition and display, so as to help them establish a correct view of party history.

Objective: This paper analyzes the value of Red Art archives in the education of people in the exhibition hall and their role in educational psychology, in order to enhance the red spirit of citizens and spread the red spirit and culture.

Research objects and methods: This paper selects experts in many fields such as party history, culture and Museum, provincial and municipal archives in two red revolution base areas as the research object, and analyzes the role of the value of Red Art archives in the education of people in the exhibition hall and educational psychology through the Support Vector Machines (SVM) classification model. The evaluation includes three aspects: quality, will and cognition. The value range of contribution value is 0-1. The larger the value is, it indicates that the educational value of Red Art archives in the exhibition hall has a great impact on psychological factors. In order to ensure the reliability of the results, the average value of the evaluation results of all research objects is taken as the final result.

Methods: Through DAS data statistical analysis software, this paper analyzes the evaluation results of the value of teaching Red Art archives in the education of people in the exhibition hall and the role of teaching psychology.

Table 1. The value of Red Art archives in the education of people in the exhibition hall and its influence on educational psychology

Base area	Quality	Will	Cognition
Base area 1	0.88	0.90	0.88
Base area 2	0.82	0.93	0.82
Base area 3	0.86	0.88	0.88
Base area 4	0.82	0.87	0.93
Base area 5	0.83	0.83	0.87
Base area 6	0.84	0.86	0.86

Results: Table 1 refers to the influence of the value of Red Art archives in the education of people in the exhibition hall on educational psychology. It can be seen from Table 1 that the contribution value of Red Art archives in the education of the exhibition hall is high in terms of quality, will and cognition. This shows that

after the introduction of educational psychology theory, the effect of Red Art archives in the education of people in the exhibition hall is more obvious.

Conclusions: The value of Red Art archives in educating people in the exhibition hall has a particularly obvious impact on educational psychology, especially in terms of will. In order to play a greater role in educating people in the exhibition hall, the Red Art archives need to be fully combined with the theory of educational psychology, which plays an important role in the education of senior officials.

Acknowledgement: The research is supported by: Research and Application of Red Art Image in Shandong Base Area (No. 2021-SKCZ-57), an Applied Research Project on Popularization of Social Sciences in Shandong Province in 2021, and Research on Yimeng Art in Shandong Base Area Period (No. 20LDYMM1), a Special Subject of Yimeng Spirits Research of Linyi University in 2020.

INFLUENCE OF DYNAMIC MODELING OF GOVERNMENT PUBLIC SERVICE QUALITY EVALUATION SYSTEM ON PEOPLE'S COGNITIVE PSYCHOLOGY

Junzhi Li^{1,2} & Zhenlei Sun³

¹*School of Public Administration, Jilin University, Changchun 130000, China*

²*School of Management, Inner Mongolia Minzu University, Tongliao 028000, China*

³*College of Physical Education, Inner Mongolia Minzu University, Tongliao 028000, China*

Background: Since the national development and Reform Commission proposed to “comprehensively improve the quality of public services and enhance people’s sense of access and satisfaction”, the level of government public services has been significantly improved. Compared with the past, the breadth of government public services shows a qualitative breakthrough, but the depth of public service quality still needs to break through the shackles. The sense of mass gain has obvious local color. Enhancing the sense of mass gain is the primary task in the process of development and reform. In the previous system regulations, the main body of the evaluation of the government public service quality is the leading cadres. In order to effectively improve the people’s sense of gain and satisfaction, the main body of the evaluation of the government public service quality is changed to the people. Taking the subjective feeling and positive perception of the people’s sense of gain as the main basis for evaluating the quality of government public services can make the government pay more attention to the vital interests and feelings of the people on the basis of paying attention to the growth of economic data. The people’s feelings about government public services are rich and diverse. From the perspective of cognitive psychology, it can more objectively and accurately analyze people’s subjective experiences such as sense of acquisition or satisfaction. Cognitive psychology is a research direction of psychology. In a broad sense, the main research object of cognitive psychology is people’s advanced psychological process, including perception, attention, memory, representation, thinking, creativity and so on. In a narrow sense, cognitive psychology can be regarded as an information processing psychology, which mainly explores people’s cognitive process, views and attitudes through information processing. The most remarkable research feature of cognitive psychology is to pay attention to the psychological mechanism based on human behavior, and obtain the internal psychological process of the observed object by analyzing the observable surface phenomena. From the perspective of cognitive psychology, the evaluation system of government public service quality can realize dynamic and objective analysis.

Objective: In the actual process of government public service, the service scope and service quality will show some differences. Therefore, the government public service quality evaluation system needs to have strong universality and reliability, and can accurately evaluate the quality of different public services. In order to achieve this goal, this study will build a government public service quality evaluation system from the perspective of cognitive psychology, and realize dynamic modeling and analysis.

Research objects and methods: 158 ordinary people were randomly selected as the research objects in the society. Using the SERVQUAL evaluation model of perceived service quality, different evaluation dimensions were set through cognitive psychology to explore the evaluation results of all subjects on the quality of government public services.

Research design: The SERVQUAL evaluation model of perceived service quality is applied to construct the evaluation indexes of government public service quality in different dimensions, which covers six dimensions: tangibility, correspondence, efficiency, information, empathy and fairness and law-abiding. It includes 21 evaluation indexes such as the modernization of government infrastructure and the reasonable internal layout of government departments, which are expressed from A to U respectively. Give full

consideration to people's sense of acquisition and satisfaction under cognitive psychology. 158 subjects were asked to evaluate 21 evaluation indexes. The evaluation results were determined as satisfactory, average and dissatisfied, which were expressed as 2, 1 and 0 respectively.

Methods: Using Excel and SPSS24.0 to collect and analyze the corresponding evaluation data.

Results: Figure 1 shows the evaluation results of government public service quality based on cognitive psychology. According to Figure 1, 158 subjects are highly satisfied with the quality of government public services, of which only the satisfaction evaluation value of item H is 0, indicating that the people are not satisfied with the evaluation result of the government public services. People choose 7 general evaluation indexes, and their satisfaction evaluation value is 1. The satisfaction evaluation value of the remaining 13 evaluation indicators is 2, indicating that the public is satisfied with the evaluation results of the 13 government public services. This shows that the government public service quality evaluation system based on cognitive psychology has a good dynamic analysis effect, and can accurately analyze the cognitive process and perceived attitude under people's cognitive psychology.

Figure 1. Evaluation results of government public service quality based on cognitive psychology

Conclusions: In cognitive psychology, people's perception process, views and attitudes are the core content of the research, and people's evaluation of government public service quality is mainly based on people's own perception and satisfaction with service quality. The government public service quality evaluation system based on cognitive psychology can fully consider the people's inner will and their satisfaction with government services, and obtain more objective and accurate evaluation results by refining various government public service indicators.

THE INFLUENCE OF ACCOUNTING COMPUTERIZATION ON TAX INSPECTION UNDER COGNITIVE IMPAIRMENT AND ITS COUNTERMEASURES

Qiru Luo

School of Digital Economics, Sichuan Vocational and Technical College, Suining 629000, China

Background: Cognitive impairment is a manifestation of cognitive impairment, which is mainly caused by various external influencing factors or internal pathological factors. When the brain advanced intelligent processing process related to learning, memory and thinking is abnormal, which leads to a series of aphasia, apraxia, learning impairment and memory impairment, it can be judged that an individual has a certain cognitive impairment. There are many types of cognitive impairment, and they are closely related and can affect each other, which greatly hinders the accuracy of diagnosis and the effectiveness of treatment. The basic causes of cognitive impairment have a certain diversity. Brain aging, craniocerebral trauma, cerebrovascular diseases, chronic systemic diseases, mental and psychological states, environmental factors and so on may lead to a great negative impact on the advanced neurological function of individual cerebral cortex, resulting in cognitive impairment of different severity. As a kind of mental disease, the mental state of patients with cognitive impairment is extremely unstable. Patients with cognitive impairment will not only show typical symptoms such as memory impairment, visuospatial impairment,

executive dysfunction and computational impairment, but also may have a series of complications, which will eventually lead to the loss of basic daily living ability of patients. For patients themselves and their families, Are a heavy burden.

In the traditional tax inspection work, the tax inspection clues are all inclusive, including bookkeeping vouchers, statements, account books, original vouchers and other financial account data. Tax inspectors can check the legitimacy, authenticity and accuracy of the data in all account tables through various tax inspection clues and random accounting. Under the positive influence of the rapid development of computer network technology, the traditional tax inspection work has been improved to a certain extent, and the computerized accounting is taken as a powerful means to assist the tax inspection work. Computerized accounting can significantly improve the efficiency and reliability of tax inspection on the basis of getting rid of the manual bookkeeping mode. However, at present, the application of computerized accounting in tax inspection is still in the primary stage, and there are many restrictive factors, including the lagging application of computerized accounting by the majority of tax inspectors, the lack of various original documents reflecting the occurrence of business, and more hidden tax inspection clues. In the context of improving cognitive impairment, it is very important to optimize the application of accounting computerization in tax inspection, which can help the efficient implementation of tax inspection and improve the application effect of accounting computerization.

Objective: To explore the impact of computerized accounting on tax inspection under cognitive impairment, and put forward effective countermeasures according to the problems existing in the daily work of tax inspectors, in order to ensure the smooth development of tax inspection.

Research objects and methods: 20 tax inspectors were randomly selected from four tax inspection centers as the research object, and the impact of accounting computerization on tax inspection under cognitive impairment was analyzed by decision tree algorithm.

Research design: Using canonical correlation analysis (CCA) and mini mental state examination (MMSE), this paper explores the correlation between different influencing factors of accounting computerization and five levels of cognitive impairment of tax inspectors: orientation, memory, attention and calculation, memory and language ability. The influencing factors include the types of accounting computerization software, the concealment of accounting computerization data, the flexibility of accounting computerization account set setting, and the professional level of tax inspectors under accounting computerization. Rank the correlation between different influencing factors and the smooth development of tax inspection, and 0-4 respectively represent the correlation. The larger the value is, the stronger the correlation is.

Methods: This study uses MATLAB software to analyze all experimental data to explore the impact of accounting computerization on the symptoms of cognitive impairment of tax inspectors under cognitive impairment.

Results: It can be seen from Table 1 that the influence rating of three different influencing factors of accounting computerization on the cognitive impairment symptoms of tax inspectors is 3 or 4, which indicates the type of accounting computerization software, the concealment of accounting computerization data, the flexibility of accounting computerization account set setting, and the orientation, memory, attention and calculation, recall ability of the professional level of tax inspectors under accounting computerization on the cognitive impairment of tax inspectors Language ability has a great influence.

Table 1. Influence of cognitive impairment of tax inspectors under three influencing factors

Influence factor	The influence of each evaluation item of cognitive impairment				
	Directional force	Memory	Attention and computational power	Recall ability	Language ability
Types of accounting computerization software	4	4	3	3	4
Concealment of computerized accounting data	3	3	4	4	4
Flexibility of accounting computerization A / C set setting	4	3	4	3	3
Professional level of tax inspectors under Accounting Computerization	3	4	4	4	3

Conclusions: The influence of accounting computerization on tax inspection under cognitive impairment involves many aspects, and the influence is large. This study puts forward corresponding countermeasures after the improvement of cognitive impairment, which can effectively reduce the negative impact and promote the smooth development of tax inspection.

EVALUATION SCALE AND INTERVENTION EFFECT OF MILD COGNITIVE IMPAIRMENT IN THE ELDERLY

Ping Chen¹, Zhengmao Pan², Xiang Yi¹ & Canhui Li¹

¹*School of Nursing, Yueyang Vocational Technical College, Yueyang 414000, China*

²*Office of Party and Government, Yueyang Vocational Technical College, Yueyang 414000, China*

Background: Cognition refers to the process in which the human brain processes information intelligently to obtain corresponding theoretical knowledge or applied knowledge when receiving various external information. In the whole process of cognition, it will involve learning, memory, emotion, language, execution, thinking, understanding and other complex social behaviors and activities. When the human cerebral cortex is damaged due to various factors, the brain's intelligent processing process will be affected and limited to some extent, resulting in abnormal or damaged cognitive function, and finally leading to cognitive impairment. Cognitive impairment mainly includes three types: perceptual impairment, memory impairment and thinking impairment. The causes are significantly diverse. In addition to organic diseases, mental disorders such as neurasthenia, obsessive-compulsive disorder, mental classification, bipolar disorder, paranoid or reactive psychosis will lead to cognitive impairment. Mild cognitive impairment is the early stage of Alzheimer's disease, which is between normal aging and dementia. Compared with severe cognitive impairment, the disease course of patients with mild cognitive impairment can be slowed down under the intervention measures, and the decline rate of cognitive function can also be controlled to a certain extent. In the process of increasing global aging, the incidence of mild cognitive impairment in the elderly shows a continuous upward trend. However, there is no effective drug to prevent the occurrence of mild cognitive impairment in the current medical field. Therefore, the hot spot of medical research is mainly complementary and alternative therapy, especially homework. For the elderly with mild cognitive impairment, occupational therapy is an effective treatment, which can play a significant effect in improving cognitive impairment and improving the ability of daily living of elderly patients with mild cognitive impairment.

Objective: For the elderly patients with mild cognitive impairment, the reduction of cognitive function will have a great negative impact on their daily life, and it is a heavy burden on the patients themselves and their families. Based on this, it is imperative to accurately evaluate and intervene the mild cognitive impairment of the elderly. This study will conduct an in-depth exploration on the cognitive impairment and its performance of patients, and intervene the course of disease with occupational therapy, in order to alleviate the cognitive impairment of patients and improve their cognitive level and self-care ability.

Research object and method: In four communities, 96 elderly patients with mild cognitive impairment were selected by convenient sampling. The Mini-Mental State Examination (MMSE) was used to evaluate the level of cognitive function and the severity of cognitive impairment. The evaluation indexes of MMSE mainly include five aspects: orientation, memory, memory, language ability, attention and calculation. In the MMSE score evaluation criteria, a score of 24 or above indicates normal. The score is in the range of 13-23 points, indicating mild cognitive impairment. 5-12 points, indicating moderate cognitive impairment; If the score is less than 5, it is severe cognitive impairment.

Research design: All patients were intervened with occupational therapy from five aspects: orientation, memory, memory, language ability, attention and calculation of cognitive impairment. Before and after the intervention, MMSE was used to evaluate the level of cognitive function of all patients.

Methods: Support vector machine was used to classify the evaluation results of patients' cognitive impairment. All measurement data were expressed in the form of mean \pm standard deviation. MATLAB software and Excel software were used for data analysis, and $P < 0.05$ was used as the standard with statistical significance.

Results: Figure 1 shows the intervention effect of occupational therapy in elderly patients with mild cognitive impairment. It can be seen from Figure 1 that before the intervention, the MMSE score level of the tested patients was low, indicating that they were in the state of mild cognitive impairment. After one month of intervention, the MMSE score increased, but the increase was small. After 2 months of intervention, the MMSE score of patients increased significantly to about 22.85. After 3 months of intervention, the increase of MMSE score decreased, but still maintained an upward trend, indicating that the cognitive impairment of patients has been significantly alleviated under the intervention of occupational therapy. The errors of MMSE scores are indicated in Figure 1. Compared with that before the intervention, the difference of MMSE scores at three different time nodes after the intervention was

statistically significant ($P < 0.05$).

Figure 1. MMSE scores of elderly patients with mild cognitive impairment before and after intervention

Conclusions: The cognitive impairment of the elderly can be effectively alleviated under the intervention of occupational therapy, and the level of cognitive function is significantly improved. Occupational therapy has a good intervention effect, which can enhance patients' self-care ability on the basis of improving their cognitive level. This method can be widely used in the treatment of patients with cognitive impairment.

THE INFLUENCE OF IDEOLOGICAL AND POLITICAL EDUCATION REFORM ON COLLEGE STUDENTS' EMPLOYMENT AND ENTREPRENEURSHIP ANXIETY

Lili Zhao

International Education School, Hebei University of Economics and Business, Shijiazhuang 050061, China

Background: Modern medicine believes that anxiety is related to genetic factors. Anxiety can be found in the families of patients with anxiety. It is an organic disease with physiological and biochemical abnormalities in the brain, especially in the amygdala, hippocampus, hypothalamus and frontal cortex. The role of other brain structures in the development of anxiety. The physiological changes of anxiety disorder show the overactivity of neural activity as a whole, but these physiological changes are not unique to anxiety disorder, so they may also be the result of the disease rather than the cause. In short, the clinical manifestations of anxiety disorder are chronic anxiety disorders such as tension, excitement of autonomic nerve function and excessive vigilance, accompanied by a series of symptoms such as muscle tension, autonomic nerve disorder and exercise anxiety, which last for a long time. It is generally believed that over compensation for negative emotions can lead to anxiety disorder. With the development of social economy, people's life and work pressure are increasing. The incidence rate of anxiety disorders is also increasing. It should be pointed out that mild anxiety has a positive impact, which can stimulate spirit, improve attention and make talents think quickly. However, excessive anxiety can inhibit the brain and make people confused all day. The anxiety of college students in the upcoming graduation, job hunting or other learning stages of the university is mainly caused by excessive employment pressure, which is called "Employment anxiety". Employment anxiety is the anxiety experienced by college students in the face of employment problems. Employment anxiety is a strong and lasting emotional experience accompanied by physiological changes. At the same time, entrepreneurial anxiety refers to the emotional experience that college students may fail to achieve their initial goals due to entrepreneurial failure when facing entrepreneurial problems after graduation. In other words, entrepreneurial anxiety refers to college graduates' cognitive evaluation of internal and external stimuli in entrepreneurial situations, and the expectation that fuzzy dangerous stimuli inside and outside entrepreneurial situations will threaten themselves and self-esteem, resulting in strong and lasting emotional experience and feeling unable to cope. This is a kind of state anxiety, which will be relieved as the problem is solved. In psychology, mild employment and entrepreneurship anxiety is everyone's normal psychological response. Moderate anxiety will make people feel pressure and urge

graduates to seek work and self-entrepreneurship, but excessive anxiety will interfere with the normal life of college students.

Ideological and political education is not only the primary content of China's spiritual civilization construction, but also one of the main ways to solve social contradictions and problems. Ideological and political education is both important and difficult to do. Especially under the condition of market economy, China's ideological and political work is relatively weak and does not meet the requirements of the development of modern society. There are many reasons for the poor effect of ideological and political work, but one of the important reasons is the long-term neglect of psychological education and training. Psychological education and cultivation are the basis of ideological and political education. Without this foundation, ideological and political education is like rootless duckweed, always drifting on the surface of people's thoughts and cannot go deep. Relevant studies have pointed out that ideological and political education in colleges and universities has an important impact on alleviating college students' employment and entrepreneurship anxiety. It can not only help college students form correct values, but also dredge and overcome the psychological pressure of college employment and entrepreneurship. Therefore, explore the psychological role of ideological and political education in alleviating college students' employment and entrepreneurship anxiety. It has both theoretical and practical value.

Objective: In order to alleviate college students' anxiety about employment and entrepreneurship, this paper constructs a reform model of ideological and political education in colleges and universities based on psychological training, which aims to dredge college students' anxiety about employment and entrepreneurship, so as to point out the direction for college students' graduation life.

Research objects and methods: 300 college students were randomly divided into control group and experimental group, with 150 students in each group. The control group implemented traditional ideological and political education, and the experimental group implemented the reform mode of ideological and political education based on psychological training for 3 months. Then, combined with the Self-rating Anxiety Scale (SAS), the employment and entrepreneurship anxiety of college students is measured. The higher the score, the more serious the anxiety of college students. Finally, the psychological improvement of employment and entrepreneurship anxiety of the two groups of college students are compared and analyzed.

Methods: Complete the data analysis through SPSS23.0 data statistical analysis software.

Results: Table 1 shows the psychological improvement of employment and entrepreneurship anxiety of college students in the two groups. Compared with the control group with routine ideological and political education and the experimental group with the reform mode of psychological training ideological and political education, the psychological improvement of college students' entrepreneurship and employment anxiety is more significant, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. The psychological improvement of employment and entrepreneurship anxiety of college students in the two groups ($n=300$)

Factor	Control group ($n=150$)	Experience group ($n=150$)	<i>P</i>
Somatization	2.75±0.61	1.66±0.61	0.00
Obsessive compulsive symptoms	2.69±0.59	1.52±0.60	0.00
Interpersonal sensitivity	2.47±0.43	1.39±0.43	0.00
Depressive status	2.54±0.55	1.45±0.56	0.00
Anxiety state	2.36±0.41	1.25±0.43	0.00
Hostile situation	2.44±0.56	1.43±0.57	0.00
Psychological state of terror	2.29±0.42	1.28±0.43	0.00
Paranoid mental state	2.75±0.61	1.66±0.61	0.00
Psychotic	2.69±0.59	1.52±0.60	0.00

Conclusions: The reform mode of ideological and political education based on psychological training has an important impact on alleviating college students' employment and entrepreneurship anxiety. It can not only help college students form correct values, but also dredge and overcome the psychological pressure of college employment and entrepreneurship. Therefore, it can be said that the reform model of ideological and political education based on psychological training has high theoretical and practical value.

ANALYSIS ON THE INFLUENCE OF THE INTEGRATION MODE OF TRADITIONAL CULTURE EDUCATION AND CHINESE LANGUAGE TEACHING ON COLLEGE STUDENTS' POSITIVE PERSONALITY UNDER EDUCATIONAL PSYCHOLOGY

Xue Nan¹ & Shijun Song²

¹*School of General Education, Sichuan University of Science and Technology, Meishan 620564, China*

²*Office of Asset and Lab Management, Southwest Jiaotong University, Chengdu 610031, China*

Background: Educational psychology is the product of the combination of educational activities and psychology. It is a science to explore the psychological law and teaching law of middle school in the process of education. So far, educational psychology, as a science, has only a hundred years of history and is still a very young science. Educational psychology is a social psychology that studies human learning, the effect of educational intervention, teaching psychology and school organization under the educational situation. The focus of educational psychology is to apply the theory or research results of psychology to education. Educational psychology can be used to design courses, improve teaching methods, promote learning motivation, and help students face various difficulties and challenges in the process of growth. With the increasing attention of education to people's all-round development, educational psychology has shifted from the initial focus on the research of learning psychology and the discussion of learning laws to the cultivation of moral behavior, independent thinking and practical ability. Specifically, educational psychology includes three aspects: first, the characteristics of educators. Educational psychology first needs to understand the characteristics of the executors of the educational process, that is, teachers, and the impact of these characteristics on the teaching process. Every educator has his own set of teaching ideas and methods, and the personality characteristics of educators will also affect the educational process. Second, the characteristics of educational objects. As the object of education, educators must understand the individual characteristics of the object of education and its learning motivation, learning ability and learning habits. Only in this way can education be targeted and play a full role. Third, educational methods. The influence of different educational methods on different subjects and different teaching contents, and how educators cooperate with teaching methods to achieve good teaching results are also the research content of educational psychology. In short, educational psychology has made important achievements in both theory and practice. Therefore, it is worth continuing to expand the application scope of educational psychology. Psychology believes that there are two forces of struggle in everyone's heart: one force is negative and the other force is positive. Anyone of these two forces can defeat who. The key is to see which force the individual is constantly injecting new energy and creating a suitable psychological environment for survival. A good external environment is an important source of personality formation. To construct a good external environment, we can develop people's active behavior ability. One's realistic ability (including one's ability to evaluate one's own behavior, the ability to specify goals, the ability to plan to achieve goals, etc.) is incorporated into the construction of personality and becomes an important force affecting personality. In short, positive personality is very important for the development of college students' mental health.

Chinese traditional culture is a national culture that reflects national characteristics and integrates with the evolution of Chinese civilization. It is the overall expression of various ideological, cultural and conceptual forms in the history of a country. It refers to the cultural heritage created by the Chinese nation and its ancestors in China. It is a culture with distinctive national characteristics, a long history, broad and profound connotation and fine traditions inherited and developed by the Chinese nation from generation to generation. In short, it is the general name of various national civilizations, customs and spirits expressed in different cultural forms. Traditional culture education in colleges and universities is very important for the inheritance and development of Chinese traditional culture. Chinese language teaching in colleges and universities is a subject that studies Chinese vocabulary and syntax, appreciates ancient and modern poetry, prose, novels and other literary works, and is familiar with the basic knowledge of editing and publishing. By learning Chinese and literature, you can have a solid Chinese foundation and strong writing ability, know how to evaluate literary works, and have rich knowledge and excellent humanistic quality. At this stage, the integration of traditional culture education and Chinese language teaching has become an inevitable trend of college education reform. Relevant research points out that the integration of traditional cultural education and Chinese language teaching can not only ensure that students have excellent traditional cultural connotation and literary quality cultivation, but also help students develop their psychological personality. At the same time, educational psychology is mainly committed to exploring people's internal happiness, optimism, gratitude, happiness and other positive and excellent qualities, advocating the appreciation of people's positive energy, and paying attention to people's survival and development and the perfect realization of life value. The idea of educational psychology runs through the whole process of the

integration of traditional cultural education and Chinese language teaching, creates a warm educational atmosphere, actively pays attention to the internal development needs of modern college students, and explores their own virtue and quality, which is conducive to guiding college students to improve their virtue and beauty, and then fully ensure the physical and mental health development of modern college students.

Objective: This paper constructs a psychological intervention model based on the integration of traditional cultural education and Chinese language teaching, which aims to improve college students' positive personality and ensure the all-round development of college students' physical and mental health.

Research objects and methods: 300 college students were selected as the research objects and divided into three groups: the pure traditional culture education group (100), the pure Chinese language teaching group (100), and the experimental group of the integration of traditional culture education and Chinese language teaching (100). The intervention lasted for 1 month. Then, combined with the positive personality scale, the students' positive personality is measured. The higher the score, the more stable the corresponding positive personality is. Finally, the changes of positive personality of the three groups of students are analyzed and compared.

Methods: All data were statistically processed by SPSS22.0.

Results: Table 1 shows the changes of positive personality of college students in the three groups after one month of intervention. It can be seen from Table 1 that the students in the experimental group integrating traditional culture education and Chinese language teaching scored the highest in all dimensions of positive personality, with statistical difference ($P < 0.05$).

Table 1. Changes of positive personality of college students in the three groups after one month of intervention ($n=300$)

Dimensions of college students' positive personality	Pure traditional culture education group ($n=100$)	Simple Chinese language teaching group ($n=100$)	Traditional culture + Chinese language group ($n=100$)
Creativity	3.03±0.61	3.03±0.61	5.97±0.67*#
Curiosity	3.06±0.79	3.06±0.79	5.12±0.77*#
Judgment	3.34±0.76	3.34±0.76	6.38±0.77*#
Studious	3.65±0.81	3.65±0.81	6.51±0.84*#
Insight	3.78±0.66	3.78±0.66	6.72±0.71*#
Brave	4.00±0.59	4.00±0.59	5.95±0.70*#
Insist	3.09±0.65	3.09±0.65	4.28±0.64*#
Sincere	3.09±3.60	3.09±3.60	6.39±0.67*#
Enthusiasm	3.66±0.74	3.66±0.74	6.97±0.64*#
Love	3.56±0.68	3.56±0.68	5.97±0.67*#
Kindhearted	3.77±0.73	3.77±0.73	5.12±0.77*#
Intelligence	3.78±0.69	3.78±0.69	6.38±0.77*#
Team	3.34±0.76	3.15±0.67	5.12±0.77*#
Fair	3.65±0.81	3.03±0.61	6.38±0.77*#
Leadership	3.78±0.66	4.00±0.59	6.51±0.84*#
Tolerant	3.78±0.69	3.03±0.61	6.72±0.71*#
Modest	3.15±0.67	3.06±0.79	6.01±0.62*#
Cautious	3.03±0.61	3.34±0.76	5.97±0.67*#
Autonomy	3.03±0.61	3.65±0.81	5.12±0.77*#
Appreciate	3.06±0.79	3.78±0.66	6.38±0.77*#
Gratitude	3.34±0.76	4.00±0.59	6.51±0.84*#
Hope	3.65±0.81	3.09±0.65	6.72±0.71*#
Humor	3.78±0.66	3.09±3.60	5.95±0.70*#
Faith	4.00±0.59	3.66±0.74	4.28±0.64*#

Note: * $P < 0.05$ compared with traditional culture education group, # $P < 0.05$ compared with Chinese language teaching group.

Conclusions: The teaching mode based on the integration of traditional cultural education and Chinese language teaching based on educational psychology not only has a high degree of consistency, but also can

fully improve the positive personality, and then has important value for students' psychological development, which is worthy of popularization and application in the practice of teaching reform in colleges and universities.

INTERVENTION OF UYGHUR LEARNING ON COGNITIVE IMPAIRMENT OF COLLEGE STUDENTS

Lisha Ren & Xiaoxiao Xiong*

Xinjiang Institute of Technology, Aksu 843100, China

Background: As a mental disease, cognitive impairment mainly refers to the abnormal processing of human intelligent knowledge, which leads to the disorder of learning and memory function, and leads to the loss of line, cognition, use and other pathological behaviors. The diagnostic criteria of cognitive impairment include normal overall cognitive function, memory impairment and behavior disorder inconsistent with age. The main causes of cognitive impairment are chronic brain injury, chronic systemic diseases and mental and psychological abnormalities, among which mental and psychological abnormalities are the most important. According to the latest research, the number of patients with cognitive impairment in China is increasing year by year, which has a serious negative impact on the patients themselves and their families. Timely intervention for patients with cognitive impairment can actively change their cognitive function, and then it is very important to reduce the quality of life of patients and their families. As a neurocognitive impairment disease, in order to better understand cognitive impairment disease, it is necessary to deepen the understanding of cognitive impairment from the perspective of cognitive type classification. Specifically, cognitive impairment includes two main types: perceptual cognitive impairment and thinking cognitive impairment. For perceptual cognitive impairment, it needs to be clear that perception belongs to the category of human perceptual cognition, which corresponds to the surface understanding of things. When people have perceptual and cognitive impairment, they usually cannot understand the surface laws of things, and directly lead to doubt and fear of the common-sense world, which is reflected in the physiological level: the sensory threshold of the body is reduced, and they are aware of their own breathing, blood pressure, heartbeat, gastrointestinal peristalsis, posture and posture. At the same time, they are highly sensitive to environmental stimuli, especially those regarded as threats by patients. In short, perceptual cognitive impairment only needs to trigger psychosomatic response according to the individual characteristics of its external image, without more contact with the thing itself. For thinking cognitive impairment, it needs to be clear that compared with perceptual cognition, thinking belongs to higher-level cognitive activities, including basic cognitive processes such as analysis, synthesis and comparison of things. Patients with thinking and cognitive impairment can self-confirm that they have cognitive impairment because they have a stable conceptual basis. However, the negative effect is that patients will form strong subjective bias because of their own concept cognition, resulting in patients falling into self-panic. Once there is a little physical or psychological reaction, they will deny their treatment effect and think that their old problems are very complex. In short, patients with thinking and cognitive impairment often have no "sense of normality" and always think they are ill, which brings great psychological pressure to themselves and great challenges to clinical treatment. In recent years, many researchers at home and abroad have conducted intervention research on mild cognitive impairment. The intervention measures mainly include nutrition intervention, drug intervention, physical exercise, cognitive training, traditional Chinese medicine and acupuncture intervention. However, both in theory and in practice, we should actively expand the intervention measures for the treatment of cognitive impairment.

Relevant studies have pointed out that the main characteristics of Uighur pronunciation include pronunciation, intonation, stress and rhythm, which makes Russian spelling simple, catchy, clear, smooth and powerful. When learners make progress in reading aloud and feel that they are reading correctly, they will have a sense of beauty, which plays an important role in enlightening people's mood and soul. In view of this, this study designed a cognitive impairment treatment model based on Uighur language learning, which aims to alleviate students' cognitive impairment through Uighur language learning, and then provide a new intervention model for the clinical treatment of cognitive impairment.

Objective: A cognitive impairment treatment model based on Uyghur learning is designed to alleviate students' cognitive impairment and promote the all-round development of college students' physical and mental health.

Research objects and methods: 300 college students were randomly divided into control group and

experimental group, with 150 students in each group. The measurement of students' cognitive impairment was carried out in combination with Montreal Cognitive Assessment scale (MoCA). The scale includes 7 factors: executive ability, naming ability, attention, language ability, abstract ability, delayed recall the higher the score of orientation ability, the better the cognitive function. Among them, the control group adopted the conventional psychological intervention mode, and the experimental group added Uyghur learning content on the basis of the conventional psychological intervention mode. The intervention cycle was 3 months. The improvement of cognitive impairment of college students in the two groups was compared and analyzed.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Results: Table 1 shows the improvement of cognitive impairment of college students in the two groups after 3 months of intervention. It can be seen from Table 1 that compared with the control group with routine psychological intervention, the experimental group with cognitive impairment treatment mode based on Uyghur learning has a better effect on Improving college students' psychological cognitive impairment, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. The improvement of cognitive impairment of college students in the two groups after 3 months of intervention ($n=300$)

Factor	Control group ($n=150$)	Experience group ($n=150$)	<i>P</i>
Executive ability	2.54±0.55	4.62±0.58	<0.05
Naming ability	2.36±0.41	4.66±0.61	<0.05
Attention	2.69±0.59	4.52±0.60	<0.05
Language ability	2.47±0.43	4.62±0.58	<0.05
Abstract ability	2.54±0.55	4.66±0.61	<0.05
Delayed recall	2.54±0.55	4.52±0.60	<0.05
Orientation ability	2.36±0.41	4.62±0.58	<0.05

Conclusions: The cognitive impairment treatment model based on Uyghur learning not only effectively improves the cognitive impairment of college students, but also enriches and expands the intervention measures for the treatment of cognitive impairment.

* * * * *

THE CULTURAL MEANING OF CHINESE COLOR WORDS UNDER COGNITIVE IMPAIRMENT AND ITS EXPRESSION IN UYGHUR

Xiaoxiao Xiong, Lisha Ren* & Zhenxu Ma

Xinjiang Institute of Technology, Aksu 843100, China

Background: As a mental disease, cognitive impairment mainly refers to the disorder of learning and memory function caused by abnormal processing of human intelligent knowledge, and leads to pathological behaviors such as loss of line, recognition and use. The diagnostic criteria of cognitive impairment include normal overall cognitive function, main complaints of memory impairment and behavioral disorders inconsistent with age. The main causes of cognitive impairment are chronic brain injury, chronic systemic diseases and mental and psychological abnormalities, among which mental and psychological abnormalities are the most important. According to the latest research, the number of patients with cognitive impairment in China is increasing year by year, which has a serious negative impact on the patients themselves and their families. Timely intervention for patients with cognitive impairment can actively change their cognitive function, and then it is very important to reduce the quality of life of patients and their families. In recent years, many researchers at home and abroad have conducted intervention research on mild cognitive impairment. The intervention measures mainly include nutrition intervention, drug intervention, physical exercise, cognitive training, traditional Chinese medicine and acupuncture intervention. In short, cognition is an intelligent processing process of acquiring knowledge through a series of random, psychological and social behaviors such as learning, memory, language, thinking, spirit and emotion. Cognitive impairment refers to the abnormality of the brain's advanced intelligent processing process in all these processes, resulting in the changes of thinking, spirit, emotion and judgment. At present, the research of cognitive impairment mainly focuses on the field of medicine. However, matching the performance of medical

cognitive impairment with the cultural meaning of Chinese color words and their expression in Uyghur, and exploring the strategies and methods to solve the problem is an effective way to solve the cognitive impairment of Uyghur learning. At the same time, it has theoretical and practical significance for the application and development of the cultural meaning of Chinese color words.

The function of color words is closely related to national psychology and human emotion. The same color may cause different associations and have different symbolic meanings in the minds of different nationalities. This has a long history and tradition, which is the result of the role of national character. Of course, there is the same situation, which is the result of the interaction and mutual infiltration of human culture. For the concept of basic color, Han and Uygur are basically the same, but for a certain color, due to the constraints of national culture, there will be different reference ranges and show differences. In short, each language has color words, and each nation has its own color word system. Different nationalities have great differences in the cognition and expression of the same color words. A comparative study of color words in Chinese and Uyghur will help to explore their universality and national characteristics, contribute to the exchange of Chinese and Uyghur language and culture, and improve the unbalanced distribution of color words, which has certain theoretical and practical significance for the teaching of color words in Chinese and Uyghur.

Objective: In order to effectively improve the common cognitive impairment of college students in Uyghur language learning, based on the theories and methods of comparative linguistics, this study analyzes the cultural meaning of Chinese color words and their expression in Uyghur language, and intervenes students' Uyghur language learning by distinguishing the similarities and differences between the color words of the two language families, so as to solve the problem of cognitive impairment encountered by students in Uyghur language learning.

Research objects and methods: 300 Uyghur learning students were selected as the research object, and the measurement of students' cognitive impairment was carried out in combination with the Montreal Cognitive Assessment scale (MoCA). The scale includes seven factors: executive ability, naming ability, attention, language ability, abstract ability, delayed recall and orientation ability. The higher the score, the better the cognitive function. Then, based on the analysis of the cultural meaning of Chinese color words and their expression role in Uyghur, the students are intervened in Uyghur learning, and the intervention period is 6 months. Finally, the improvement of students' cognitive impairment in Uyghur learning before and after the intervention is compared and analyzed.

Methods: Data through SPSS23.0 statistical analysis software is completed.

Results: Table 1 shows the improvement of students' cognitive impairment in Uyghur learning before and after the intervention. It can be seen from Table 1 that compared with before the intervention, based on the analysis of the cultural meaning of Chinese color words and their expression in Uyghur, the cognitive impairment of students' Uyghur learning has been improved after the intervention, with a statistical difference ($P < 0.05$).

Table 1. Improvement of students' cognitive impairment in Uyghur learning before and after intervention ($n=300$)

Factor	Before intervention	Intervention 3 months	Intervention 6 months
Executive ability	1.28±0.43	3.54±0.55*	4.62±0.58*
Naming ability	1.66±0.61	3.36±0.41*	4.66±0.61*
Attention	1.52±0.60	3.69±0.59*	4.52±0.60*
Language ability	1.45±0.56	3.54±0.55*	4.39±0.43*
Abstract ability	1.28±0.43	3.36±0.41*	4.45±0.56*
Delayed recall	1.66±0.61	3.69±0.59*	4.62±0.58*
Orientation ability	1.52±0.60	3.54±0.55*	4.66±0.61*

Note: * $P < 0.05$ compared with that before intervention.

Conclusions: Based on the analysis of the cultural meaning of Chinese color words and their expression in Uyghur, the cognitive impairment of students' Uyghur learning has been improved. Therefore, it can be said that analyzing the cultural meaning of Chinese color words and their expression in Uyghur, and intervening students' Uyghur learning by distinguishing the similarities and differences between the color words of the two language families can effectively improve students' cognitive impairment in Uyghur learning, and then it is of great significance to students' psychological development in the process of Uyghur learning.

THE POSITIVE INFLUENCE OF THE REFORM AND POLICY DEVELOPMENT OF MUSIC EDUCATION IN COLLEGES AND UNIVERSITIES ON STUDENTS' COGNITIVE IMPAIRMENT

Beibei Li

School of Music, Henan University, Kaifeng 475001, China

Background: As a psychological disease, cognitive impairment develops from the perspective of psychological disease. In essence, cognitive impairment can be attributed to a kind of neurocognitive impairment, which is mainly manifested in many levels of psychological disorders, such as thinking, perception, memory, learning and so on. In the field of medicine, cognitive impairment mainly includes six kinds: social cognition, complex attention, language, perceptual motor function, learning and memory, and executive function. Mild cognitive impairment is characterized by wandering, anxiety, depression, forgetfulness, memory and attention loss. Moderate cognitive impairment is characterized by further deterioration of cognitive ability. Patients are characterized by large emotional fluctuations, paranoia, anxiety, reduced ability of understanding and language expression, and reduced resolution of objective things such as time. Severe cognitive impairment develops further from moderate cognition. Patients show a decline in overall function and develop dementia, which will lead to delusion, indifference, lack of self-care ability and so on. However, as a mental disease, cognitive impairment does not have more significant external manifestations than the traditional psychological, emotional, behavioral and physical disorders. On the contrary, cognitive impairment is the concept of maladaptation caused by maladaptive cognition, and its clinical manifestations are more recessive. Moreover, because the function of the brain is complex, different types of cognitive impairment are interrelated, that is, cognitive problems in one aspect may lead to cognitive abnormalities in another or more aspects. Therefore, cognitive impairment is one of the most difficult problems in the diagnosis and treatment of brain diseases. In short, there is no unified diagnosis and treatment plan and method for patients with cognitive impairment at this stage. We should actively explore new ideas and directions for the treatment of patients with cognitive impairment.

Music education majors cultivate professionals with good music literacy and teaching ability to meet the needs of the construction of socialist market economy and the development of educational reform. Through the study of this major, we can meet the requirements of teachers' professional development, systematically master the basic theories and methods of music education, have the ability to analyze, solve practical problems and carry out teaching research by using the learned knowledge, and be able to engage in the education and teaching work after the new curriculum reform of music education in primary and secondary schools. Aesthetic education refers to the education of cultivating students' ability to understand, love and create beauty, which is also called aesthetic education or aesthetic education. It is an indispensable part of quality education. The aesthetic education in China's socialist schools serves the construction of socialist spiritual civilization and the cultivation of students' spiritual beauty and behavioral beauty. Aesthetic education can promote the all-round development of students' morality, intelligence and physique. It can improve students' thinking ability and cultivate students' moral sentiment. It can enrich students' knowledge and develop their intelligence. It can improve people's physical and mental health and improve the quality of sports. It can encourage students to love work, love working people and carry out creative work. Relevant studies have pointed out that college music education based on aesthetic education plays an important role in alleviating the symptoms of patients with cognitive impairment, that is, by excavating the spiritual beauty and behavioral beauty in music art, it can improve the physical and mental health of patients with cognitive impairment, so as to play the effect of treating cognitive impairment diseases.

Objective: This paper constructs a college music teaching intervention model for aesthetic education, which aims to expand the content of psychological intervention into college music reform and policies, so as to provide a new idea for the treatment of cognitive impairment.

Research objects and methods: 200 patients with cognitive impairment were selected as the research object, and the measurement of students' cognitive impairment was carried out in combination with Montreal Cognitive Assessment Scale (MoCA). The scale includes 7 factors. The higher the score, the better the cognitive function. The intervention mode of college music teaching for aesthetic education was adopted, and the symptoms of patients with cognitive impairment were compared after the intervention for 6 months.

Methods: Use Excel software to complete data analysis.

Results: Table 1 shows the improvement of symptoms in patients with cognitive impairment after 6 months of intervention. It can be seen from Table 1 that compared with before the intervention, after the intervention of the college music teaching intervention model for aesthetic education, the symptoms of

patients with cognitive impairment improved significantly, and there was a statistical difference before and after the intervention ($P < 0.05$).

Table 1. Improvement of symptoms in patients with cognitive impairment after 6 months of intervention ($n=200$)

Factor	Before intervention ($n=100$)	After intervention ($n=100$)	<i>P</i>
Executive ability	2.47±0.43	4.66±0.61	0.00
Naming ability	2.54±0.55	4.52±0.60	0.00
Attention	2.36±0.41	4.39±0.43	0.00
Language ability	2.69±0.59	4.45±0.56	0.00
Abstract ability	2.47±0.43	4.66±0.61	0.00
Delayed recall	2.54±0.55	4.52±0.60	0.00
Orientation ability	2.36±0.41	4.39±0.43	0.00

Conclusions: The college music teaching intervention model for aesthetic education can significantly improve the symptoms of patients with cognitive impairment, and then has important value and significance for clinical treatment of cognitive impairment diseases.

Acknowledgement: The research is supported by Research Project on Teacher Education Curriculum Reform in Henan Province in 2021. Research on Music Curriculum Reform in Normal Universities Based on Aesthetic Education Training Objectives of Primary and Secondary Schools (No. 2021-JSJYZD-006).

STUDY ON THE COUPLING AND COORDINATION BETWEEN CONSUMER ANXIETY AND HIGH-QUALITY DEVELOPMENT OF ENVIRONMENTAL ECONOMY

Xiaohui Peng^{1,2} & Xiao Yu¹

¹*College of Northeast Asia Studies, Jilin University, Changchun 130012, China*

²*School of Management, Inner Mongolia Minzu University, Tongliao 028000, China*

Background: According to the relevant research of psychology, anxiety psychology is a common negative psychological emotion in society. Generally speaking, the changes of inherent attributes in the environment or the activities of surrounding groups will cause psychological anxiety to a certain extent. Psychological anxiety is the most common negative psychological emotion. The common clinical symptoms are anxiety, anxiety and depression. Patients with severe anxiety disorder will gradually turn their anxiety into paranoia and appear the illusion of persecution. The existence of anxiety psychology seriously endangers people's physical and mental health. With the continuous development of social life, all walks of life began to gradually promote the product design process in order to meet the needs of consumers. In order to meet the needs of consumers for the tourism environment, the tourism industry also gradually began to pay attention to the surrounding environment. However, it is undeniable that with the development of tourism, the emergence of various new products and new landscapes has also caused consumers to have anxiety and affected consumers' shopping behavior. The anxiety psychology of consumers is the anxiety emotion generated by consumers before and during consumption. The anxiety psychology before consumption is mainly manifested in distrust of products. Patients have shopping anxiety and fear that the products they buy cannot meet their own needs. Anxiety in consumption is that patients are unwilling to follow-up consumption after selecting the products they need, which leads to patients' preference for products on the one hand and questioning of consumption behavior on the other hand, resulting in consumption anxiety. At present, the treatment of anxiety psychology is only to alleviate the negative emotions of patients through psychological induction. In the face of consumers' anxiety psychology, some studies have proposed to realize the treatment of consumers' anxiety psychology through environmental change and social development.

Under the influence of consumers' anxiety, the sales volume of tourism related products in the tourism industry began to decrease gradually. Therefore, in order to improve this situation, the tourism industry began to pay attention to the ecological environment security of scenic spots, hoping to alleviate consumers' psychological anxiety and achieve economic growth through the improvement of ecological environment. Under the influence of national strategic layout and social development, each scenic spot

began to expand its regional area, but it also caused great damage to the ecological environment, affected consumers' consumption psychology, and caused consumers' anxiety. Therefore, it is particularly important to study the coupling and coordination between consumers' anxiety psychology and the high-quality development of environmental economy. There are few studies on the coordinated development of consumer anxiety psychology and environmental economy, and most of them are oriented to a wide range of comprehensive development. Under the background of national high-quality development, exploring the coupling and coordination process between small-scale consumer psychology and environmental economic development can help improve the literature demand of China's economic development. Therefore, this study explores the objective reality of the coordinated development of consumer anxiety psychology and high-quality environmental economy, and puts forward efficient and coordinated development strategies in order to alleviate consumer anxiety and promote China's economic development.

Objective: Explore the psychological anxiety of consumers in tourism, analyze the correlation between consumer anxiety and the environmental and economic development of scenic spots, put forward the high-quality coupling development path of consumer anxiety and environmental economy, and put forward the scheme and measures to alleviate consumer anxiety.

Study design: The research takes an ecological scenic spot in Southwest China as the object, counts the economic development of the ecological scenic spot from 2018 to 2021, and counts the anxiety psychology of consumers in the scenic spot during this period. The evaluation index system is constructed, the entropy method is used to determine the weight of the index, and the coupled co scheduling model is constructed to measure the coupled co scheduling of consumer anxiety and high-quality development of environmental economy.

Results: The coupling coordination degree between consumer anxiety and high-quality development of environmental economy from 2018 to 2021 is shown in Table 1. The coupling degree between 0.8-1.0 indicates very strong coupling, between 0.6-0.8 indicates strong coupling, between 0.4-0.6 indicates moderate coupling, between 0.2-0.4 indicates if coupling and between 0-0.2 indicates very weak coupling. Table 1 shows that with the increase of time, the coupling degree between consumers' anxiety, anxiety and high-quality development of environmental economy gradually increases, and finally reaches more than 0.6 in 2021, which is a strong coupling.

Table 1. Change of coupling degree between consumer anxiety and high-quality development of environmental economy

Project	2018	2019	2020	2021
Impatience-environmental and economic development	0.31	0.45	0.57	0.63
Unrest-environmental and economic development	0.29	0.44	0.53	0.61

Conclusions: With social and economic development, consumer anxiety has gradually become the norm in society. In the development of tourism, the change of ecological environment leads to the aggravation of consumer anxiety, which affects the economic development of scenic spots. Therefore, it is of great significance to analyze the coupling relationship between consumer anxiety and the environmental economic development of scenic spots. In the study, the anxiety psychology of consumers in tourism is analyzed, the economic development of scenic spots is counted, the evaluation index system is constructed, and the coupling degree is calculated. The results show that there is a strong coupling between consumers' anxiety psychology and the high-quality development of environmental ecological economy. Therefore, in order to ensure the stable development of social economy and stabilize consumers' anxiety psychology, it is of great significance. The reconstruction of ecological environment is needed to meet the psychological needs of consumers, alleviate consumers' anxiety, and finally realize the high-quality development of China's economy.

THE CONNOTATION OF SOCIAL PSYCHOLOGY IN THE RISK ASSESSMENT OF RETURNING TO POVERTY AFTER TOURISM

Shulan Wang

School of Food Science, Henan Institute of Science and Technology, Xinxiang 453003, China

Background: Social psychology is scientific research that analyzes psychological activities from the

social nature. In social psychology, it mainly studies the communication psychology among social individuals, groups and organizations. In social psychology, social representation is the guarantee that determines the development of social communication. According to the research content of social psychology, social representation can help individuals have a clearer understanding ability in social communication. In addition, social psychology shows that social representation can help the specific analysis of a specific phenomenon in social communication and increase the ability of communication and interaction between societies. From the perspective of social psychology, the communication between all sectors of society has intensified, which has also promoted the social and economic development to a certain extent. Under the guidance of social psychology, the development speed of tourism is obvious. The reason is that people are more willing to enjoy life because of the improvement of the national economy. The visual pleasure brought by tourism can effectively help people experience life. Driven by social psychology, tourism has become the main way of social communication. With the help of social psychology, the communication between tourists and scenic spot residents has become more and more frequent, and social channels have been formed, which has brought poor areas out of poverty. However, social psychology also believes that the long-term conduct of social activities will lead to social fatigue of individuals or groups in the social environment, which will lead to a certain social disconnection after tourism out of poverty, resulting in the risk of returning to poverty.

Anti-poverty has always been an issue of close concern in China's social development. As one of the important ways and means to help rural areas get rid of poverty, rural tourism has been gradually implemented in many rural areas. After years of development, under the mode of rural tourism, rural areas have been getting rid of poverty and reaching the standard of getting rid of poverty. However, it is undeniable that most rural areas can reach the poverty alleviation standard with the support of tourism, but there is still a certain risk of returning to poverty. The risk of returning to poverty refers to the risk of returning to poverty after getting rid of poverty. In rural tourism, some studies have proposed that rural areas are prone to blood loss, desensitization and transfer. In the study, it is considered that after rural tourism gets rid of poverty, it is easy to reduce the risk of returning to poverty under the influence of tourists. In addition, due to the lack of tourists, social exchanges are reduced, and the countryside is unable to accept the latest news, resulting in desensitization and poverty. In social psychology, it is believed that tourism is the flow of people driven by psychological activities, and that rural tourism will change its role in social communication, which will lead to the failure of self-regulation within the countryside and lead to the transfer of poverty. In order to better understand the connotation of social psychology in social activities, the research starts with the analysis of the return to poverty risk assessment after tourism is lifted out of poverty, and analyzes the path of social psychology in the return to poverty assessment, so as to provide reference for rural tourism to lift out of poverty for a long time.

Objective: Explore the relevant contents of social psychology in rural tourism, and explore the impact of social activities on social psychology based on the connotation of social psychology in the risk assessment of returning to poverty after rural tourism gets rid of poverty.

Study design: This paper analyzes the social psychology in rural tourism, constructs the rural tourism return to poverty risk evaluation model from the perspective of social psychology by using the fuzzy evaluation method, takes the rural tourism return to poverty risk in a certain area of China as the research object, and selects tourists, group organizations and scenic spot employees in Tourism development as the evaluation subject. Using Excel statistical evaluation data and MATLAB to analyze all the data, get the risk value of poverty return in the region, judge the risk of local poverty return, and finally get the social and psychological changes of tourists, group organizations and employees in scenic spots in the risk of poverty return.

Results: The psychosocial changes such as self-identity, others' identity and social identity of tourists, group organizations and scenic spot employees are analyzed, as shown in Table 1. Table 1 shows that as the time in the risk assessment gradually pushes back, the proportion of self-identity, others' identity and social identity among tourists, group organizations and scenic spot employees shows a phenomenon of continuous improvement.

Table 1. Psychosocial changes in risk assessment

Project	First year (%)	The second year (%)	The third year (%)	The fourth year (%)
Self-identity	42.2	49.8	62.7	75.3
Others' identity	46.2	59.8	64.7	69.3
Social identity	47.5	49.6	52.3	73.6

Conclusions: Social psychology is widely used. In rural development, tourism, as an important measure of economic development, contains a very rich content of social psychology. Therefore, in order to

understand the connotation of social psychology in social activities, the study takes the return to poverty risk assessment of tourism as the research means, and analyzes the changes of social psychology in the process of constructing a fuzzy evaluation model to evaluate the return to poverty risk of rural tourism in an area. The results show that in the risk assessment of returning to poverty, the number of self-identity, others' identity and social identity of tourists, group organizations and scenic spot employees is increasing, indicating that the social psychology of people will also change in the change of social activities. Therefore, in order to promote China's economic development, it is necessary to analyze the social and psychological changes in social activities, so as to provide reference basis for risk assessment in economic development.

RESEARCH ON THE PATH OF INTEGRATING CHINESE TRADITIONAL CULTURE INTO IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiaoli Wang

College of Marxism, Baoji University of Arts and Sciences, Baoji 721013, China

Background: Educational psychology is a type of psychology proposed according to the current situation of education. The purpose of educational psychology is to use students' psychology to solve the problems of traditional teaching schemes in innovative design. Educational psychology believes that in Teachers' teaching, students' learning behavior and teachers' teaching behavior are affected by psychological activities. Under the subjective concept of teaching psychology, it is considered that the design of teaching methods needs to pay attention to the changes of students' learning behavior at all times, so as to analyze the changes of students' psychological activities. Broadly speaking, using psychological analysis, educational psychology can be divided into pedagogy and psychology, combined with the teaching practice in pedagogy theory and the characteristics of teachers' and students' learning psychological activities in psychological theory. In educational psychology, pedagogy and psychology integrate and influence each other. Teachers' teaching plans are formulated according to students' psychological activities, and students' psychological activities are affected by teachers' teaching plans. With the needs of social development, the research objects of educational psychology also began to increase. From previous studies, we can know that early educational psychology focused on students' psychology and students' behavior, and focused on the cultivation of students' professional knowledge by using students' psychology. With the change of the concept of social education, college education will focus on the cultivation of students' all-round comprehensive quality, that is, the cultivation of students' life values. So far, from the perspective of college teaching, educational psychology has gradually been used in the ideological and political cultivation of students.

In the ideological and political education in colleges and universities, teachers continue to try different teaching schemes to adapt to the changes of students' thoughts. With the increasing attention to traditional culture in China, students can receive more and more cultural shocks. On this basis, college ideological and political teachers began to focus on Chinese traditional culture, aiming to improve the value training system in Ideological and political teaching with the help of the cultural spirit and thought in traditional culture, so as to reshape and improve the students' thought. Chinese traditional culture is an important spiritual heritage in China. In China's Millennium inheritance, traditional culture, as an important spiritual food, continues to affect the development of the Chinese nation. Therefore, taking traditional culture as a key part of daily teaching can help protect and inherit traditional culture to a certain extent. In the ideological and political education in colleges and universities, the cases of teachers integrating traditional culture into them also began to increase, but a large number of teaching practice can not only analyze the specific role of traditional culture in ideological and political education, but also know its specific impact on students' thought. Therefore, from the perspective of educational psychology, the research takes students' thoughts as the main object and integrates traditional culture into ideological and political teaching, in order to

improve students' learning mood and achieve the purpose of cultural inheritance.

Objective: To explore the psychological changes of students in ideological and political education in colleges and universities is to analyze the impact of the innovative scheme of ideological and political education on students' psychology, analyze the application mode of traditional culture in the construction of the innovative scheme of ideological and political education, and explore its impact on students' psychology.

Study design: Taking a university as an example, two ideological and political majors in colleges and universities were randomly selected for a control experiment. The analytic hierarchy process is used to select the traditional cultural content that has a significant impact on students' thought, and it is applied to different parts of the ideological and political education program according to the weight of each cultural content index. The class with innovative teaching scheme will be positioned as the experimental class, and the class under traditional teaching will be positioned as the control class. The number of students with positive psychology will be evaluated before and after teaching, and the comparison between classes will be made. The teaching time is 12 months. SPSS22.0 statistical analysis of student evaluation data, with $P < 0.05$ as statistically significant.

Results: The changes and comparison of the number of students with positive psychology in the experimental class and the control class before and after teaching are shown in Table 1. Table 1 shows that after teaching, the number of students with positive psychology in both classes increased, but it can also be seen that the growth rate of the number of students in the experimental class before and after teaching was significantly higher than that in the control class.

Table 1. Changes in the number of students with positive psychology in two classes

	Group	Before teaching	After teaching	<i>P</i>
Positive psychology	Experimental class ($n=102$)	27	91	<0.05
	Control class ($n=100$)	25	59	<0.05
	<i>P</i>	>0.05	<0.05	-

Conclusions: Ideological and political education in colleges and universities is the main course to cultivate students' correct values. The focus of ideological and political teaching is to awaken students' positive psychology to promote students' learning. Traditional culture is introduced to improve the ideological and political education program in colleges and universities, and the feasibility of the program is evaluated by comparing the number of students with positive psychology in the classes before and after teaching. The results show that after teaching, the number of positive psychology students in the ideological and political teaching experimental class introducing traditional culture increases rapidly, which is significantly higher than that in the control class. Therefore, in the ideological and political teaching in colleges and universities, we can appropriately consider taking Chinese traditional culture as the teaching content to help students expand their ideas, protect the cultural inheritance and improve students' positive psychology of learning.

THE DEVELOPMENT DIRECTION AND ENERGY SUPPLY MODE OF PURE ELECTRIC VEHICLE UNDER THE BACKGROUND OF COGNITIVE IMPAIRMENT

Daxue Liu

College of Intelligent Transportation, Zhejiang Institute of Communications, Hangzhou 311112, China

Background: With the development of economy and the rapid consumption of resources, the problem of environmental protection is becoming more and more serious. In this context, green, clean and environmentally friendly pure electric vehicles began to rise and develop rapidly. However, limited to the technical level, the energy supply and development of pure electric vehicles in China are not ideal. Due to the inability to accurately predict the market, some pure electric vehicle enterprises have suffered losses all year round, resulting in the management of some pure electric vehicle enterprises falling into anxiety and depression for a long time, which leads to cognitive impairment. Cognition refers to the process that

the brain processes the acquired information and skills intelligently. In the process of cognition, it will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain's intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients and is not conducive to the harmonious development of society. Therefore, finding appropriate methods to treat cognitive impairment is of great significance to patients themselves and social development.

Cognitive psychology is a branch of psychology that began to rise in 1950. It mainly studies human advanced psychological processes, such as attention, perception and so on. The orientation of cognitive psychology focuses on the mode of thinking and reasoning by using cognition. Cognitive psychology is an important school of contemporary psychological research. It explains how people deal with information in cognitive activities. The basic principles of cognitive psychology mainly include five points: emphasizing the structural and organizational principles in the process of cognition; Emphasize the internal process, that is, the processing of symbol information; Emphasize the driving role of ideas; Emphasize the role of cognitive feedback; Emphasize the individual differences of cognitive style. Based on cognitive psychology, this study studies the cognitive and psychological process of the management of pure electric vehicle enterprises, in order to analyze the development direction and energy supply mode of pure electric vehicles, and the factors leading to the cognitive impairment of the management of pure electric vehicle enterprises. The Apriori algorithm is used to build a data mining model to mine valuable information from a large amount of data, so as to improve the utilization efficiency of information, accurately predict the market, improve the sales volume of pure electric vehicles, and then alleviate the cognitive barrier of management.

Objective: Limited to the technical level, the energy supply and development of pure electric vehicles in China are not ideal. Some pure electric vehicle enterprises have suffered losses all year round, resulting in the management of some pure electric vehicle enterprises falling into anxiety and depression for a long time, which leads to cognitive impairment. Based on cognitive psychology, this study studies the cognition and psychological process of the management of pure electric vehicle enterprises, in order to analyze the development direction and energy supply mode of pure electric vehicles, the factors leading to the cognitive impairment of the management of pure electric vehicle enterprises, and then carry out targeted intervention treatment to alleviate the cognitive impairment of the management.

Research objects and methods: 60 management personnel from 18 pure electric vehicle enterprises are selected as the research object, and the Apriori algorithm is used to mine the database of the above enterprises. Self-rating Anxiety Scale (SAS) was used to evaluate the anxiety level of the subjects, and Mini-Mental State Examination (MMSE) and mental health part of 36-Item Short Form Survey (SF-36) were used to evaluate the degree of cognitive impairment.

Research design: Using random number table method, 60 subjects were randomly divided into study group and control group, with 30 people in each group. The research group adopts the data mining model based on Apriori algorithm for data mining, and then carries out market analysis; The control group used the traditional market analysis method. After a period of time, the cognitive impairment and anxiety levels of the two groups were compared.

Methods: The software SPSS17.0 and excel were used to count and analyze the relevant data.

Results: The degree of cognitive impairment decreased significantly after 4 months in the study group ($P < 0.05$). There was no significant change in the control group ($P > 0.05$), and it was significantly lower than that in the study group ($P < 0.05$), as shown in Table 1.

Table 1. Changes in the degree of cognitive impairment between the two groups

Timing	MMSE Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before work	11.4±5.5	11.3±5.2	0.254	0.671
After work	26.4±2.4	12.2±4.0	6.673	0.035
<i>t</i>	7.643	0.361	-	-
<i>P</i>	0.001	0.412	-	-

Conclusions: The pure electric vehicle with clean and environmental protection power resources as fuel instead of traditional fossil fuel can effectively solve the pollution problem of automobile exhaust, so it has attracted the attention of people from all walks of life. Limited to the technical level, the energy supply and development of pure electric vehicles in China are not ideal. Some pure electric vehicle enterprises have suffered losses all year round, resulting in the management of some pure electric vehicle enterprises falling into anxiety and depression for a long time, which leads to cognitive impairment. Based on cognitive psychology, the research uses Apriori algorithm to mine the data of pure electric vehicle enterprises, and

then analyzes the development direction and energy supply mode of pure electric vehicles, the factors that lead to the cognitive impairment of the management of pure electric vehicle enterprises, and then carries out targeted intervention to alleviate the cognitive impairment of the management.

OBSTACLES AND COUNTERMEASURES IN ORAL ENGLISH COMMUNICATION UNDER THE BACKGROUND OF HAINAN FREE TRADE ZONE

Xiao Li

Department of International Education, Hainan College of Economics and Business, Haikou 571127, China

Background: Free trade zones, or free trade zones, refer to the free flow of goods between member states that have signed free trade agreements without tax and quantitative restrictions, which can greatly promote economic development. In 2018, China's Hainan Province began to build a pilot Free Trade Zone in an all-round way. In this context, Hainan has frequented economic and cultural exchanges with foreign countries, and oral English communication is also very common. Therefore, the demand for talents who master English skills in the UK has also increased greatly, and more and more attention has been paid to the English level of students. However, due to the problems of low teaching quality, limited English level, low psychological quality and limited thinking logic, students often have communication obstacles in oral English communication. Oral English communication disorder will lead to the impairment of students' self-confidence, resulting in negative emotions such as anxiety, resulting in students' learning weariness and affecting students' personal development and growth. Moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Therefore, it is necessary to put forward strategies based on educational psychology to solve the problem of students' oral English communication obstacles, so as to alleviate students' anxiety.

Educational psychology is a branch of psychology. Its main research direction is the learning effect of students, the effect of teaching intervention, the teaching psychology of teachers and the social psychology of school organization under the educational situation. Educational psychology is to apply psychological theory to education, so as to improve teaching methods, improve students' learning enthusiasm, and help students solve various problems in the process of learning and growth. Educational psychology has important applications in teaching design, teaching mode improvement, promoting students' learning motivation and helping students overcome psychological problems. Through educational psychology, teachers can have a deeper understanding of students, improve the pertinence of teaching, adjust teaching methods and teaching methods, and improve teaching quality. Based on educational psychology, this study analyzes the psychological changes of students in English learning and oral English communication, and then improves oral English teaching methods, helps students overcome psychological obstacles, overcome oral English communication obstacles, and improves students' self-confidence, so as to alleviate students' anxiety.

Objective: Due to the problems of low teaching quality, limited English level, low psychological quality and limited thinking logic, students often have communication obstacles in oral English communication, resulting in anxiety. The research puts forward strategies based on educational psychology to improve the oral English teaching model, hoping to improve students' English level and self-confidence and alleviate students' anxiety.

Research objects and methods: Two classes were randomly selected from a university as the research objects. The oral English test results of the two classes were used to evaluate the oral English teaching effect of the two classes, and the Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the anxiety degree of students.

Research design: One of the two classes is class A, with 73 people. The other class is class B, with 71 people. Class a adopts the improved oral English teaching mode based on educational psychology. Class B adopts the traditional oral English teaching mode. Three months later, the teaching effect and anxiety level of the two classes were compared.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: After teaching, the anxiety level of students in the research group was significantly lower than that of students in the control group ($P < 0.05$), as shown in Table 1.

Table 1. SAS scores of two groups of students

Timing	SAS scores		<i>t</i>	<i>P</i>
	Research group	Control group		
Before teaching	76.2±12.3	76.5±12.1	0.304	0.653
After teaching	52.6±8.7	65.2±11.9	6.420	0.013
<i>t</i>	6.371	4.421	-	-
<i>P</i>	0.000	0.019	-	-

Conclusions: In 2018, China's Hainan Province began to build a pilot Free Trade Zone in an all-round way. In this context, Hainan has frequented economic and cultural exchanges with foreign countries, and oral English communication is also very common. Therefore, the demand for talents who master English skills in the UK has also increased greatly, and more and more attention has been paid to the English level of students. However, due to the problems of low teaching quality, limited English level, low psychological quality and limited thinking logic, students often have communication obstacles in oral English communication, leading to mental anxiety. The research puts forward strategies based on educational psychology to improve the oral English teaching model. The results showed that after teaching, the anxiety level of students in the study group was significantly lower than that of students in the control group ($P < 0.05$).

CURRICULUM DESIGN AND PRACTICE OF UAV MISSION PLANNING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Fuli Qi

School of Information Engineering, Shanghai Zhongqiao Vocational and Technical University, Shanghai 201514, China

Background: The teaching effect of UAV mission planning course is related to the professional quality and ability of UAV professionals in China, so the design and practice of the course are very important. At present, there are some defects in the UAV mission planning course, which leads to students' inability to fully understand and master some complex theories. For a long time, students' psychological pressure, such as learning pressure and employment pressure, has increased, and their negative emotions have accumulated, which has evolved into anxiety psychology. Anxiety is an emotional and behavioral disorder that excessively worries about bad expected results, including generalized anxiety, social anxiety, panic disorder, learning anxiety and so on. Short-term and moderate anxiety can help students establish learning goals and direction, and contribute to students' learning. However, long-term and excessive anxiety will lead to the impairment of students' physical and mental health, affect students' normal life and study, increase the burden on students' families, and have a negative effect on students' personal development and the construction of a harmonious society. Therefore, the UAV mission planning course should be designed and improved to improve the teaching quality and avoid students' anxiety due to worrying about their studies.

Educational psychology is a psychological theory put forward under the background of teaching reform. It has important theoretical and practical significance in promoting the reform of the education system. In addition, educational psychology is also of great significance to the improvement of educators' psychological quality and teaching methods. Educational psychology contains many related theories, including psychological content, the law of psychological changes of students in the learning process, teachers' analysis and cultivation of students' learning motivation, teachers' transfer and promotion of students' learning, teachers' analysis of the development of students' cognitive ability, teachers' cultivation of students' cognitive understanding, students' memory development, students' knowledge consolidation methods. The formation of students' cognitive strategies, the cultivation of students' problem-solving ability and innovation ability, the cultivation of students' correct self-consciousness, students' group psychology and students' mental health education. Using educational psychology to analyze students' psychology and learning motivation, and then optimize the original UAV task planning course can effectively improve the teaching quality of the course, improve students' learning efficiency, and avoid students' anxiety due to excessive pressure. It is of great significance to students' personal development and the development of UAV industry.

Objective: At present, there are some defects in UAV mission planning course, which leads to students'

inability to fully understand and master some complex theories, and then suffer from an anxiety disorder. Based on educational psychology, the research improves the teaching mode of UAV mission planning course, so as to improve the teaching quality of the course, improve students' learning efficiency and avoid students' anxiety caused by excessive pressure.

Research objects and methods: Two classes were randomly selected from the major of UAV system engineering in a university as the research object. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate the degree of anxiety of students.

Research design: One class (58 people) is used as the research group to teach the improved UAV task planning course based on educational psychology, and the other class (56 people) is used as the control group to teach the traditional UAV task planning course. After a period of time, the test scores and psychological anxiety of the two classes were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the SAS score, SDS score and had score of the students in the study group were significantly lower than those in the control group ($P < 0.05$). The SAS scores of the two groups are shown in Table 1.

Table 1. SAS scores of two groups of students

Timing	SAS score		<i>t</i>	<i>P</i>
	Research group	Control group		
Number of students	58	56	-	-
Before teaching	65.3±12.3	66.1±12.9	0.403	0.762
After teaching	44.6±6.2	65.3±10.1	4.354	0.042
<i>t</i>	8.019	0.431	-	-
<i>P</i>	0.000	0.437	-	-

Conclusions: The teaching effect of UAV mission planning course is related to the professional quality and ability of UAV professionals in China, so the design and practice of the course are very important. At present, there are some defects in UAV mission planning course, which leads to students' inability to fully understand and master some complex theories. For a long time, students' psychological pressure, such as learning pressure and employment pressure, has increased, and their negative emotions have accumulated, which has evolved into anxiety psychology. Based on educational psychology, the teaching mode of UAV mission planning course is improved. The results showed that after a period of teaching, the SAS score, SDS score and had score of the students in the research group were significantly lower than those in the control group ($P < 0.05$). Therefore, using educational psychology to optimize the UAV task planning course can effectively improve the teaching quality of the course, improve students' learning efficiency, and avoid students' anxiety due to excessive pressure. It is of great significance to students' personal development and the development of UAV industry.

ON THE SIGNIFICANCE OF THE RESEARCH ON THE “YUFU ZHI” IN CHINESE DYNASTIES FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Fayuan Mai¹ & Wen Hua²

¹Department of Tourism and Art, Guangling College, Yangzhou University, Yangzhou 225000, China

²College of Textile and Clothing, Yangzhou Polytechnic College, Yangzhou 225000, China

Background: As a branch of psychology, social psychology combines psychological theory with sociological theory, studies the social psychological performance of individuals and groups under the background of social environment, analyzes the psychological characteristics of individuals and social groups, and discusses the emotional thought and behavior performance of individuals under the restriction of others or groups under the social environment. From the individual level, social psychology analyzes the psychological characteristics of social individuals such as self-consciousness, social perception and psychological behavior motivation, and makes an in-depth study on the interaction between social individuals, including the psychological laws of multiple interactive behaviors such as individual

interpersonal communication and communication psychology. From the perspective of social groups, social psychology analyzes the psychological basis behind the customs and culture of social groups, and explores the differences of psychological characteristics between different social classes and nationalities. YuFu Zhi is the research literature of clothing system in important dynasties in Chinese history. Under the guidance of social psychology theory, this paper studies and analyzes YuFu Zhi, combines social psychology theory with clothing field, and realizes the extension and expansion of social psychology in clothing field. Social psychology in the field of clothing is to analyze the dressing psychology of individuals and groups in the social situation, excavate the dressing behavior characteristics of individuals and social groups, and explain the essence of dressing psychological behavior of individuals and groups through the extension of various theories.

Clothing culture is an indispensable part of Chinese traditional culture. The characteristics of clothing culture in different times show the social development and technical level at that time, and the social style and cultural characteristics in different historical periods. China is a country of rites, and the clothing culture runs through ancient and modern times. Many historical books have specially set up chapters of YuFu Zhi to record and analyze the clothing system in ancient China. The study of YuFu chronicles of previous dynasties can find the changing characteristics of Chinese clothing culture from historical data and excavate the characteristics of Chinese clothing culture in different historical periods, which is conducive to the in-depth study of Chinese traditional culture with clothing culture as the starting point. The research on the annals of public service in the past dynasties of China is an in-depth excavation of the Chinese etiquette culture and national spirit. From the perspective of the dress culture in the past dynasties of China, this paper analyzes the characteristics and connotation of the national spirit under the historical dynasties of China.

Objective: Based on the theory of social psychology, this study organically integrates social psychology and the field of clothing, analyzes the characteristics and connotation of the chronicles of public service in Chinese dynasties, and discusses the research significance and value of the chronicles of public service in Chinese dynasties, hoping to find a new entry point for the study of Chinese history and culture, explore new research ideas of national spirit and cultural connotation in different historical periods.

Research design: Using the method of literature, the study studied the relevant research literature of YuFu annals and YuFu annals of Chinese dynasties, understood the characteristics of YuFu annals of Chinese dynasties, and obtained the connotation and characteristics of YuFu annals of Chinese dynasties. By using the method of questionnaire and expert interview, we can understand the understanding of ancient historical data researchers and readers of relevant works on the research value of public service chronicles of Chinese dynasties. Taking the researchers of ancient Chinese historical materials and the readers of relevant documents and works as the research object, this paper discusses the research value of YuFu chronicles of Chinese dynasties from the perspectives of researchers and readers, and analyzes the significance and connotation of the research of YuFu chronicles of Chinese dynasties. Combined with the methods of questionnaire and focus interview, this study discusses the research value and significance of YuFu annals of Chinese dynasties from five perspectives: the change of traditional clothing system, the compilation of historical materials, the connotation development of Chinese traditional culture, the characteristics of etiquette culture and agricultural production.

Results: The survey results of the research value of the chronicles of public service in Chinese dynasties are shown in Table 1. Researchers of ancient historical materials and related works believe that the research value of the chronicles of public service in Chinese dynasties is high.

Table 1. Investigation results of the research value of YuFu Zhi in previous dynasties in China

Survey object	Researcher of ancient Chinese historical materials	Readers of relevant literature and works
Changes in traditional clothing system	3	4
Compilation and revision of historical materials	4	3
The connotation and development of Chinese traditional culture	4	4
Characteristics of etiquette culture	3	4
Agricultural production	4	3

Conclusions: It is of great historical value and practical significance to study YuFu chronicles of Chinese dynasties. A comprehensive study of YuFu chronicles of Chinese dynasties can help historians understand the changes of clothing system in ancient China, clarify the changes of clothing and hierarchy in ancient China, and start from the clothing system in different historical periods of China. Learn about the ancient hierarchy. And as a part of the historical records, the historical records of YuFu in the past dynasties of China also show

the editing characteristics of historical materials in different historical periods of China. The study of the historical records of YuFu in the past dynasties of China is helpful for us to understand the characteristics of the history of ancient China.

PRACTICE AND EXPLORATION OF DOCTORAL STUDENTS IN COLLEGES AND UNIVERSITIES IN IDEOLOGICAL AND POLITICAL EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Cheng Su

School of Marxism, Northwestern Polytechnical University, Xi'an 710000, China

Background: Educational psychology is a marginal interdisciplinary subject of pedagogy and psychology. Based on educational psychology, pedagogical theory and psychological theory, it analyzes the characteristics and changes of psychological activities of educators and educates in educational practice, and probes into the causes and influencing factors of the phenomenon of psychological activities in educational practice. The development time of educational psychology is relatively short. Educational psychology developed into an independent discipline in the late 19th century, but the application scope of educational psychology is wide. Every educational practice contains the theoretical background of educational psychology. Educational psychology has become an important means for teachers to improve the quality of teaching. Educational psychology extends the theory of psychology to the field of education and discusses students' psychological activities in many aspects such as character cultivation, will building and knowledge learning in educational practice, which can effectively help teachers grasp the characteristics of students' psychological changes, accurately guide students' learning attention and improve learning efficiency and effect.

Social education is accompanied by people's life. Education guides and trains individuals in knowledge and morality through planned and purposeful social education practice. Ideological and political education guides and cultivates students' ideological concepts and value orientation, guides students' psychological trend through ideological and political education, promotes students to establish a good outlook on life, values and world outlook, and helps students realize healthy learning and growth. Students' values are not mature and are in the establishment stage of life values. Therefore, it is necessary to guide the development of students' mental health, help students standardize their moral behavior, cultivate students' personality quality, and achieve the real education of building morality and cultivating people. Doctoral students are the highest training level of China's higher education talent training system, but there are many problems in doctoral students' ideological and political education. The government and colleges pay less attention to doctoral students' ideological and political education, and the effect of ideological and political education is not significant.

Objective: Under the guidance of educational psychology theory, this study analyzes the current situation of ideological and political education of doctoral students in colleges and universities, understands the problems existing in the ideological and political education system of doctoral students, discusses the reform direction and path of ideological and political education of doctoral students in colleges and universities, and provides help to improve the ideological consciousness level of doctoral students in colleges and universities. The research deeply excavates the concept and content of ideological and political education, analyzes the guiding role of ideological and political education on doctoral students in colleges and universities, discusses the practical value of doctoral students' Ideological and political education, and puts forward suggestions for promoting the all-round development of doctoral students.

Research design: Combined with the review and investigation on the quality of graduate education carried out by a university in 2021, this study analyzes the situation of ideological and political education in doctoral education in colleges and universities, and obtains the evaluation data of doctoral groups and review and evaluation experts on the level of doctoral ideological and political education from the review report. Based on the review data and combined with the theory of educational psychology, the research analyzes the psychological characteristics of doctoral students in educational and teaching activities, deeply analyzes the teaching problems existing in the ideological and political education of doctoral

students in colleges and universities, and analyzes the optimization and improvement direction of the ideological and political education of doctoral students in colleges and universities in the future. Based on the analysis of the psychological law of doctoral education, the research puts forward the new concept and innovative development model of doctoral ideological and political education, hoping to provide new development ideas for the reform of doctoral ideological and political education system in colleges and universities, and promote the improvement of doctoral ideological and political consciousness in colleges and universities. Then, the pilot experiment is used to verify the feasibility and effectiveness of the reform of doctoral students' ideological and political education system, and to verify the role of the new doctoral students' ideological and political education model in promoting doctoral students' ideological and political consciousness and mental health level. The research takes a university as the pilot unit for the experiment. During the experiment, the ideological and political education of doctoral students in the university adopts the new teaching mode. The experiment lasts for three months. Doctoral students carry out ideological and political education once a week, and each class hour is 1.5 h.

Results: After the pilot experiment, the changes of ideological and political awareness score and mental health quality score of doctoral students in colleges and universities are shown in Table 1. After the implementation of the teaching reform of ideological and political education for doctoral students under the guidance of educational psychology, the degree of ideological and political awareness of doctoral students in colleges and universities has been significantly improved, which is of great significance to enhance the firmness of doctoral students' ideological ideas. Under the new ideological and political education model, the level of mental health quality of doctoral students has been significantly improved, and the score of mental health quality has increased significantly.

Table 1. After the pilot experiment, the changes of ideological and political consciousness score and mental health quality score of doctoral students in colleges and universities

Survey object	Before the pilot experiment	After the pilot experiment
Ideological and political consciousness score	2.16±0.36	3.74±0.38
Mental health quality score	1.98±0.34	3.71±0.26

Conclusions: Based on the analysis of the psychological characteristics of doctoral students' ideological and political education, the research carries out innovative reform on the ideological and political education system of doctoral students in colleges and universities. It is required to clarify the basic principles of the framework of doctoral students' ideological and political education, and construct the framework of doctoral students' ideological and political education based on the principles of subjectivity and society. The innovation of the ideological and political education system of doctoral students in colleges and universities should start from the educational concept, under the guidance of the basic principles, combined with educational practice, analyze the shortcomings of ideological and political education in colleges and universities, and innovate the educational concept of doctoral students in colleges and universities. Colleges and universities should also pay attention to the path innovation of doctoral students' ideological and political education, expand the channels and methods of ideological and political education, connect ideological and political education with daily scientific research work, and improve doctoral students' ideological and political consciousness. The experimental results show that the new model of doctoral students' ideological and political education can effectively promote the improvement of doctoral students' ideological and political consciousness and thinking firmness, and is of great value to improve the quality of doctoral students' mental health.

PROTECTION AND APPLICATION OF DIGITAL TECHNOLOGY TO INTANGIBLE CULTURAL HERITAGE FROM THE PERSPECTIVE OF HUMANISTIC PSYCHOLOGY

Wei Wang¹, Yazhi Deng¹, Zhen Zhang² & Huizhong Xia³

¹College of Engineering and Design, Hunan Normal University, Changsha 410000, China

²Department of Hunan Resources, Hunan Normal University, Changsha 410000, China

³Art Design Institute Porcelain College, Hunan Vocational College of Science & Technology, Changsha 410000, China

Background: Humanistic psychology is to explore people's unique nature and characteristics, oppose the

natural science orientation of scientific psychology, and adopt the research mode of humanistic orientation to analyze and study people's fundamental characteristics and the relationship between people and the outside world. At the same time, humanistic psychology pays more attention to people's subjectivity and diversity than the only objectivity. Compared with the pursuit of objective connection in scientific psychology, it has certain advantages and merits. Scientific psychology has an objective perspective of "absoluteness" to the surrounding things and people at this stage, while the transfer in humanistic psychology, such as psychoanalysis, focuses on the relationship between analysts and analysts. This theory is an idea or an investigation method or a treatment method based on the existence of unconsciousness. In the final analysis, humanistic psychology focuses on placing people in the objective environment to explore the relationship between people and things, and emphasizes that people's subjective initiative and "conscious emotion" are closely related to our life, and applies its theory to real life to help us pay more attention to the value of "people" when looking at and understanding the world, such as analyzing the social group psychology and humanistic care expressed in the film, linking the details with people's attributes and values can effectively improve people's cognitive and practical ability. At the same time, humanistic psychology has jumped out of the "unique worship" of science and technology, so taking it as a means and weapon for our understanding and practice can help us better understand the humanistic feelings in the long history. The development and renewal of digital technology provides a more diverse and secure means for the protection of China's intangible cultural heritage, and reduces the damage to historical traces. However, at present, in the intangible cultural heritage under the protection of digital technology, the research staff of the Institute of cultural heritage protection ignore the cultural attributes and sustainability of its own heritage when carrying out the protection of intangible cultural heritage. They only apply digital technology to the protection work, but pay little attention to its inheritance and the exploration of cultural and humanistic values. Therefore, the research on the protection and application of intangible cultural heritage in digital technology from the perspective of humanistic psychology will help staff pay attention to the affirmation and emphasis on human value in cultural inheritance, timely change the working concept of "focusing on science and technology", reduce their negative emotions and resistance caused by thinking limitations in the process of cultural heritage protection, and further better promote the protection and application of intangible cultural heritage.

Objective: Based on the theory of humanistic psychology, the research analyzes the protection and application of intangible cultural heritage, speeds up the protection and inheritance of intangible cultural heritage by discussing the current situation of the protection and inheritance of intangible cultural heritage, as well as the humanistic feelings and psychological value behind it, and analyzes the emotional problems and psychological limitations of protection staff under the current operation of digital technology, Provide protection path in line with humanistic psychology.

Research design: Research on collecting information from intangible cultural heritage related protection websites, obtain the current progress and situation of intangible cultural heritage protection in China, excavate the current problems of intangible cultural heritage, and collect the problems and psychological emotions of staff in using digital technology to protect intangible cultural heritage for data collection. The research uses analytic hierarchy process to analyze the weighting of indicators and influencing factors under the digital construction system of intangible cultural heritage protection, and explores the application path of humanistic psychology to intangible cultural heritage protection under digital technology by ranking the weights of indicators. It also studies the theoretical knowledge of humanistic psychology for the staff, helps them grasp the Humanistic Psychological characteristics in the protection of intangible cultural heritage, and realizes the protection and inheritance of intangible cultural heritage from the perspectives of publicity, platform construction and data sorting.

Results: The perspective of humanistic psychology can effectively guide staff to grasp people's psychological laws and emotional changes in cultural inheritance in the process of intangible cultural heritage, and then enrich the protection and application means of digital technology for intangible cultural heritage, making the optimized protection path more humanistic value. Table 1 shows the statistics of negative emotions of staff under different application protection paths.

Table 1. Statistics of negative emotions of staff under different application protection paths

Work psychological emotion	Anxious	Depressed	Conflict
Before	25.34±1.26	18.17±1.65	22.11±1.06
After	12.32±1.16	10.71±1.03	11.58±1.36

Conclusions: Humanistic psychology can emphasize people's value and potential, pay attention to individual differences and diversity, provide protection ideas for the protection of digital intangible cultural heritage from this perspective, enrich its working means, effectively help the staff of heritage protection

institute to carry out targeted protection and application according to people's value and attributes in Heritage Inheritance, improve their mental health and improve their negative emotions at work.

RESEARCH ON THE INFLUENCE OF UNIVERSITY BEHAVIOR MODE ON THE CONSTRUCTION OF VALUES CULTIVATION SYSTEM FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Dongdong Zhang, Jiajing Zou & Qingwen Zhou

School of Economics and Management, Jiangsu University of Science and Technology, Zhenjiang 212100, China

Background: As a marginal interdisciplinary subject of pedagogy and psychology, educational psychology, based on the theories of pedagogy and psychology, expands and applies psychological knowledge in the field of education, analyzes the change law of psychological activities of educators and students in the process of educational practice, and discusses the psychological performance characteristics of educational subjects in the process of education. The fundamental purpose of educational psychology research is to apply the theoretical knowledge of psychology to educational practice, guide educational practice activities, help teachers improve curriculum and teaching methods, and promote the improvement of teachers' teaching quality. Based on the theory of educational psychology, theoretical guidance for the reform and construction of university higher education system can effectively improve the scientization and rationalization of higher education system, and promote the reform of higher education system with the support of advanced psychological theory.

Under the open social situation, the behavior patterns and values of contemporary college students also show the characteristics of open-minded and responsive. Contemporary college students have a strong sense and spirit of innovation and entrepreneurship, and adhere to the principle of sublation and reconstruction of subject consciousness. Values refer to people's internalization of social value consciousness in the process of socialization, which has become the fundamental point of view of personal value relationship. The establishment of individual values through the cognition and evaluation of objective things, through individual subjective judgment and choice, internalize the social value consciousness, so as to establish the concept of individual value relationship. Individual values are affected by their knowledge and cultural level, social background, individual psychological model and other factors, showing different individual characteristics. As a special young social group, college students have strong perception of social change, and their values also have a unique representation of college students.

Objective: Based on the theory of educational psychology, by understanding the change law of educational psychological characteristics behind the cultivation of college students' behavior patterns and values, this paper analyzes the cultivation system of college students' behavior patterns and values, discusses new ways to scientifically cultivate college students' behavior patterns and values under the new social situation, conforms to the development trend of the times, and provides help to promote the all-round development of college students' comprehensive quality. The research analyzes the characteristics of college students' behavior patterns and values, discusses the cultivation system of college students' behavior patterns and values, and helps college students establish scientific values.

Study design: Based on the characteristics of contemporary college students' behavior patterns and the development status of values training system, this study analyzes the internal mechanism between college students' behavior patterns and their values training, and explores the development ideas of college students' behavior patterns and values training through the analysis of the development of contemporary college students' values. The research uses the way of correlation analysis to analyze the impact of college students' behavior patterns on the construction of their values cultivation system, explore the internal relationship between college students' behavior patterns and the construction of values cultivation system, and analyze the influence of college students' behavior patterns in the construction of their values cultivation system. Combined with grey correlation analysis, this study explores the impact of college students' behavior mode on the construction of college students' values training system, analyzes the educational psychological changes of college students in college values training, and judges the impact of college students' educational psychology on the construction of college students' behavior mode and values

training system.

Result: The statistical analysis results of the development of values of contemporary college students and the impact of college students' educational psychology on values are shown in Table 1. Contemporary college students show the characteristics of the lack of scientific values. The values of contemporary college students have the problems of lost ideals, individualism and valuing money over morality. At the same time, it can be seen that college students' active learning psychology and curriculum love psychology have a significant impact on students' values.

Table 1. Results of statistical analysis on the development of values of contemporary college students

Survey object	Freshman	Sophomore	Junior	Senior	Learning positive psychology	Course love psychology
Lost ideals	1	2	2	2	2	2
Individualism	1	1	1	2	2	2
Valuing wealth over morality	2	2	1	1	2	2

Conclusions: Contemporary college students are affected by the objective economic environment and disturbed by the negative money worship and hedonism derived from the market economy. Their behavior patterns show negative characteristics such as extreme individualism, which leads to the negative fission of some college students' values. And some college students are affected by the commodity economy, linking personality, knowledge and emotion with commodities, showing the characteristics of extreme personal behavior mode and value orientation, which seriously hinders college students from establishing scientific values and is not conducive to the all-round development of college students. On the other hand, China's ideological and political education is relatively backward, does not keep up with the pace of development of the times, the teaching form is single, the teaching content is rigid, the traditional ideological and political education lacks the analysis of students' psychological characteristics in educational activities, and does not understand the psychological law of students' values training, which makes some college students lack scientific values, ignore the importance of morality and quality, but overemphasize talent and money, some young college students show bad behavior patterns and ideological and moral tendencies. Therefore, we should focus on the changes of students' educational psychology in college learning, analyze the impact of students' educational psychology on their values, and help students establish a good concept of development.

INFLUENCE OF HYBRID TEACHING BASED ON "CLOUD CLASS" ON STUDENTS' THINKING DISORDER IN FIRST AID TECHNOLOGY TEACHING

Qiuxia Xie

School of Nursing, Yunnan Medical Health College, Kunming 650106, China

Background: With the continuous improvement of people's requirements for physical health, the advantages and disadvantages of medical technology have become the focus of attention. Therefore, the teaching of first aid technology in colleges and universities has gradually improved the requirements. First aid technology is an important course in medical teaching. Teachers generally have strict requirements for students in first aid teaching, but it is undeniable that the individual differences targeted by first aid will lead to cognitive differences in the learning process of students, resulting in negative learning attitude. Under the influence of multiple factors, students will have confusion in thinking logic in the study of emergency technology. Thinking disorder can be summarized in psychology and psychiatry at the same time. In psychiatry, thinking disorder is not only a kind of cognitive disorder, but also a mental disorder after brain damage. Psychiatry believes that the treatment of thinking disorders requires more thorough surgical

treatment or long-term drug relief. In psychology, it is believed that the generation of individual thinking disorder is largely affected by the outside world. In the teaching process, the generation of middle school students' thinking disorder is considered to be affected by families, classmates and teachers. Therefore, in general psychology, the treatment of students' thinking disorder depends on Teachers' teaching mode. Among the conventional psychological treatment methods of thinking disorder, the application of education and teaching methods has begun to be popularized in the region. Therefore, in the face of the problem of students' thinking disorder in the first aid teaching classroom, the adoption of an innovative teaching scheme will improve students' thinking disorder to a great extent.

In order to solve the problem of ideological obstacles in emergency technology teaching and ensure the normal development of emergency technology teaching, some studies have proposed a hybrid teaching mode based on "cloud class", which refers to online and offline interactive teaching using mobile Internet technology. From the current teaching situation of the "cloud class", the "cloud class" has the advantage of representational teaching content, can tell the relevant teaching content in detail remotely, and accurately transmit it in the form of pictures and videos, while retaining the real-time interaction ability of offline classes. The "cloud class" hybrid teaching of first aid technology can instill the first aid skills expressed in language and text with pictures and videos to a certain extent, and students can more clearly understand the learning points of first aid technology in the learning process. Therefore, it can be learned that when facing the students in the first aid technology teaching course with thinking disorder, the "cloud class" hybrid teaching mode can use visual information to guide the students' thinking change, which also has a certain impact on the treatment of students' thinking disorder. In order to accurately understand the impact of the mixed teaching mode of "cloud class" on students' thinking disorders, it is necessary to study and design relevant experiments for more in-depth research, so as to provide a guarantee for the smooth development of emergency technology teaching.

Objective: To explore the current situation of students' thinking obstacles in the teaching of emergency technology, and analyze the mitigation of students' thinking obstacles under the influence of the mixed teaching mode of "cloud class" and the mastery of students' emergency technology knowledge, in order to provide a reference for the cultivation of emergency talents in China's medical industry.

Study design: 200 nursing students in a medical college were randomly divided into experimental group and control group. Both groups were taught by the same teacher. The students in the experimental group adopted the mixed teaching of "cloud class" and the students in the control group adopted the traditional classroom teaching mode. The improvement of thinking form obstacles and thinking content obstacles of the two groups were compared and analyzed. The evaluation standard of thinking form disorder is evaluated according to the expression of students' thinking form. The fewer forms, the lower the degree of students' thinking form disorder. Thinking content disorder is evaluated according to the degree of students' delusion. The lower the degree of delusion, the lower the degree of thinking content disorder. SPSS24.0 was used to compare the degree of students' thinking disorder 0, with $P < 0.05$ as the difference, the difference was statistically significant.

Results: The comparison between the two groups of students' thinking obstacles after teaching is shown in Table 1. The total score of thinking form obstacle evaluation is 13 points, 0 means no thinking form obstacle, and 13 means extremely serious thinking form obstacle. The total score of thinking content disorder is 5, 0 indicates no delusion, and 5 indicates extreme delusion. Table 1 shows that the degree of thinking form disorder and thinking content disorder of the students in the control group are significantly higher than those in the experimental group after teaching. The improvement effect of thinking disorder in the experimental group is significantly higher than that in the control group, and the difference is statistically significant.

Table 1. Changes in students' thinking disorders

Group	Thinking form obstacle	Thinking content barrier
Experience group	4.3±2.1	2.1±1.8
Control group	9.1±1.2	3.4±1.2
<i>t</i>	13.679	9.234
<i>P</i>	<0.05	<0.05

Conclusions: First aid technology teaching is one of the key contents of medical students' learning. Alleviating students' cognitive impairment in the teaching process is the key consideration in first aid teaching. In the teaching of first aid technology, students' thinking obstacles will affect students' learning efficiency. The use of "cloud class" hybrid teaching can effectively alleviate students' thinking obstacles, reduce students' thinking form obstacles and thinking content obstacles, help students alleviate thinking obstacles, and contribute to the development of first aid technology teaching. Therefore, when teaching

first aid technology to medical students, we should fully consider the student groups with thinking obstacles, and carry out concrete teaching in combination with new technologies such as “cloud class” to comprehensively improve students’ professional level and promote the growth and development of talents in China’s medical industry.

* * * * *

THE SOCIAL PSYCHOLOGICAL CHANGES OF LEADERS IN THE TOP-LEVEL DESIGN OF CHINA’S GRAND CANAL BASED ON THE TERNARY LEADERSHIP THEORY

Dexin Tian¹, Jing Li¹ & Mengyuan Huang²

¹*College of International Studies and China Grand Canal Research Institute, Yangzhou University, Yangzhou 225127, China*

²*College of International Studies, Yangzhou University, Yangzhou 225127, China*

Background: A large number of traditional cultures have been born in China’s thousands of years of development. Among them, the Grand Canal culture is one of the proudest cultures. The Grand Canal culture refers to the material or spiritual cultural values produced by taking the Grand Canal as the core for a long time. The basic understanding of the Grand Canal culture can be divided into a comprehensive culture based on the Grand Canal belt, taking the surrounding geographical space as the carrier, and gradually developing along the surrounding towns on the basis of regional transportation through protection, inheritance and utilization. The top-level designer of the Grand Canal is an engineering term, which refers to the overall consideration of all levels and elements in the Grand Canal Project, and finding the fastest way to solve problems through hierarchical management between different levels. In the top-level design of the Grand Canal, according to its core idea, a theoretical basis called ternary leadership was born. For the top-level design of the Grand Canal, the ternary leadership included are authoritarian leadership, benevolent leadership and moral leadership. Authoritarian leadership is worth linking water control and governance, and exploring the importance of the common survival of man and nature on the basis of ecological and environmental protection. Benevolent leadership refers to a series of top-level design schemes proposed by the central government based on the protection and inheritance of the Grand Canal, always follow the people-oriented principle, and adopt benevolent leadership to improve the surrounding environment of the Grand Canal and retain the Millennium civilization of the Grand Canal. At the level of moral leadership, it emphasizes the distinction between public and private, maintains an honest and responsible attitude in the implementation of tasks, provides positive guidance to other personnel through personal morality, words and deeds, and takes measures to improve the overall appearance in the management of the Grand Canal to protect the ruins of the grand canal in time.

In the final analysis, the theory of ternary leadership is the concept of power, which is the basis of experimental research and theoretical construction. Social psychology regards power as a structural variable, that is, to determine that power does exist in the state of social facts. With the development of society, social psychology gradually regards power as a psychological feature and believes that the ternary theory can conceptualize it in the embodiment of specific power roles. From the basic theory of the Grand Canal top-level design under the ternary leadership theory, it can be seen that the measures and methods mentioned in the ternary leadership are models in social communication behavior, and the specific implementation steps of the ternary leadership theory can be deeply explored through social psychology. For example, according to the basic theory of social psychology, leaders need to be familiar with the way of social communication in management, gradually infect people at different levels through authority, kindness and virtue, and finally change the social psychology of the surrounding people in a positive way, so as to achieve the purpose of the top-level design of the Grand Canal. At the same time, social psychology puts forward that there are two psychological characteristics in power. The first is the sense of control. In the ternary leadership theory, the sense of control plays a role of cognitive and self-esteem behavior control. Secondly, social psychology believes that the ternary leadership theory, as a power theory, also contains explicit and implicit psychological characteristics. In the explicit and implicit, it reflects a psychological theory of social distance. The emergence of social distance leads to the difference of ideas among leaders at different levels, which will also lead to the negative emotions of low-level leaders, showing depression and anxiety. Therefore, in the top-level design of the Grand Canal under the ternary leadership theory, understanding the changes of social psychology at each leadership level is helpful to analyze the management implementation plan at the leadership level.

Objective: This paper expounds on the basic concepts of Grand Canal top-level design and ternary

leadership theory, discusses the social and psychological changes of ternary leadership theory in China's Grand Canal top-level design, combs out the implementation path of China's top-level design, and improves the effect of top-level design by alleviating the psychological anxiety and depression of leaders.

Study design: Use the literature method to understand the development and evolution of China's Grand Canal culture, use the Excel table to count the basic situation of China's grand canals, sort out the relevant measures taken by the Chinese government in the protection and inheritance of the Grand Canal, and put forward the principle of scientific water control under the background of the new era. The Self-rating Anxiety Scale was used to analyze the changes in leaders' psychological anxiety at all levels in the application of ternary leadership theory, and to analyze the impact of ternary leadership theory on leaders' social psychology.

Result: Using the literature method, this paper statistically analyzes the application of the ternary leadership theory in the top-level design of the Grand Canal in China, and evaluates the impact of the ternary leadership theory on social psychology and psychological anxiety of the leadership level in the top-level design. The 0-4 score system is used to represent the impact effect, in which 0 represents no impact, 1 represents slight impact, 2 represents general impact, 3 represents obvious impact and 4 represents complete impact. SPSS software is used to analyze the differences between the data, and the impact of authoritarian leadership, benevolent leadership and moral leadership on social psychology is shown in Table 1.

Table 1. The influence of social psychology on the application of ternary leadership theory

Factor	Authoritarian leadership	Benevolent leadership	Moral leadership
Social psychology	4	4	4

Conclusions: China's Grand Canal culture is of great significance to the national economic development and social and cultural development. Analyzing the connotation of the ternary leadership theory in the top-level design of the grand canal can better understand the deep meaning of the Grand Canal culture, help the leadership establish perfect social psychology and reduce their psychological anxiety. The ternary leadership theory can be effectively transmitted with the help of social communication activities, and finally achieve hierarchical class management, which can effectively control the social psychology at the leadership level. Therefore, it can be learned that in the water control project of Universiade culture in the new era, it is of great significance to analyze the transmission of ternary leadership theory and realize the social and psychological changes of leaders in the top-level design, which can effectively reflect the mental health problems at the leadership level, so as to optimize the management scheme.

RESEARCH ON THE APPLICATION OF REVERSE THINKING TEACHING METHOD COMBINED WITH CAREER EDUCATION IN AEROBICS TEACHING IN HIGHER VOCATIONAL COLLEGES UNDER THE BACKGROUND OF PSYCHOLOGY

Xiaoling Xu

Physical Culture Institute, Guangdong Business and Technology University, Zhaoqing 526040, China

Background: In recent years, the physical quality of college students has gradually shown a downward trend. Therefore, the Ministry of Education has issued many programs and measures to promote the healthy development of college students. In order to improve the comprehensive physical quality and ability of college students, some colleges and universities began to enrich the content of students' sports activities. At the same time, with the continuous development of education, higher vocational colleges also began to gradually increase school sports. In higher vocational colleges, due to the short education cycle, schools pay

more attention to students' professional technology. Therefore, in view of the improvement of students' physical quality, aerobics teaching has gradually been paid attention to in school talent training. In higher vocational colleges, aerobics teaching often adopts the way of career education. By taking aerobics as a kind of professional-quality training for curriculum teaching, the purpose is to cultivate students' Aerobics professional ability and improve students' attention to aerobics. At the same time, in order to further improve the students' aerobics technical level in some higher vocational colleges, the reverse thinking teaching method is introduced into the curriculum education while carrying out the career education. The teaching planning is carried out from the perspective of students' thinking, and the teaching scheme is formulated according to the students' thinking logic, so as to achieve more remarkable teaching effect. However, from the effect reflected in the integrated education program of some schools, it can be seen that the aerobics level of students has not been significantly improved. Combined with the relevant literature and the current situation of education, it can be found that the change of students' psychological activities in the process of school is an important factor affecting teachers' teaching.

Students' psychological activities change with the changes of environment and teaching. Some psychologists put forward that when students in higher vocational colleges study special technology, their psychological changes are affected by the difficulty of professional technology. It is generally believed that simple professional knowledge has a weak impact on students' psychological activities. Some studies have also pointed out that students' psychological activities are also affected by thinking. In the teaching of higher vocational colleges, due to the strong teaching of professional knowledge, students' thinking logic is strongly guided, resulting in changes in students' psychology. Reverse thinking is a kind of thinking activity. In psychology, reverse thinking starts with students' psychological expectation results. Students will have a certain amount of psychological expectation for teaching results in teaching. In the process of students' learning, the role of reverse thinking is to help students gradually realize their learning needs according to a certain process. Psychology believes that students' psychological activities in learning are complex. Therefore, teachers need to pay attention to how to deal with students' psychological changes in teaching. Students' learning psychological activities will change with the change of teaching, and the teaching application of rational thinking from the perspective of psychology will also show quantitative changes. In aerobics teaching, students' psychology will doubt their own body performance, which will also lead to the deviation of students' expected learning results, resulting in students' negative emotions such as anxiety and depression. Therefore, in the teaching of reverse thinking, it will be helpful for teaching to obtain the changes of students' psychological activities at all times. As an institution of higher learning to cultivate students' professional ability, it is still not scientific for higher vocational colleges to optimize aerobics teaching from students' reverse thinking combined with career education. Only by formulating teaching plans combined with students' psychological changes can we realize the cultivation of students' all-round quality and improve students' comprehensive quality and ability.

Objective: Understand the specific professional level of Aerobics students in higher vocational colleges, analyze the psychological activities of students in aerobics teaching, and formulate appropriate and reasonable reverse thinking teaching method and integrate professional career education teaching plan, so as to improve students' physical quality more effectively and provide guarantee for students' future development.

Study design: This paper selects 54 aerobics majors in a higher vocational college, and obtains the basic professional level of students and students' attitude towards professional teaching from the current teaching situation. The teaching attitude includes the satisfaction with the teaching scheme and the views on teachers' teaching attitude. Formulate the aerobics reverse thinking teaching method based on students' psychological activities, integrate the teaching plan of career education, set the teaching time as 5 months, and measure the changes of students' mental health level in 5 months.

Results: Use Excel to make statistical analysis of the survey content, so as to formulate a reasonable teaching plan and evaluate the students' psychological activities in the teaching plan, quantify the scores of the evaluation results of psychological activities, and compare and analyze the differences in the changes of mental health level in the teaching process, using SPSS24.0 statistical analysis of all data shows that the changes of students' mental health level are shown in Table 1.

Table 1. Changes of students' mental health

Index	1 month	3 months	5 months	P
Positive psychology	3	17	36	<0.05
Negative psychology	24	18	6	<0.05

Conclusions: Aerobics in higher vocational colleges is a professional subject based on cultivating students' basic physical quality. Therefore, how to improve students' aerobics professional level is very

important. In the research, we first consider the changes of students' psychological activities in aerobics teaching, and then take this as the basis of teaching scheme, combined with inverse thinking teaching and career education to promote students' aerobics technical level. From the results, it can be found that from the perspective of psychology, the basic level of students' aerobics has been significantly improved, and the level of students' mental health has also been cultivated. Therefore, in the professional teaching of higher vocational colleges, the appropriate use of students' psychological activities will effectively improve the efficiency of professional teaching and promote the development of students.

ANALYSIS ON THE EFFECTIVENESS OF PARTY STYLE AND CLEAN GOVERNMENT CONSTRUCTION IN A CITY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Shuyang Sun^{1,2}

¹*Institute of Political Science and Law, Northeast Normal University, Changchun 130000, China*

²*Institute of Political Science and Law, Baicheng Normal University, Baicheng 137000, China*

Background: China's development has been ups and downs. Once again, there is no doubt about the guiding role of Chinese leaders in the process. In the development process of modern China, the determination of the Communist Party of China, as the core of the construction of socialism with Chinese characteristics, is also extremely strong. Therefore, in the process of building a harmonious society, the construction of Party style and clean government has become the core guarantee of national construction. The 5000-year history of the Chinese nation has created a country and nation with great dreams. In China's Millennium Development, it has always been developing towards the establishment of a prosperous, strong, civilized and harmonious society. After being weathered, the emergence of the Communist Party of China brought light to the establishment of new China. It is also under the leadership of the Communist Party of China that China began to gradually move from poverty to wealth. During the ruling period of the Communist Party of China, the most important thing is the construction of a clean and honest government, which is not only related to the reputation of individuals and organizations, but also related to the survival and development of the country. In the development of China in recent decades, the Party Central Committee has always attached importance to anti-corruption, and several generations of leaders have taken it as the main construction work. In the process of building a clean and honest government, it is the party organization that supervises individuals and supervises the organization. Therefore, how to build a good Party style and clean government is the primary goal of national construction.

Social psychology is scientific research that analyzes psychological activities from the social nature. In social psychology, communication is an important way to affect public psychology. The psychological mechanism of social psychology includes communication relationship and social culture. Using the communication psychology of social psychology, the rational and logical processing of communication relationship and social culture will be more convenient. In social activities, social behavior includes social behavior driven by human relations and social behavior acquiesced under the operation of power, in which psychological behavior is the basic requirement to determine explicit behavior. The generation of social psychology is generated by the communication and interaction between people. In the construction of a clean and honest government, the construction of a clean and honest government is a social activity between organizations and organizations, individuals and individuals, organizations and individuals, and a social interaction between organizations to examine individuals and individuals to supervise individuals. The communication between various leadership levels produces social-psychological behavior. From the perspective of social psychology, in the process of building a clean and honest government, we need to maintain smooth social relations, make the requirements of the region and the central government highly consistent, fundamentally ensure the construction of a clean and honest government in the region, and then gradually affect the construction of a clean and honest government in each region. In addition, in social psychology, some researchers put forward the theory of attitude change to explore the development direction of the construction of a clean and honest government. They believe that there is a specific psychological tendency between an individual and society. Attitude change is to change the social-psychological tendency into the party's behavior, and then produce a positive response in the

construction of a clean and honest government, which can change the organization and organization, organization and individual. The coordination of individual and individual opinions can promote the work efficiency of the construction of Party style and clean government. Therefore, it is of great significance to evaluate the progress of Party style and clean government construction with the help of social psychology.

Objective: Using the relevant theoretical knowledge of social psychology, this paper discusses the importance of building a clean and honest government, and analyzes the effectiveness of building a clean and honest government from the perspective of social psychology, in order to provide theoretical support for the construction of socialist harmony.

Study design: Taking the construction of party conduct and clean government in a city in China as the research object, this paper uses the literature method to obtain the current situation of the city's economic development and the construction of party conduct and clean government, and evaluates the impact of the construction of party conduct and clean government on its economic development. In order to more specifically understand the application effect of party conduct and clean government in urban construction, a questionnaire is used to conduct a random survey on urban residents. Get the citizens' satisfaction with the construction of Party style and clean government and the evaluation of urban construction and development.

Results: In the correlation analysis between the construction of Party style and clean government and economic development, it can be seen that the economic development of the city is positively affected by the construction of Party style and clean government, and the degree of influence is more obvious. In the citizens' evaluation of Party style and clean government and urban construction, it can be found that the construction of Party style and clean government improves the lives of urban residents and is conducive to the construction of urban harmony. 0-4 scale is used to evaluate the degree of impact, where 0 means no impact, 1 means slight impact, 2 means general impact, 3 means obvious impact, 4 means full impact, "+" means positive impact and "-" means negative impact. The correlation between the construction of Party style and clean government and economic development is shown in Table 1.

Table 1. The correlation between the construction of Party style and clean government and economic development

Project	Tourism economic development	Catering economic development	Construction and economic development
Construction of Party style and clean government	+3	+4	+4

Conclusions: Building a clean and honest government is the foundation and foundation of urban construction. It is effective to analyze the current situation and effectiveness of building a clean and honest government by using social psychology. From the perspective of social psychology, from the perspective of urban economic development, the results show that urban economic development is positively guided by the construction of Party style and clean government, which significantly improves the overall economy of the city and contributes to the harmonious development of urban society. Therefore, in order to build a harmonious and civilized society, the construction of Party style and clean government is essential, Leaders of all regions or cities need to give full play to their supervisory role and do a good job in the construction of Party style and clean government.

THE REVITALIZATION OF RURAL TOURISM BASED ON THE PSYCHOLOGY OF SPORTS TOURISTS

Jun Chen

Beibu Gulf Ocean Development Research Center, Beibu Gulf University, Qinzhou 535011, China

Background: After the 19th National Congress of the Communist Party of China, an important development strategy was put forward, which advocated the "rural revitalization" strategy with solving the "three rural" problems as the core. As the main strategy of China's current development, the "rural revitalization" strategy has been paid more and more attention by all sectors of society. In the "Rural revitalization" strategy, we take the countryside as the strategic point and drive the rural development by looking for the rural development path. At present, China's "rural revitalization" is mainly concentrated in the poorer inland areas. By opening up the road from the countryside to the economic market, with the help

of China's relatively developed economic market, we can expand the rural external contact area, and then sell the relevant products in the countryside. In terms of the strategy, China will gradually expand its rural areas to the coastal areas with rich land resources, but gradually accelerate the revitalization of the coastal areas. With the growth of national economy, more and more people began to yearn for marine sports. On this basis, coastal rural areas began to gradually promote "rural revitalization" from the development of marine leisure sports, culture and tourism industry. With the development of "rural revitalization" in coastal areas and people's desire for new things, the development of new tourism industry has become a key step to speed up the pace of "rural revitalization".

Social psychology is a psychological science that studies communication psychology among social individuals, groups and organizations. In rural revitalization, coastal villages have adopted marine leisure sports and cultural tourism, emphasizing the use of social communication to promote cultural communication and achieve the goal of rural revitalization. In social psychology, social representation is the guarantee that determines the development of social communication. According to the research content of social psychology, social representation can help individuals have a clearer understanding ability in social communication. In addition, social psychology shows that social representation can help the specific analysis of a specific phenomenon in social communication and increase the ability of communication and interaction between societies. On the other hand, social psychology believes that the discourse sharing of social representation provides a development background for rural revitalization, enabling all sectors of society to communicate effectively and increase the conditions for rural revitalization. The development of "rural revitalization +" marine leisure, sports and cultural tourism industry mainly aims to expand the external influence of coastal villages with the help of tourism industry and attract more tourists to participate in the consumption of marine leisure, sports and cultural tourism. From the perspective of social psychology, the visit of tourists and the industrial development of tourism are social and psychological exchanges between groups. In the cognition of social psychology, the tourism behavior of tourists is a kind of behavior of participating in social activities. Its psychological activities determine social activities. The industrial development of tourism is also a kind of social behavior. The tourism industry determines the development direction of tourism industry through invisible communication with tourists or local residents. For the marine leisure sports and cultural tourism under the "rural revitalization", tourists are eager to participate in marine sports projects, and the tourism industry is eager for tourists to participate in the consumption of marine projects. There is a certain social relationship between them, that is, tourists get the corresponding services with social consumption psychology, while tourism obtains the corresponding consumption with social service psychology. According to social psychology, tourism and tourists complement each other and reach a certain agreement in social communication. When this kind of agreement comes into being, the purpose of "rural revitalization" has been achieved by coastal villages with the help of marine leisure, sports, culture and tourism industry. In order to speed up the development of coastal villages, it is of great practical value to explore the development direction of marine leisure sports culture tourism industry from the perspective of social psychology.

Objective: Understand the importance of "rural revitalization" to China's social development, explore the "rural revitalization" strategy of coastal villages, analyze the role of "rural revitalization +" marine leisure sports and cultural tourism industry in the development of coastal villages, and explore the development direction of marine leisure sports and cultural tourism industry, so as to provide theoretical support for China's "rural revitalization".

Study design: Using the method of literature, this paper collects the development status of coastal villages and the development status of marine leisure sports and cultural tourism industry in coastal villages under the "rural revitalization", analyzes the changes in social and psychological activities in the development of marine leisure sports and cultural tourism industry, and puts forward the development direction of tourism industry to promote rural development. Finally, the development prospect of coastal villages is predicted through simulation analysis.

Results: With the development of the marine leisure sports culture tourism industry, the social and psychological activities of tourism and tourists have changed significantly. Simulation analysis is used to predict the development of coastal villages. The results show that after determining the development path, the leisure sports culture of post coastal villages can be coordinated and the rural economy can be significantly improved. See Table 1 for the specific situation.

Table 1. Prediction results of coastal rural development

Index	3 months	6 months	9 months
Economic growth rate (%)	7	11	19
Coordination degree	0.22	0.39	051

Conclusions: "Rural revitalization" is one of the important strategies for China's development.

Promoting the process of “rural revitalization” is of great practical significance. In the development of coastal villages, it is effective to use social psychology to find the development of marine leisure, sports, culture and tourism industry, which can significantly accelerate the “rural revitalization” efficiency of coastal villages and drive the development of regional economy. Therefore, on the basis of “rural revitalization” strategy, implementers need to make full use of the social and psychological activities of regional development participants and determine the development direction in order to ensure the normal development of “rural revitalization”.

A STUDY ON THE INFLUENCE OF FEMALE CONSCIOUSNESS IN VICTORIAN BRITISH FEMALE NOVELS ON WOMEN’S POSITIVE PSYCHOLOGY FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Xiaoyan Dong

School of Foreign Languages, Yancheng Institute of Technology, Yancheng 224051, China

Background: Social psychology pays attention to the psychological changes of individuals and groups in social activities, and is committed to summarizing some universal laws, and advocates the application of these methods and models to deal with social relations and social problems. Compared with traditional psychology, social psychology pays more attention to the psychological patterns of groups in society, such as group subconscious thinking mode, group cultural habits, group initiation and group bias, etc., but paying attention to groups does not mean that social psychology society despises the influence of individual psychology. Therefore, social psychology is more suitable than traditional psychology to analyze the social problems obviously affected by the social environment and the psychological related problems of individual members in the society. From the perspective of research methods, social psychology attaches importance to case study on the basis of using traditional psychological research methods. Therefore, sociological research methods such as questionnaire survey, expert consultation, comparative experiment and interview are often used in the research of social psychology. Female consciousness is gender consciousness, which is the understanding of women’s role and status, and the experience of women’s value as human beings. Female consciousness exists in female literature and changes with the development of the times. Female consciousness is prominent in British women’s literary works, and has played an important role in enlightening and leading British women’s female consciousness. The female consciousness in female literary works is not suitable for separate analysis. It should be analyzed in combination with the social environment and female group psychology at that time. Therefore, this study uses the method of social psychology to study the female consciousness in Victorian British female novels, hoping to provide some reference and inspiration for China to stimulate and improve women’s positive psychology through literary works.

Objective: By analyzing the female consciousness in Victorian British female novels, to find out the elements of female consciousness affecting the positive psychology of female groups in female novels at that time, so as to provide some references for guiding the development of female consciousness through literary works in China.

Objects and methods: Collect several famous Victorian British female novels, such as the tragedy of mares, virginity, pride and prejudice, and study these novels to extract the female consciousness that may have an impact on the positive psychology of female groups at that time. Then 35 female consciousness experts and social psychology experts from home and abroad are selected to form an expert group, and these elements are sent to the expert group. Members are required to judge and supplement whether the influencing elements are accurate and whether there are omissions. At the same time, the degree of influence of various factors on the extreme psychology of British women at that time is evaluated. The evaluation is divided into five levels: no influence, slight influence, general influence, obvious influence full impact.

Results: After the members of the expert group reached an agreement, stop the feedback cycle, sort out the final opinions of the expert group, and get Table 1.

Table 1. Statistical results of final opinions of the expert group

Reason	No effect	Slight impact	General impact	Obvious influence	Full impact
Their own inaction is also the cause of tragedy	1	5	6	13	10
Economic status can affect social status	5	8	10	7	5
You can change your destiny	0	3	8	13	11
You don't have to rely on men	9	15	6	3	2
Social customs are not necessarily right	2	7	10	10	6

The figures in Table 1 represent the number of expert groups who believe that the corresponding female consciousness factors will have a corresponding hierarchical impact on the positive psychology of Victorian British women. It can be seen from Table 1 that the expert group believes that “you can change your destiny” and “your inaction is also the cause of tragedy” have the most significant impact on the positive psychology of Victorian British women, and “you cannot rely on men” has the least impact.

Conclusions: From the perspective of social psychology, this study analyzes the elements of female consciousness in British female novels that affect the positive psychology of Victorian British female groups. In the study, firstly, several famous Victorian British women's novels were collected. After reading, the elements that may have an impact on the positive psychology of women at that time were extracted and sent to the expert group for adjustment. The expert consultation results show that the expert group believes that “you can change your destiny” and “your inaction is also the cause of tragedy” female consciousness have the most significant positive psychological impact on Victorian British women. This is because in the context of the Renaissance and the era of great navigation, the concept of “changing fate depends on self-struggle” spread more and more widely, and also affected the female groups at that time. Repeated publicity of these concepts through popular media works such as novels will further stimulate the positive psychology of the majority of female groups to change the treatment of themselves and their social groups.

* * * * *

AN EMPIRICAL STUDY ON THE CORRELATION EFFECT BETWEEN PRIVATE EQUITY FUNDS AND REGIONAL ECONOMIC DEVELOPMENT FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY

Ran Hu¹ & Xi Zhao²

¹*College of Economics & Management, Hefei Normal University, Hefei 230601, China*

²*School of Economics and Management, Hefei University, Hefei 230601, China*

Background: Social psychology is a subject that studies the psychological and behavioral conditions of individuals and organizations in the social environment, and summarizes the laws used to solve the corresponding social problems. Social psychology is an interdisciplinary subject of sociology and psychology. Compared with traditional psychology, it focuses on language, friends, family, living environment While the learning environment has an impact on itself, it also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. Because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to prevent irrelevant variables affecting the results from being introduced into case study. Private Equity fund (PE) refers to the fund investment in the non-public trading equity of non-listed companies or listed companies through the non-public offering. It is observed that the local economy with more private equity funds in China is developing faster than the whole country. Financial experts have conducted a lot of research on this phenomenon, but they are basically carried out from the economic perspective. However, the private equity funds are operated by people, and the investment objects (i.e., companies) are also managed by people. Their psychological factors will greatly affect their decision-making and judgment. Therefore, it is necessary to study the relationship between private equity funds and regional economy from the perspective of social psychology.

Objective: To analyze the correlation between private fund investment and regional economic development in China, and investigate the social psychology principles that produce this correlation, so as to put forward some suggestions to help develop the economy of backward areas in China.

Objects and methods: Purchase the economic development data of China’s private equity funds and their investment regions in recent 10 years from a data service provider. Clean the data set, and then analyze the correlation between the investment amount of private equity funds in the region and the average annual economic growth rate in the region since private equity investment. Then, 38 heads of relevant government departments and financial experts in the investment area of private equity funds were consulted, combined with the theoretical methods of social psychology, to summarize the psychological reasons for this correlation, and let them evaluate the impact of each psychological reason on this correlation. The degree of impact was expressed in five categories: no impact, slight impact, general impact, obvious impact and full impact, and assigned 1, 2, 3, 4 and 5 respectively. In addition, in the correlation model, the significance level is set to 0.05.

Results: The experimental results of correlation analysis show that there is a positive correlation between the investment amount of private equity funds in the region and the average annual economic growth rate of the region since private equity investment. The fitting effect of linear regression model is the best. At this time, the output correlation coefficient is 0.527, and the *P* value is 0.031, which is less than the significance level. The results obtained by consulting experts are shown in Table 1.

Table 1. Expert consultation results

Reason	Average score of influence degree	Overall impact level interval	Standard deviation of impact rating
Profit seeking psychology	3.79	General impact – obvious impact	0.25
Group psychology	4.16	Obvious influence – full influence	0.27
Halo effect	4.58	Obvious influence – full influence	0.33

The “overall impact level interval” in Table 1 represents the two impact levels closest to the average of the impact level scores of experts. According to Table 1, experts believe that the psychological reasons leading to the positive correlation between private equity funds and economic development mainly include “profit seeking psychology”, “herd psychology” and “halo effect”.

Conclusions: In order to explore the relationship between private equity fund investment and the economic development of the invested region, this study purchased the economic development data of China’s private equity fund and its investment region in recent 10 years from a data service provider, analyzed the correlation between the investment amount of private equity fund in the region and the average annual economic growth rate of the region since private equity investment, and the analysis results showed that there was a positive correlation between the two. Analyzing the mechanism of these reasons from the perspective of social psychology, it can be seen that private fund investment enables the invested enterprises to provide better treatment for talents, which greatly mobilizes the subjective initiative and positive psychology of talents, improves the external impression of enterprises, attracts more investment (halo effect and conformity psychology), and contributes to the better development of enterprises. In addition, after the overall treatment of relevant personnel of the enterprise is improved, they will have greater psychological motivation to consume, so as to drive the development of surrounding consumption and related industries, and continue to attract more people who are eager to change their living conditions to gather in these areas, which will further promote local economic development (profit-seeking psychology) and form a virtuous circle.

RESEARCH ON THE TEACHING REFORM OF ECONOMIC LAW COURSE IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF EDUCATIONAL PSYCHOLOGY

Wenbo Wang

College of Finance and Economics, Harbin Vocational College of Science and Technology, Harbin 150300, China

Background: Educational psychology is a branch of social psychology, and it has a close relationship with general psychology, pedagogy, its main research object is in the environment of education, the learning psychology of the educatee, the teaching psychology of the educator. By studying the psychology of educatees and educators, the application of educational psychology can improve teaching methods, stimulate students' learning motivation, assist students to face the difficulties in the process of learning and so on. As educational psychology helps improve teaching methods, teachers and scholars often apply it to the teaching of subjects that are difficult to teach or learn. Economic law, the subject of this study, is such a subject. Because of the economic law in colleges and universities curriculum is complex, involving disciplines background knowledge is broad, the teaching difficult, relevant professional post recruitment requirements higher characteristic, make students learn this course has great mental pressure, they worried he wasn't part of the students a good grasp of curriculum content, worried about being in the job market does not have enough competitive advantage. Even worried about failing the course evaluation, based on these reasons, the produced part of the economic law of college students' employment psychological anxiety, this is not conducive to the students learning course content, is unfavorable to cultivation of talents in colleges and universities, so it is necessary from the perspective of students' learning psychology and education psychology teachers' psychological state in the process of teaching. Thus, it provides some useful thinking for determining the path of course reform of economic law in colleges and universities.

Objective: To analyze the current educational situation of economic law course in colleges and universities in China, including students' learning effect, teachers' teaching mode, training project content, teaching hours, auxiliary teaching tools and teaching environment, etc. So as to understand the shortcomings of economic law teaching, and then design teaching experiments to explore the impact of integrating educational psychology into college economics curriculum reform on students' employment anxiety.

Objects and methods: To consult the teaching contents and employment points of economic law course from the economic law teachers in domestic colleges and universities and the personnel staff in enterprises with management-related recruitment positions. One economic university with certain teaching strength was selected from domestic universities, and 200 college students who were willing to participate in the experiment and suffered from different degrees of employment anxiety were randomly selected as the research objects. The research objects were divided into experimental group and control group. Two teachers with similar teaching experience and teaching style were selected from the school to teach the economic law courses of the two groups of students respectively. The teaching contents were the same, but the teachers in the experimental group were required to pay attention to the observation of students' psychological state and emotional state in the teaching process, and take timely measures to ask the reasons when students have anxiety change teaching methods and encourage students to adjust students' anxiety. The teaching lasts for one semester. All teachers are also required to understand the severity of students' employment anxiety before and after the experiment, and evaluate them in five categories: no anxiety, slight anxiety, medium anxiety, significant anxiety and severe anxiety. Five integers of 1-5 are used to quantify the anxiety level. The way for teachers to investigate students' anxiety level is through semi-structured interview.

Results: After the experiment, the statistical quantitative data of the severity of students' employment anxiety are shown in Table 1. Note that the quantitative data is described in the form of mean \pm standard deviation, and the *t*-test is conducted. The significance level is 0.05.

Table 1. Statistical results of employment anxiety of two groups of students

Group	Before teaching	After teaching	<i>P</i>
Experience group	3.24 \pm 0.17	0.82 \pm 0.25	0.001
Control group	3.25 \pm 0.23	3.26 \pm 0.22	1.173
<i>P</i>	1.248	0.001	-

It can be seen from Table 1 that before the teaching experiment, there was no significant difference in the quantitative score data of the employment anxiety level between the two groups, but after the completion of the teaching, the average quantitative scores of the employment anxiety level of the experimental group and the control group were 0.82 and 3.26 respectively. The former decreased significantly compared with the latter, and the data difference was statistically significant.

Conclusions: In view of the problem that students are prone to employment anxiety after the teaching of economic law course in colleges and universities, this study analyzes the current educational situation of

economic law course in colleges and universities in China, understands the shortcomings in economic law teaching, and then designs teaching experiments to explore the impact of integrating educational psychology into the reform of economics course in colleges and universities on students' employment anxiety. The experimental results show that after the completion of the teaching experiment, the average quantitative scores of the employment anxiety level of the experimental group and the control group are 0.82 and 3.26 respectively. The former has a significant decrease compared with the latter, and the data difference is statistically significant. The results of this teaching experiment show that students' psychological characteristics should be considered in the formulation of the path of economics curriculum reform in colleges and universities, which has certain guiding significance for improving the teaching quality of the curriculum and alleviating students' employment anxiety.

RESEARCH ON THE REFORM OF UNIVERSITY MANAGEMENT SYSTEM FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY AND UNIVERSITY GOVERNANCE

Bingyu Zhu¹ & Jie Zhang²

¹*Office of University Relations and Public Affairs, Xuzhou University of Technology, Xuzhou 221000, China*

²*School of Humanities, Xuzhou University of Technology, Xuzhou 221000, China*

Background: The early proposal of educational psychology is an important theoretical idea to help colleges and universities solve teaching problems. In educational psychology, taking college teaching reform as the single purpose, starting from multiple levels such as students, teachers and schools, this paper analyzes the impact of different levels on teaching reform, and discusses the psychological changes in the process of teaching reform and innovation of different groups. Educational psychology believes that in the educational situation, human learning behavior is affected by psychology. In the design of teaching methods, advocates paying attention to students' learning habits and development space, and also emphasizes the changes of teachers' emotions in the teaching reform. Generally speaking, in the teaching process, students' subjective thoughts are the main factors affecting teaching results. Students' subjective thoughts in the teaching process include learning enthusiasm, teachers' recognition and attention to learning content. In the evaluation of teachers in the teaching process, educational psychology takes teachers' professional ability and professional quality as the main factor of teachers' psychological change. Teachers' psychological activities under the two influencing factors determine the normal development of teaching. In the governance of colleges and universities, educational psychology believes that it is necessary to carry out collaborative governance from the two levels of students and teachers. Some studies believe that the relationship between teachers and students in educational psychology can be expressed as that teacher can take psychology as the theoretical basis to formulate teaching curriculum plans, and students can help improve teaching plans through psychological behavior feedback in teaching practice.

The management system of colleges and universities is the practical support of university governance. In the process of social development, the impact brought by social changes will also affect colleges and universities. Therefore, colleges and universities need to formulate a management system suitable for the development of colleges and universities while coping with the social impact. From the development of the management system of colleges and universities, it can be found that colleges and universities often make the final decision in the formulation of the management system and determine the management plan of the school from the leadership level, although this way can better adapt to social changes and help colleges and universities develop sustainably under the impact of society. However, it is undeniable that this way of university management system reform is not universal for students and teachers. In the teaching process, teachers and students are not only unilateral knowledge dissemination, but also an emotional expression, which contains the rich teaching and learning emotions of teachers and students. Therefore, on the premise of meeting the social requirements, how to help colleges and universities formulate a reasonable management system and provide reference for college governance is an urgent problem to be solved. From the perspective of educational psychology and university governance, this paper puts forward the path of university management system reform with comprehensive benefits, so as to provide ideas for university reform.

Objective: This paper discusses the psychological changes of teachers and students under the influence

of educational psychology, analyzes the relevant problems existing in university governance, and explores the reform path of university management system under the influence of educational psychology.

Study design: Taking four colleges and universities of college students in a city as the research object, the teachers' curriculum professional psychology and teaching positive psychology in colleges and universities from the perspective of statistical educational psychology, and the students' learning positive psychology and subject recognition psychology in learning are counted. Cluster analysis is used to explore the common problems of university governance in the four schools. With the help of the psychological changes of teachers and students and the problems of university governance in colleges and universities, this paper puts forward the reform strategy of university management system.

Results: The impact of the psychological activities of middle school students and teachers in four universities on the reform of the university management system is shown in Table 1. It is graded from 0 to 4. 0 means no impact, 1 means slight impact, 2 means general impact, 3 means obvious impact and 4 means full impact. The results show that the psychological activities of teachers and students can significantly affect the system reform of colleges and universities.

Table 1. The influence of teachers and students on the reform of university management system

Project	Teacher		Student	
	Curriculum professional psychology	Positive psychology of teaching	Learning positive psychology	Subject recognition psychology
Reform of university management system	4	4	4	3

Conclusions: The reform of university management system is an important measure to determine the development direction of colleges and universities. How to make the reform of university system more reasonable is what college leaders need to pay attention to. The research starts with educational psychology and university governance. By analyzing the changes of psychological activities of students and teachers in the teaching process, this paper puts forward the humanistic problems that need to be paid attention to in university reform, and puts forward the social problems that need to be solved in university reform by analyzing the problems existing in university governance. The results show that the psychological activities of university teachers and students can significantly affect the reform of university system. Therefore, in the development of colleges and universities, college leaders need to use educational psychology to start with the psychology of students and teachers, and put forward a perfect management system reform path in line with the development of colleges and universities and meet the needs of students and teachers.

THE INTEGRATION OF INNOVATION AND ENTREPRENEURSHIP EDUCATION AND ENTERPRISE MANAGEMENT IN COLLEGES AND UNIVERSITIES UNDER COGNITIVE IMPAIRMENT

Zhixing Wu

School of Economics Management, Kaili University, Kaili 556011, China

Background: In the theory of cognitive impairment, shallow cognitive impairment is considered that the cognition of a specific part can be effectively used by cognitive individuals within a certain range, and even produce positive effects. However, when this cognition is transferred to other cognitive fields, it will have a negative or even wrong effect, making the cognition of cognitive individuals deviate. This kind of cognitive impairment is often a barrier that individual cognitive activities are difficult to surpass. It is hidden in individual cognitive behavior, accompanied by cognitive behavior, and most individuals are difficult to realize their cognitive impairment without external warning. This feature is the concealment of cognitive impairment. Once warned by the outside world, cognitive individuals can recognize the existence of cognitive impairment, and then correct the wrong cognition through repeated variant practice, so as to achieve the effect of overcoming cognitive impairment when aiming at specific problems. In addition, shallow cognitive impairment also has the characteristics of continuity and commonality. Continuity refers to that the process of cognitive impairment migrating from one field to another is continuous, and the

cognitive impairment existing in one cognitive field is likely to have a negative impact in other cognitive fields. The commonality of cognitive impairment refers to that the type, time and manifestation of cognitive impairment are very different, and there are commonalities for groups with certain characteristics. In the process of innovation and entrepreneurship education in colleges and universities, students' shallow cognitive impairment seriously affects the learning effect of enterprise management theory. The sources of students' cognitive impairment are diverse. After classification, they can be roughly divided into three kinds. One is that students' nervous system itself has some defects, which lead to cognitive impairment. Second, students' lack of attention in the process of learning enterprise management theory leads to incomplete collection of cognitive content. Third, students are unable to correctly extract and process information in the process of information processing, resulting in obstacles in the process of cognitive processing, although they can collect information completely.

Objective: Through the analysis of the characteristics of students' cognitive impairment in the process of innovation and entrepreneurship in colleges and universities, we can provide a path for the establishment of an education system to intervene students' cognitive impairment, so as to help students improve their learning effect in the learning of enterprise management knowledge, and help students better combine entrepreneurial knowledge with practical management.

Subjects and methods: This study takes the establishment of variable model as the main research means, takes theoretical research as the basis, designs the college entrepreneurship education and enterprise management model under the environment of cognitive impairment by quantifying and substituting different elements into the model variables, and analyzes it with the model as the framework.

Study design: This study divides the cognitive dimension of entrepreneurship education and the dimension of enterprise management, and creates variables according to their causality. On this basis, SEM structural equation model is used to analyze the path of causality correlation mode, and study the mediation effect and regulation effect between different variables.

Methods: This study uses Excel to make descriptive statistics on the relevant data of the study. On this basis, AMOS22.0 software for model data analysis.

Results: The significance analysis results of standardized path coefficient of the model are shown in Table 1.

Table 1. Significance analysis of standardized path coefficient

Route	Standardized path coefficient	<i>P</i>
Individual cognitive impairment pathway	0.07	0.006
Path of classroom cognitive impairment	0.83	0.012
Group cognitive impairment pathway	0.25	0.009
Strategic cognitive impairment pathway	0.51	0.009

In Table 1, those with $P > 0.05$ are not statistically significant, those with $P < 0.05$ are statistically significant, and those with $P < 0.01$ are statistically significant. It can be clearly seen that the P values of the standardized path coefficients of the four paths in the model are below 0.05, which is statistically significant. Among them, the P values of individual cognitive impairment path, group cognitive impairment path and strategic cognitive impairment path are below 0.01, which is statistically significant.

Conclusions: In the process of innovation and entrepreneurship education in colleges and universities, students with cognitive impairment often have difficulty in systematically mastering enterprise management theory and knowledge, resulting in insufficient learning effect. Most of the cognitive impairment symptoms of relevant students are shallow cognitive impairment, which can have a positive impact on students' cognitive impairment in the process of learning enterprise management knowledge from four aspects: personal factors of innovation and entrepreneurship education, classroom factors, learning team factors and teaching methods. Through the adjustment of this educational means, we can fully ensure that students encounter fewer obstacles in the learning process, and provide an effective path for students to improve their learning effect.

Acknowledgement: The research is supported by: 2021 New Liberal Arts Research and Reform Practice Project of Kaili University: Innovation and entrepreneurship education and practice from the perspective of new liberal arts construction (No.12).

THE INFLUENCE OF PHYSICAL EDUCATION MODEL ON STUDENTS' PSYCHOLOGICAL STATE UNDER EDUCATIONAL PSYCHOLOGY

Ming Gao

PE Department, Yunnan University of Finance and Economics, Kunming 650221, China

Background: Educational psychology is a subject whose main research object is the psychological function relationship and law between students and teachers in the teaching process. In recent years, educational psychology has been widely used in physical education, especially in the process of college physical education. Compared with primary and secondary school students, college students' psychology is more perfect and their individual consciousness is stronger. Therefore, compared with the past teaching methods, it is easier to mobilize students' enthusiasm by using the teaching methods of educational psychology. In addition, physical education based on educational psychology is also one of the important modules to ensure the physical and mental health of college students in the contemporary college education system. Because the process of sports is a process in which students constantly achieve their goals and acquire skills by urging themselves to forge ahead. In the process of physical education in which teachers and students cooperate, the psychological feedback of middle school students is often positive, which is beneficial to the mental health of students. According to the self-efficacy theory, whether an individual chooses to continue the current activities in a specific situation depends on his evaluation and expectation of whether he has the ability to complete the activities. Students are guided by teachers' psychology in the teaching process and choose to continue the training of their own sports skills, which often means students' expectation and affirmation of their own ability. This psychological expectation and affirmation can not only bring results in the physical education classroom, but also derive from the physical education classroom to other activities. Students can bring their expected experience and successful experience in the process of physical education learning into their daily life, so as to achieve the effect of positive feedback through self-training in daily life. This chain psychological reaction starting from the physical education classroom is very beneficial to students' personality development and life experience in the future. Therefore, the construction of college students' physical education curriculum teaching model based on educational psychology is not only beneficial to physical education itself, but also beneficial to students' comprehensive quality and personality development. It is one of the important directions of contemporary teaching innovation.

Objective: Through the combination of educational psychology and college students' physical education, this study explores the psychological configuration of physical education curriculum teaching, so as to help students obtain better psychological experience in physical education while obtaining the motivation of physical education learning.

Subjects and methods: According to the needs and characteristics of the construction of the teaching model of college students' physical education course in educational psychology, this study combines the expert investigation method and analytic hierarchy process to establish the model index system, and endows the weight in the index correlation weight according to the importance of the index, which is used for the measurement between the indexes and the subsequent model correlation analysis.

Study design: This study establishes the teaching model system of college students' physical education curriculum through expert investigation, decomposes the teaching evaluation indexes of college Students' physical education curriculum layer by layer through analytic hierarchy process, and determines the weight distribution of each index. Finally, the model is verified with the data obtained from the survey.

Methods: In this study, Excel and SPSS software were used to sort out and count the research data.

Table 1. Index weight table

Primary index	Primary weight	Secondary index	Secondary weight
Interactive design of physical education classroom	0.0899	Scientific nature	0.3944
		Overall	0.1763
		Feasibility	0.4293
		Environment	0.0764
Interactive implementation of physical education classroom	0.4881	Skill	0.1136
		Content	0.2599
		Student participation	0.2623
Physical education classroom interaction results	0.2574	Skill mastery	0.3713
		OOD health	0.1213

Results: The index weight designed according to educational psychology is shown in Table 1.

The psychological communication between teachers and students is based on classroom interaction. Therefore, the index design of physical education model based on educational psychology focuses on classroom interaction.

Conclusions: By combining educational psychology with college students' physical education and establishing the psychological configuration of college students' physical education curriculum teaching, we can effectively improve the learning motivation of college students in the process of physical education learning and enhance their physique. At the same time, the teaching model of college students' physical education curriculum using educational psychology can also help college students obtain positive psychological experience and psychological hint with self-affirmation in the process of physical education learning. Through relevant psychological experience, college students can bring the positive feedback action principle learned in the physical education classroom into their study and life, so as to improve their self-expectation and self-affirmation in other activities, obtain a better life experience and form an optimistic and sound comprehensive personality.

IMPROVING THE EDUCATIONAL EFFICIENCY OF RED CULTURE BY IDEOLOGICAL AND POLITICAL COURSES IN COLLEGES AND UNIVERSITIES UNDER THE BACKGROUND OF SOCIAL PSYCHOLOGY

Xuejun Zhang

Marxism School, Pingdingshan University, Pingdingshan 467000, China

Background: Based on American experimental social psychology, traditional social psychology studies the diversity and complexity of individual psychology in a specific social environment in the form of experiments. However, with the development of the times, this kind of social psychology, which is divorced from the culture and social culture of the times and exists only in experiments, has been gradually abandoned. Contemporary social psychology is psychology that puts the psychological state of individuals and groups into the era and social background. Its research content is also carried out around the correlation between social psychology and social culture, and there is no psychology divorced from culture. There is no culture that is divorced from psychology. Therefore, from the perspective of social psychology, the education of red culture in the ideological and Political curriculum education in contemporary colleges and universities must be closely related to the psychological state of students. In a specific social environment, social psychology and social culture show a mutually constructed relationship, that is, social-cultural production and social-cultural sharing will affect the psychological tendency of individuals and groups in the social environment to a great extent. This social environment can be either a large social environment or a relatively small but self-contained social environment. Regard the learning environment of colleges and universities as a small and self-contained social environment. The production and sharing ability of red culture in the campus environment is closely related to the psychological acceptance of students. The main platform for the production and sharing of red culture in contemporary colleges and universities is the ideological and political course in colleges and universities. Therefore, by improving the production and sharing mode of red culture in the ideological and political course education in colleges and universities, it is likely to effectively improve students' acceptance of red culture, so as to produce a red cultural atmosphere among students and form a "red culture education circle". Starting from the social culture and social psychology theory in social psychology, this study provides students with an environment for in-depth learning of red culture, improves students' learning enthusiasm and improves the educational effect of red culture by improving the production and sharing path of red culture in Ideological and political education in colleges and universities.

Objective: This study uses the theory of social psychology to help ideological and political education in colleges and universities improve the path of red culture education, so as to improve students' acceptance from a psychological point of view, and then form a "red culture education circle", so as to improve the effectiveness of red culture education.

Subjects and methods: This study mainly uses the correlation analysis method and K-nearest neighbor classification method to classify the learning ways of students in the process of ideological and political education, find the educational ways with the highest influence on students and the highest educational efficiency, and construct the red culture educational strategy on this basis.

Study design: This study uses the K-nearest neighbor algorithm to classify the student groups who use

different ways to recognize the red culture in the process of ideological and political education in colleges and universities, and analyzes the correlation and influence between the influence degree of different ways and the psychological state of students when learning the red culture.

Methods: The data used in this study are mainly obtained from the background of the teaching platform. On this basis, SPSS software is used for data statistics and analysis.

Results: The influence degree of different cognitive approaches obtained after classification on students' learning effect of red culture is shown in Figure 1.

Figure 1. The influence of improving the red education model on students

Figure 1 students whose learning psychology is significantly affected account for 53% of the total number of students, students whose learning psychology is significantly affected account for 21% of the total number of students, students whose learning psychology is generally affected account for 17% of the total number of students, and students whose learning psychology is not affected account for 9% of the total number of students. It can be seen that more than half of the students were significantly affected, and the sum of the significantly affected and significantly affected students reached 74%.

Conclusions: Red culture education is an important practical activity to transform students' psychological state. Traditional education methods lack flexibility, and students' acceptance of red culture is not high. Based on social psychology, this study treats the campus as a micro-social environment with specific rules, applies social psychology and social culture theory to the education system of ideological and political education in colleges and universities, as well as the production and sharing behavior of red culture, and improves students' acceptance and learning enthusiasm of red culture through path innovation and mode innovation, form a "red culture and education circle". This study can provide a reference theoretical and data basis for the formulation of contemporary college students' red culture education strategies, help major colleges and universities optimize the path of the red culture education and improve the efficiency of red culture education.

PERSPECTIVE OF POSITIVE PSYCHOLOGY THE INFLUENCE OF COLLEGE STUDENTS' INNOVATION AND ENTREPRENEURSHIP ABILITY TRAINING AND EMPLOYMENT GUIDANCE ON STUDENTS' POSITIVE PSYCHOLOGY

Yun Fu¹ & Wenxia Liu²

¹Admission and Employment Office, Sichuan Film and Television University, Chengdu 610036, China

²International School of Creative Art, Sichuan Film and Television University, Chengdu 610036, China

Background: Positive psychology advocates those human beings should treat and interpret human psychological phenomena and psychological problems with a positive attitude, so as to stimulate the inherent potential positive psychological quality and psychological strength of individuals in this way. At the subjective level, positive psychology emphasizes the positive role of individual subjective experience in individual behavior guidance. These individual subjective experiences include but are not limited to

individual happiness, satisfaction, optimism and expectation in the process of behavior. Positive psychology believes that the mutual triggering of positive mentality and positive behavior will form a positive cycle of psychology and behavior, so as to maintain the upward life course of the individual as a whole. At the same time, the long-term accumulation of these positive psychological states will also make individuals produce positive psychological traits such as execution, courage and interpersonal skills. These positive psychological traits are an important factor for individuals to succeed in the social environment. In a social group, the more individuals with positive psychological characteristics, the more conducive the whole social environment is to the formation of healthy families and communities, enterprises with a sense of social responsibility and other factors conducive to social development. In the process of Cultivating College Students' innovation and entrepreneurship ability, the application of positive mentality is just in line with the ideal theoretical state of positive psychology. To introduce the psychology behavior cycle theory of positive psychology into college students' innovation and entrepreneurship education, we first need to clarify college students' entrepreneurial goals, clarify the direction for college students' future employment, and have their own goals. College students' efforts will be easier to obtain positive feedback and form an expected positive subjective experience. In the allocation of entrepreneurship teaching, we should add more practical courses, strengthen college students' positive psychological experience, and consciously cultivate college students' positive psychological characteristics in the continuous and repeated positive psychological experience. These characteristics will become the cornerstone of college Students' success in the future.

Objective: This study substitutes the positive psychological behavior cycle theory of positive psychology into the cultivation of college students' innovation and entrepreneurship ability and employment guidance education, so as to provide students with positive psychological experience, form positive psychological characteristics, help students improve their entrepreneurial ability and comprehensive quality, and point out the direction for students' future employment.

Subjects and methods: This study combines the fuzzy analysis method with the factor analysis method. Through the quantitative evaluation of the elements of college students' innovation and entrepreneurship ability and positive psychological elements, the quantitative indicators are formed, and on this basis, the factor analysis method is used to analyze the relationship and action mode between the quantitative indicators.

Study design: This study conducted an experiment by carrying out a new innovation and entrepreneurship course for college students, collected interview data on the psychological state of college students during the course, transformed the course framework and students' ability into relevant indicators, and conducted quantitative evaluation by using fuzzy evaluation method. It also analyzes the relationship and function between psychological factors and students' entrepreneurial ability under the curriculum framework.

Methods: In this study, students participating in entrepreneurship guidance courses were recruited by means of campus network application, and the courses were carried out on the basis of informing the experimental contents, and the interview data were collected by Excel.

Results: The analysis of entrepreneurial ability training elements in innovation, entrepreneurship and employment guidance education is shown in Figure 1.

Figure 1. Influencing factors of entrepreneurial ability

Among the four main entrepreneurial ability training elements in Figure 1, the entrepreneurial achievement feedback has the greatest impact on students' entrepreneurial ability, reaching level 5, and the impact is the most significant. The second is the supporting training strategy, reaching level 4, which has a significant impact. The cultivation environment and cultural atmosphere are of level 3 influence. It can be seen that the actual positive result feedback can effectively promote the formation of students' positive psychological state, and then achieve the effect of improving students' innovation and entrepreneurship ability.

Conclusions: Positive psychology plays a subtle role in cultivating college students' entrepreneurial ability. By making use of the characteristics of positive psychology to create a sufficient practical environment for students in innovation and entrepreneurship education and employment guidance for college students, and giving positive feedback to college students in the practical environment, we can help college students form a positive psychological state, and use the repeated positive feedback process to increase the positive psychological characteristics of college students, provide psychological basis for students' future entrepreneurial success. By applying the theory of positive psychology to the cultivation of entrepreneurial ability and employment guidance, we can arouse students' internal psychological strength to solve external entrepreneurial problems, make students respond to entrepreneurial demands with behavior, and achieve good training results.

ON THE CRIMINAL LAW REGULATION OF TELECOM NETWORK FRAUD CRIME UNDER PSYCHOLOGICAL VISION

He Ge Ri Le Hu

Inner Mongolia RTVU Xilin Gol League Branch (Urban and Rural Community University), Xilingol Vocational College, Xilinhot 026000, China

Background: As one of the psychological products of human beings, the emergence and existence of criminal law largely follow the basic psychological laws of human beings. In Freud's psychological theory, there are two kinds of instincts: the instinct of life and the instinct of death. The psychological instinct of life is essentially the self-protection instinct of human beings in order to continue the ethnic group, and the psychological instinct of death is essentially the destructive instinct of human beings. As an external destructive behavior, crime can be regarded as the release of psychological destructive instinct, while criminal law regulation is relatively the practice of self-protection psychological instinct. In psychology, criminal law is necessary. Therefore, with the development of telecom network, the telecom network fraud produced in human society should also be regulated. In modern cognitive psychology, the existing knowledge and information structure in people's psychological cognition plays a decisive role in human behavior and cognition, that is, the existing knowledge in people's psychological cognition can determine whether people confirm the existence of a goal and how to achieve it. For example, murder is a serious illegal act, which violates the most basic psychological needs of human self-protection and human psychological instinct. Therefore, the vast majority of social individuals will have a clear psychological understanding of the concept of "illegal murder". However, as a new type of crime rising with the development of telecommunication network, with the development of telecommunication network in recent years, telecommunication network fraud gradually presents the trend of frequency and diversity. Therefore, many social individuals, including criminals, lack the most basic psychological cognition, which leads to the most basic difficulty in the process of criminal law regulation, that is, the psychological cognition difficulty of the concept of criminal law. At the same time, the cognition and regulation of a new type of crime can be realized not only in the legal norms, but also in the psychological behavior norms of social individuals, so as to achieve a good social restraint effect.

Objective: From the perspective of psychology, this study analyzes the psychosocial nature and criminal law path of the new crime type of telecom network fraud, and strives to provide a psychological theoretical basis for the criminal law regulation of telecom network fraud, improve the psychological and criminal law cognition of the public, and optimize the criminal law regulation path from the perspective of social psychology.

Subjects and methods: This study uses the method of combining a large number of sample survey and support vector machine classification to analyze the impact of criminal law norms on social groups at the social psychological level from the perspective of social people's psychological cognition of telecom fraud crime from the perspective of criminal law.

Study design: This study uses the way of street survey to collect a large number of sample data. The main content of the collected information is the relevant content of the social masses' psychological cognition of telecom fraud crime from the perspective of criminal law. On this basis, support vector machine algorithm is used to classify the sample groups with nonlinear characteristics, so as to assist in analyzing the psychological impact of the criminal law regulation of telecom network fraud crime on different social groups.

Methods: During the impact analysis, this study quantifies the impact degree into the form of impact grade, which is divided into five grades from grade 0 to grade 4. The impact degree of elements increases with the increase of grade.

Results: The influence degree of criminal law regulation of telecom network fraud crime on various social and psychological functions is shown in Figure 1.

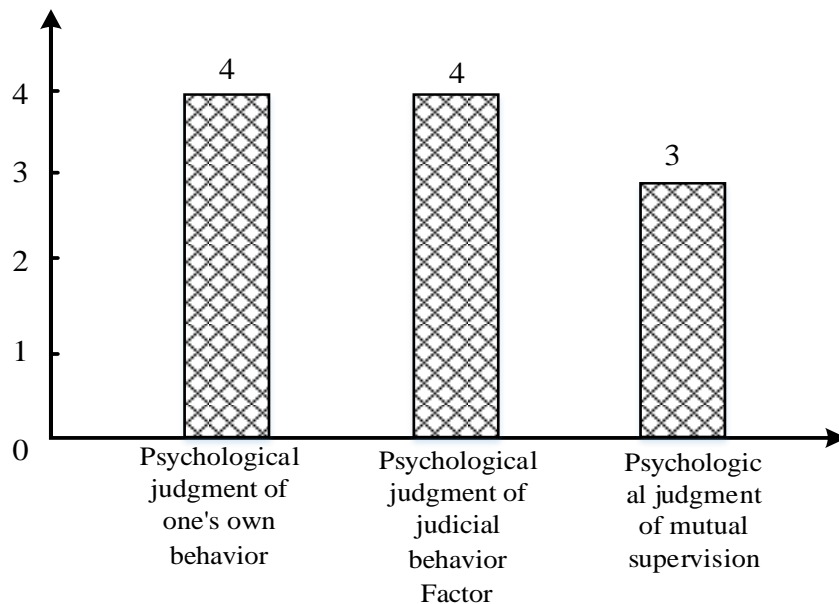

Figure 1. Social psychological function of criminal law regulation

In Figure 1, among the three social psychological functions of psychological judgment of social individuals' own behavior, psychological judgment of judicial behavior and psychological judgment of mutual supervision of social individuals, the psychological judgment of their own behavior and psychological judgment of judicial behavior are the most affected by the criminal law regulation of telecom network fraud, and the influence level reaches level 4, which constitutes a significant impact, while the psychological judgment of mutual supervision of social individuals only reaches level 3, constitute a significant impact. It can be seen that the criminal law regulation of telecom network fraud can have an impact on the psychological cognition of social groups from two aspects: the judgment of their own behavior and the judgment standard of judicial behavior.

Conclusions: Most social groups still lack specific understanding of telecom network fraud, a new criminal means rising with modern network technology. Through the regulation of criminal law, we can regulate the cognitive psychology and actual behavior of social groups from the perspectives of legal norms and social psychology. This paper comprehensively standardizes the behavior of telecom network fraud crime from three functional perspectives: the judgment standard of social individual's own behavior, the judgment standard of judicial behavior and the judgment standard of social individual's mutual supervision, so as to control the spread of new telecom network fraud crime.

* * * * *

THE VOLATILITY EFFECT OF INTERNATIONAL FINANCIAL MARKET UNDER THE BACKGROUND OF SOCIAL PSYCHOLOGY

Letian Hu¹ & Xin Zhang²

¹*School of Economics and Management, Guilin University, Guilin 541006, China*

²*School of Business, Trade and Law, Guilin University, Guilin 541006, China*

Background: In social psychology, cognition refers to the information processing process including feeling, intuition, thinking, memory and other elements in the process of social individuals acquiring and applying knowledge. The cognitive decision-making process will also produce deviation according to the individual's own special and different ability to process information. Within the scope of social groups, the consensus with characteristics generated among different individuals may also change the self-decision-making of other minority individuals and form group decision-making. This kind of decision-making behavior is generally reflected in human investment psychological behavior. When financial market investors face investment decisions, they often have psychological deviation due to the fluctuation of international financial market, senior investment psychological preference and other factors. This psychological deviation can be roughly divided into the following types: herd behavior, which is reflected in that when the information obtained by investors is asymmetric or incomplete in the social environment, investors will question their decision-making basis at the psychological level and follow the overall decision-making of large-scale social groups. Behavioral preference refers to a set of relatively fixed investment models established by investors based on their familiarity with investment behavior. In most cases, investors only invest based on their own investment model. Overconfidence means that investors believe in their optimistic judgment excessively when facing the external environment, and the investment expectation is always higher than the expected level expressed by market changes. Disposal effect, that is, the behavior of investors is not based on the conclusion of rational thinking and trade-off, but out of more urgent motivation. Anchoring effect, that is, the long-term decisions made by investors often change to a certain extent due to the frequent fluctuations of the actual situation. Remorse avoidance effect: investors who have experienced remorse are prone to impulsive behavior of avoiding remorse due to psychological stress effect. The greedy effect, that is, investors' attitudes change dramatically with the drastic changes in the external environment. When the external changes give investors better information signals, investors' psychological expectations will rise sharply and take action immediately, and their psychological tendency is more radical. The above types of social psychological tendencies are reflected in the fluctuating environment of the international financial market. Through the research on the psychological tendency and psychological motivation behavior of investors in the fluctuating environment of the international financial market, we can provide a certain psychological theoretical basis for market supervision.

Objective: This study analyzes the psychological state of investors under the fluctuation environment of the international financial market and the psychogenic behavior caused by psychological deviation from the perspective of social psychology, and then studies the motivation and influence relationship between the fluctuation of the international financial market and the social psychology of investors, so as to provide an idea for the supervision of psychogenic behavior of investors in the international financial market.

Subjects and methods: This study uses the combination of quantitative research and the VAR model to study the relevance and influence by combining the indicators of international financial changes with the social and psychological indicators of investors.

Study design: This study first selects the international financial market and investors' social psychological indicators through qualitative analysis, then quantifies the qualitative indicators, establishes a VAR model with the help of international financial market indicators, investors' social psychology and confidence indicators, and discusses the dynamic relationship between variables through this model. Then it analyzes the two-way interactive relationship between investors' social psychology and the fluctuation of international financial market.

Methods: In this study, when analyzing the interactive relationship of data under different indicators, due to the large relationship between data dimension and numerical level, the data standardization method is adopted for unified processing.

Results: The social psychology of investors is affected by the fluctuation of financial market, as shown in Figure 1.

Figure 1 analyzes the three main psychological types of investors: conformity psychology, preference psychology and expectation psychology. Among them, preference psychology and expectation psychology are significantly affected by financial market fluctuations, while conformity psychology is significantly affected by financial market fluctuations.

Conclusions: Fluctuations in international financial markets often have a significant impact on the psychological state of investors. As a social individual with limited rationality, the psychological deviation caused by the fluctuation of the international financial market is likely to lead to the deviation of rational expectation and even actual utility, and the collection of group psychological deviation in the financial market will further lead to systematic deviation in the international financial market. Therefore, effective control of investors' social psychology can correct investors' psychological deviation from a cognitive

perspective, and then indirectly play the effect of supervising the international financial market.

Figure 1. Analysis of investors' psychological impact

THE INFLUENCE OF VIRTUAL REALITY COURSE OF DIGITAL MEDIA MAJOR ON STUDENTS' LEARNING PSYCHOLOGY IN COLLEGES AND UNIVERSITIES

Yuchen Song & Yi Chen

School of Arts and Design, Nanjing Vocational University of Industry Technology, Nanjing 210000, China

Background: Educational psychology is a science that accurately reflects the psychological changes of students and the psychological function relationship between teachers and students in the process of education. Under the function of educational psychology, teachers can adjust the teaching mode according to students' psychological state, and then help students form a positive cycle of learning psychology and more efficient learning habits. The constructivist psychological education method in educational psychology holds that with the development of students' intelligence and theoretical knowledge, there is a development range of learning achievements in the student union, which is a psychological behavioral feedback cycle of efficient learning and efficient return. The goal of psychological teaching is to mobilize students' internal learning ability and enthusiasm through teachers' psychological guidance, make them build their own framework, and maintain the positive cycle of learning psychology and learning behavior in an efficient area. In this process, students' learning ability and knowledge structure ability are regarded as developable constants, so students' learning results mainly depend on students' psychological enthusiasm and subjective initiative. The way of students' psychological enthusiasm is mainly the sense of pleasure and immersion brought to students by the learning process. The learning atmosphere and rhythm in the teaching process will have a strong impact on students' enthusiasm. On this basis, appropriate psychological incentive method is also helpful to students' positive psychology. In terms of students' subjective initiative, students' learning motivation depends on their deep recognition of learning content and learning behavior. From a psychological point of view, the satisfaction of students' psychological needs can skillfully improve students' motivation. In the teaching of digital media specialty in colleges and universities, virtual reality course, as a high-tech teaching means, can help students maintain a sense of immersion and freshness in the learning process, mobilize students' learning enthusiasm and subjective initiative, and use the characteristics of virtual reality to help students recognize and understand the knowledge system more three-dimensional in the teaching process. Promote students to shape a more comprehensive and

three-dimensional thinking ability, and provide students with a new learning experience different from traditional education.

Objective: This study analyzes the psychology of college students majoring in digital media from the perspective of educational psychology, applies the virtual reality course to the curriculum system reform, improves students' learning enthusiasm through the virtual and interactive characteristics of the virtual reality course, and provides students with a more immersive learning experience.

Subjects and methods: This study combines the factor analysis method with the grid subdivision algorithm, designs the virtual reality curriculum through the grid subdivision algorithm, and analyzes the relationship between students' learning psychology and the characteristics of virtual reality teaching of digital media specialty through the factor analysis method.

Study design: According to the characteristics of virtual media, the course is designed in the form of virtual reality. On this basis, the psychological state and learning effect of students in the process of curriculum learning is recorded in the form of pilot curriculum, and on this basis, the correlation characteristics between curriculum elements and students' psychological elements in the process of virtual reality teaching are analyzed by factor analysis.

Methods: This study uses Excel to count the psychological data of college students majoring in digital media.

Results: The analysis results of students' psychological impact at different levels are shown in Figure 1.

Figure 1. Analysis of students' psychological influence

Figure 1 among the three psychological modes of interest psychology, cognitive psychology and immersion psychology of middle school students, the influence degree of interest psychology and cognitive psychology is level 3, which constitutes a significant influence, while the influence degree of immersion psychology is level 4, which constitutes a significant influence. It can be seen that the virtual reality curriculum system can best affect college students majoring in digital media in terms of immersion psychology, so that students can obtain a sense of learning immersion, and then improve the learning experience and learning effect

Conclusions: Virtual reality, an emerging technology, is beneficial to improve students' learning experience from the psychological level, and then help students form a positive learning feedback cycle from the perspective of psychological incentive behavior. Digital media courses combined with virtual reality technology can be taught in a more three-dimensional and appropriate way, which is more conducive to students' cognitive understanding. At the same time, the establishment of a virtual reality curriculum system is also beneficial to the students majoring in digital media to improve their learning freshness and enthusiasm. In the learning process, it provides students with a more immersive learning experience beyond the traditional forms of education, so as to help students form their subjective initiative in learning and improve their learning effect from both direct and indirect perspectives.

THE INTERVENTION EFFECT OF CULTURAL APPRECIATION OF TOMB MURALS ON GROUPS WITH COGNITIVE IMPAIRMENT IN THE HAN AND TANG DYNASTIES

Zuyuan Wang^{1,2}

¹*School of History, Zhengzhou University, Zhengzhou 450001, China*

²*School of Architecture, Henan University of Technology, Zhengzhou 450001, China*

Background: Cognitive impairment refers to that the cognitive ability of social individuals being inconsistent with the general cognitive ability of individuals of normal age or normal education level, but individuals still have a certain degree of daily living ability and do not have dementia symptoms. In the early description of the clinical characteristics of cognitive impairment, the identification of cognitive impairment requires the existence and persistence of subjective memory impairment for more than half a year. At the same time, the objective memory and learning ability are significantly reduced, and the overall cognitive ability does not meet the criteria for dementia. With the progress of the times, the concept of cognitive impairment with memory impairment as the main connotation has been gradually expanded. The scope of cognitive impairment includes not only forgetting cognitive impairment, but also non-forgetting cognitive impairment. With the expansion of the scope of inclusion, there is a significant decline in phased cognitive ability (including the decline of subjective self-cognitive ability experience and the decline of cognitive ability under objective judgment of others). However, individuals whose daily activity ability still belongs to the normal category can be included in the category of cognitive impairment. This includes a variety of cognitive impairment groups between normal aging and dementia, such as memory impairment, executive ability disorder, attention disorder and so on. These symptoms intersect and are extremely unstable, which form the common precursor symptoms of a variety of dementia diseases. Some people with cognitive impairment have congenital cognitive deficiency in the face of cultural information, that is, it is difficult to effectively extract, recognize and remember abstract information. In modern society with high cultural popularity, people with cognitive impairment belong to one of the physiological vulnerable groups. As one of the excellent traditional Chinese cultures, the cultural value of the tomb mural culture in the Han and Tang Dynasties cannot be effectively conveyed to the groups with cognitive impairment. Therefore, this study studies the cultural appreciation of the tomb mural culture in the Han and Tang Dynasties for the groups with cognitive impairment, and puts forward the auxiliary strategies for cognitive impairment by analyzing the characteristics of cognitive impairment. So as to help the groups with cognitive impairment more effectively accept and understand the cultural value of tomb murals in the Han and Tang Dynasties.

Objective: This study analyzes the cognitive difficulties in the process of appreciating the tomb murals of the Han and Tang Dynasties by the groups with cognitive impairment, and then establishes a popular auxiliary strategy for cultural appreciation of the groups with cognitive impairment to help the groups with cognitive impairment understand and appreciate the tomb mural culture of the Han and Tang Dynasties.

Subjects and methods: This study combines the support vector machine algorithm with the usability evaluation technology to analyze the psychological characteristics, find the psychological correlation elements, establish the psychological overall planning model and analyze the effectiveness of the psychological model in order to study the auxiliary strategy of cultural appreciation of tomb murals in Han and Tang Dynasties.

Study design: In this study, patients with cognitive impairment were selected for the experiment of appreciating tomb murals in the Tang Dynasty, and the characteristics of cognitive impairment in the process of appreciating tomb murals in the Han and Tang Dynasties were classified by using support vector machine algorithm. On this basis, the psychological cognitive model of appreciating tomb murals in the Han and Tang Dynasties was established. Finally, usability evaluation technology is used to evaluate the effectiveness of the psychological cognitive model of tomb mural appreciation.

Methods: This study used online eye-tracking technology to record the eye movement data of experimental participants, and combined the data with the results of psychological interviews.

Results: The results of patients' psychological cognitive performance are shown in Figure 1.

The psychological cognitive performance of patients used in this study is divided into memory psychological cognition, understanding psychological cognition, loving psychological cognition and participatory psychological cognition. To a large extent, the four psychological manifestations can show the cognitive depth changes of patients with cognitive impairment. Memory represents the shallowest psychological cognition, while participating representatives can participate in group discussion, which is the deepest psychological cognition. Among them, the cognitive number of understanding sexual psychological cognition reached 62, with the largest number. It can be seen that the largest number of patients are in the second level of cognition, and some of them have not formed a psychological preference for arrival.

Figure 1. Psychological cognitive performance of patients

Conclusions: Due to their physiological cognitive defects, patients with cognitive impairment will encounter various obstacles in the appreciation of tomb murals in the Han and Tang Dynasties, making it difficult for them to understand the cultural value of murals. By analyzing the characteristics of patients' psychological cognitive impairment when appreciating murals, we can obtain the key cognitive elements of patients, establish a cognitive auxiliary model, help patients understand the cultural value of tomb murals in the Han and Tang Dynasties, promote the cultural dissemination of Chinese traditional culture among social vulnerable groups, and provide a basis for the establishment of a traditional culture promotion society traditional culture provides part of the theoretical basis for a sharing society.

RESEARCH ON THE APPLICATION OF ADVANTAGEOUS CARRIERS AND INTRODUCTION STRATEGIES OF CROSS-CULTURAL EDUCATION IN ENGLISH TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Yongqi Wang

School of Foreign Languages, Heze University, Heze 274000, China

Background: Educational psychology is a subject whose main research object is the psychological law of students. In educational psychology, students' learning behavior and learning results often depend on students' psychological factors, which mainly take emotion and motivation as the main driving force of learning progress. However, in cross-cultural education, students' English learning achievement depends not only on the emotional motivation of their own subjective initiative, but also on the psychological impact of the external learning environment on students. In the process of English learning, students' individual psychological variables, psychological differences caused by language acquisition environment, psychological acceptance of cross-cultural language and other psychological factors will have a serious impact on students' English learning. In the part of the differences of students' individual psychological variables, students' purpose of learning cross-cultural language will have a significant impact on their learning behavior. In the process of learning English, students' psychological non acceptance and non-recognition of cross-cultural language is likely to be an important reason why it is difficult to improve their learning results, most students who are difficult to learn English well lack internal motivation because they are difficult to find the purpose of learning English at the psychological level. The concept of going abroad for further study, which has a strong purpose, will continue to be based on the motivation of students' self-supervision at the psychological level to promote the improvement of students' learning achievements. In addition, the environment of language learning also determines the effect of students' English learning. Students living in a cross-cultural environment from an early age will promote their cultural and emotional development and the transformation of psychological concepts through the second language when they first contact the social communication network. This transformation provides help for

students to achieve better second language learning results. In the process of English cross-cultural teaching, teachers should actively make use of the impact of these external psychological factors on students' English learning process, optimize the learning carrier, strengthen the introduction effect of English learning, so as to promote students' acceptance of English and improve the effect of English learning.

Objective: This study starts with the internal and external psychological factors of students in the process of cross-cultural second language learning, and improves the effect of students' learning introduction by optimizing the production conditions of external positive psychological factors, so as to promote students to improve their English ability.

Subjects and methods: This study combines neural network algorithm with comparative analysis to classify students with psychological characteristics in the process of English learning, and compares the psychological states of students with cross-cultural education and ordinary students without cross-cultural education.

Study design: In this study, cross-cultural education courses are tried out in colleges and universities, and on this basis, the learning process data of students are obtained through the teaching background system of colleges and universities. The psychological states of English students who participate in cross-cultural education and those who do not participate in cross-cultural education are compared, and the psychological characteristics of different individuals are classified by neural network algorithm, In the classification and comparison, it analyzes the psychological advantages formed by students in the learning process under the intervention of cross-cultural education.

Methods: This study uses the background of colleges and universities to obtain students' learning materials, and uses algorithm programs to classify.

Results: The comparison results of the positive effects of different educational psychological elements on students are shown in Figure 1:

Figure 1. Comparison of positive effects of educational psychological elements on students

In Figure 1, among the students who adopt cross-cultural education, the number of students whose internal psychological factors have a positive impact on their English learning effect is 42, the number of students whose external psychological factors have a positive impact on their English learning effect is 41, and the number of students whose personality guiding factors have a positive impact is 28. The number of students in the category of 13 psychological factors is lower than that in the category of traditional psychological factors. The number of students in the category of 13 psychological factors is the same as that in the category of 13 psychological factors. It can be seen that cross-cultural education has stronger advantages in students' internal psychology, external environmental psychology and personality guidance factors. It can give students stronger psychological guidance, form the amplification effect of educational factors at the psychological level, and help students form stronger learning motivation.

Conclusions: In the process of English teaching, compared with traditional education methods, cross-cultural education can not only provide students with internal psychological driving force, but also provide students with an external environment to contact the second language culture. Internal and external factors act on students' psychological level, which can more effectively help students improve their psychological acceptance of the second language and form their second language thinking cognition, Provide help for English learning.

EXPLORATION AND OPTIMIZATION OF THE CONSTRUCTION PATH OF ECOLOGICAL CIVILIZATION EDUCATION FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Tianyun Tao^{1,2,3}, Juanjuan Wang^{3,4}, Yun Ma^{3,4}, Wang Chen^{3,4} & Yu Xue^{3,4}

¹Office of the President, Yangzhou University, Yangzhou 225009, China

²College of Agricultural, Yangzhou University, Yangzhou 225009, China

³College of Environmental Science and Engineering, Yangzhou University, Yangzhou 225009, China

⁴Soil Health Institute, Yangzhou University, Yangzhou 225009, China

Background: In the initial subject of educational psychology, “epiphany”, as an important sign of psychological changes in the learning process, has always been a psychological activity phenomenon pursued by educational psychology. With the gradual development of educational psychology, the complexity and diversity of students’ cognitive development ability in the process of education have been gradually recognized. How to achieve a good teaching effect through the application of psychological law has become the main topic of educational psychology. In the more traditional educational psychology theory, students’ intellectual development level, learning motivation and learning strategies are important factors affecting students’ learning behavior. Learners’ intellectual development level determines students’ learning degree and learning speed, and learning motivation can become the internal driving force of students’ active learning and help students maintain a subjective initiative of active learning. In the face of new knowledge and difficulties in the learning process, a pleasant attitude is helpful for students to have a more sober and comprehensive view of learning behavior in the learning process, and it is also the basis for students to develop learning strategies. With the development of educational psychology, the cultural path of educational psychology has gradually evolved. The core problem of cultural path in educational psychology lies in the guiding role of situational view in students’ situational cognition in the process of learning. Compared with the traditional didactic education, the education method with situational characteristics is easier to convey specific and applied information to students, and promote students to mobilize the existing knowledge in cognition to think in a new situation. This situational cognition is affected not only by students’ knowledge system, but also by the cultural environment in which students live. Through the construction of ecological civilization education, students can create a cultural environment with ecological civilization as the main proposition, and then create a cognitive situation of ecological civilization, so that students can apply their existing knowledge to this new situation and solve new problems.

Objective: This study creates an ecological civilization situation through the construction of ecological civilization education, and integrates students’ cognitive framework into this situation, so as to help students establish the concept of ecological civilization, promote students to understand the necessity of ecological civilization and learn the knowledge of ecological civilization.

Subjects and methods: This study combines support vector machine classifier with experimental intervention methods to analyze the correlation factors and influence degree between students’ psychological state and ecological civilization education by classifying and comparing differences.

Study design: This study uses support vector machine algorithm to classify students’ psychological states in the process of ecological civilization knowledge learning, and tests the impact of students’ different psychological deviation states on ecological civilization knowledge learning through experimental intervention, and then puts forward the path and strategy of ecological civilization education construction on this basis.

Methods: In the process of analyzing the influence of factors, this study adopts the five-level quantitative method, which is divided into five levels from level 0 to level 4. The higher the quantitative level is, the more significant the influence is.

Results: The impact of ecological concept on students’ psychological state is shown in Figure 1.

Figure 1 quantifies the impact of students’ ecological concept on their psychological state. It can be seen that the cultivation of ecological concept can help students improve their psychological cognition of ecological concept at the psychological level, enhance their sense of belonging to ecological and cultural atmosphere, and cultivate students’ psychological expectation for the positive development of ecological culture and ecological society.

Figure 1. Voltage and current waveform comparison

Conclusions: Due to the differences in the concept influence of students in the process of growth, they will have different psychological deviation states in the process of receiving ecological civilization education. These psychological deviation states may have an impact on ecological civilization education. This study analyzes the heart rate deviation of students in the process of ecological civilization learning, so as to provide targeted construction basis for the construction of ecological civilization education. The results show that students' psychological cognitive deviation, knowledge and behavior transformation deviation and lack of ecological belonging may lead to students' insufficient psychological acceptance of ecological civilization education and affect the learning effect. Therefore, we should make great efforts to popularize ecological knowledge, give full play to the main channel role of psychological education, strengthen the penetration of the concept of ecological civilization in various professional courses, and strengthen the construction of cognitive situation of ecological civilization from all aspects, so as to provide environmental advantages for students' ecological civilization learning.

AN ANALYSIS OF THE IMPACT OF THE "FAMILY" CULTURAL EDUCATION MODEL OF THE ACADEMY SYSTEM IN INTERNATIONAL COLLEGES AND UNIVERSITIES ON THE PSYCHOLOGICAL PLIGHT OF MULTINATIONAL STUDENTS

Changjian Hu

College of International Cooperation, Xi'an International University, Xi'an 710077, China

Background: In international education, cross-cultural psychological adaptation has always been one of the main research topics. In psychology, cross-cultural psychological adaptation refers to the process in which social individuals or social groups reconstruct their psychological cognition in the process of responding to the external needs of the new cultural environment when they reach a new cultural environment. There are only two ways for individuals to adapt to the external environment in a strict psychological way. Ultimately, there are only two ways for individuals to adapt to the external environment, and there is no psychological correct result. Another result is that individuals cannot successfully reconstruct their psychological cognition, resulting in the state of resisting the external social environment for a long time. The individual's good psychological adaptation process will play a positive role in promoting

their mental health. The individual's psychological personalized variables can match the life change time of the external society and the prediction of social support. At the same time, they show a semi-naturalized state in the continuous psychological experience. Individuals who maintain inner resistance to the external social environment will inevitably encounter various difficulties in their daily life because they are difficult to integrate into the local culture. It is easy for multinational students to have similar problems when they study in Chinese universities. Through the "home" cultural education of college system in colleges and universities from the perspective of internationalization, it can help multinational students overcome the period of cross-cultural psychological adaptation from a cultural perspective, solve students' daily learning and life difficulties and mental health needs, and provide multinational students with a good environment to integrate.

Objective: This study analyzes the cross-cultural psychological adaptation difficulties of multinational students, and analyzes the impact of "home" cultural education of college system on the daily learning life and mental health of multinational students from an international perspective, so as to provide mode optimization strategies for the international college system education model.

Subjects and methods: This study adopts the K-nearest neighbor algorithm and model building method. In the research process, the K-nearest neighbor algorithm is used for classification. At the same time, the whole person psychological development scale and college system identity scale are compiled, and on this basis, the college system student psychological development model is established. By analyzing the functional relationship of the elements in the model, this paper studies the advantages and disadvantages of the "family" cultural education mode of college system in colleges and universities from the perspective of internationalization.

Study design: This study uses the K-Nearest Neighbor algorithm to classify the psychological integration difficulties and cultural integration difficulties faced by multinational students, and combines the psychological difficulties faced by multinational students with the psychological education mode of "home" cultural education mode of college system in colleges and universities, it also puts forward the optimization path and strategy of multinational students' psychological education under the "family" cultural education mode of college system in colleges and universities.

Methods: SPSS19.0 was used in this study make statistics on the scores of students' psychological development dimension under the "family" cultural education mode of college system in colleges and universities.

Results: The psychological dilemma of multinational students are shown in Figure 1.

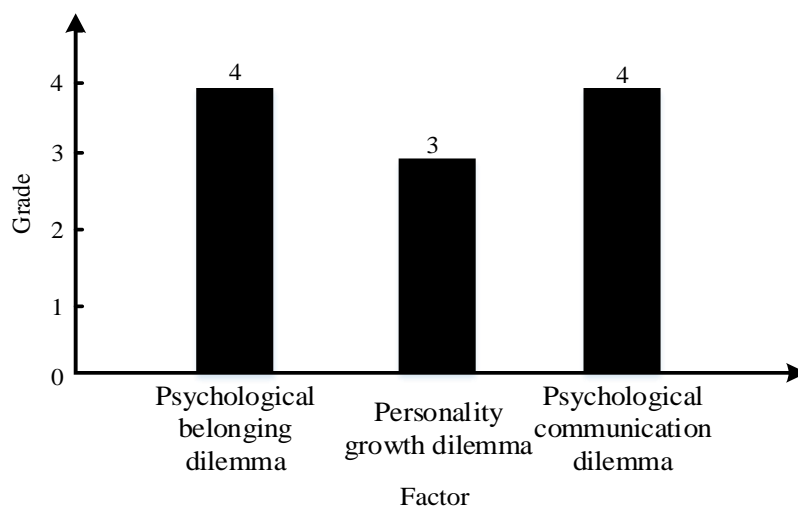

Figure 1. Degree distribution of psychological distress

Figure 1 from the analysis of three kinds of multinational students' psychological development dilemmas: psychological belonging dilemma, personality growth dilemma and psychological communication dilemma, it can be seen that among the three kinds of multinational students' psychological dilemmas, psychological belonging dilemma and psychological communication dilemma have a relatively large impact on multinational students' psychological development, while personality growth dilemma has a relatively small impact on multinational students' psychological development. The college can help students overcome their psychological difficulties from three aspects.

Conclusions: Multinational students often have difficulties in cross-cultural psychological adaptation during their study because of social and cultural differences. By analyzing the psychological adaptation of

multinational students, this study provides mode optimization strategies for the “home” cultural education mode of college system in colleges and universities from the perspectives of moral cultivation, learning motivation, psychological attribution and self-awareness, so as to help multinational students successfully pass the period of cross-cultural psychological adaptation. It provides a solution platform for the learning and living difficulties and psychological confusion caused by cultural differences in the daily life of multinational students, and provides theoretical support for the development of international college system “home” culture of domestic colleges and universities in line with the actual psychological situation of multinational students.

THE INFLUENCE OF TRADITIONAL VILLAGE LANDSCAPE DESIGN ON TOURISTS’ TOURISM PSYCHOLOGY UNDER ENVIRONMENTAL PSYCHOLOGY

Xiaolin Mei¹ & Changfeng Zou²

¹*College of Landscape Architecture and Art, Jiangxi Agricultural University, Nanchang 330045, China*

²*Jiangxi Rural Culture Development Research Center, Jiangxi Agricultural University, Nanchang 330045, China*

Background: According to the theory of environmental psychology, at the psychological level, human individuals have a great degree of consistency with the environment, that is, human beings require the environment to change due to their own needs, and the environment also has the ability to change human beings. Therefore, the starting point of harmonious coexistence between human and environment is the change of the concept of consistency between human and environment. In modern people’s environmental psychology, this consistency is often ignored because human beings will give priority to their own needs at the level of psychological cognition, such as individual financial needs, physiological preferences, changes in cognitive ability, and even individual needs caused by social factors. In the process of giving priority to needs, human beings subconsciously attribute the environment to constants that are difficult to change at the psychological level, and then ignore its impact on themselves. This misconception is still very common even in modern times. In environmental psychology, the interaction between human and environment is divided into two dimensions, namely, the cognition of interaction and the behavior form of interaction. In the two dimensions, there are two force directions of positive force and negative force respectively. By combining the two dimensions with the forces in two directions, we can get four models of psychological interaction, namely interpretation model Evaluation model, operation model and response model. The cognitive model of individual and the interpretation of the main characteristics of personality. The evaluation model mainly involves personal psychological tendency and attitude towards the environment. The operational model mainly involves the relationship between individual psychological activity space and environmental space. The response model mainly involves the positive or negative psychological perception of individuals in the environment. This study applies the concept of environmental psychology to the landscape design of traditional villages, and analyzes the psychological preferences of tourists in the process of tourism from the perspectives of interpretation, evaluation, operation and response, so as to lay a theoretical foundation for the landscape design of traditional villages and provide an optimized path for the development of traditional rural tourism industry.

Objective: This study analyzes the psychological needs of tourists for traditional villages and the psychological changes in the process of playing through environmental psychology, and applies it to the traditional village landscape design of the rural tourism industry to help the rural tourism industry improve the landscape design level and design a traditional village landscape more in line with the psychological needs of tourists.

Subjects and methods: This study combines the clustering algorithm with the factor analysis method, extracts the leading factors from the complex and diverse psychological states of tourists, and based on the leading factors, combines the traditional village landscape design with environmental psychology to study in the form of factor analysis.

Study design: This study uses the clustering algorithm to cluster the tourists’ personal psychological preferences in the traditional village tour, and finally forms several psychological preference classifications that dominate the tourists’ tour experience. On this basis, the elements of tourists’ psychological

preferences and the elements of traditional village landscape design are analyzed together through the element analysis method.

Methods: This study uses clustering algorithm program to cluster the psychological state of traditional village tourists, uses Excel table to sort out and count the element data, and uses the five-level quantitative method to analyze the impact analysis. The higher the level, the higher the degree of impact.

Results: The impact of tourists' psychological preference on the landscape design of traditional villages is shown in Figure 1.

Figure 1. Tourist psychological elements

In Figure 1, among the four psychological elements of tourists' psychological space, aesthetic preference, participation experience and psychological guidance, the three psychological elements of aesthetic preference, participation experience and psychological guidance have a greater impact on the landscape design of traditional villages, reaching level 4, while the psychological space only reaches level 3. This is because the scope of tourists' personal psychological space is constantly changing according to environmental changes, and each individual has different measurement methods. However, aesthetic preference, participation experience and psychological guidance dominate the psychological experience of tourists in the process of traditional village tour, so it is more important.

Conclusions: In the landscape design of the tourism industry, the psychological factors of tourists are very important. If we can't grasp the psychological needs of tourists, we can't design a landscape welcomed by tourists. Starting from environmental psychology, this study analyzes the psychological state of tourists in the process of visiting the traditional village landscape, and extracts the tourists' psychological preferences in terms of psychological space, aesthetic preference, participation experience and psychological guidance, so as to provide a psychological theoretical basis for the traditional village landscape design of the tourism industry. Help the tourism industry to enhance the tourist attraction of self-designed traditional village landscape.

THEORETICAL ANALYSIS AND SKILL EXPLORATION OF COLLEGE ENGLISH TRANSLATION TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xuemei Jin

School of Foreign Languages, Qianan Normal University for Nationalities, Duyun 558000, China

Background: With the help of psychological theory, educational psychology analyzes and intervenes the

psychological laws and change characteristics of both subject and object in teaching under specific circumstances, and is of great significance to teaching design, teaching scheme, teaching means and teaching motivation guidance in the teaching process. Educational psychology is the application and expression of psychological theory in the field of education. On the premise of respecting students' individualization and difference, it actively intervenes and guides students' knowledge learning ability, personality development and talent training means. At the same time, educational psychology takes building morality and cultivating people as the educational concept and adheres to people-oriented as the teaching purpose. It can provide psychological science theoretical basis for curriculum setting and provide ideological guidance for teachers to improve teaching quality and teaching means. The teaching process is essentially a process of interaction and progress between both sides of teaching. With the help of educational psychology, we can choose appropriate teaching means and methods on the basis of understanding the psychological characteristics of teaching subjects and educational psychology, so as to improve teaching quality and efficiency. As far as foreign language teaching is concerned, various schools of pedagogy in history have directly established their own theoretical systems based on the corresponding psychological views. In China's current higher education, the cultivation of students' English ability has gradually become one of the key directions of education, and English translation is an important way for students to understand English and master English learning methods. However, in the current English translation teaching in colleges and universities in China, the limitation of teaching materials and the lack of teaching theory system make the classroom less interesting, the enthusiasm of students' participation is poor, and the teaching effect is not satisfactory. The students' innovation and application of English teaching methods are limited to a certain extent. Therefore, the intervention of English translation teaching means and programs with the help of educational psychology theory can help students better understand English translation theory and skills. Furthermore, students' anxiety, anxiety, resistance and other negative emotions and mental diseases caused by the difficulty of professional learning can improve their mental health level and emotional regulation ability.

Objective: To analyze the teaching problems and learning psychological laws of students in the process of English translation teaching with the help of educational psychology. And grasp the students' theoretical cognition and skills in English translation, and improve their psychological problems and negative emotions caused by professional learning problems.

Research objects and methods: The research takes English majors in a university as the research object. It collects information on the learning problems and needs of college students and the current situation of English translation teaching, and then improves and optimizes the college English translation teaching model to build a new model that meets the psychological needs of students and the characteristics of English teaching. And test the improvement of students' psychological status with the new teaching model.

Method design: With the help of principal component analysis, this paper makes a factor analysis on the influencing factors affecting the effect of English translation teaching, and then optimizes the classroom model, teaching means, teaching resources and teaching practice of English translation teaching, so as to analyze the changes of learning quality and professional ability of the experimental subjects in four months. The data before and after the experiment are compared and analyzed to explore the theory and skill teaching model of college English translation teaching from the perspective of educational psychology and the improvement of students' psychological problems.

Methods: SPSS22.0 analysis tool to process the experimental data, extract the influencing factors by principal component analysis, and analyze the changes of students' learning situation and psychological emotion before and after the experiment with the help of the new teaching classroom model.

Results: From the perspective of educational psychology, improving the current college English translation teaching classroom is helpful to grasp the teaching focus and breakthrough, improve students' understanding of English translation theory and skills, and further improve their professional ability. The results show that the college English translation education classroom under the improvement of educational psychology can greatly improve students' learning initiative and creativity and improve their professional quality on the basis of grasping students' needs. Table 1 shows the changes of students' psychological emotion before and after the improvement of classroom teaching mode.

Table 1. Changes of students' psychological emotion before and after the improvement of classroom teaching mode

Learning psychological emotion	Anxiety	Depression	Uneasiness	Resistance
Before improvement	35.35±4.62	27.16±3.35	24.25±7.53	22.86±3.48
After improvement	17.68±3.17	14.37±1.26	11.34±5.101	12.24±4.24

Conclusions: Educational psychology can effectively grasp the psychological law and teaching law of

teaching subject and object, teach students according to their aptitude, teach without category, and greatly improve the teaching level and quality. College English translation course is of great significance for students to understand English and improve their English level. Therefore, teachers should actively change their inherent concepts, actively integrate educational psychology into the teaching process, help students master more translation skills, improve their professional ability and comprehensive quality, and better adapt to the development requirements of the times for talents.

A STUDY ON THE INFLUENCE OF PRAGMATIC FAILURE CAUSED BY LOGICAL BARRIERS IN CROSS-CULTURAL COMMUNICATION

Weijun Duan

College of Foreign Studies, Jinan University, Guangzhou 510632, China

Background: Thinking logic refers to the ability to observe, compare, analyze, summarize, judge and reason things with scientific logical methods, and then accurately and orderly express our thinking process. It is an important tool for us to recognize and guide the objective world. As a cognitive process with mathematical characteristics, thinking logic emphasizes the logic between things. It is an important embodiment of the unity of external things and their own cognitive level. It has high requirements for people's language organization ability and thinking expression ability. The differences of education level, age structure and self-cognition level will make individual thinking show different thinking and cognitive habits at different stages and times. When an individual is carrying out cognitive activities, it will produce thinking logic obstacles under the influence of the confusion of thinking starting point, the fuzziness of thinking image, the deviation of thinking direction and the confusion of thinking logic, which will make it difficult for objective things to appear normally in the human brain, which is manifested in the abnormality of thinking process and thinking content. Thinking logic disorder mostly refers to the lack of certain logicity and coherence in the connection of language organization. It often has the symptoms of poor thinking, slowness, mandatory thinking, pathological restatement and delusion. It is often manifested in pathological symbolic thinking, new words, logical wrong thinking and sophistry thinking. Its essence is that thinking deviates in the process of information processing and processing. Thinking logic disorder will not only affect people's thinking ability and cognitive ability, but also make them lack comprehensiveness and objectivity in the analysis and treatment of problems, affect the depth and breadth of things evaluation, and seriously doubt their own behavior and affect people's normal life.

When using local language for communication, there is often no semantic ambiguity or pragmatic failure to cause thinking logic obstacles. Language communication ability and organizational ability are the concentrated embodiment of thinking logic, while "cross-cultural communication" refers to the communication between people with different language backgrounds and languages, which is an embodiment of comprehensive competitiveness. It is also a comprehensive test of language users' language application ability in the process of communication. However, in the current college English education, teachers ignore the cultivation of students' language expression ability and communication ability, and students are unable to understand the logical connotation in English culture in cross-cultural communication learning and practice due to the lack of relevant language background learning and differences in language habits, resulting in pragmatic failure. Therefore, exploring students' pragmatic failures in cross-cultural communication from the perspective of thinking logic disorder will help to enhance students' confidence in English understanding logic and language communication, and then alleviate their symptoms of thinking logic disorder, which has important practical significance and guiding value.

Objective: Starting from the characteristics of students' thinking logic and the current situation of English teaching, this study focuses on the cultivation of students' cross-cultural communication ability, and carries out targeted teaching and intervention according to their existing language logic problems, such as language background learning and dialogue training, so as to improve the teaching mode, so as to continuously improve students' thinking logic obstacles and improve their professional ability and mental health.

Research objects and methods: The study takes 900 English Majors in three universities as the research object, collects information and evaluates their thinking logic level, thinking misunderstanding and cross-cultural communication level, and then explores the correlation between thinking logic obstacles and

English cross-cultural communication ability with the help of association rule algorithm. And according to the problems and needs of the research object in English teaching, so as to improve students' pragmatic failure and thinking logic misunderstanding in cross-cultural communication.

Method design: Explore the correlation between thinking logic ability and English cross-cultural communication level with the help of association rule algorithm, and carry out group teaching intervention according to students' cross-cultural communication learning status and thinking logic characteristics. The experiment lasted for eight weeks. After the experiment, the students' thinking logic improvement and cross-cultural communication level were collected and processed.

Methods: The deviation between the expression of logic and the expression of logic will affect the input and output of thinking. The research uses an association rule algorithm to explore the correlation between thinking logic ability and English cross-cultural communication level, and intervenes the research object with targeted teaching means, so as to analyze the improvement of students' thinking logic with the help of statistical analysis tools, and obtain the experimental results.

Results: People's thinking activities include four aspects: thinking association, thinking logic, thinking reasoning and thinking content. When people output information, they will process and process it in their mind in advance. If there are problems such as abnormal thinking process and illogical logic, there will be thinking logic obstacles. The communication ability and communicative ability of language are the display of thinking logic. The fluency and rationality of thinking logic language will affect the accuracy of language information output. Intercultural communicative competence is the ability to make rational use of language on the basis of a certain understanding of language. The deep-seated connotation of language expression is to reorganize and reproduce language information on the basis of grasping the deep-seated connection of thinking logic. Exploring the pragmatic failure caused by the thinking logic barrier in cross-cultural communication ability, it can help to reduce the logical confusion and other problems existing in the process of language use, so as to improve the thinking expression ability and improve the thinking logic barrier. Table 1 shows the scores of each dimension of students' thinking logic disorder before and after the experiment.

Table 1. Statistics on the difference of students' thinking logic scores before and after the experiment

Representation dimension	Before the experiment	After the experiment
Thinking processing bias	25.24±2.43	12.77±2.49
Confusion of thinking logic	28.42±2.77	8.28±2.63
Coherence of thinking language processing	22.43±2.05	11.22±3.83

Conclusions: The communicative competence of language and culture not only refers to the improvement of language expression ability, but also requires students to master the corresponding basic cultural knowledge and cultural background. The cross-cultural communicative competence not only reflects the students' ability to use the language, but also reflects the logic and fluency of information processing. With the help of college English teaching reform to improve students' cross-cultural communicative competence, it will help to improve students' ability of language organization, adaptability and speculation, deeply grasp the logic and internal relationship of English language, and strengthen their ability of information processing. Then reduce the thinking logic obstacles such as language errors and improve the level of mental health.

TELLING CHINESE STORIES WELL IN THE CONTEXT OF COGNITIVE PSYCHOLOGY: INNOVATIVE EXPRESSION OF CULTURAL VARIETY SHOWS

Shu Zhou

*School of Journalism & Communication, Hunan Mass Media Vocational and Technical College, Changsha
410100, China*

Background: Cognitive psychology is a psychological trend rising in the West in the mid-1950s. It is a psychological mechanism as the basis of human behavior. Its core is the internal psychological process between input and output. It aims to study the operation of memory, attention, perception, knowledge

representation, reasoning, creativity and problem-solving. For the category of cognitive psychology, there are two versions: broad sense and narrow sense. The broad sense believes that cognitive psychology is the advanced psychological process of human beings, while the narrow sense believes that cognitive psychology is the process of information processing. In this process, the psychological mechanism based on human behavior is the information processing between information input and output. Modern cognitive psychology believes that human activities are a unified whole of interrelated and interactive cognitive elements, rather than a single and one-sided. Different individuals have different cognitive states of the same thing, and people's cognitive activities are very vulnerable to the interference of external things and the influence of mental and psychological state, showing different forms in different stages. Cognitive psychology helps us understand and perceive the world, and as a psychological intervention theory, it can guide us to give better play to creativity and innovation in real life. Mastering the learning methods and psychological laws of cognitive psychology will help us speed up the speed of cultural input and output on the basis of understanding the operating mechanism of cognitive psychology, and better create spiritual and cultural works that meet the cognitive needs. At the same time, there is a close relationship between mass media and audience sexual psychology, which is the embodiment of demand and satisfaction theory. The audience's psychology is affected by the audience's personality, age structure, demand level, psychological expectation and other factors, and will have different psychological expectations and sensory experience in the process of watching the program. At the same time, an in-depth understanding of the impact of the audience's demand level, personality type, psychological expectation, behavior motivation and other factors is conducive to grasp the connection point between the audience's psychological characteristics and media management, so as to reduce the risk for the number, direction, theme, presentation effect and style of program production, and realize media health. Since the general office of the CPC Central Committee and the general office of the State Council issued the opinions on the implementation of the inheritance and development project of Chinese excellent traditional culture, accelerating literary and artistic creation is one of the key tasks of inheriting Chinese excellent traditional culture. The majority of literary and artistic creators should not only pay attention to the combination of excellent traditional culture with artistic values and the requirements of the characteristics of the times, display in rich and diverse artistic forms, but also adhere to the creative transformation of culture Innovative development. The presentation of the content of many cultural variety shows has marked that the innovative development of traditional culture has entered a new stage. However, in the process of its development, the interpretation of cultural connotation and humanistic value of artworks is not deep enough, and some content expressions flow on the surface of culture, which is difficult to strengthen people's participation, interaction and innovation of traditional culture.

Objective: The audience's personality includes five aspects: emotional stability, extroversion, openness, easygoing and prudence, and the audience's psychological demand level for variety shows changes. Different psychological expectations will affect their starting point and psychological preference for media themes. From the perspective of cognitive psychology, strengthen the innovative expression of cultural variety shows, make them create a cultural form more in line with the public's favorite and cognitive needs, and meet the level of the audience's psychological needs, so as to guide the correct establishment of the public's cognitive value and the improvement of the psychological mechanism.

Research objects and methods: 200 students majoring in editing and directing in a film academy were selected as the research objects. By collecting their evaluation views on the current cultural variety show and their own cognitive status, taking the spread of classics as an example, they were then taught about the content of cognitive psychology, and asked to produce a small video of cultural variety show within 10 minutes after learning. In order to evaluate the changes and differences in the cognitive level of the subjects.

Method design: The subjects were randomly divided into learning group and non-learning group. The difference lies in whether they learned the background knowledge of cognitive psychology. The experimental time is four weeks. Then, video creative works are used to evaluate the influence of cognitive psychology on the creative ideas of cultural variety, the expression forms of traditional culture and the unique perspective of telling Chinese stories.

Methods: The association between cognitive psychology and literary creation was explored by association rule algorithm with the help of SPSS22.0 statistical tools to analyze the differences of the data of the experimental subjects.

Results: Using cognitive psychology to analyze the creative means and ideas of literary and artistic works is helpful to help students understand the expression of traditional culture, provide new ideas for their creative and communication methods, and it is easier to guide the public to establish correct values and improve their psychological cognition level with excellent works on the basis of grasping the psychology of the audience. Table 1 shows the statistical differences of cognitive performance of experimental subjects in different groups.

Table 1. Statistical differences in cognitive performance of experimental subjects in different groups

Evaluating indicator	Study group	Non learning group	t	P
Satisfaction of public cognitive needs	4.79±3.56	3.10±2.88	2.77	0.042
Innovative expression of traditional culture	5.84±2.13	3.07±1.54	3.68	0.039
Guidance of correct values	9.67±3.12	2.46±2.31	4.94	0.001

Conclusions: The audience’s expectation of the program will also affect their psychological changes. In addition to pursuing the satisfaction of entertainment needs, the educational function of knowledge acquisition to make up for their own limitations is also one of the manifestations of the audience’s needs. When inheriting excellent traditional culture, cultural variety shows should actively absorb what can be used for reference under the principle of openness and inclusiveness, constantly enrich cultural connotation and spiritual value, and pay attention to the consideration of audience’s psychological and emotional value in subject selection, content presentation, program production and editing, so as to effectively adjust audience’s emotion and sensory experience. At the same time, strengthen the integration of cognitive psychology into the creative ideas of literary and artistic works, and create excellent works in line with people’s cognitive habits and ways of thinking, so as to enhance their value guidance and cultural identity to the public when resonating with the audience, improve their cognitive level and ability, and meet their expected psychological motivation and needs for literary and artistic variety.

ANALYSIS ON THE STRATEGY OF CULTIVATING PROFESSIONAL FARMERS FROM THE PERSPECTIVE OF POSITIVE PSYCHOLOGY

Hui Deng

Economics and Management, Luoyang Institute of Science and Technology, Luoyang 471023, China

Background: There are differences between positive psychology and traditional psychology, which studies psychology from a positive perspective. The research angle of positive psychology is just opposite to that of negative psychology. The research angle of negative psychology is negative orientation. As a new research field of psychology, positive psychology advocates the study of human virtues such as optimism and progress. Through the way of positive psychology, guide the individual’s attention to pay attention to the positive aspects of things. Positive psychology emphasizes adhering to scientific principles and using scientific methods to guide the positive psychological quality of individuals, so that individuals can have a positive attitude, bravely face difficulties and fight them to the end. The positive psychological qualities of individuals include honesty, courage, persistence, optimism and so on. Through positive psychology to guide individual psychology and stimulate the inherent strength of human nature, relevant education, training and other activities can be carried out more effectively and smoothly. The goal of positive psychology is to explore and study the good development factors such as individuals and groups. Under the action of these influencing factors, it can promote the improvement of human life quality, which is conducive to the good development of their physical and mental health, and then promote the prosperity of society.

Professional farmers refer to farmers who take agriculture as their profession. These farmers have relevant professional skills, and their professional income comes from agricultural production and operation. In traditional agriculture, farmers are limited by land, the scope of their activities is closed to a certain extent, and their income is low, which depends on heaven to a certain extent. The weather often determines the income of rural farmers, which greatly restricts the development of rural economy. Therefore, the cultivation of professional farmers has epoch-making significance, which can change the traditional agricultural mode, increase the scope of farmers’ activities by cultivating farmers’ professional skills, improve the activity of professional farmers, and make agriculture have stronger anti-risk ability. However, due to the limitation of farmers’ knowledge level, there are great difficulties in the process of cultivating professional farmers. There are differences in farmers’ understanding ability, insufficient ability to absorb and accept knowledge, slow speed and long time, which will attack farmers’ learning enthusiasm. Therefore, from the perspective of positive psychology, we should use scientific methods to actively guide the learning attitude of professional farmers, cultivate their positive psychological quality and improve their learning efficiency. It also analyzes the cultivation strategies of specific professional farmers.

Objective: Understand the problems existing in the learning process of farmers, apply positive psychology to the cultivation of professional farmers, help professional farmers learn knowledge and

professional skills, improve farmers' learning psychology, cultivate farmers' positive psychological quality, enhance their self-confidence in the learning process of professional skills, and study relevant strategies. Through on-demand teaching, improve farmers' attention and make them more proactive in the learning process. Understand the relevant conditions of local agriculture, rural areas and farmers, and comprehensively grasp them. On this basis, carry out scientific and reasonable cultivation of professional farmers. In the process of cultivation, the combination of long-term vocational training and field practice allows farmers to apply the learned professional skills in the process of practice, improve learning efficiency and further improve farmers' learning enthusiasm.

Subjects and methods: 100 rural residents were randomly selected from 4 villages understand their income sources, crop cultivation and their attitude towards learning agricultural professional skills, and record relevant data. Through fuzzy evaluation, the influence of professional farmers' cultivation strategy on professional farmers' learning enthusiasm, learning initiative and learning efficiency from the perspective of positive psychology is carried out. 1-5 grades are adopted. The higher the score, the greater the degree. The relevant data are processed by SAS software.

Results: In order to change the traditional agricultural mode, the concept of professional farmer was put forward. Considering the low learning efficiency and low learning enthusiasm of farmers in the process of cultivating professional farmers, positive psychology is applied to the strategy analysis of cultivating professional farmers, and relevant strategies are designed and formulated on this basis, so as to improve the enthusiasm and initiative of professional farmers and cultivate their positive psychological qualities such as self-confidence and sense of achievement in professional skills. Among them, the on-demand strategy has the greatest impact on the learning enthusiasm of middle-aged farmers, with a score of 5. The relevant results are shown in Table 1.

Table 1. The influence of professional farmers' cultivation strategy on farmers' learning enthusiasm

Age group	Teach on demand	Vocational training	Practical activity
Youth	4	5	5
Young and middle-aged	4	4	5
Middle age	5	4	5

Conclusions: In response to the rural revitalization strategy, the state suggests cultivating professional farmers. By using the knowledge of positive psychology to mobilize farmers' learning enthusiasm and improve farmers' learning initiative, farmers can obtain good learning effect and learn the professional technology they need in the process of cultivating professional farmers, so as to promote the development of rural economy.

THE INTEGRATION OF TRADITIONAL ART DESIGN AND MODERN ART UNDER THE BACKGROUND OF COGNITIVE PSYCHOLOGY

Jing Tan

School of Preschool Education, Zibo Vocational Institute, Zibo 255000, China

Background: As a discipline in the field of psychology, cognitive psychology can be traced back to Plato's philosophical speculation. It was not until the 1950s that Donald Broadbent established the basic theoretical framework of cognitive psychology and began to move towards science. Cognitive psychology is a science that explores the laws of thinking, memory, learning, attention and perception in the process of cognition. The difference between modern design cited by cognitive psychology and traditional art design lies in the cognitive process of perceptual subject. In traditional art design, the cognitive process of traditional art including color is simplified as a stimulus-response, which is a simple and primitive logical structure. Cognitive psychology can be divided into two types: broad sense and narrow sense. The narrow sense of cognitive psychology holds that it is a science of information processing. In a broad sense, cognitive psychology includes information-processing psychology, psychologism school and structuralism psychology. Structural cognitive psychology originated from the cognitive development process of children obtained by psychologists in continental Europe. Psychologism refers to the speech of behaviorist psychologists. They analyze the memory and perception of complex phenomena and study the influencing factors of memory function. Cognitive psychology explains brain processes based on long-term memory, which is controlled by

attention and emotion and gives meaning to short-term memory or stimuli.

This will have a very negative effect on people's life, work and study. There are many problems caused by different cognition in the combination of modern art and design with traditional aesthetics, which can be reflected in the poor integration effect of modern art and design, the narrow application scope of traditional aesthetics and so on. Painting, calligraphy, paper cutting and other arts, as traditional Chinese aesthetic arts, have become works in line with people's aesthetics through funeral etiquette and festival customs. Traditional art is a very important folk art. It has obvious and strong modeling characteristics, regional characteristics and universality of the masses. Combining traditional art with modern art design for development and inheritance is of great positive significance. The combination of traditional art in modern art design has the characteristics of diversified forms of expression and extensibility in other design fields. In the process of modern art design, the integration of traditional art is reflected in the following aspects: modern illustration and traditional art, film and television creation and traditional art, advertising design and traditional art, packaging design and traditional art, book design and traditional art. Therefore, the combination of modern art and traditional art is considered to be the most popular field for designers in the future, which helps to improve the integration effect of traditional elements of modern art.

Objective: In order to analyze the effect of the integration of traditional art design and modern art on residents' cognitive psychology, this paper aims to provide constructive suggestions for the improvement of people's cognitive psychology.

Research objects and methods: 100 residents in a certain area were selected as the research object. The effect of the integration of traditional art design and modern art on people's cognitive psychology was evaluated by support vector machine algorithm. The experimental duration was 1 month. Set the evaluation index as correlation degree, and quantify the correlation degree through five levels of 0-4. The numerical numbers 0, 1, 2, 3 and 4 respectively mean no correlation, slight correlation, general correlation, serious correlation and complete correlation. The evaluation contents include long-term memory, attention, thinking, speech and appearance. In order to ensure the rationality and reliability of the final result, the average value of the audience used is selected as the final result.

Methods: Through BMDP data analysis software, this paper analyzes the effect of the integration of traditional art design and modern art on people's cognitive psychology.

Results: Table 1 refers to the effects on people's cognitive psychology before and after the integration of traditional art design and modern art. On the whole, in the five cognitive psychologies of long-term memory, attention, thinking, speech and image, the correlation degree of the five cognitive psychologies after the integration of traditional art design and modern art increases gradually with the increase of time. Therefore, the integration of traditional art design and modern art plays a positive role in the improvement of cognitive psychology.

Table 1. The effect of the integration of traditional art design and modern art on people's cognitive psychology

Mental health indicators	After 1 month	After 2 months	After 3 months
Long-term memory	72.0	81.0	86.0
Attention	72.0	82.0	88.0
Thinking	71.0	82.0	85.0
Speech	74.0	82.0	89.0
Appearance	73.0	78.0	88.0

Conclusions: Under cognitive psychology, the integration of traditional art design and modern art has an excellent improvement effect on people's cognitive psychology, especially in the four psychological cognition aspects of long-term memory, attention, speech and image. The proposed design scheme integrating modern art has a certain promotion value and can play a considerable role in the field of follow-up modern design.

THE INFLUENCE MECHANISM OF BRAND PERSONALITY ON CUSTOMER PERCEIVED VALUE BASED ON PSYCHOLOGY

Limei Zhou

Department of Information Engineering Sichuan Tianyi College, Mianzhu 618200, China

Background: In today's social situation, the acceleration of economic development makes the enterprise competition increasingly fierce, and the product brands emerge one after another in the market, resulting in the problem of homogenization between products. It is the core way for enterprises to establish distinctive brand image in the market competition, and it is also an important way to help enterprises to achieve brand identity in the market competition. The homogenization between the technology, design and other factors of enterprise products will affect the perceived value of customers' products, and the perceived difference of customers' product functionality gradually decreases. Enterprises are required to establish a unique brand image and enhance customers' purchase satisfaction and satisfaction with products. In the process of establishing brand personality, enterprises should start from their own development direction and path, combine the advantages of self-contained products, fully consider customers' perceived value and customers' interests, strengthen the contribution of enterprise brand to customers' emotion, value and attribute interests, strengthen customers' satisfaction with enterprise brand and products from multiple angles, and enhance customers' loyalty to brand.

In the process of market sales, the consumer psychological characteristics of customers are also the key issues that need to be paid attention to in market operation. Enterprises are required to deeply analyze the consumer psychology of customers, take the consumer psychological characteristics and change law of customers in the process of product purchase as the starting point, establish a unique enterprise brand personality image, and enhance the market core competitiveness of enterprises. In the process of consumption, customers have the characteristics of habit psychology, and customers often have their own different consumption habits. The expression of emotional demands in the personality of enterprise brand can stimulate customers' consumption psychology and desire, cultivate customers' consumption habits, and have a subtle impact on customers. Customers also have the characteristics of identity psychology in consumption. Customers pay great attention to whether the enterprise brand is consistent with their own identity attributes. The enterprise brand personality image directly affects the identity attributes of the audience of enterprise products. Value consumption psychology is a very important consumer psychological feature in the consumption process. Most customers pay great attention to the value attribute of products and hope that the products they buy have higher value in similar products. Therefore, value attribute is also an important consideration in the establishment of enterprise product personality image.

Objective: Based on the consumer psychological analysis of customers in the consumption process, to explore the psychological characteristics mechanism and change law of customers in the consumption of enterprise products, and to analyze the basis of psychological factors behind customers' perceived value, so as to provide reference for promoting the establishment of enterprise brand personality image. From the perspective of psychology, the research deeply analyzes the relationship between customer perceived value and enterprise brand personality, and explores the impact of enterprise brand personality on customer perceived value, hoping to provide help for promoting the establishment of enterprise brand personality image.

Research design: Study and analyze the psychological characteristics of customers in the process of consumption and shopping, master the characteristics and change laws of customers' consumption psychological activities, combined with the mining and in-depth research of customers' consumption psychology, analyze customers' perceived value of the brand from the perspectives of emotion, value and attribute. Through the analysis of the factors of enterprise brand personality, this paper establishes the structural model of enterprise brand personality, analyzes the driving factors of the formation of enterprise brand personality, and puts forward the research hypothesis of the impact of enterprise brand personality on customer perceived value. The research uses regression analysis to explore the influence mechanism of enterprise brand personality on customer attribute interests, and analyzes the influence mechanism of enterprise brand personality on customer perceived value, so as to provide reference for promoting enterprise market management and the establishment of enterprise brand personality image.

Results: The results of the retrospective analysis of the main effect of corporate brand personality on customer perceived value are shown in Table 1.

Table 1. Review and analysis of the main effect of enterprise brand personality on customer perceived value

Model	Standardization coefficient	t	P
Functionality	0.345	4.752	0.000
Emotionality	0.326	4.429	0.000
Value	0.356	4.936	0.000

Conclusions: Brand personality takes the personalization and humanization of consumers as the concept

of brand marketing, which can help enterprises convey a positive corporate image to the society and the public, and promote the improvement of customers' consumption desire by means of consumers' emotional resonance. Perceived value is the sum of the functional, emotional and value benefits of products perceived by customers. The study found that brand personality has a positive impact on perceived value. Brand personality can stimulate consumers' purchase desire, help customers distinguish enterprise products from other similar products, and enhance customers' loyalty to enterprise products. Brand personality can improve customers' cognitive value, affect customers' perceived value of enterprise products and image, enhance the market competitiveness of enterprises, and promote the development of market operation of enterprises. Starting from the consumer psychological characteristics of customers, the research analyzes the degree to which the consumer psychological factors of customers are affected by the brand personality, and finds that the perceived value of customers' brand personality has an impact on their shopping and consumption behavior. The customer's perception of the emotion, value and attribute value of brand personality will help the brand establish a personality image in the hearts of consumers and stimulate consumers' purchase desire.

DISCUSSION AND ANALYSIS ON THE POLITICAL PSYCHOLOGY AND VALUES OF THE US GOVERNMENT IN POWER FROM THE PERSPECTIVE OF SOCIAL PSYCHOLOGY – TAKING THE INAUGURAL SPEECHES OF OBAMA AND TRUMP AS AN EXAMPLE

Yichen Wang

School of History & Culture, Sichuan University, Chengdu 610065, China

Background: Social psychology is mainly used to study the psychology, emotion and behavior of individuals and organizations in the social environment, and summarize the laws to solve relevant social problems. It is an interdisciplinary subject based on sociology and psychology. Compared with traditional psychology, it pays attention to the impact of language, friends, family, living environment and learning environment on itself in the process of individual socialization. It also pays attention to the communication mode, group behavior norms, group thinking and habits of group organizations at the social level. In addition, because the research object of social psychology involves human organizations, it is necessary to strictly abide by the principle of value neutrality, systematic principle and ethical principle in the process of case study, so as to prevent the introduction of irrelevant variables affecting the results in case study. In recent years, there have been significant changes in the governing philosophy of several US governments. For example, the Obama administration supports multilateralism and international trade, while the Trump administration supports our priority. The fundamental reason for this drastic change is that the social psychology and concepts of the American people have changed greatly, which is what this study needs to analyze.

Objective: To analyze the governing psychology and values of former US presidents Barack Obama and Trump, and use the expert consultation method to consult experts on the influence of the mass social psychology behind the various governing psychology of the two US presidents, so as to understand the reasons and laws of the changes in the governing style and mode of some US governments.

Objects and methods: Repeatedly study the contents of the inaugural speeches and speech videos of former US presidents Barack Obama and Trump, analyze the elements of their speeches, such as discourse, gesture, expression, intonation, volume, audience response and so on, and then analyze their political psychology and value ideas in combination with the ruling ideas of the political parties and personal historical experience of Barack Obama and Trump. 54 experts on American issues, international politics and relations and social psychology were selected from China to form an expert group. Send the summarized governing psychology and values of Obama and Trump to the expert group, and ask the members of the expert group to judge whether these governing psychology and values are accurate, whether there are omissions and the mass social psychological factors behind their governing psychology in combination with social psychology. If there are omissions, ask them to supplement them. Sort out and summarize the feedback of the expert group, and then send it to the expert group for comments again. Cycle back and forth. When the expert group reaches an agreement, stop asking. The influence degree of the social psychological factors of the masses on the president's ruling psychology is subdivided into five categories: no influence, slight influence, general influence, obvious influence and full influence, which are successively given 1-5 five-digit integers for quantification.

Results: After the consultation of the expert group, the opinions of the members of the statistical

experts were obtained in Table 1 note that the measurement type is displayed in the form of mean ± standard deviation.

Table 1. Evaluation of the expert group on the reasons of mass social psychology of Obama and Trump's governing psychology and values

Governing psychology	No effect	Slight impact	General impact	Obvious influence	Full impact
Worried about the rising cost of living	1	10	4	18	9
Fear of unemployment or declining income	0	1	9	13	19
Demand to improve social order	7	14	15	5	1
Improve other social problems	11	20	9	2	0

The psychological impact of Obama's ruling group on the "number of people" and "people's fear of unemployment" is relatively small, followed by the "psychological impact of Trump's ruling group on the number of people and "people's fear of improving the level of public security", which will have a relatively large impact on the "number of people in power" and "people's fear of unemployment" respectively 0 people.

Conclusions: This time, the social psychology specially used to study the psychological factors between individuals and organizations in social organizations is used to analyze the main governing psychology and values of American politicians, as well as the social psychological factors of American people that produce this governing psychology, and a Delphi consulting experiment is designed. The "psychological impact" of President Obama's request for "full improvement" on the social life of the people in the United States, followed by the "psychological impact" of President Trump's request for "full improvement" on the social life of the people in the United States 910. This is because people's income level directly affects their living standards. When a large number of Americans lose their jobs or their income decreases, a large number of people will have distrust, disgust and other psychology and emotions towards the government, which will affect the stability of the president's vote, which will bring considerable pressure to the politicians' ruling psychology.

THE INFLUENCE OF INTEGRATING DEVELOPMENTAL PSYCHOLOGY INTO MACROECONOMIC REGULATION ON THE MENTAL HEALTH OF COLLEGE STUDENTS

Xiaohui Deng¹ & Xuefen Li²

¹*School of Economics and Management, Guang'an Vocational and Technical College, Guang'an 638000, China*

²*College of Civil Engineering, Guang'an Vocational and Technical College, Guang'an 638000, China*

Background: Developmental psychology is a subject that studies the occurrence and development of germline and individual psychology. Psychological development refers to the psychological evolution process from animals to humans. Individual psychological development refers to the process of birth and development of human individuals from fertilized eggs to birth, maturity and aging. Developmental psychology mainly includes animal (comparative) psychology, children's psychology, middle-aged psychology and elderly psychology. Among them, children's (including teenagers) psychology is the main content of developmental psychology. The narrow concept of developmental psychology refers to children's psychology. The meaning of developmental psychology can be divided into broad sense and narrow sense. The broad sense refers to the development of psychology, including the development of species, race and individual psychology. In the narrow sense, psychological development only refers to individual psychological development. "Development" refers to the process in which an individual's behavior changes continuously and expansively from conception to death. In this process, individual behavior is constantly enriched, from simple and complex, from rough and fine, from separation to harmony, and from differentiation to integration. The general academic consensus is that both congenital and acquired factors have an impact on psychological development, and sometimes it is even difficult to distinguish. Among the acquired factors, the influence of education is undeniable. There is no doubt that the way of college education has an important impact on the future of students. Research and support for college education will have a strong impact on the future of college students, especially negative experience will have an impact on the development of college students.

Research shows that national macroeconomic regulation and control plays an important role in promoting the mental health of college students. In the market economy, the supply and demand of goods and services are affected by the price law and free-market mechanism. Market economy brings economic growth, but it will lead to inflation, while the recession followed by the climax makes the economy stagnate or even regress. This cyclical fluctuation has a serious impact on social resources and productivity. Therefore, macro-control focuses on the economic operation of the whole society, and achieves the goal of economic planning through artificially regulating supply and demand. Economic growth is an objective process determined by many factors. At a certain stage of economic and social development, there is a considerable, reasonable or potential economic growth rate. Macroeconomic regulation and control are to keep the economic growth rate at a reasonable level. We should not only strive to improve the speed, but also prevent excessive growth, but also avoid large fluctuations, that is, what we call ups and downs. Therefore, the goal of promoting economic growth is to maintain sustained, rapid and stable economic growth on the basis of structural optimization and efficiency improvement. To increase employment, China is in the transition from a dual economy to a modern economic structure, the socialist market economic system is still far from perfect, and China's population base is large, so the employment problem is relatively serious.

Objective: Some students have serious psychological pressure in the process of personal development, so their physical and mental health has been seriously damaged, which has a serious impact on their mental health, and even suffer from depression. This paper studies the psychological status of college students' development based on macroeconomic regulation and control, and puts forward effective countermeasures to finally realize the harmonious development of society.

Research objects and methods: 120 college students with mental health problems in a university were selected as the research objects. The general situation of college students was investigated in the form of questionnaire, the loneliness intensity of college students in the process of learning and development was evaluated by UCLA Loneliness Scale, and the depression degree of college students was evaluated by the Self-rating Depression Scale (SDS).

Study design: The UCLA Loneliness Scale score of 20-32 was defined as low loneliness. 33-44 points are moderate loneliness. A score higher than 44 is defined as a high degree of loneliness. After teaching college students for one month, the changes of the number of low loneliness, moderate loneliness and high loneliness before and after teaching were compared.

Methods: The relevant data were analyzed by Excel and SPSS20.0 software for calculation and statistics.

Results: After teaching, the number of patients with high loneliness among college students decreased significantly, and the average UCLA Loneliness Scale score decreased significantly ($P < 0.05$).

Table 1. Loneliness before and after intervention

Group	Low degree		Moderate		Severe		UCLA score
	<i>n</i>	%	<i>n</i>	%	<i>n</i>	%	
Before intervention	0	0	16	13.3	104	86.7	60.14±5.85
After intervention	0	0	94	78.7	26	21.3	41.86±3.32
<i>t</i>	-	-	-	-	-	-	9.551
<i>P</i>	-	-	<0.05	<0.05	<0.05	<0.05	<0.05

Conclusions: At present, the development of China's market economy is guided by the scientific outlook on development, which mainly focuses on preventing overheating of economic development. It mainly refers to taking regulatory measures to actively regulate and control when there is an excessive trend or momentum of overheating in the process of economic development, so as to prevent unreasonable rapid economic development, basically maintain the stability of China's market economic development, and promote the positive development of China's economy.

THE IMPROVEMENT OF COLLEGE STUDENTS' NEGATIVE EMOTIONS BY INTEGRATING EDUCATIONAL PSYCHOLOGY INTO COLLEGE ENGLISH CLASSROOM

Jing Dou

School of Foreign Languages, Xuzhou University of Technology, Xuzhou 221018, China

Background: Educational psychology is a social psychology that studies human learning, the effect of educational intervention, teaching psychology and school organization in educational context. The focus of educational psychology is to apply the theory or research results of psychology to education. Educational psychology can be applied to designing courses, improving teaching methods, promoting learning motivation and helping students face various difficulties and challenges in the process of growth. The terms "educational psychology" and "school psychology" are often used interchangeably, but usually those engaged in theoretical work and research tend to be called educational psychologists, while those engaged in practical work in schools or school-related places are classified as school psychologists. Educational psychology pays attention to how students learn and develop, and pays special attention to students with special educational needs in practical work. Through the relationship with other disciplines, it is also helpful to understand educational psychology. First of all, educational psychology is based on psychology. The relationship between the two disciplines is like the relationship between medicine and biology, or engineering and physics. Then, from educational psychology, many special fields can be developed to study educational problems, including instructional design, educational technology, curriculum development, organizational learning, special education and classroom management. Educational psychology belongs to the category of social psychology, which mainly studies human learning, the effect of educational intervention, teachers' teaching psychology and so on. Educational psychology applies psychological theory and teaching practice results in the process of education. This theory can be applied to curriculum design and improve learning motivation to help students overcome various difficulties in the process of learning.

Generally speaking, when people feel nervous about something, their thoughts will be disturbed by it repeatedly and make all kinds of exaggerated imagination and assumptions. When it exceeds the critical point, anxiety begins to appear. English learning anxiety is a unique and complex psychological phenomenon in language learning. Anxiety is usually manifested in negative emotions such as self-doubt and tension. The anxiety of language learners in the classroom may also be caused by the psychological anxiety of language learners. For example, there are many reasons for the anxiety of language learners in the classroom. How to treat students' anxiety objectively and find out the causes of anxiety is an important research direction in English learning.

Objective: College students will have some bad emotions in the process of English learning. From the perspective of educational psychology, this paper studies the negative emotions of college students in English classroom. Therefore, based on the English classroom teaching method of educational psychology, this study aims to explore the psychological relief methods of college students' English learning anxiety, and provide some theoretical reference for college English classroom teaching in the future.

Research objects and methods: In six colleges and universities in a city, 200 college students with negative psychological emotions in English classroom were selected as the research objects. The English classroom teaching method based on educational psychology was used to teach all the subjects. All the college students were aged between 18 and 21, with an average of 19.5 ± 1.6 years.

Research design: Before and after teaching, students were evaluated with the self-developed English learning classroom anxiety scale to judge the learning anxiety of college students in the process of college English learning.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0 software.

Results: The comparison of English learning anxiety factors among college students with high, medium and low anxiety was statistically significant ($P < 0.05$). The pairwise comparison between the scores of each factor was statistically significant ($P < 0.05$).

Table 1. Analysis of foreign language learning anxiety factors of students with different levels of anxiety

Group	Worry	Nervous and tense	Afraid to speak English	Fear of classroom	Total learning anxiety
Low anxiety	2.31	2.45	2.43	2.34	2.38
Medium anxiety	3.15	3.19	3.31	3.36	3.24
High anxious	3.75	3.67	3.56	3.72	3.68

Conclusions: With the rapid development of information technology and the popularity of the Internet, learners around the world can have the opportunity to choose the world's best higher education resources.

At the same time, the English classroom teaching method based on educational psychology has also created a lot of experience in promoting teaching reform. Some studies have pointed out that the English classroom teaching method based on educational psychology is expected to subvert the traditional way of education. Anxiety psychology is different from ordinary mental diseases. It will not only cause serious negative emotions to college students, but also the accumulation of all kinds of negative emotions. In order to comprehensively improve college students' English learning ability and comprehensive quality, English teaching should pay attention to the cultivation of students' nonintellectual factors, so that students can obtain positive emotional experience in English learning and learn effective learning strategies, which will play a positive role in students' lifelong development.

THE EFFECT OF BUSINESS ENGLISH TEACHING AND TRAINING CURRICULUM REFORM ON EDUCATIONAL PSYCHOLOGY

Jia Li

College of Arts and Humanities, Zhongshan Vocational College, Nanjing 210049, China

Background: In recent years, educational psychology is closely related to psychiatry, medicine, sociology, anthropology, education and other fields. The main research content of educational psychology is the basic psychological laws of education and teaching situation and middle school teaching. It studies teaching design, educational technology, special education and classroom management based on psychology. Educational psychology. Different from psychology, educational psychology focuses on the psychological laws of student groups, and evaluates whether students can learn knowledge and master corresponding skills in daily teaching. The teaching subject of educational psychology theory is the workers engaged in education. The goal is to improve the level of teachers, improve the quality of education and teaching, and promote the reform of education and teaching. The practical significance of this discipline is to assist teachers to complete the problems in teaching work, provide scientific and reasonable theoretical guidance for teachers' teaching work, and assist teachers to analyze in practical teaching work. Educational psychology can be simply understood as all the sciences involved in the process of learning and teaching, including teaching methods, students' characteristics and teachers' characteristics. According to the type of subject, teachers can adopt different teaching schemes.

In the practical courses of business English teaching in colleges and universities, the traditional teaching methods lead teachers to take intellectual factors such as scores and test passing rate as the key indicators to evaluate the teaching effect, and do not consider nonintellectual factors, emotions, interests and hobbies and other psychological factors. With the proposal and improvement of modern educational psychology and other concepts, English teaching methods have undergone significant changes, from the previous cramming teaching to students' autonomous and active learning. This teaching method can cultivate comprehensive talents with high quality and high skills. The relevant data of the education part points out that most college students have varying degrees of psychological problems, and a small number of them suffer from serious psychological diseases. The future business English teaching and training courses need to be improved in combination with the theory of educational psychology, so that students can master professional English teaching knowledge and transfer relevant cultural knowledge and humanistic knowledge to students, which can not only help students receive relevant knowledge efficiently, but also create a good learning atmosphere and enhance students' interest in English learning. In the specific teaching work, teachers need to focus on practical activities, let students participate in the process of activities in the form of teaching in fun, and accept knowledge in a relaxed and pleasant way, as well as the views and thoughts that domain teachers want to convey to us in the activities.

Objective: This paper analyzes the impact of business English teaching training course combined with educational psychology on students' mental health, in order to provide a new research direction for college English teaching mode.

Research objects and methods: 100 students from a university were randomly selected as the research object and divided into control group and experimental group by digital random grouping method. The control group used conventional English teaching methods, and the experimental group used business English teaching and training teaching methods combined with educational psychology. The experimental period was 2 months. Mental health was assessed by Symptom Checklist-90 (SCL-90), and the grade classification of assessment was completed by Density Based Spatial Clustering of Application with Noise (DBSCAN). The scale includes 90 items and 10 subscales, of which subscale 10 is not used for these statistics. Each factor item was analyzed with a five-level scoring standard of 0-4 points. The higher the score of each factor, the lower the level of mental health. The subjects' evaluation of each factor is equal to or greater than 3 points, which can be used as the standard of moderate health problems and above.

Methods: Through the latest version of Epi Info data statistical analysis software, this paper analyzes the effect of business English teaching practice teaching method combined with educational psychology on students' mental health.

Results: Table 1 refers to the proportion of the experimental group with good mental health in the whole experimental cycle. The psychological problems of the patients in the experimental group were significantly improved, and with the increase of the implementation time of the new business English teaching and training teaching intervention, the psychological health level of the patients was significantly improved. Therefore, the experimental group introduced the English business English teaching practice teaching combined with educational psychology, which has an ideal effect on the intervention of patients' psychological problems.

Table 1. The proportion of the experimental group with good mental health in the whole experimental cycle (%)

Mental health indicators	After 1 month	After 2 months	After 3 months
Somatization	72.21	81.36	86.29
Obsession	72.36	82.13	87.56
Interpersonal sensitivity	71.28	82.36	84.16
Depressed	74.28	82.48	89.23
Anxious	73.68	82.39	86.34
Hostile	75.21	82.94	86.29
Terror	74.14	82.36	87.56
Paranoid	73.21	83.28	84.16
Psychotic	74.16	83.78	83.25

Conclusions: The practical teaching method of business English teaching combined with educational psychology can greatly improve students' psychological problems to varying degrees. This new teaching mode can be vigorously promoted and publicized in the future, so as to increase the educational effect of business English teaching and training.

* * * * *

THE EFFECT OF OPTIMIZED MANAGEMENT OF TOURISM INDUSTRY ORGANIZATION ON THE PSYCHOLOGY OF EMPLOYEES

Xiaowei Qiu

School of Economics, Tianjin College, University of Science and Technology Beijing, Tianjin 301830, China

Background: Organizational psychology is a science that analyzes human behavior laws and psychological phenomena in organizational management. The theory takes people as the center, constantly adjusts and optimizes the interpersonal relationship in the organization, changes and improves the external environment and conditions, gives full play to the individual's creativity, initiative and enthusiasm, and smoothly realizes the organizational objectives in a scientific way, which is conducive to the common development of the organization and the individual. The research content of organizational psychology can be attributed to three relationships: human and human, human and material, and material and material. The goal of organizational psychology is to analyze the law of psychological activities of leaders, organizations, groups and individuals in the organization with the help and application of relevant theories

and methods, and then coordinate the relationship between people by means of enhancing organizational cohesion, improving leadership level and leadership art, motivating motivation, adjusting interpersonal relationship and so on. The situational application of organizational psychology theory is mainly reflected in two aspects. Firstly, it takes national characteristic variables such as economy and culture as independent variables to analyze the phenomenon of individual and organizational ability. Secondly, find out a more important organizational characteristic, then classify the organization according to this characteristic, and draw the conclusion that the previous theory is applicable to a specific organizational characteristic.

With the improvement of people's material economy and living standards, the tourism industry has ushered in new development opportunities. However, there are still many problems in the development of the tourism industry, mainly manifested in the low coordination and unity of various departments of the tourism industry and the low enthusiasm of the management departments of the tourism industry. Under such a development background, it is of great significance to actively introduce new development ideas into the tourism industry. Tourism industry management workers should take people as objects and help relevant employees establish correct ideas and views by means of criticism, persuasion and demonstration, so as to provide the ideological basis and spiritual source for organizational development. Organizational psychology has been widely concerned by many scholars in the field of management because of its own characteristics and the impact of people's behavior on culture and society. After contextualizing the theory of organizational psychology in the tourism industry, it can not only enhance the work pertinence of relevant enterprises in the tourism industry through the demand theory, but also use the incentive theory to improve the work effectiveness of relevant enterprises and units, but also improve the work initiative of relevant employees through changing the theory. The work initiative of relevant staff in the tourism industry is mainly reflected in changing behavior through knowledge and using information communication. For the effectiveness of work, it is embodied in eliminating the sense of unfairness, preventing the widespread of bad emotions, enriching work content and making rational use of fierce means. For the pertinence of work, the staff of relevant enterprises need to do a good job of demand analysis, which helps them to achieve substantive results.

Objective: In order to analyze the application value of organizational psychology in the development of tourism industry, this paper aims to contribute to the improvement of the psychological quality of employees in tourism industry.

Research objects and methods: 100 relevant employees in the tourism industry were randomly selected as the research objects. All objects passed the tourism industry training combined with organizational psychology. The experimental period was 2 months. The psychological evaluation is carried out through five aspects: willpower, emotional ability, demand analysis, enthusiasm and leadership ability, and the evaluation grade classification of psychological related factors is completed by using C4.5 decision tree. The evaluation grades are set as bad, average, good and good. Each index is evaluated with a five-level scoring standard of 1-5 points. The calculation formula of psychological good rate is the ratio of the number of people in the three grades of general, good and good to the total number of people. In order to ensure the authenticity and reliability of the results, the average value of all subjects was used as the final result.

Methods: Through the latest version of Minitab20 data statistical analysis software to analyze the effect of tourism industry model combined with organizational psychology on tourists' mental health.

Results: Table 1 refers to the psychological good rate of relevant practitioners in the tourism industry during the experiment. It can be seen from Table 1 that after the tourism industry training combined with organizational psychology, the psychological good rate of relevant personnel has been greatly improved, and the psychological good rate has increased significantly with the increase of training time.

Table 1. Psychological good rate of relevant practitioners in the tourism industry during the experiment

Mental health indicators	Before	After 1 month	After 2 months
Willpower	72.21	81.36	86.29
Emotional ability	72.36	82.13	87.56
Requirement analysis	71.28	82.36	84.16
Enthusiasm	74.28	82.48	89.23
Leadership	73.68	82.39	86.34

Conclusions: Tourism industry training combined with organizational psychology can not only enhance the psychological quality of relevant employees and improve their psychological cognition level, but also play a positive role in the sustainable development of the tourism industry.

A STUDY ON THE PROMOTION PATH OF STUDENTS' COGNITIVE PSYCHOLOGY IN ENGLISH WORD TEACHING

Ying Xi

The School of Foreign Languages, Guangdong Innovative Technical College, Dongguan 523960, China

Background: With the continuous development of psychology, new psychological research has become a development trend, and cognitive psychology came into being under this background. Cognitive psychology is a subject that analyzes the law of human psychological activities. Its research object is the cognitive status of human body in psychology, including language, thinking, memory, perceptual learning, attention, perception and so on. Most scientists point out that the process of human memory can be divided into three stages: long-term memory and coding. In the process of information processing, people will produce short-term memory, which is the initial stage of memory generation. It is worth mentioning that the memory function will not be limited. People's memory function can store a large amount of content in a short time, and code the information to classify similar information together. It can be understood that people's forgetting of knowledge is not the forgetting of their own content, but the forgetting of memory coding. The formation of long-term memory can be regarded as that people can form long-term memory as long as they can remember the corresponding code. The key problem in English word teaching is word memory. At present, the key to solve this problem is cognitive psychology. Cognitive psychology can not only help students understand and memorize words, but also improve the quality of English word teaching.

The ways to promote students' cognitive psychology in English word teaching are as follows: situational teaching, associative teaching, understanding teaching and fragment teaching. The results of fragment teaching method have been confirmed by most mathematicians. Although the efficient memory effect in the short term is ideal, the forgetting speed is also very fast. In understanding teaching, psychological theory holds that the human brain has a deeper memory of the knowledge after understanding. No matter how long the interval is, people can remember it with a little memory. With the help of the relevant characteristics of understanding and memory, English vocabulary teaching can improve the level of English vocabulary teaching. In teaching, teachers need to help students understand words, especially the original meaning of words. Teachers also need to promote students' proficiency in English alphabetical order through continuous practice. Usually, the arrangement of most English words is closely related to pronunciation, and the specific letter combination is closely related to pronunciation. Students use a lot of exercises to deepen and consolidate their grasp of vocabulary meaning. Teachers need to teach students to copy more English words. Such repeated practice can continuously deepen the brain's memory of memory coding, and then form long-term memory. It is worth mentioning that words of different nature also have certain rules. Teachers can promote students to better understand and master words by teaching in a regular way.

Objective: This paper analyzes the promotion path of students' cognitive psychology in English word teaching, and discusses the impact of the promotion path on students' cognitive ability, in order to provide new ideas for cultivating high-quality students.

Research objects and methods: Students from five schools were selected as the research object, and the number of students in each school was 100. Through the Density-based Clustering (DENCLUE) algorithm, this paper analyzes the impact of the promotion path of students' cognitive psychology on students' psychological cognitive ability in English word teaching. The evaluation contents include thinking ability, memory ability, memory ability, representation, perception and attention. Each evaluation content is represented by three levels: no improvement, improvement and obvious improvement. The research results are expressed by the improvement rate, which is the ratio of the number of people with improved and significantly improved levels to the total number of people. The duration of the experiment was 6 months. In order to enhance the feasibility of the experimental results, the average value of all objects is taken as the final result.

Methods: This paper analyzes the influence of the promotion path of students' cognitive psychology in English word teaching on students' psychological cognitive ability through NOSA data statistical analysis software.

Results: Table 1 shows the influence of students' recognition path on students' psychological cognitive ability before and after the combination of cognitive psychology. On the whole, with the increase of experimental time, students' thinking ability, memory ability, memory ability, image, perception and attention have been significantly improved. Therefore, the cognitive psychological promotion path of students in English word teaching can improve students' psychological cognitive level to a great extent.

Table 1. The influence of students' recognition path on students' psychological cognitive ability in English word teaching before and after the combination of cognitive psychology

Category	Before	After 1 month	After 3 months	After 6 months
Thinking ability	88.24	91.23	94.26	95.13
Memory ability	85.21	87.36	89.35	92.36
Recall ability	82.31	87.36	92.31	95.36
Appearance	84.56	86.68	92.36	94.26
Perception	83.24	87.15	91.25	94.36
Attention	83.25	87.63	92.35	94.68

Conclusions: The English word teaching model combined with cognitive psychology can greatly improve students' cognitive level and strengthen students' mastery and understanding of English words. Research is of great significance in both English teaching and teaching reform.

* * * * *

THE INFLUENCE OF IDEOLOGICAL AND POLITICAL COLLABORATIVE EDUCATION INTEGRATED WITH SOCIAL PSYCHOLOGY ON COLLEGE STUDENTS' MENTAL HEALTH

Liyao Yang

College of Geosciences, Changchun Normal University, Changchun 130032, China

Background: In the university stage, college students need to face academic pressure, employment pressure, family pressure, interpersonal pressure and many other pressures at the same time. Some students have negative emotions such as anxiety and depression under pressure. Moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Clinically, researchers divide anxiety disorders into two types: pathological anxiety and realistic anxiety. The mental anxiety of college students is generally realistic anxiety, which is caused by college students' worries about their studies, achievements, social and work. Finding a suitable way to solve the anxiety of students in the process of learning is of great significance to students' personal development.

Ideological and political collaborative education is an educational concept that takes "building morality and cultivating people" as its own task, constructs an all-round education pattern, and then complements and cooperates with other courses and ideological and political courses, so as to form a synergistic effect, which is of positive significance to alleviate students' anxiety. However, at present, there are still some defects in the ideological and political collaborative education model in colleges and universities, and its effect of alleviating students' anxiety is not ideal. Social psychology is a branch of psychology, which mainly studies the occurrence and change law of psychology and behavior of individuals and groups in social interaction, and discusses interpersonal relations at the individual level and social group level, including group communication structure, group norms and so on. Social psychology is generally divided into three fields: individual process, interpersonal process and group process. Among them, the individual process involves individual attitude, personal perception and self-consciousness, as well as the change law of individual personality development and social development. Based on social psychology, this study analyzes the psychological and behavioral patterns of teachers and students in the construction of ideological and political collaborative education system in colleges and universities, and puts forward strategies to improve the ideological and political collaborative education system in colleges and universities, so as to alleviate students' anxiety, improve students' academic performance and deliver high-quality talents to the society.

Objective: In the university stage, college students are prone to negative emotions. Based on social psychology, this study analyzes the psychological and behavioral patterns of teachers and students in the construction of ideological and political collaborative education system in colleges and universities, and puts forward strategies to improve the ideological and political collaborative education system in colleges and universities, so as to alleviate students' anxiety, improve students' academic performance and deliver high-quality talents to the society.

Research objects and methods: 100 students were randomly selected as the research object in a university. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate

students' mental health. Using students' Ideological and political course examination results to evaluate the teaching effect.

Research design: 100 students were randomly divided into study group and control group. The students in the research group used the college ideological and political collaborative education system based on social psychology to teach. The students in the control group used the traditional college ideological and political collaborative education system for teaching. After three months, the anxiety degree and ideological and political examination scores of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: After 3 months of teaching, the SAS score of students in the research group was significantly lower than that of students in the control group ($P < 0.05$), as shown in Figure 1.

Figure 1. SAS scores of students in both groups

Conclusions: When the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life. Based on social psychology, this study analyzes the psychological and behavioral patterns of teachers and students in the construction of ideological and political collaborative education system in colleges and universities, and puts forward strategies to improve the ideological and political collaborative education system in colleges and universities. The experimental results showed that after 3 months of teaching, the SAS score of students in the research group was significantly lower than that of students in the control group ($P < 0.05$). Therefore, the college ideological and political collaborative education system based on social psychology can alleviate students' anxiety, improve students' academic performance and transport high-quality talents for society.

Acknowledgement: The research is supported by: Special Research Project on Ideological and Political Education of Jilin Provincial Department of Education: Analysis on the Path of New Media Leading the Ideological Growth of College Students (No. JJKH20210934SZ).

RESEARCH ON THE INFLUENCE OF GREEN BRAND PRODUCT IMAGE FROM THE PERSPECTIVE OF COGNITIVE PSYCHOLOGY

Ling He

Academy of Fine Arts, Langfang Normal University, Langfang 065000, China

Background: Cognitive psychology is a psychological trend rising in the West in the mid-1950s. It is a psychological mechanism based on human behavior. Its core is the internal psychological process between input and output. It is also related to western traditional philosophy. Its main feature is that it emphasizes the role of knowledge and believes that knowledge is the main factor determining human behavior. Cognitive psychologists' study internal mechanisms and processes that cannot be observed, such as memory processing, storage, retrieval and memory changes. From the perspective of information processing, the research on cognitive process is the mainstream of modern cognitive psychology. It can be said that cognitive psychology is equal to information processing psychology. It regards people as an information

processing system, and holds that cognition is information processing, including the whole process of encoding, storing and extracting sensory input. According to this view, cognition can be divided into a series of stages, each stage is a unit that performs specific operations on the input information, and the reaction is the product of this series of stages and operations. The various components of the information processing system are interrelated to some extent. With the development of cognitive psychology, sequential processing is increasingly challenged by parallel processing theory and cognitive neuropsychology. It can be said that cognitive psychology is a psychology that studies the psychological process behind cognition and behavior (including thinking, decision-making, reasoning and the degree of some motivation and emotion). This science covers a wide range of research fields and aims to study the operation of memory, attention, perception, knowledge representation, reasoning, creativity and problem solving. Cognitive psychologists focus on the psychological mechanism as the basis of human behavior, and its core is the internal psychological process between input and output. However, people cannot directly observe the internal psychological process, but can only speculate by observing the input and output. Therefore, the method used by cognitive psychologists is to infer unobserved psychological processes from observable phenomena. Some people call this method convergence proof, that is, collect data of different properties and draw conclusions. Now, cognitive psychology research usually needs the joint support of experiment, cognitive neuroscience, cognitive neuropsychology and computer simulation. This multi-directional research is becoming more and more popular. By studying the brain, cognitive psychologists hope to reveal the basic process of cognitive activity, not just speculate on its process. The most commonly used is to study the cognitive differences between patients with brain injury and normal people to prove the existence and specific patterns of cognitive processing. In short, both in theory and in practice, cognitive psychology has made important achievements. Therefore, it is worth continuing to expand the application scope of cognitive psychology.

Green brand is not limited to the category of ecological and environmental protection. It is the general name of the brand established through faithful practice, advocacy and promotion of the green concept of "health and peace". This is a green and sustainable brand. The green concept of "health and peace" is deeply integrated into the brand management and promotion process, so that the direct impression of the brand carrier formed in the hearts of consumers is "health and peace", so as to bring the green experience premium to the brand owner and produce the intangible assets of green experience value-added. However, people have cognitive barriers to the product image of green brand, which is mainly reflected in the qualitative thinking and stereotype of green brand products, while ignoring the practicability, value and ideology of green brand products. Therefore, how to promote people to have a correct understanding of the product image of green brand is of great practical significance for the promotion and practice of green concept.

Objective: In order to promote people's correct understanding of the image of green brand products and promote and practice the green concept, this paper constructs a green brand product promotion model based on cognitive psychology to ensure the organic unity of practicability, value and ideology of the image of green brand products.

Research objects and methods: 200 consumers were randomly divided into control group and experimental group, with 100 in each group. The control group adopted the conventional green brand product promotion mode, and the experimental group adopted the product promotion mode based on cognitive psychology. The measurement of students' cognitive impairment is carried out in combination with Montreal Cognitive Assessment Scale (MoCA). The scale includes 7 factors. The higher the score, the better the cognitive function. Compare the improvement of consumers' cognitive impairment of green brand products before and after the intervention.

Methods: Use Excel software to complete data analysis.

Table 1. Improvement of consumers' cognitive impairment of green brand products before and after intervention ($n=200$)

Factor	Before intervention ($n=100$)	After intervention ($n=100$)	<i>P</i>
Executive ability	2.47±0.43	4.66±0.61	0.00
Naming ability	2.54±0.55	4.52±0.60	0.00
Attention	2.36±0.41	4.39±0.43	0.00
Language ability	2.69±0.59	4.45±0.56	0.00
Abstract ability	2.47±0.43	4.66±0.61	0.00
Delayed recall	2.54±0.55	4.52±0.60	0.00
Orientation ability	2.36±0.41	4.39±0.43	0.00

Results: Table 1 shows the improvement of consumers' cognitive impairment of green brand products before and after the intervention. It can be seen from Table 1 that compared with before the intervention, after the intervention of the product promotion model based on cognitive psychology, consumers' cognitive impairment of green brand products has been significantly improved, and there is a statistical difference before and after the intervention ($P < 0.05$).

Conclusions: The promotion mode of green brand products based on cognitive psychology can effectively promote consumers' correct understanding of the image of green brand products, and then is of great significance to carry forward and practice the green concept.

EMOTIONAL ANALYSIS ON THE ROLE SHAPING OF FILM AND TELEVISION DRAMAS

Xiao Zhang

College of Information Technology and Communication, Hexi University, Zhangye 734000, China

Background: Color is the basic feature of life and non-life in the world. Color always surrounds people, and the emergence and expression of color also constantly affect people's daily life. Some psychological studies have pointed out that there is emotional expression of color in people's emotional expression, which shows that color can affect people's psychological emotions, including excitement or excitement, stress or pleasure. On this basis, some studies have deeply understood the impact of color balance on people's mental health and behavior. The more color tends to balance, the stronger the people's sense of moral satisfaction. When people face unbalanced colors, they will have anxious psychological emotions. In addition, some color psychologists believe that the color stimulation generated in social activities will affect personal emotion. From the process of social development, film and television works gradually change from black-and-white display to color display, which contains a large number of personal emotional changes that are difficult to estimate. With the deepening of research, the importance of color psychology is also increasing, and gradually evolved into an important discipline in higher education. At the visual level, psychology believes that the main characteristics of color include symbolism and association. The expression of the two characteristics, brings unique sensory stimulation to the individual, promotes the individual to bring a variety of emotional expression, and induces a stronger emotional language. Therefore, more and more studies on the emotional analysis of film and television works take the viewer's color psychology as the main research object to analyze the audience's color psychological changes to determine the emotional changes in film and television works.

In film and television works, scene layout, plot setting and role shaping are indispensable and important contents, in which role shaping is the main carrier of film and television emotional expression. In the emotional expression of characters in film and television works, film and television producers will use the physical behavior and language expression of characters to state the core ideas of film and television works, and also express the real ideas of creators. However, with the continuous development of the film and television industry, more and more producers are not confined to this more direct way of expression, and begin to focus on the implicit expression in the role modeling, including indirectly expressing their personal feelings from the character's clothing and the character's environmental characteristics. In the costume design of role modeling, color is important content, and different colors have significant differences in the visual impact on the audience. Therefore, in order to enable the audience to clearly understand the emotion in film and television works, the emotional way of color in role modeling is very important. In the study, in order to clearly understand the emotional expression of characters in film and television dramas, we start with the analysis of viewers' color psychology, in order to provide reference for the role shaping of film and television dramas.

Objective: This paper discusses the basic application status of color psychology, analyzes the color application in the role shaping in film and television works, and analyzes the influence of the creator's color in the film and television role shaping on the viewer's emotional expression under the color psychology.

Study design: Taking the students in the course of film and television appreciation in a university as the main research object, the application of color psychology in long-term teaching is counted. According to the current situation, teachers formulate a teaching model aimed at cultivating students' color psychology. The teaching mode is adopted to carry out the teaching of film and television appreciation for 6 months, and evaluate the changes of aesthetic emotional expression and conscious association psychology in the color psychology of middle school students in the role appreciation of film and television drama works in the teaching.

Results: In the appreciation of film and television works, teachers use different types of film and television drama works to guide students to conduct emotional analysis on the role shaping in the works, and evaluate students' aesthetic emotional expression and conscious association psychology in the analysis. See Table 1. Table 1 shows that in the face of different types of film and television drama works, students show different aesthetic emotional expression and conscious association psychology.

Table 1. The influence of film and television works on color psychology (%)

Project	Joy	Sadness	Sympathy	Self-confidence
Emotional expression	86	82	94	93
Conscious association	91	87	91	90

Conclusions: Film and television works are becoming more and more important in social development, and the emotions contained in them are becoming more and more obscure. Therefore, how to improve the ability of emotional expression and understanding in film and television works is a problem that we need to solve. Based on color psychology, this study analyzes the emotion of film and television works and the changes of students' color psychology from the color design in role shaping. The results show that in the appreciation course of colleges and universities, there are differences in teachers' evaluation of students' color psychological changes in the process of students' film and television works appreciation, and there are obvious differences in students' color psychology for different types of film and television works. Therefore, in the face of the increasingly developing modern society, in order to better adapt to the products of social development, in view of the increasing number of film and television drama works, it is necessary to understand the emotional changes in film and television works from color psychology, so as to cultivate personal color psychology and improve personal interest in daily life.

Acknowledgement: The research is supported by: Phased Achievements of the Project "Design and Production of Art Derivatives of Change-4 Satellite" of Innovation and Entrepreneurship Mu Course in Colleges and Universities in Gansu Province.

THE INFLUENCE OF CULTURAL AND CREATIVE PRODUCT DEVELOPMENT ON SOCIAL PSYCHOLOGY IN DAWAN DISTRICT, GUANGDONG, HONG KONG AND MACAO

Liyao Wu

College of Dancing, Kyung Hee University, Seoul 02453, Korea

Background: In the city one belt, one road city, Guangdong, Hong Kong and Macau, the development of the bay area has attracted much attention. The development and construction of the Bay Area in Guangdong, Hong Kong and Macao is an important development decision made by the Central Committee of the CPC. It emphasizes that the big bay area of Guangdong, Hong Kong and Macao needs to develop into a world-class city group, and become an important support for the whole area. At the same time, it should also make the city a livable and comfortable social circle. In the development of Guangdong, Hong Kong and Macao Bay area, its cultural and creative products are also gradually emerging. As a huge social community, Guangdong, Hong Kong and Macao Bay area contains rich and diverse cultures. With the support of diversified cultures, the cultural and creative products of Guangdong, Hong Kong and Macao Bay area are also diverse. However, multiculturalism not only brings many opportunities, but also brings many challenges. Under the influence of multiculturalism, there is a gap in the communication between different social communities, which leads to the differences in the cultures of different regions in Guangdong, Hong Kong and Macao Bay area, which also hinders the development of cultural and creative products. It can be seen from the existing research that the development of cultural and creative products directly affects regional economic development. When the development of cultural and creative products is blocked, the regional economy will be seriously affected.

Social psychology is a psychological science that studies the communication psychology among social individuals, groups and organizations. In the process of social development, different regions of China gradually use local culture to achieve economic development. At the same time, it emphasizes the use of social communication to promote cultural communication and achieve the purpose of regional comprehensive development. In social psychology, social representation is the guarantee that determines

the development of social communication. According to the research content of social psychology, social representation can help individuals have a clearer understanding ability in social communication. In addition, social psychology shows that social representation can help the specific analysis of a specific phenomenon in social communication and increase the ability of communication and interaction between societies. On the other hand, social psychology believes that the discourse sharing of social representation provides a development background for regional development and enables all sectors of society to communicate effectively. For some coastal areas, inland cities expect to accept their cultural products, and coastal cities also desire to sell cultural and creative products to inland cities. There is a certain social relationship between them, that is, consumers get corresponding services with social consumption psychology, while merchants get corresponding consumption with social service psychology. According to social psychology, businesses and consumers complement each other and reach a certain agreement in social communication. Therefore, how to analyze the development of cultural and creative products in Guangdong, Hong Kong and Macao Bay area from the perspective of social psychology can promote the consumption exchange between inland and Guangdong, Hong Kong and Macao Bay area and promote regional development.

Objective: This paper discusses the individual social communication psychology of Guangdong, Hong Kong and Macao Dawan District, analyzes the cognition of inland consumers on cultural and creative products in Guangdong, Hong Kong and Macao Dawan District, and discusses the correlation between cultural and creative products and social psychological activities of social groups in Guangdong, Hong Kong and Macao Dawan District, so as to provide theoretical support for the development of cultural and creative products and social psychological analysis.

Study design: Taking the merchants and consumers in the sales of cultural and creative products in Dawan District of Guangdong, Hong Kong and Macao as the research object, 20 merchants and 200 consumers in the sales of cultural and creative products in Dawan District of Guangdong, Hong Kong and Macao were selected to count their social and psychological status. Using principal component analysis, this paper summarizes the social-psychological activities of cultural and creative product sales merchants and consumers in Guangdong, Hong Kong and Macao, and analyzes the social-psychological impact of cultural and creative product development on merchants and consumers in Guangdong, Hong Kong and Macao.

Results: The impact of cultural and creative product development in Guangdong, Hong Kong and Macao Dawan district on the social and psychological activities of sellers and consumers are shown in Table 1. It is graded from 0 to 4. 0 means no impact and 4 means full impact.

Table 1. The impact of product development on the social psychology of merchants and consumers

Content	Business		Consumer	
	Self-cognition	Social cognition	Self-cognition	Social cognition
Innovation	4	3	4	4
Practicability	3	3	4	3
Appreciability	4	4	3	4

Conclusions: China's regional development is a necessary stage with social development. The purpose is to promote national economic development by promoting regional economic development and bring better life experience to citizens. In the development of Guangdong, Hong Kong and Macao Bay area, the development of its cultural and creative products determines the regional economic development rate to a certain extent. In the research, it fully analyzes the regional internal social activities in the development of Guangdong, Hong Kong and Macao Bay area and the social activities in the sales of cultural and creative products, and puts forward the development path of cultural and creative products, so as to analyze the social and psychological changes of merchants and consumers in product development and consumption. The results show that the innovation, practicability and appreciability of the development of cultural and creative products in Guangdong, Hong Kong and Macao can significantly affect the social and psychological activities of businesses and consumers, indicating that in the subsequent development, in order to meet the social psychology of consumers, the development and design of cultural and creative products in Guangdong, Hong Kong and Macao should be carried out from the three levels of innovation, practicability and ornamental. Social psychology is psychological research that studies social activities. Its development closely affects the national economic development. Therefore, it is necessary to make full use of social psychology to reflect the changes of psychological activities of social groups and promote economic development.

RESEARCH ON THE APPLICATION OF MANAGEMENT PSYCHOLOGY IN THE INNOVATION AND DEVELOPMENT OF ENTERPRISES

Dapeng Ji & Lei Li

School of Management, Henan University of Technology, Zhengzhou 450001, China

Background: Management psychology was created in the 1950s. In a word, it is a science that studies human psychological phenomena, the psychological processes and development laws in the process of management. It is the branch of industrial psychology that applies the knowledge of psychology to analyze, explain, and guide individual and group behaviors in management activities. Its purpose is to maximize the motivation of people, improve organizational structure and leadership performance, improve the quality of work and life, establish healthy and civilized interpersonal relationships, and achieve the purpose of improving management and developing production.

In recent years, with the rapid development of productivity, the labor-management contradictions in production relations are sharpened, enterprises urgently need to seek new management theories and methods, and the development and use of management psychology has emerged.

Objective: Apply management psychology to corporate management to enhance the company's operational development capabilities, improve the effectiveness and scientificity of corporate decision-making capabilities, better manage the existing employees within the company, and enhance the autonomy and enthusiasm of employees in their work; exert the employees' own value, provide theoretical reference and guidance for the development and management of the enterprise, enhance the internal operation ability of the enterprise in a true sense, and ensure the long-term and comprehensiveness of the enterprise's development.

Subjects and methods: The use of management psychology in corporate management mainly includes: corporate culture dissemination, training activities, creation of incentive systems, and strengthening of team management.

Management psychology requires managers to establish a relationship between corporate culture and employees' self-values, strengthen employees' sense of identity with corporate culture, and put employees' personal interests and corporate interests in the same position, in order to achieve the goal that the employees and the company are related to each other and advance and retreat together. Only when companies regularly carry out training activities can they keep pace with the times, continuously improve their work abilities, and innovate work results, so that the company can continue to develop in a sustainable and healthy manner in line with the needs of the times. Creating an incentive system is significant since talent strategy is the core strategy of an enterprise. The more prominent the salary incentive effect, the higher the cohesion of employees, the higher the labor efficiency, and the more significant the core competitive advantage of the enterprise. The enterprises should combine certain concepts in management psychology and adopt appropriate psychological methods to reasonably solve employees' previous conflicts.

Study design: Divide employees from 7 companies in a city that have not adopted the management psychology model into two groups. The observation group is guided by management psychology, and the control group maintains routine operations. One month later, design a questionnaire evaluation form, and calculate the corporate culture index, employee motivation index, employee satisfaction index, and team management index between the two groups by means of questionnaire surveys, and the sum is used as the overall management score. In addition, according to the evaluation data of the management personnel of each enterprise and the company's operating results, the performance indicators of each group are sorted separately.

Results: The overall management scores of each enterprise in the observation group and the control group are shown in Table 1, and the performance indicators of the observation group and the control group are shown in Table 2.

It can be seen from Table 1 that the overall management score of the observation group using management psychology has obvious advantages compared with the control group. In the actual work process, the efficiency, work enthusiasm, and working atmosphere of the observation group are greatly improved.

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \sum_{i=1}^n (y_i - \bar{y})^2}}$$

Use the Pearson Correlation Coefficient formula to calculate the correlation coefficients between the management scores and performance indicators of the observation group and the control group.

After calculation, the correlation coefficient between the management scores and the performance indicators of the observation group r_1 is 0.968, $r_1 > 0.8$, and the correlation coefficient between the management scores and the performance indicators of the control group r_2 is 0.837, $r_2 > 0.8$, so both the relationship between the management scores and performance indicators of the two groups is highly relevant. As can be seen in Table 2, the performance indicators of the observation group using management psychology are overall ahead of the control group. This shows that the application of management psychology has improved the management level of the enterprise, and the higher management level is directly related to the final performance data, which in turn affects the smooth operation and long-term development of the enterprise.

Table 1. Management score table of each enterprise

Company	Company 1	Company 2	Company 3	Company 4	Company 5	Company 6	Company 7
Observation group	8.2	7.9	8.3	8.5	8.4	8.7	8.1
Control group	4.3	5.2	5.8	5.1	5.8	4.8	5.6

Table 2. Performance indicators

Company	Company 1	Company 2	Company 3	Company 4	Company 5	Company 6	Company 7
Observation group	0.53	0.49	0.55	0.56	0.56	0.58	0.53
Control group	0.12	0.19	0.24	0.18	0.23	0.22	0.26

Conclusions: Through the application of management psychology, the management level of the company has been significantly improved, which is reflected in the employees' more active work enthusiasm, higher sense of corporate responsibility and more comfortable working environment; reflected in the management level, the company performance is significantly improved, the labor relations are more stable, and the labor costs are greatly reduced. In today's situation, talent strategy has become more and more important for enterprises. Only with high-quality and innovative talents can the company's own competitiveness be improved. The effective application of management psychology in company management and human resource development provides a new and high-quality approach to the enterprise's talent strategy and overall development, which should be paid attention to.

ADAPTABILITY ANALYSIS OF ANXIETY PATIENTS TO PUBLIC MANAGEMENT EDUCATION REFORM

Fuxi Chen

Department of Humanities and Social Sciences, Shaoxing University, Shaoxing 312000, China

Background: From the generation and gradual accumulation of anxiety to the formation of anxiety disorder, this process is a long and painful process for patients with anxiety disorder. Patients with anxiety disorder often shoulder a large burden in their psychological life and social life. In addition, anxiety disorder may also cause physiological disorders such as headache, muscle soreness and pain, resulting in great pain for patients. Patients with anxiety disorder will experience three main psychological stages: negation, anxiety and acceptance. In terms of psychological distress, the anxiety content of patients with anxiety disorder is often events that may not appear or are difficult to predict in advance in their daily life, and this sense of anxiety is persistent and reflected in the details of patients' life behavior. The embodiment of these life details will further strengthen the psychological anxiety symptoms of patients with anxiety disorder, leading to a vicious circle. This psychological state of anxiety is called "expected anxiety state". Patients in this state usually show a state of being extremely sensitive to the stimulation of the external environment, unable to control their thoughts, but also have psychological fear and avoidance of external things, which will further affect their personal life. The response of anxiety patients to anxiety is mainly divided into two kinds. One is evasive behavior, that is, negative emotion, immersed in their own anxiety and fantasy, difficult to respond to external information and raise corresponding interest, which reflects

the characteristics of “Inaction” in behavior. The other is that patients are eager to use a large number of ineffective behaviors to transfer their anxiety. This kind of action is often lacking organization, and the behavior effect is not satisfactory. It is difficult for patients with an anxiety disorder to intervene in their symptoms through their own psychological and behavioral regulation. Therefore, the service support of external society is an extremely important part of their disease intervention. This study takes the reform of public management education as the main research carrier, through the establishment of public management education anxiety auxiliary intervention system, intervene the state of anxiety students in the process of students, and giving psychological education support to anxiety students.

Objective: This study takes the public management education anxiety auxiliary intervention system as the main means to help anxiety students get rid of anxiety problems in their study and life, and provide a new psychological reform path for the modern public management education system while improving students’ academic performance.

Subjects and methods: This study combines the experimental comparison method with the K-means clustering algorithm to compare and analyze whether the auxiliary intervention system of anxiety in public management education has the corresponding effect through clustering classification and actual intervention experiments.

Study design: This study clusters and classifies the anxiety symptoms of students in the process of public management education through K-means clustering algorithm, divide the existing students’ anxiety symptoms into several main symptom types, and on this basis, carries out the comparative experiment before and after the intervention, and analyzes the experimental results with the main anxiety symptoms of students as the dimension. To test the anxiety intervention effect of public management education anxiety auxiliary intervention system in the process of education.

Methods: This study uses Excel to sort out and analyze the data.

Results: The changes of students’ anxiety scores after the auxiliary intervention of anxiety in public management education are shown in Table 1.

Table 1. Anxiety score

Index type	Before intervention	After intervention	<i>P</i>	<i>F</i>
Social anxiety score	60.31	56.42	<0.05	2.61
Expected anxiety score	56.53	51.25	<0.01	0.32
Efficacy anxiety score	55.41	51.76	<0.05	3.68
Positive psychological score	29.27	35.13	<0.05	2.57
Self-identity score	28.61	34.94	>0.05	4.83

Note: *P* < 0.05 means that the data difference is statistically significant, *P* < 0.01 means that the data difference is statistically significant, and *P* > 0.05 means that the data difference is not statistically significant.

In Table 1, only the *P* value of positive self-identity score is greater than 0.05, that is, it is not statistically significant. The *P* values of social anxiety score, efficacy anxiety score and positive psychology score are less than 0.05, which is statistically significant, and the *P* value of expected anxiety score is less than 0.01, which is statistically significant. It can be seen that the auxiliary intervention method of public management education anxiety can form a positive intervention on the social anxiety, expectation anxiety and efficiency anxiety of anxiety students, improve students’ positive psychological score and help students get rid of the negative psychological cycle of anxiety.

Conclusions: It is very difficult for patients with anxiety to adjust their own psychological and social support. This study investigates the anxiety disorder of contemporary public management students, and establishes an auxiliary intervention system for public management education anxiety according to the anxiety characteristics of students, so as to help students get rid of the three main anxiety types of social anxiety, expectation anxiety and efficiency anxiety, break the anxiety psychology and establish a positive psychological cycle, so as to balance the psychological state of students and improve the learning effect.

* * * * *

THE ROLE OF BEHAVIORAL PSYCHOLOGY IN EMOTIONAL EXPRESSION IN DRAMA PERFORMANCE

Dan Yu

College of Art, Anhui University, Hefei 230601, China

Background: Behavioral psychology is a psychological school originated in the United States in the early 20th century. Its founder is American psychologist Watson. Behaviorism holds that psychology should not study consciousness, but only behavior. The so-called behavior is the combination of various physical reactions used by organisms to adapt to environmental changes. These reactions are nothing more than muscle contraction and gland secretion. Some of them are expressed outside the body, some are hidden inside the body, and the intensity is also different. Behavioral psychology holds that people's psychological consciousness and spiritual activities are unpredictable and inaccessible. Psychology should study people's behavior. Behavior is the body's comprehensive response to environmental changes, which are just muscle contraction and gland secretion. The purpose of behavioral psychology research is to find out the relationship between stimulus and response, so as to infer response according to stimulus and stimulus according to response, so as to predict and control human behavior. Behavioral psychology no longer regards human consciousness as a reflection determined by objective things without its own regulations. It does not believe that the material source required by psychological activities is the content and source of psychological activities. Just as all human material products are always the result of human intellectual activities acting on external materials and the crystallization of internal and external factors, the deepening and development of human psychological activities is always the result of the joint action of internal and external factors. Objective things as the source of external stimulation and instinct or demand as the source of internal stimulation jointly constitute the source of psychological activities, and the content of psychological activities is organically composed of internal and external factors. Only by decomposing cognitive factors and intention factors from people's psychological activities and understanding people's instincts or needs as an intentional existence relatively independent of objective reality and the existence of the whole life, can we logically explain why people have subjective initiative and respond to the actual situation of objective reality. The application and good effect of behavioral psychology in the treatment of autism have been widely recognized in academia, patients and families in some countries. Generally speaking, behavioral therapy for autistic patients can include environmental transformation based on functional analysis, effect regulation and skill training. For the treatment of autism, in addition to the above methods, the more commonly used treatment methods can be summarized as intensive treatment, natural treatment and group treatment. In short, both in theory and in practice, behavioral psychology has made important achievements. Therefore, it is worth continuing to expand the application scope of behavioral psychology.

It should be said that since the birth of dramatic performance art, people have also had academic thinking on this artistic creation practice. Therefore, in fact, there has always been drama performance in drama academia. Whether drama or TV series, actors are required to create vivid, flesh and blood characters to make them have aesthetic value. In the process of shaping the image, the actor needs to "incarnate into a role", that is, the actor takes himself as the carrier, turns himself into a role in the script, shows another role, and becomes another role. However, when actors cannot overcome their emotional expression obstacles, it undoubtedly hinders the shaping of role image. In view of this, this paper constructs a drama performance intervention model based on behavioral psychology, which aims to break the difficulty of emotional expression in the characterization of actors, so as to comprehensively improve the performance ability of actors and bring us vivid and three-dimensional performing artworks.

Objective: To explore the intervention mode of drama performance based on behavioral psychology, in order to solve the emotional expression obstacles of actors in character shaping, so as to improve the performance ability of actors and bring more vivid drama and artworks to the audience.

Research objects and methods: 100 actors were randomly divided into control group and experimental group, with 50 in each group. Combined with the self-made drama emotional expression disorder scale, the emotional expression disorder of actors is measured. The scale consists of five dimensions: limb disharmony, unclear speech, unnatural form, lifeless expression and inattention. The higher the score, the more serious the emotional expression disorder. Among them, the control group adopted the intervention mode of routine performance training, and the experimental group added behavioral psychology on the basis of routine performance training. The intervention period was 1 month. The improvement of emotional expression disorder of the two groups was compared and analyzed.

Methods: Data through SPSS22.0 statistical analysis software is completed.

Results: Table 1 shows the improvement of emotional expression disorder of actors in the two groups after one month of intervention. It can be seen from Table 1 that compared with the control group, the experimental group based on behavioral psychology performance training intervention has a better effect on improving the emotional expression disorder of actors, and there is a statistical difference between the two groups ($P < 0.05$).

Table 1. The improvement of emotional expression disorder in the two groups after one month of intervention ($n=100$)

Factor	Control group ($n=50$)	Experience group ($n=50$)	<i>P</i>
Uncoordinated limbs	4.54±0.55	2.69±0.59	0.00
Unclear enunciation	4.99±0.69	2.47±0.43	0.00
Unnatural form	4.54±0.55	2.54±0.55	0.00
Inflexible expression	4.96±0.41	2.36±0.41	0.00
Mental disorder	4.84±0.46	2.69±0.59	0.00

Conclusions: Performance training intervention based on behavioral psychology can effectively improve the emotional disorder of actors. Therefore, it is worth popularizing and applying in the field of drama performance, so as to bring more three-dimensional and vivid works of art to the audience.

THE INFLUENCE OF THE TEACHING MODE REFORM OF COLLABORATIVE EDUCATION IN PRESCHOOL EDUCATION ON CHILDREN'S PSYCHOLOGICAL DEVELOPMENT

Baoliang Xu

School of Educational Sciences, Lingnan Normal University, Zhanjiang 524048, China

Background: Children are not only the initial stage of individual intellectual development, but also the stage of individual forming preliminary cognition of the world. Therefore, correct and appropriate preschool education is of great significance to children's intellectual development, personality shaping and mental health. Preschool education refers to the education that parents, schools and teachers systematically, periodically and scientifically educate children through a series of means and objects, so as to stimulate children's brain and gradually improve the functions of various parts of children's brains. It is an activity of nursing and education for children before the age of 6 weeks. In recent years, with the development of economy and the intensification of competition, people pay more and more attention to preschool education, and the demand for preschool education talents is also increasing. Therefore, the status of preschool education specialty is becoming higher and higher. The teaching effect and efficiency of preschool education courses are related to the quality level of preschool education talents. In order to better improve the teaching effect and quality of preschool education courses, the ministry of education has put forward a collaborative education teaching mode of combining production and learning, so as to improve the practical ability of college students and the teaching quality of kindergartens. Collaborative education teaching mode, that is, before formal work, carries out practical activities for students and practical teaching in kindergartens. In the collaborative education teaching mode, some students are difficult to grasp the key points, their practical ability cannot be improved, and it also hits the students' self-confidence. Therefore, it is necessary to propose a method to reform the collaborative education teaching mode of preschool education.

Behavioral psychology originated in the United States in the early 20th century. It is a branch of psychology. Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Children's mind has not been developed enough and their self-awareness is strong. Therefore, there will be many unfriendly and abnormal behaviors, such as bullying classmates, screaming, and so on. Therefore, the analysis of children's behavior and psychology based on behavioral psychology can effectively improve the teaching quality of college students. Based on the above contents, integrating the theory of behavioral psychology into the collaborative education teaching mode of preschool education, reforming the collaborative education teaching mode of preschool education can effectively improve the teaching quality, then improve the teaching level of students, and transport more high-quality preschool education talents for the society, which is also of positive significance to the long-term development of our country.

Objective: Correct and appropriate preschool education is of great significance to children's intellectual development, personality shaping and mental health. With the development of the economy and the

intensification of competition, people pay more and more attention to preschool education, and the demand for preschool education talents is also increasing. Therefore, the status of preschool education specialty is becoming higher and higher. The teaching effect and efficiency of preschool education courses are related to the quality level of preschool education talents. The research integrates the theory of behavioral psychology into the collaborative education teaching mode of preschool education, reforms the collaborative education teaching mode of preschool education, and then improves the teaching quality of college students.

Research objects and methods: 60 students were selected from the preschool education major of a normal university by stratified cluster sampling. Among the 60 students, 21 were male and 39 were female, aged from 18 to 24 years old. We should use the cooperative teaching mode of professional education to evaluate the effect of students' pre-school education.

Study design: 60 students were randomly divided into study group and control group with 30 students in each group. For the students in the research group, the cooperative education reform teaching mode of preschool education based on behavioral psychology was adopted for professional course teaching. For the students in the control group, the traditional collaborative education teaching mode of preschool education is used for professional course teaching. After three months of teaching, the examination results of professional courses of the two groups of students were compared.

Methods: The corresponding data were processed and analyzed by software SPSS17.0.

Results: After teaching, the scores of the two groups were significantly improved ($P < 0.05$). After 3 months of teaching, the academic performance of students in the research group was significantly better than that of students in the control group ($P < 0.05$). The examination results of the two groups of students before and after teaching are shown in Figure 1.

Figure 1. The examination results of the two groups of students before and after teaching

Conclusions: In order to better improve the teaching effect and quality of preschool education courses, the ministry of education has put forward a collaborative education teaching mode combining production and learning, so as to improve the practical ability of college students and the teaching quality of kindergartens. In the collaborative education teaching mode, some students are difficult to grasp the key points, their practical ability cannot be improved, and it also hits the students' self-confidence. Therefore, the research integrates the behavioral psychology theory into the collaborative education teaching mode of preschool education, and reforms the collaborative education teaching mode of preschool education, so as to improve the teaching quality of college students. The experimental results show that after teaching, the scores of the two groups of students' professional courses are significantly improved ($P < 0.05$). After 3 months of teaching, the academic performance of students in the research group was significantly better than that of students in the control group ($P < 0.05$). Therefore, integrating the theory of behavioral psychology into the collaborative education teaching mode of preschool education can effectively improve the teaching quality, then improve the teaching level of students, and transport more high-quality preschool education talents for the society, which is also of positive significance to the long-term development of our country.

Acknowledgement: 2020 Lingnan Normal University School-level Education and Teaching Reform Project: Research on the Training Model of Talents in the "Three-two Division" of Majors in Pre-school Education. (No. [2020] 240).

ON THE LIVING SITUATION OF THE ELDERLY WITH MENTAL ANXIETY IN NURSING HOMES

Ying Wang¹ & Lei Guo²

¹*School of Sociology, University of Chinese Academy of Social Sciences, Beijing 102488, China*

²*School of Government, University of Chinese Academy of Social Sciences, Beijing 102488, China*

Background: In the process of accelerating the pace of modern life and intensifying social competition, people often face huge psychological pressure. If the pressure cannot be effectively relieved, it is very easy to produce anxiety. Due to the growth of age and the degradation of physical function, the elderly is prone to anxiety. In the environment of increasing population aging, the number of elderly people living in nursing homes is increasing year by year. Under normal circumstances, the elderly leaves the familiar environment and are separated from their children's relatives and friends. In addition, they are unfamiliar with the environment of nursing homes, unwilling to communicate, and have weak adaptability. They have an obvious sense of loneliness and lack of spiritual and cultural life, which is very easy to produce negative emotions such as anxiety and depression. Most elderly people are also accompanied by a variety of chronic diseases, which further aggravate their negative emotions and make their mental anxiety more serious, Will have a serious impact on their quality of life. In the current social and academic environment, people usually focus on the external and material needs of the elderly, such as their physical health level, economic income and old-age security, while ignoring the spiritual needs and mental health level of the elderly. In recent years, more and more elderly people suffer from psychological diseases such as anxiety and depression, especially the elderly in nursing homes. The anxiety of the elderly is a common problem that puzzles their physical and mental health. It is mainly manifested in excessive worry, inner anxiety, tension, chest tightness, low sleep quality, restlessness and other symptoms. The anxiety of the elderly is related to many factors, including their own factors and social factors. The causes and influencing factors of mental anxiety of the elderly in nursing homes are diverse, which are mainly divided into four aspects: living environment, children's visit, nursing service and interpersonal relationship. Under the influence of different influencing factors, there are some differences in the mental anxiety of the elderly in nursing homes. The severity of mental anxiety has a significant impact on the life satisfaction, mental state and mental health level of the elderly. It will not only reduce their physical and mental health level, but also be a great burden to themselves and their families.

Objective: In order to improve the mental health level of the elderly in nursing homes and alleviate their mental anxiety to the greatest extent, this study will analyze the living situation of the elderly with mental anxiety in nursing homes, fundamentally explore the causes of their mental anxiety, and put forward corresponding improvement measures.

Research object and method: The elderly with mental anxiety were randomly selected from four nursing homes. 18 elderly people were selected from each nursing home, a total of 72. 72 elderly people with mental anxiety were selected as the research objects, and they were evaluated by Self-rating Anxiety Scale (SAS) and Geriatric Anxiety Inventory (GAI). SAS includes 20 evaluation items of anxiety degree, and the score is limited by 50 points. If the score is lower than 50 points, it means normal. 50-59 points, indicating mild anxiety. 60-69 points, indicating that the elderly subjects are accompanied by moderate anxiety. If the SAS score is 70 or above, the elderly is accompanied by severe anxiety. There are 20 evaluation items in GAI, which makes the elderly subjects answer "yes" and "no" according to their own feelings. The total score of GAI is 20. The higher the GAI score of the elderly, the more serious their mental anxiety symptoms are.

Research design: 72 elderly people with mental anxiety were analyzed by ant colony classification algorithm, and the severity of mental anxiety was obtained under the accurate evaluation of SAS and GAI. For all the elderly subjects, psychological intervention was used to alleviate their anxiety, and the SAS score and GAI score of the elderly subjects before and after the intervention were compared and analyzed.

Methods: By means of regression analysis, the survival situation and anxiety level of the elderly with mental anxiety in nursing homes were explored. The SAS score and GAI score of the elderly before and after the intervention were statistically analyzed by MATLAB software. All measurement data are expressed in the form of mean \pm standard deviation, and $P < 0.05$ is taken as the standard with statistical significance.

Results: Table 1 shows the comparison results of SAS score and GAI score of the elderly with mental anxiety in the nursing home before and after the intervention. It can be seen from Table 1 that before the intervention, the mental anxiety symptoms of the elderly were more serious. After the intervention, the

SAS score and GAI score were significantly reduced, indicating that their mental anxiety had been effectively alleviated.

Table 1. SAS and GAI scores of elderly people with mental anxiety in nursing homes before and after intervention

Evaluation time	Before intervention	After 3 months of intervention	After 6 months of intervention	After 9 months of intervention
SAS score	64.37±5.07	56.14±4.68	52.69±5.13	47.69±5.11
GAI score	18.24±1.16	12.01±0.89	9.94±1.08	7.52±0.93

Note: Compared with that before implementation, * $P < 0.05$.

Conclusions: The living situation of the elderly with mental anxiety in nursing homes is not very optimistic. Therefore, on the basis of giving the elderly basic elderly care services and meeting their daily life needs, we should also accurately evaluate and analyze their mental anxiety symptoms. Intervention measures can significantly alleviate the mental anxiety of the elderly and improve their mental health level.

META ANALYSIS OF THE EFFECT OF EXERCISE ON COGNITIVE FUNCTION IN PATIENTS WITH ALZHEIMER'S DISEASE

Yunliang Wang, Wenzhao Li, Jingxin Wu, Huatao Jin & Biao He

College of PE, Anhui Normal University, Wuhu 241003, China

Background: Cognition is the process in which the human brain receives external information, processes it, and transforms it into internal psychological activities, so as to obtain knowledge or apply knowledge. It includes memory, language, visual space, execution, calculation, understanding and judgment. Cognitive impairment refers to the impairment of one or more of the above cognitive functions, which affects an individual's daily or social ability, and can be diagnosed as dementia. There are many reasons. Except for organic diseases, most of them are caused by mental diseases. Such as neurasthenia, hysteria, hypochondriasis, climacteric syndrome, depression, obsessive-compulsive disorder, Alzheimer's disease, schizophrenia, reactive psychosis, paranoid psychosis, mania, manic depression, etc. The human brain involves a wide range of cognitive functions, including learning, memory, language, movement, thinking, creation, spirit, emotion and so on. Therefore, the manifestations of cognitive impairment are also diverse. These manifestations can exist alone, but they often appear at the same time. Cognitive impairment is a common neuropsychological symptom in patients with stroke, brain injury and various dementia. In the rehabilitation process of patients with brain injury, cognitive impairment is an important factor that hinders the improvement of limb function and activities of daily living. Paying attention to the clinical manifestations of various cognitive impairment, timely examination and diagnosis will help to treat cognitive impairment in time, shorten the rehabilitation process of patients with brain injury and promote the rehabilitation of brain injury. Rehabilitation training plays an important role in alleviating symptoms and delaying the progress of symptoms. Training includes attention training, memory training, calculation training and perceptual obstacle training.

Alzheimer's disease (AD), also known as Alzheimer's disease, is a degenerative disease of the central nervous system. It has a hidden pathogenesis and chronic progression. It is the most common Alzheimer's disease. It is mainly manifested in neuropsychiatric symptoms such as progressive memory impairment, cognitive impairment, personality change and language disorder, which seriously affect social, professional and life functions. The etiology and pathogenesis of AD have not been clarified, and its characteristic pathological change is the formation of amyloid deposition B Extracellular senile plaques, neurofibrillary tangles formed by hyperphosphorylation of tau protein, and neuronal loss caused by glial cell proliferation. The disease may be caused by a variety of social (heterogeneous) factors. From the current research, there are more than 30 possible factors and assumptions of the disease, such as family history, female, head injury, low education level, thyroid disease, high or low childbearing age of mother, virus infection and so on. The following factors are related to the onset of the disease: family history, physical diseases, head trauma, etc. In terms of clinical manifestations, the onset of this disease is slow or hidden. Patients and their families usually don't know when to start. This is more common among people over the age of 70. The symptoms of a few patients quickly become clear after physical disease, fracture or mental stimulation. There are more

women than men (the ratio of men to women is 3:1). The main manifestations are the decline of cognitive function, mental symptoms and behavioral disorders, and the gradual decline of daily living ability. It is divided into three periods according to the deterioration of cognitive ability and physical function. In terms of examination methods, it mainly includes neuropsychological examination, hematological examination and neuroimaging examination.

At present, the clinical treatment of ad is mainly drugs, but the progress of drug research and development is very slow. Some studies have shown that non drug intervention can improve cognitive function. Epidemiological investigation shows that routine exercise can reduce the decline rate of cognitive function. Exercise can improve cerebral blood flow velocity, nerve connection, maintain and increase brain volume, and promote nerve regeneration and vascular regeneration. However, clinical randomized studies have not determined the effect of exercise on improving cognitive function. Some clinical studies believe that exercise can improve cognitive function, while others believe that exercise can not improve cognitive function. The reason may be related to the small sample size and the short intervention time. In other words, whether the effect of exercise on cognition is effective in clinic is controversial. Therefore, this paper makes a meta-analysis on the role of exercise in improving cognitive function of ad disease.

Objective: Through the evaluation method of meta-analysis, this paper defines the impact of exercise on cognitive function of AD patients, in order to provide evidence-based basis for clinical intervention.

Research objects and methods: Search databases such as PubMed, Web of Science, evidence-based health care database (JBI), Cochrane Library, EMBASE, EBSCO, Ovid, CNKI, Wanfang, VIP and CBM. The retrieval time limit is from the establishment of the database to December 2021, and trace its references. Finally, 6 literatures were included (all randomized controlled trials). The experimental group was given exercise therapy, and the control group was given routine intervention (the control group was given foot bath or plantar massage, and the control group was given game intervention); The baseline of the experimental group was similar to that of the control group, and there was no significant difference between the two groups before intervention; Combined with the mini mental state examination scale (MMSE, used to evaluate cognitive state, the total score is 30 points. The higher the score, the better the cognitive function).

Methods: RevMan5.3 statistical software was used for meta-analysis.

Results: Figure 1 shows the forest diagram of the effect of exercise on cognitive function in patients with AD. As shown in Figure 1, exercise can improve the cognitive function of AD patients, and the difference is statistically significant (MD = 2.72, 95% CI: 1.19-4.25, $P < 0.05$).

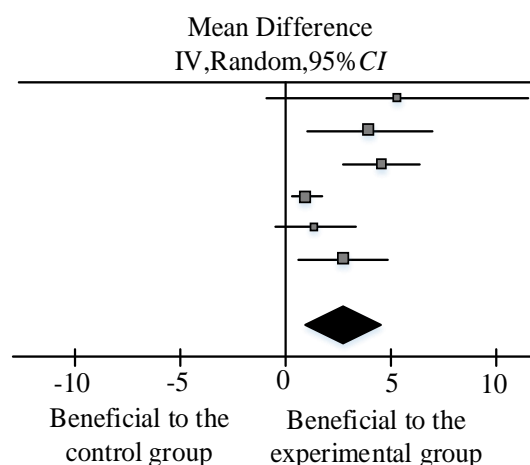

Figure 1. Forest diagram of the effect of exercise on cognitive function of AD patients

Conclusions: Exercise can improve the cognitive function of AD patients. As a new type of patient intervention model, exercise therapy is the future treatment direction of AD patients by reconstructing the intervention structure, integrating advanced information technology, taking patients as the center, paying attention to the awakening of patients' potential, actively guiding patients to actively receive treatment and comprehensively exercising patients' cognitive function.

Acknowledgement: The research is supported by: Anhui Provincial Natural Science Foundation, Research on The Molecular Mechanism of PGC-1A Mediated Exercise Against Alzheimer's Disease, (2108085MH265).

INFLUENCE AND EXPLORATION OF COLLEGE STUDENTS' PSYCHOLOGICAL ANXIETY FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Xiang Zhao

School of Art and Media, Yangtze University, Wuhan 430110, China

Background: The anxiety of college students is a common phenomenon in college learning. The main reason for students' anxiety is that students' psychology cannot adapt to the college environment. In college learning, learning tasks and learning requirements have been qualitatively improved compared with middle school teaching, which requires students to achieve more satisfactory results after teaching, but the increase of learning pressure also further increases students' psychological pressure, when students cannot meet the learning tasks issued by teachers and cannot meet the learning requirements required by teachers, they will have anxiety. In psychology, psychological anxiety is defined as a short-term negative emotion, which is easy to breed under the influence of the outside world. Generally, it will only affect students' psychological activities in a short time. However, when patients with anxiety disorder have long-term anxiety, they often have anxiety. In the face of real life, it is difficult to express their true feelings, and it is never easier to have doubts and uneasiness about the unknown, resulting in serious mental damage. The treatment of students' psychological anxiety in colleges and universities is mostly concentrated in routine teaching. Through course teaching and after-class communication, we can understand students' psychological anxiety, help students solve their own anxiety problems, and keep students in good psychological mood in daily learning.

In order to alleviate the psychological anxiety of college students, colleges and universities began to apply educational psychology to education and teaching. The main content of educational psychology is to formulate the teaching plan through the psychological feedback of students or teachers, and optimize the teaching plan through the psychological changes of students or teachers in the follow-up teaching process. Educational psychology is one of the main research contents in psychology. Its core idea is to carry out educational reform from the perspective of psychology. Educational reform includes the college teaching system, teachers' teaching plan and students' school strategy. Under the category of educational psychology, the purpose is to deeply grasp students' learning psychology by analyzing students' psychological behavior, stimulate students' motivation in the learning process, induce students to actively give full play to their self-study ability in learning, and then improve the learning effect. In addition, educational psychology can also make the teaching plan more scientific by grasping the psychological changes of teachers. For college teachers, according to educational psychology, teachers can be fully encouraged to use innovative teaching methods to exercise students' learning thinking, effectively alleviate students' learning pressure and reduce students' psychological anxiety. Therefore, the research takes educational psychology as the main breakthrough point to innovate the teaching mode of colleges and universities, and uses the teaching innovation mode to teach students in order to improve students' psychological anxiety.

Objective: This paper discusses the significance and value of educational psychology in college education and teaching reform, and analyzes the specific impact of college teaching reform on students' psychological anxiety from the perspective of educational psychology.

Study design: Using the literature method to collect the research status of teaching reform in colleges and universities using educational psychology, and using the principal component analysis to extract the content of educational psychology with important significance, so as to construct the teaching innovation scheme of colleges and universities. Taking a university as the research object, the number of students with psychological anxiety in the university was counted, and the anxiety status of all students was measured by self-rating anxiety scale. Innovative programs were adopted for all students to teach, and the changes of students' anxiety in the teaching process were evaluated by SPSS22.0 for statistical analysis, $P < 0.05$ is statistically significant.

Results: According to the statistics, the number of students suffering from anxiety in a university before teaching is 276. All anxiety students are taught with innovative programs. The results are shown in Table 1. Table 1 shows that through the innovative program teaching under educational psychology, the number of students with anxiety has been significantly increased, resulting in a significant decrease in the average anxiety score of 276 students, and the difference between before and after data is statistically significant ($P < 0.05$).

Table 1. Changes of students' anxiety

Project	Before teaching	After teaching	<i>P</i>
Anxiety number	276	123	<0.05
Anxiety score	66.2±2.05	36.37±1.19	<0.05

Conclusions: To improve students' anxiety in college teaching is one of the important contents of college teaching reform. How to alleviate students' psychological anxiety is also a problem that colleges and universities need to solve. In the research, educational psychology is used to obtain the psychological changes of teachers and students in teaching, analyze the main influencing factors of students' psychological anxiety, and formulate innovative teaching plans. The teaching results show that the number of anxiety students receiving innovative teaching has decreased significantly, and the anxiety scores of students with anxiety psychology have also decreased significantly. Therefore, in college teaching, we need to be people-oriented, fully understand the psychological impact of students from the level of students and teachers, and formulate appropriate teaching plans to alleviate students' learning anxiety and promote students' healthy growth.

INFLUENCE OF LANDSCAPE ARCHITECTURE ON THE REHABILITATION EFFECT OF DEPRESSIVE PSYCHOSIS

Jie Deng¹ & Juanjuan Zhu²

¹*Department of Agronomy, Yongzhou Vocational Technical College, Yongzhou 425100, China*

²*Department of Child and Adolescent Psychology, The Brain Hospital of Hunan Province, Changsha 410000, China*

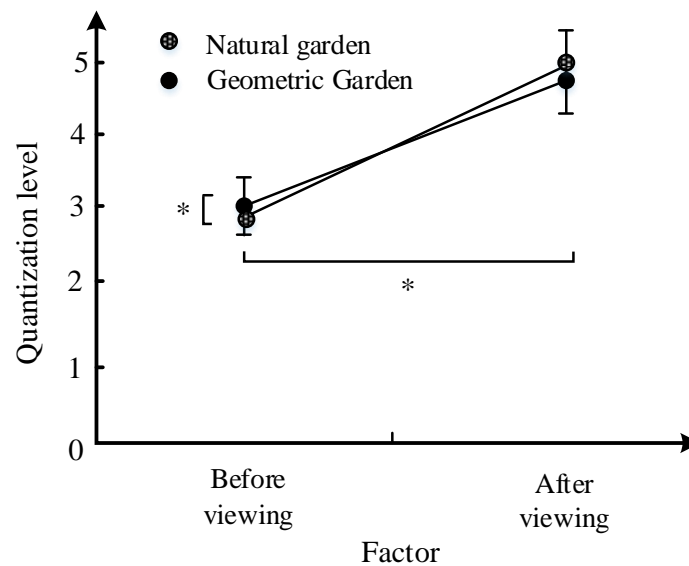

Background: Depression can also be called a depressive disorder. In clinical manifestations, it is mostly manifested in patients' depression, pessimism, cognitive and emotional disorders. Patients often fall into strong pessimism, ineffective control of Self Meditation and uncontrollable negative thinking. Patients often have poorer psychological function and higher risk of recurrence than ordinary people, it is a common emotional mental disease in clinic. The pathogenic factors of depressive psychosis are complex, involving the effects of individual physiology, individual social environment, individual psychological characteristics and so on. Depressive psychosis has both separate and concurrent conditions. Previous studies have shown that there is a significant correlation between depression and inflammatory factors in patients. Patients often have the phenomenon of increased inflammatory factors and decreased anti-inflammatory factors. Research also shows that when individuals have inflammation, patients' nuclear factors will be activated, and form depression and anxiety behavior after a series of protein expressions. At present, the drugs produced for the physiological pathogenesis of depressive psychosis have gradually diversified. Among them, monoamine oxidase inhibitors, tricyclic antidepressants and tetracyclic antidepressants have been widely used in clinical treatment, but a single physiological treatment often has strong path dependence. Once separated from drugs, patients will relapse depressive symptoms, so drug treatment is not an appropriate way for long-term convalescence. By using the environmental construction of garden landscape, the physical and mental state of patients with depressive psychosis can be effectively improved, and as a psychogenic treatment method, it can help patients get rid of drug path dependence. As a convalescent means to interfere with depressive psychosis by relying on the external environment, the garden landscape can create comfort, relaxation and a positive garden atmosphere can also provide a space for depression patients to communicate with each other, and improve the rehabilitation effect of depressive psychosis patients from the perspective of environmental psychology.

Objective: The purpose of this study is to help patients get rid of drug path dependence in the convalescence process of depressive psychosis, provide psychological convalescence for patients through garden landscape psychogenic convalescence, promote the enrichment of patients' positive psychology, and help patients get rid of the influence of depression.

Subjects and methods: This study combines the Semantic Differential method (SD) with the analysis of variance, and uses the field experiment to analyze the changes of depressive mood of the experimenters before and after viewing in the garden scenic spot, so as to analyze the correlation between the garden landscape and the changes of depressive mood of patients with depressive psychosis.

Study design: In this study, a total of 60 patients with different conditions were selected from the treatment institutions of depressive psychosis, and the ornamental experiment was carried out in the selected garden scenic spot. The experimenters will walk in the garden scenic spot for about 30 minutes, and conduct a psychological measurement and psychological interview before and after the ornamental behavior, according to the contextual differences, the psychological state of the experimental personnel is divided into two contextual dimensions: positive emotion and negative emotion, which are analyzed respectively. The data analysis is carried out by means of mean change, analysis of variance and so on.

Methods: This study uses SPSS19.0 for comparative analysis and change analysis of research data.
Results: The depression scores of the experimenters before and after viewing are shown in Figure 1.

Note: * means $P < 0.05$, and the difference is statistically significant.

Figure 1. Depression score before and after viewing

From the comparison of scores before and after viewing in Figure 1, it can be seen that both natural gardens and geometric gardens have a significant effect on alleviating the depression of patients with depressive psychosis. The starting point of the model line of natural gardens is lower than that of geometric gardens, but the key position is higher than that of geometric gardens after closing, it can be seen that natural gardens have a stronger effect on relieving depression than geometric gardens.

Conclusions: Affected by the high recurrence rate of depressive psychosis, patients with depressive psychosis often have a certain degree of drug dependence in traditional drug intervention, and will face a greater risk of recurrence once the drug is stopped. Therefore, this study takes the psychological intervention of garden landscape as the main intervention means to assist the convalescence of patients with depressive psychosis. Through the enthusiastic setting of the garden landscape, it provides a tour environment conducive to physical and mental health for patients with depressive psychosis. Both natural gardens and geometric gardens can have a positive impact on the psychology of patients with depressive psychosis, compared with geometric gardens, natural gardens have a stronger positive impact on patients with depressive psychosis. Patients with depressive psychosis can relax their body and mind and accept positive ideas by visiting at a fixed time and frequency, so as to control depression and anxiety symptoms.

THE EFFECT OF STAGE PRACTICE TEACHING OF MUSIC PERFORMANCE SPECIALTY ON ALLEVIATING STUDENTS' ANXIETY

Ji He

College of Humanities and Music, Hunan Vocational College of Science and Technology, Changsha 410004, China

Background: The research on the psychological development of college students shows that about 20% – 47% of them are not fully affected by the psychological development of others. When dealing with the relationship between the external environment and their own psychology, students are prone to conflict, and the handling of interpersonal relations and the worry about employment prospects will cause students' anxiety. The anxiety psychology of college students includes social anxiety, examination anxiety, employment anxiety and so on. Anxiety disorder is a very complex psychological and emotional disorder. It is usually manifested in motor agitation and sympathetic hyperactivity, often accompanied by negative emotions such as anxiety, shame, disappointment, anxiety, fear and so on. Appropriate anxiety can make

students in a more active learning state and have a more active attitude towards themselves and the environment. However, excessive anxiety will cause students' resistance and affect the quality of learning and daily life. Music performance is a kind of performance activity with high requirements for performers. The training goal of music performance specialty is professionals with a solid and systematic combination of basic theories of musicology and basic professional skills, and has high requirements for students' comprehensive quality. However, in the current teaching of music performance specialty, its teaching mode basically imitates the music education specialty, ignores the talent training law of music performance specialty, and the construction goal is not clear, which makes it difficult for students to improve their innovation ability and practical ability. At the same time, the major of music performance pays insufficient attention to students' practical teaching in terms of teaching scheme design and teaching objectives, ignores the changes of students' individual differences and psychological quality, and then it is very easy for students to have a one-sided evaluation, self-doubt and negation of the outside world and their own professional level, resulting in negative emotions and psychological problems such as anxiety. Therefore, exploring the role of stage practice teaching in music performance specialty in alleviating students' anxiety is helpful to improve their mental health level, and has important practical significance and value.

Objective: In order to improve the anxiety of college students, alleviate their anxiety symptoms and help them improve their mental health level, this paper studies the active intervention of college students' psychological anxiety by strengthening the stage practice teaching of music performance specialty.

Research objects and methods: The research takes the college students with anxiety disorder in a music performance major as the research object, innovates their teaching practice, strengthens the stage practice teaching, and explores its alleviation of college students' anxiety psychology on this basis.

Method design: First, grade students according to their psychological anxiety symptoms, and then promote the improvement of teaching scheme by strengthening stage practice teaching, so that the teaching design can better meet the psychological needs and emotional value of anxiety college students. The experiment lasted for three months. After the experiment, the change of psychological anxiety of students majoring in music performance was analyzed with the help of a Self-rating Anxiety Scale, so as to better explore the intervention mechanism of stage practice teaching of a music performance major in alleviating college students' anxiety.

Methods: With the help of social statistical analysis tool SPSS20.0 this paper makes a statistical analysis on the anxiety relief of middle school students in stage practice teaching of music performance specialty.

Results: The dance teaching of performance specialty can guide students to actively show themselves and improve their confidence to a great extent, so as to effectively improve the anxiety level of anxiety college students, alleviate their negative emotions and effectively improve their mental health level. Table 1 shows the scores of anxieties in each dimension of the two groups of students before and after the experiment.

Table 1. The anxiety scores of the two groups before and after the experiment

Anxiety dimension	Before the experiment		After the experiment	
	Average value	Standard deviation	Average value	Standard deviation
Interpersonal relationship processing	2.15	1.96	3.74	2.32
Professional learning confidence	2.76	1.19	3.04	1.41
Employment prospect planning	3.15	1.98	4.59	2.06
Low life emotion	3.97	1.65	2.75	1.47

Conclusions: Vocal singing can improve people's perception, expression and aesthetic ability of music art, and different styles and types of music works bring people different psychological feelings and emotional values. The difference of the main melody of vocal music can effectively bring different emotional experiences to the audience, make them feel "immersive", and then help them relieve their emotions in the process of vocal music singing. At the same time, the teaching of music performance specialty has high requirements for the application and practice of the specialty, and the inherent teaching mode is very easy to cause students' anxiety and psychological problems. The active intervention of anxiety students through stage practice teaching can strengthen the relationship between them and society, improve their affirmation and confidence in their own major, help them actively regulate their emotions and improve their mental health.

ALLEVIATING THE ANXIETY OF COLLEGE STUDENTS BY MUSIC DRAMA EDUCATION

Ying Yao

Fine Arts School, Binzhou University, Binzhou 256600, China

Background: In today's fast-paced society, anxiety has become a common emotional stress response. The body of college students is basically mature, but their mind is not fully developed, and their ability to control and master emotions is insufficient, which leads to large emotional fluctuations in the face of various pressures, resulting in damage to the social function of college students and anxiety. Studies have shown that a considerable number of college students have varying degrees of psychological problems, such as emotional instability, negative will, abnormal interpersonal relationships and so on. There are many factors leading to college students' anxiety, which can be roughly divided into poor adaptability, improper handling of interpersonal relationships, academic pressure, employment pressure and so on. Moderate anxiety can help students concentrate, so that they can study more attentively and hard, and then improve their academic performance. However, when the degree of anxiety is too high and lasts too long, students' physical and mental health will be damaged, students' interest in learning will decline, and even weariness will appear, which will greatly affect students' normal study and life.

Behavioral psychology originated in the United States in the early 20th century. It is a branch of psychology. Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Based on the theory of behavioral psychology, this paper analyzes the causes of anxiety of college students, discusses the behavior mode and psychological change law of anxious college students, and puts forward the use of the emotional communication and spiritual relaxation function of music drama to alleviate the anxiety of college students. The study provides a new way to alleviate the anxiety of college students, which is of positive significance to the academic progress, personal development and social development of college students.

Objective: The body of college students is basically mature, but their mind is not fully developed, and their ability to control and master emotions is insufficient, which leads to large emotional fluctuations in the face of various pressures, damage to the social function of college students and anxiety. Based on the theory of behavioral psychology, this study proposes to use the emotional communication and spiritual relaxation functions of music drama to alleviate the anxiety of college students, which provides a new way to alleviate the anxiety of college students.

Research objects and methods: 80 students were selected as the research objects in a university. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Symptom Checklist-90 (SCL-90) were used to evaluate the degree of anxiety of students.

Study design: The students were randomly divided into study group and control group by random number table method, with 40 people in each group. The students in the study group watched music and drama for half an hour every day for intervention treatment. The students in the control group did not intervene. After a period of intervention, the anxiety levels of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: Before the intervention, there was no significant difference in SAS score, SDS score and SCL-90 score between the two groups ($P > 0.05$). After the intervention, the SAS score, SDS score and SCL-90 score of the students in the study group were significantly lower than those in the control group ($P < 0.05$). The SAS scores of the two groups of students before and after the intervention are shown in Figure 1.

Conclusions: In today's fast-paced society, anxiety has become a common emotional stress response. Studies have shown that a considerable number of college students have varying degrees of psychological problems, such as emotional instability, negative will, abnormal interpersonal relationships and so on, which leads to a high prevalence of anxiety among college students. Based on the theory of behavioral psychology, this paper analyzes the causes of anxiety of college students, discusses the behavior mode and psychological change law of anxious college students, and puts forward the use of the emotional communication and spiritual relaxation function of music drama to alleviate the anxiety of college students. The results showed that there was no significant difference in SAS score, SDS score and SCL-90 score between the two groups before intervention ($P > 0.05$). After the intervention, the SAS score, SDS score and SCL-90 score of the students in the study group were significantly lower than those in the control group ($P < 0.05$). It shows that the research provides a new way to alleviate the anxiety of college students, and is of positive significance to the academic progress, personal development and social development of college students.

Note: * $P < 0.05$ compared with that before intervention; # It indicates that compared with the control group, $P < 0.05$.

Figure 1. SAS scores of two groups of students before and after intervention

INFLUENCE OF PRESCHOOL MUSIC INNOVATION EDUCATION IN HIGHER VOCATIONAL COLLEGES ON ALLEVIATING STUDENTS’ PSYCHOLOGICAL ANXIETY

Li Cai

College of Preschool Education and Humanities, Dongguan Polytechnic, Guangdong 523808, China

Background: Psychological anxiety refers to the panic and anxiety caused by social individuals in the face of difficulties or obstacles because they are difficult to solve in time or worried that they cannot solve them effectively. Appropriate psychological anxiety can promote individual behavior and effectively supervise individuals to improve self-efficiency. However, excessive psychological anxiety will seriously affect the quality of individual mental health and lead individuals to fall into negative emotions, under the new social situation, higher vocational students in China are only children, and their family life is relatively closed and constrained, so they are shy and introverted. A long time alone leads to the low ability of these vocational students to deal with problems in interpersonal communication and cannot form a normal interpersonal relationship, which makes vocational students prone to psychological anxiety in the face of interpersonal communication and communication. On the other hand, with the improvement of social and economic level, the connivance of parents to students in modern society is increasing day by day. Some parents spoil students too much, resulting in students’ low psychological pressure resistance and fragile psychological defense line. Therefore, when students leave their families for collective life, they are prone to problems with low willpower and emotional control in the face of difficulties and setbacks, and are troubled by negative emotions such as psychological anxiety in the process of problem solving.

Music assisted therapy is a common method of assisted therapy for psychological problems in psychology, and music psychological education is also the most accepted psychological education mode for students. With the help of the strong emotional appeal of music, music psychological education regulates students’ emotional changes and promotes the improvement and consolidation of students’ psychological quality. Music psychological education stimulates the nervous system in students’ cerebral cortex through beautiful and pleasant music melody, so as to make students have psychological resonance with music, so as to help students relieve pressure, relax and eliminate anxiety. For students majoring in preschool education in higher vocational colleges, music education is an important professional course. Reform and innovate the music education of preschool education specialty in higher vocational colleges, integrate psychological education into preschool music education, improve the professional quality of music education of preschool

education specialty, at the same time, it can also alleviate students' psychological anxiety, improve the mental health level and quality of higher vocational college students, and promote the all-round development of the comprehensive quality of higher vocational college students.

Objective: Through the statistical analysis of the mental health status of students majoring in preschool education in higher vocational colleges, to understand the level of psychological anxiety of students in higher vocational colleges, and to analyze the causes of psychological anxiety of students in higher vocational colleges in combination with family, social background and other factors. Based on the analysis of the current situation and incentives of students' psychological anxiety in higher vocational colleges, this paper puts forward the direction of innovative development of preschool music education in higher vocational colleges, and expects to alleviate the psychological anxiety of students in higher vocational colleges through the reform and optimization of music education of preschool education major in higher vocational colleges.

Research design: With the help of the review and investigation activities of higher vocational college students' mental health level carried out by a city in 2021, this paper grasps the mental health level of higher vocational college students at this stage, understands the current situation of higher vocational college students' psychological anxiety, analyzes the causes of students' psychological anxiety, and discusses the entry point of alleviating higher vocational college students' psychological anxiety. Combined with the analysis of students' psychological anxiety in higher vocational colleges, using the evaluation method of artificial neural network and the powerful data mining and deep learning ability of BP neural network, this paper analyzes the effect of preschool music innovation education in higher vocational colleges on alleviating students' psychological anxiety. The research uses BP neural network to construct the preschool music innovation education model, takes the psychological anxiety status data of higher vocational college students as the model input vector, obtains the changes of higher vocational college students' psychological anxiety under preschool music innovation education, and analyzes the role of preschool music innovation education in higher vocational colleges in alleviating students' psychological anxiety.

Results: The review results of psychological anxiety of students in higher vocational colleges are shown in Table 1. The psychological anxiety of students in higher vocational colleges is generally high.

Table 1. Review results of psychological anxiety of students in higher vocational colleges

Survey object	Freshman	Sophomore	Junior	Senior
Family anxiety	4	3	3	4
Academic anxiety	4	3	4	3
Employment anxiety	3	4	3	4

Conclusions: With the advancement of social process and increasing social pressure, the mental health status of higher vocational students is not optimistic, and the number of higher vocational students with various psychological disorders such as psychological anxiety is increasing. The fundamental purpose of education is to cultivate high-quality compound talents needed by society under the needs of the times. Therefore, higher vocational education must pay attention to students' mental health problems and actively alleviate students' psychological anxiety and other negative psychological states through various ways. Therefore, research on the innovation and reform of preschool music education in higher vocational colleges, through the special form of music, through various music education and teaching activities for students, improve students' aesthetic consciousness and music appreciation ability, so as to alleviate students' psychological anxiety.

EFFECT OF LITERATURE THERAPY ON DEPRESSION OF COLLEGE STUDENTS

Wei Tong

Academic Registry, Miyun Campus of Capital University of Economics and Business, Beijing 101500, China

Background: With the development of urbanization, the psychological pressure of urban residents is increasing day by day. At present, there are nearly 350 million patients with depression worldwide, and the number of suicides caused by depression has reached about 1 million every year. According to the clinical characteristics of high recurrence and difficult diagnosis of depression, as well as the social and

psychological characteristics that have not been paid attention to by the majority of social groups. There are still a large number of potential depression groups around the world who have failed to successfully diagnose depression. Depression has become an important mental health problem to be solved all over the world. Depression is an affective mental disorder characterized by psychological symptoms such as depression, slow thinking speed and fading of personal will. On the one hand, patients themselves suffer from psychological depressive symptoms and concurrent symptoms brought by depressive symptoms, such as physiological changes and out-of-control behavior. On the other hand, they bear great psychological pressure in the social environment and are prone to negative emotions such as self-blame and inferiority complex. These negative emotions will have a serious impact on the treatment process of patients themselves. For patients with depression, the social environment cannot improve the individual's sense of well-being, but will continuously lower the individual's sense of well-being, and the low sense of well-being will further aggravate the symptoms of depression and form a vicious circle. Among all depressive symptoms, the impairment of social function has the most serious impact on the quality of life of patients. Therefore, in the clinical research of depression, some researchers have suggested that the final quality of life of patients with depression should be the focus of clinical trials. At present, there are both drug intervention and psychological intervention in the treatment of depression. Drug intervention often causes patients' physiological dependence, while psychological intervention is relatively more conducive to patients' physical and mental health. This study uses literary therapy to intervene the depression of college students, give play to the maintenance effect of literary works on human mental health, help college students with depression get rid of depression and establish a normal personal social life.

Objective: This study uses the mental health maintenance function of literary works to help college students get rid of depression by applying literary therapy to the treatment of depression among college students.

Subjects and methods: This study combines the factor analysis method with the experimental comparison method, studies the key factors that play an active role in the depressive symptoms of college students in the literary treatment method by means of correlation analysis and comparative analysis, and verifies the effectiveness of the literary treatment method.

Study design: This study analyzes the relationship between psychological elements and depression elements of literary works through factor analysis, establishes the specific intervention mechanism of literary therapy, and then analyzes the intervention effect of literary therapy through comparative experiments.

Methods: In this study, Excel was used to make statistics and analysis on the depression-related data of college students.

Results: The analysis of variance of different depression levels of college students before and after the test is shown in Table 1.

Table 1. Analysis of variance of different depression levels before and after test

Level	Light (M±SD)	Moderate (M±SD)	Severe (M±SD)	P	F
Pretest	0.523±0.026	0.652±0.027	0.705±0.006	0.000	65.332*
Post-test	0.478±0.045	0.468±0.055	0.675±0.022	0.011	6.187*

Note: * indicates $P < 0.05$, ** indicates $P < 0.01$, *** indicates $P < 0.001$.

In Table 1, there are extremely significant statistical differences in the comparison of different levels of depressive symptoms among college students before the test ($P < 0.01$), while there are extremely significant statistical differences in the comparison of different levels of depressive symptoms after the test ($P < 0.05$).

Conclusions: Drug intervention for depression often leads to the dependence of patients with depression on drugs. Once separated from drug maintenance, depressive symptoms are likely to relapse. Therefore, in addition to drug intervention, psychological intervention therapy for patients with depression is also very important. This study uses the maintenance effect of literary works on human mental health to apply literary therapy to the intervention of depressive symptoms of college students. Through literary works, literary works can meet the inner emotional needs of patients with depression from the perspective of aesthetic appreciation, promote patients with depression to have a deeper sense of happiness and enhance the inner richness of patients with depression in daily life. At the same time, literature can provide alternative satisfaction for the instinctive desire of patients with depression, help patients establish a more healthy and perfect personality and get rid of the influence of depression.

* * * * *

EFFECTS OF PERIAPICAL PERIODONTITIS ROOT CANAL THERAPY ON PATIENTS' PSYCHOLOGY AND ANXIETY

Zhixing Jing¹, Changjiang Mi¹ & Fei Teng²

¹Department of Stomatology, North Sichuan Medical College, Nanchong 637000, China

²School of Administration, North Sichuan Medical College, Nanchong 637000, China

Background: Periapical infection is an infection caused by the necrosis of dental pulp under the influence of pulpitis, and the toxin enters the dental pulp tissue and destroys the apical foramen. There are acute and chronic periapical periodontitis. In the field of medicine, acute periapical periodontitis has a great impact on the physical and mental health of patients. In addition, the incidence of periapical periodontitis is not only pulp necrosis caused by late pulpitis, but also iatrogenic infection, external force and poor eating habits. In recent years, with the gradual increase of incidence rate of periapical periodontitis, the psychological anxiety of patients after illness has gradually increased, and the increase of patients' psychological anxiety has increased the infection degree of periapical periodontitis to some extent. Psychology believes that people's anxiety psychology is affected by external attention. In the long-term infection of patients with periapical periodontitis, the degree of destruction of dental pulp tissue is related to the degree of attention of patients. When patients receive more attention, their inner anxiety will increase rapidly, which will have a negative impact on the follow-up treatment and rehabilitation of patients.

With the proposal of root canal treatment technology, the treatment effect of periapical periodontitis began to be significantly improved. In the process of patient treatment, on the one hand, it is to carry out radical treatment for patients with periapical periodontitis, on the other hand, it is to regulate the psychological mood of patients. Previous studies have shown that in the radical treatment of patients with periapical periodontitis, radical treatment is divided into one-time and multiple treatments. One-time treatment is to take one-time treatment operation in the treatment to reduce the number of follow-up visits of patients. Multiple treatment is to take multiple operations in the treatment. Patients will have regular follow-up visits within a certain period of time after the first treatment, and they will be treated again during the follow-up visit. Only after the doctor determines that the treatment of periapical periodontitis is completed, there is no need for follow-up visits. For the psychological changes of patients during radical treatment of periapical periodontitis, some studies have pointed out that either one-time or multiple treatments can alleviate the psychological anxiety of patients, but it is worth mentioning that few studies have analyzed the differences of psychological anxiety after one-time and multiple treatments, It is impossible to understand the specific impact mechanism of radical treatment of periapical periodontitis on patients' psychological anxiety. Therefore, in order to scientifically and reasonably regulate the psychological anxiety of patients with periapical periodontitis, it is necessary to deeply study the regulation effect of one-time and multiple radical treatment, and select a more effective treatment scheme for patients.

Objective: To investigate the psychological anxiety status of patients with periapical periodontitis, and explore the impact of radical treatment on the psychological anxiety of patients with periapical periodontitis, so as to provide theoretical support for the follow-up treatment and mental health regulation of patients with periapical periodontitis.

Study design: Fifty patients with periapical periodontitis were selected for follow-up investigation. The patients' psychological anxiety was collected before the patients received radical treatment. SAS anxiety rating scale was used for anxiety evaluation, and excel was used to count the patients' psychological anxiety. After treatment, the patients were divided into one-time group and multiple groups according to the treatment methods received by the patients. The psychological anxiety of the two groups was investigated, and the inter group and intra group comparisons were made to evaluate the regulation effect of the two treatment methods on the psychological anxiety of the patients.

Table 1. Changes of psychological anxiety in patients

Group	Before treatment	After treatment	P
Disposable group	65.63±2.34	37.44±1.26	<0.05
Multiplicity group	67.32±2.11	52.44±1.43	<0.05
P	>0.05	<0.05	-

Results: Before treatment, there was no significant difference in anxiety score between the two groups, which was not statistically significant. After treatment, in the intra group comparison, the post-treatment anxiety scores of patients in the one-time group and multiple groups were significantly lower than those

before treatment ($P < 0.05$). In the comparison between groups, there were significant differences in anxiety scores between the one-time group and the multiple groups, and the anxiety scores of patients in the one-time group were significantly lower than those in the multiple group ($P < 0.05$). See Table 1 for details.

Conclusions: Patients with periapical periodontitis will have obvious psychological anxiety before treatment. Regulating the psychological anxiety of patients has a significant positive effect on the follow-up treatment of patients. The study found that radical treatment can significantly alleviate the psychological anxiety of patients, and it can be seen that the use of one-time treatment can not only achieve the same radical effect as multiple treatment but also significantly reduce the psychological anxiety of patients. Therefore, in the treatment of patients with periapical periodontitis, one-time treatment should be the main treatment means to help patients with radical treatment and reduce patients' psychological anxiety at the same time.

STUDY ON THE INFLUENCE OF DEPRESSION REPORT ON THE MOOD OF PATIENTS WITH DEPRESSION

Ruiliang Liu

Administrative Department, Communication University of China, Nanjing, Nanjing 211172, China

Background: Depression is a kind of psychological disease with depression as the main symptom. The causes are emotional disorder, affective disorder and so on. At present, the clinical manifestations of depression are high prevalence, high recurrence rate and high suicide rate. The domestic epidemiological survey of mental diseases shows that the lifetime prevalence of depression is about 10%, of which 75% of patients are at risk of recurrence. Patients with depression will reduce their self-identity and deny their self-worth, show very negative emotions, and seriously affect their quality of life due to the long-term impact of negative emotions. The attention, memory and other cognitive functions of patients with depression will be damaged in varying degrees poor attention and memory function. Patients cannot achieve normal study, life and work when their condition is relatively mild. At present, the common intervention measures are offering lectures on professional knowledge of mental health and targeted personalized psychological intervention. The former popularizes common psychological problems and the adverse effects of psychological problems to patients through regular lectures on mental health knowledge, and provides patients with channels to obtain psychological assistance. The latter alleviates and improves psychological problems through active psychological intervention measures, and sets up a special psychological counseling room to complete psychological counseling. However, these depression intervention programs are difficult to implement, poor effect and low real-time, so it is difficult to fundamentally solve the psychological problems of patients with depression.

Some research reports claim that depression reports play a positive role in the treatment of depression patients' bad emotions. The reason may be that the thinking of patients with depression is easily affected by the external natural environment and human factors. If patients are in a negative environment for a long time, their thinking will be affected by negative factors, and their depressive psychological problems will further worsen. If patients with depression are in a positive and optimistic environment, their thinking, thoughts and behavior will be positively affected, which will reduce the degree of psychological depression. Depression report can be regarded as creating a positive environment for patients. Patients can understand the causes of depression, the intervention methods of depression, the characteristics of depression population, etc. Through depression report, which can alleviate the psychological problems of patients with depression to a great extent, help them see depression objectively and fairly and face it with a positive and optimistic attitude. In addition to displaying the relevant knowledge of depression diseases, depression reports will also share the actual cases of depression patients cured, which can build the confidence of depression patients to recover and enhance the determination of depression patients to recover themselves.

Objective: Analyze the effect of depression reports on the mood of patients with depression, improve the mental health level of patients, and improve the cure rate of patients with depression.

Research objects and methods: 200 patients with depression were randomly divided into control group and experimental group, with 100 patients in each group. The study used Hamilton Depression Scale (HAMD) to analyze the measurement of depressive symptoms of two groups of patients, and used the algorithm of ordering points to identify the clustering structure (options) to classify the improvement effect. The scale

includes seven factors: despair, sleep disorder, block, day and night change, weight, cognitive disorder and anxiety. Set the evaluation index of improvement effect as no improvement, improvement and obvious improvement. The improvement rate is the ratio of the number of people and the total number of people at the two levels of improvement and obvious improvement. The control group took the routine psychotherapy mode for intervention, while the experimental group increased the report of depression on this basis. The whole intervention cycle was one month. The improvement of depressive symptoms of the two groups were compared and analyzed.

Methods: The latest version of SPLM data statistical analysis software was used to analyze the effect of depression reports on the mood of patients with depression.

Results: Table 1 shows the improvement of depressive symptoms in the two groups after the experiment. The depressive symptoms of patients in the experimental group improved more significantly, while the depressive symptoms of patients in the control group improved to a certain extent. Therefore, the introduction of depression report in the experimental group has a significant effect on the intervention of patients.

Table 1. The Improvement of depressive symptoms in the two groups after the experiment (%)

Dimensions of anxiety measurement	Control group (n=100)	Experience group (n=100)
Sense of despair	82.21	89.36
Sleep disorder	83.23	89.67
Block	82.36	90.22
Diurnal variation	85.32	91.23
Weight	84.35	92.31
Cognitive barriers	84.65	93.14
Anxious	86.35	92.14

Conclusions: Depression has a serious impact on people's normal life, and all sectors of society should pay special attention to it. The results show that compared with the general psychological intervention program, the psychological intervention program of depression report has obvious advantages in improving the symptoms of patients with depression, which is worthy of clinical application.

* * * * *

EFFECT OF URBAN PUBLIC SPACE LANDSCAPE ON ADJUVANT TREATMENT OF PATIENTS WITH DEPRESSION

Diefan Wang^{1,2}

¹*School of Art, Southeast University, Nanjing 211189, China*

²*School of Art and Design, Changzhou University, Changzhou 213164, China*

Background: Depression is a psychological disease with high prevalence, high recurrence rate and high suicide rate. In clinical practice, patients can pay attention to the people, things and things around them that worry them. At present, there is no mature theory to explain the causes of depression. Analyze the reasons, which may be related to the negative emotions they have been exposed to in the past. Patients with depression are likely to focus on the negative emotions that make them sad, which will further aggravate their depression. A large number of medical studies have pointed out that the mood of patients with depression will be affected by their memories, thoughts, thoughts and other factors in their brain. At present, the common intervention measures are lectures on professional knowledge of mental health and personalized psychological intervention. Lectures on mental health knowledge can not only provide a channel for patients with depression to obtain psychological assistance, but also enable patients to understand and learn the adverse effects of common psychological problems and psychological problems on themselves and their relatives and friends. Positive psychological intervention measures need to be completed by setting up a special psychological counseling room. Psychological counseling can alleviate and improve the psychological problems of patients with depression. However, the implementation of these common depression intervention programs is difficult, the effect is poor, and the real-time performance is low. It is difficult to fundamentally solve the psychological problems of patients with depression. The effect of clinical application is not particularly ideal.

The latest research points out that urban public space landscape can play an important role in the intervention of patients with depression, and experts in the fields of spatial healing and psychological counseling have begun to apply this treatment. Urban public space landscape is a unique landscape formed for different regional styles, times, environment and so on. It has publicity, artistic value, social value, medical value and so on. The manifestations of urban public space landscape are landscape art, green environmental protection, urban sculpture, flexibility, public space field and so on. At present, the design elements usually contained in urban public space for patients with depression have attracted extensive attention from all walks of life. Healing urban public space has unique healing elements, landscapes and other natural scenery. These elements can not only cure patients through their senses, but also bring good spatial feelings to patients with depression. Therefore, the landscape design of urban public space should not only have good environmental construction, but also skillfully use people's psychology to maximize the effect of environmental governance.

Objective: Analyze the adjuvant treatment effect of urban public space landscape on patients with depression, in order to alleviate the symptoms of depression and provide some help for the adjuvant treatment of patients with depression.

Research objects and methods: 100 patients with depression were randomly divided into control group and experimental group, with 50 patients in each group. The study used Hamilton Depression Scale (HAMD) to measure the depressive symptoms of patients, and classified the improvement effect through Balanced Iterative Reduction and Clustering Using Hierarchies (BIRCH). The HAMD scale includes seven dimensions: despair, sleep disorder, block, day and night change, weight, cognitive disorder and anxiety. Each dimension is evaluated with a five-level scoring standard of 0-4 points. Set the improvement effect evaluation index into four levels: no improvement, slight improvement, improvement and obvious improvement. The improvement rate is the ratio of the number of people with slight improvement, improvement and obvious improvement to the total number of people. The control group took the general psychotherapy mode to intervene with the patients, while the experimental group increased the urban public space landscape intervention on this basis. The whole intervention lasted for 3 months. After the experiment, the improvement of depressive symptoms of the two groups were compared and analyzed.

Methods: Through the latest version of Epi Info data statistical analysis software, the improvement effect of urban public space landscape on patients with depression was analyzed.

Results: Table 1 shows the improvement degree of depression in the experimental group in the whole experimental cycle. The depressive symptoms of patients in the experimental group improved significantly, and the degree of improvement was gradually obvious with the increase of treatment time. Therefore, the introduction of urban public space landscape in the experimental group has an obvious effect on the intervention of patients.

Table 1. The Improvement of depressive symptoms in the two groups after the experiment (%)

Dimensions of anxiety measurement	After 1 month	After 2 months	After 3 months
Sense of despair	82.21	85.36	89.36
Sleep disorder	82.36	86.57	91.23
Block	81.28	86.34	91.24
Diurnal variation	84.28	86.29	91.23
Weight	83.68	87.56	93.17
Cognitive barriers	85.21	84.16	89.35
Anxious	84.14	83.25	93.26

Conclusions: Patients with depression will not only have a significant impact on their physical and mental health, but also have a bad impact on the quality of life of their family and friends. Through the urban public space landscape, the degree of depression of patients can be greatly improved. This adjuvant treatment method has a certain promotion value in the intervention of depression.

* * * * *

STUDY ON THE INFLUENCE OF DIFFERENT MODE TYPES OF MUSIC ON COLLEGE STUDENTS' ANXIETY PSYCHOLOGY

Xiaoyang Xiao

School of Drama, Film and Television, Shenyang Conservatory of Music, Shenyang 110818, China

Background: Anxiety psychology refers to people's emotional reflection caused by the serious deterioration trend of the value characteristics of real things or unknown things in the future. In other words, anxiety is a kind of negative psychological emotion generated by individuals for unknown or dangerous things, mainly including tension, worry, anxiety, worry, etc. Anxiety is mainly divided into two types: realistic anxiety and pathological anxiety. The former refers to people's basic emotional reflection in the process of adapting and solving problems, which will disappear with the disappearance of realistic threats or problems. The latter refers to anxiety without specific reasons, usually accompanied by obvious autonomic nerve dysfunction, continuous subjective pain, impairment of social function and other symptoms. College students are in a critical period of social role transformation and mental maturity, which is likely to produce serious tension under the influence of external pressure or setbacks. At present, a large number of college students will feel confused or uneasy about their employment prospects during the graduation season. They usually have difficulties in maintaining their concentration, losing interest in the things around them, excessive pride or inferiority. College students' anxiety psychology will have a huge negative impact on their study, employment and interpersonal communication, which is not conducive to the improvement of their professional ability and the realization of the goal of all-round development. In recent years, the positive influence of music on individual physical and mental health has been paid more and more attention. Music has been widely used in many fields, such as psychological counseling, clinical treatment and so on. Music has many types. Different types of music can convey different emotional or artistic expressions. Appropriate music can effectively alleviate tension to a certain extent, so as to eliminate anxiety and relax. The pitch, rhythm, melody, mode and timbre of music have strong diversity and richness, which can have different effects on people's emotions. In all the elements of music, mode is the best expression of music emotional characteristics, which can effectively arouse people's emotional changes and relieve their anxiety. In the process of diagnosis and treatment of college students' anxiety psychology, only relying on drug treatment cannot effectively alleviate their anxiety psychology, and it is difficult to obtain significant treatment effects. Therefore, nondrug treatment methods such as cognitive-behavioral therapy and acceptance commitment therapy need to be adopted. As an effective auxiliary treatment, music therapy not only has the characteristics of low cost and easy to control, but also plays a great positive role in alleviating college students' anxiety.

Objective: At present, college students face more external pressure and are prone to anxiety under the negative influence of pressure sources such as study and employment. Therefore, it is imperative to find an effective way to alleviate their anxiety. This study explores the music of different modes and applies it to the relief process of college students' anxiety, in order to effectively alleviate their anxiety and improve their mental health level.

Research objects and methods: 113 college students with anxiety psychology were randomly selected in colleges and universities to give them different mode types of music to explore the impact of different mode types of music on students' anxiety psychology, mainly divided into major fast, major slow, minor fast and minor slow. Self-assessment Manikin (SAM) and Hamilton Anxiety Scale (HAMA) were used to evaluate their anxiety psychology.

Research design: Using different modes of music as an intervention means to explore the changes in college students' anxiety before and after the intervention. Sam's rating standard is 1-9 points. The higher the score, the lower its pleasure. HAMA contains 20 evaluation items in total and adopts 5-level evaluation standard. From 0 to 4, it indicates asymptomatic, mild, moderate, severe and extremely severe. HAMA's score threshold for judging whether there is psychological anxiety is 14 points. If it is greater than 14 points, it means that the subject must be accompanied by anxiety.

Methods: The evaluation results were classified by MATLAB software and support vector machine algorithm, and the relevant scoring data were counted and analyzed.

Table 1. Evaluation results of Sam subscale of college students under different modes and types of music intervention

Intervention mode	Valence	Arousal
Fast in major	4.27±0.85	4.14±1.02
Slow in major	6.56±0.92	6.73±0.89
Minor fast	5.26±1.09	4.25±1.07
Minor slow	7.02±0.97	7.13±1.15

Results: Table 1 shows the SAM score results of college students under different modes and types of music intervention, mainly divided into two aspects: pleasure and arousal. According to Table 1, in terms of

the evaluation results of pleasure degree, the rapid intervention effect in major is the best, and its pleasure degree is the highest, indicating that the anxiety psychology of college students can be effectively alleviated. According to the evaluation results of arousal degree, the arousal degree of the fast major and fast minor is better, and the former has a more significant effect on the improvement of college students' anxiety psychology.

Conclusions: Different modes of music can have different degrees of positive effects on college students' anxiety psychology. Four modes of music can effectively alleviate college students' anxiety psychology, among which the rapid intervention effect of major is the best.

* * * * *

EFFECT OF VISUAL COMMUNICATION DESIGN ON ANXIETY OF PATIENTS WITH DEPRESSION

Longfan Cui

Academy of Fine Arts, Langfang Normal University, Langfang 065000, China

Background: Depression is a kind of psychological disease dominated by depression. It also shows decreased interest and depression. The most common pathogenic factor is mental disorder. Specifically, the typical symptoms of patients with depression include core symptoms, psychological symptoms and physical symptoms. The core symptoms include depression, decreased interest or loss of pleasure. Psychological symptoms include anxiety, thinking retardation, cognitive symptoms, self-blame and self-sin, attempted suicide and behavior, psychomotor changes and self-knowledge. Physical symptoms include sexual dysfunction, depression, light day and night, energy loss, eating and weight disorders, and sleep disorders. Depression patients have low self-identity and self-worth, which seriously affects the quality of life due to the long-term impact of negative emotions, and even suicidal tendencies in serious cases. Patients with depression have different degrees of impairment of cognitive functions such as attention and memory, which are manifested as poor attention and memory function. Patients cannot achieve normal study, life and work when their condition is relatively mild. According to the severity, type and quantity of depression, clinical medicine can divide depression into three types: mild, moderate and severe. According to the characteristics of different populations, depression can also be divided into postpartum depression, child depression and senile depression. Aiming at the etiology of the disease, relatively mature studies believe that the pathogenesis and psychosocial factors, genetics, brain imaging, neuroimmunology, neuroendocrine, biochemistry and so on.

At present, the common intervention measures are offering lectures on professional knowledge of mental health and targeted personalized psychological intervention. Positive psychological intervention measures need to be completed by setting up a special psychological counseling room. Psychological counseling can alleviate and improve the psychological problems of patients with depression. However, the effect of these common depression intervention programs is poor and the scope of application is greatly limited. The psychological problems of patients with depression cannot be fundamentally treated, and the effect of clinical application is not particularly ideal. Some research reports claim that visual communication design plays a positive role in the treatment of bad emotions in patients with depression. Visual communication design is the active behavior of transmitting specific things through visual form, which is usually realized with the help of two-dimensional space such as electronic equipment, color, illustration, graphic design, painting, logo and typesetting. In visual communication design, the visual symbols that human visual organs can feel have specific functions. The reason may be that the thinking of patients with depression is easily affected by the external natural environment. Covering green, red and another favorable visual impacts can make patients with depression in a relatively relaxed and comfortable range, which helps them temporarily stay away from their bad emotions and maintain the dimension of space that makes them happy and flexible.

Objective: To analyze the influence of visual communication design on the anxiety psychology of patients with depression, in order to improve the mental health level of patients and improve the cure rate of patients with depression.

Research objects and methods: 100 patients with different degrees of depression in two cities were selected as the research object. The mental health status of patients before and after the application of visual communication design was analyzed by Hamilton Anxiety Rating Scale (HAMA), and the anxiety of patients was analyzed by Density-Based Clustering (DENCLUE), which lasted for 6 months. The scale is divided into mental and physical factors, including a total of 14 items, and each item is evaluated by 4-level

score. The higher the score on the scale, the more serious the anxiety of patients. The anxiety level is divided into four levels: no anxiety, possible anxiety, obvious anxiety and serious anxiety. The improvement rate was selected as the final evaluation index.

Methods: The effect of visual communication design on anxiety of patients with depression was analyzed by the latest version of SASD data statistical analysis software.

Results: Table 1 refers to the improvement rate of anxiety psychology of patients with depression before and after the application of visual communication design. It can be seen from Table 1 that the anxiety psychology of patients with depression has been significantly improved after the intervention of visual communication design, and the improvement rate has increased significantly over time, mainly because visual communication design can reduce the psychological anxiety of patients with depression to a certain extent through diversified visual symbols.

Table 1. Improvement rate of anxiety in patients with depression before and after the application of visual communication design

Mental health indicators	After 1 month	After 3 months	After 6 months
Spirituality	81.0	86.0	89.0
Somatization	82.0	87.0	92.0

Conclusions: The Institute proposed that visual communication design can improve the psychological anxiety of patients with depression, and this method can have strong popularization value in the anxiety intervention of patients with depression. Later, this method can be applied to the intervention of patients with other types of depression, so as to maximize the scope of application.

THE NECESSITY OF PSYCHOLOGICAL COUNSELING IN POSTOPERATIVE NURSING OF BURN AND SCALD

Bei Ge, Jingjing Zhang & Jingjing Yuan

Burn Plastic Surgery Department of the Main Department, Qingdao Municipal Hospital, Qingdao 266011, China

Background: Burn and scald is a special type of surgical diseases. Burns and scalds are mostly sudden and unexpected. Patients often have a variety of negative emotions, which lead to psychological problems. Such as tension, anxiety, fear, irritability, etc. Burns and scalds are mostly accidents. Patients do not have enough psychological preparation and psychological buffer zone. Coupled with the lack of burn knowledge, patients cannot correctly face their own injuries, which will produce anxiety. The pain, the change of appearance, the worry about the future and the fear of death will make the patients have the psychology of fear and fear. After operation, continuous pain, dressing change, dressing, venipuncture and other nursing work will lead to irritability of patients. Burn patients need surgery for complete treatment, and patients generally lack relevant knowledge of burn surgery, resulting in patients' fear of surgery. In addition, due to the unacceptability of accidents, patients will also have negative emotions such as anger and depression. The above psychological problems will lead to anxiety symptoms. The treatment compliance of anxiety patients will be reduced, which will slow down the recovery speed of patients, cause greater economic burden for patients' families, and waste medical resources at the same time. Therefore, it is necessary to conduct psychological counseling for patients.

Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Based on behavioral psychology, the study analyzes the behavior patterns and psychological laws of patients, and then formulates targeted psychological counseling strategies to alleviate the negative emotions of patients. Including: establishing a good doctor-patient relationship with patients, rational use of nonverbal communication, minimize the pain of patients during operation. Carry out corresponding medical knowledge education for patients. Psychological counseling based on behavioral psychology can effectively alleviate the anxiety of patients, improve the recovery speed of patients, reduce the economic burden of patients' families, and save hospital medical resources.

Objective: Burns and scalds are often sudden and unexpected. Patients often have a variety of negative emotions, which lead to psychological problems. Based on behavioral psychology, the study analyzes the behavior patterns and psychological laws of patients, and then formulates targeted psychological counseling strategies to alleviate the negative emotions of patients, so as to improve the recovery speed of patients, reduce the economic burden of patients' families and save the medical resources of the hospital.

Subjects and methods: 100 burn and scald patients were selected from the surgery of a third-class hospital. Self-rating Anxiety Scale (SAS) and Symptom Checklist-90 (SCL-90) were used to evaluate the degree of anxiety.

Study design: 100 burn and scald patients were randomly divided into study group and control group, with 50 people in each group. Among them, the patients in the study group combined with psychological counseling based on behavioral psychology on the basis of routine nursing. The patients in the control group only received routine nursing. After a period of time, the anxiety levels of the two groups were compared.

Methods: The relevant data were processed and analyzed by software SPSS18.0 and Excel.

Results: Before treatment, there was no significant difference in SAS score and SCL-90 score between the two groups ($P > 0.05$). After a period of treatment, the SAS score and SCL-90 score of patients in the study group were significantly lower than those in the control group ($P > 0.05$). The changes of SAS scores of the two groups before and after treatment are shown in Table 1.

Table 1. Changes of SAS scores of two groups of patients before and after teaching

Timing	Score		<i>t</i>	<i>P</i>
	Research group	Control group		
Before treatment	78.7±3.8	78.6±2.9	0.246	0.752
After treatment	52.1±1.3	61.4±3.8	6.537	0.013
<i>t</i>	8.462	4.453	-	-
<i>P</i>	0.000	0.012	-	-

Conclusions: Most burns and scalds are sudden and unexpected. Patients often have a variety of negative emotions, which lead to psychological problems. The treatment compliance of anxiety patients will be reduced, which will slow down the recovery speed of patients, cause greater economic burden for patients' families, and waste medical resources at the same time. Based on behavioral psychology, this study analyzes the behavior patterns and psychological laws of patients, and then formulates psychological counseling strategies. The results showed that there was no significant difference in SAS score and SCL-90 score between the two groups before treatment ($P > 0.05$). After a period of treatment, the SAS score and SCL-90 score of patients in the study group were significantly lower than those in the control group ($P > 0.05$). Therefore, psychological counseling based on behavioral psychology can effectively alleviate the anxiety of patients, improve the recovery speed of patients, reduce the economic burden of patients' families, and save hospital medical resources.

STUDY ON THE DEVELOPMENT OF CULTURAL TOURISM INDUSTRY AND ITS ROLE IN EMOTIONAL RELIEF OF PATIENTS WITH ANXIETY DISORDER

Yunchao Wu

Tourism Management Department, Guizhou University of Commerce, Guiyang 550014, China

Background: With the development of my country's comprehensive national strength, people's quality of life has been improved. After getting rid of poverty, more people yearn for spiritual freedom and are willing to use their spare time to travel to achieve the effect of relaxing their body and mind. To a certain extent, it has stimulated the development of my country's tourism industry. After several years of development, in order to fully meet the needs of customers, the tourism industry will actively promote new activities to attract tourists, and the mentality of tourists has also changed to some extent. At this point, cultural tourism has emerged to meet people's growing spiritual needs. Modern people, especially young people, often experience anxiety or depression due to the pressure of school, work, and family. Anxiety is a common emotional state in people's psychology. The etiology usually has a certain diversity, including the blow of great changes, physical diseases and so on. Anxiety within the normal range is a natural response of human instinct and a mechanism for human self-protection, and is often referred to as physiological anxiety. If the

severity of anxiety exceeds the normal range, it manifests as pathological anxiety. There are three types of anxiety disorders: generalized anxiety, acute anxiety, and phobias. The clinical manifestations of patients with different types of anxiety disorders are different. To alleviate the anxiety of patients with anxiety disorders, not only need to rely on the patient's own corresponding psychological adjustment, but also need to rely on the positive influence of external environmental factors. Usually, people use energy release method to relieve anxiety, and its main forms can be divided into two categories, namely intrusion and venting, and letting anxiety patients travel is an intrusive energy release method, which invades the brain through external thoughts to achieve diversion. strength and relieve anxiety. Patients with anxiety disorders can choose the corresponding cultural tourism independently, which can achieve a more relaxed state and finally achieve effective relief of anxiety.

Objective: The daily life of patients with anxiety disorder will be negatively affected by their own anxiety, resulting in emotional disorder, cognitive function transformation, neurological disorder and other symptoms, and finally significantly reduce the quality of life of patients. This topic will analyze the development of cultural tourism industry and explore its impact on the emotional relief of anxiety patients, in order to improve the mental health status of anxiety patients.

Subjects and methods: 94 patients with anxiety disorder were selected from the hospital by stratified cluster random sampling, and then the anxiety relief of the two groups of anxiety patients was explored in the form of comparative experiment and questionnaire survey.

Research design: 94 patients with anxiety disorder will be divided into control group and observation group by random number table method, with 47 cases in each group. The patients in the control group were not treated. The patients in the observation group were given guidance on the relevant information of cultural tourism industry and allowed to experience a completely independent cultural tourism. The experimental time was set as one month. Questionnaires were distributed to the two groups of patients before and after the experiment to collect and analyze the anxiety of the patients. In this study, 94 questionnaires were distributed each time. The number of effective questionnaires recovered before and after the experiment were 94 and 92 respectively, and the corresponding questionnaire recovery rates were 100% and 97.87% respectively.

Methods: The questionnaire was mainly Self-rating Anxiety Scale (SAS), which was used to score the anxiety state of the two groups of patients before and after the experiment. The higher the SAS score, the more serious the anxiety of the patients. Through Excel and SPSS19.0 software, the anxiety and its relief of the two groups of patients were statistically and compared. The statistical data are expressed as $\bar{x} \pm s$. t -test is used to compare the data between groups. $P < 0.05$ indicates that the difference is statistically significant.

Figure 1. Comparison of SAS scores between the two groups before and after the experiment

Results: As shown in Figure 1, there was no significant difference in SAS scores between the two groups before the experiment ($P > 0.05$), and the comparison between the two groups was comparable. After the experiment, the SAS score of patients in the observation group decreased significantly, indicating that the anxiety of patients was relieved. The SAS score of patients in the control group fluctuated slightly, almost maintained a stable state, and was much higher than that of patients in the observation group ($P < 0.05$).

Conclusions: The rapid development of cultural tourism industry is not only helpful to improve the

national economic level and enhance the sense of Chinese cultural identity, but also has a significant positive impact on the emotional relief of patients with anxiety disorder. Anxiety patients who experience cultural tourism show a significant decrease in SAS score and a significant improvement in mental health, which verifies that the development of cultural tourism industry can provide strong support for anxiety patients to alleviate anxiety.

RESEARCH ON THE IMPROVEMENT OF COLLEGE STUDENTS' ANXIETY BY THE INTEGRATION MODE OF INDUSTRY AND EDUCATION OF VOCATIONAL EDUCATION IN THE NEW ERA

Yuqi Chu

College of Economics and Management, Suzhou Polytechnic Institute of Agriculture, Suzhou 215008, China

Background: In recent years, with the increasing attention of all sectors of society to college students' mental health education, mental health education in higher vocational colleges has also developed rapidly. The integration of industry and education and school enterprise cooperation are the main characteristics of the development of higher vocational colleges in the new era. Looking at the talent training mode of higher vocational education, most of them are "employment oriented and based on job needs". Higher vocational education focuses more on improving students' professional and vocational skills, pays insufficient attention to students' professional quality, psychological quality and personality growth, and pays insufficient attention to students' values, outlook on life and world outlook. The concept of "whole person" training for students is not established. Therefore, under the background of the development of higher vocational education integrating industry and education in the current new era, how to innovate the form and content of mental health education and promote the development of physical and mental health and psychological quality of students in higher vocational colleges is an important issue that the majority of mental educators must think deeply. At present, due to the imbalance of students' physical and mental development, many students often face psychological confusion and psychological conflict, and some develop into serious psychological obstacles such as weariness, loneliness and inferiority, and even lead to psychological diseases. According to the viewpoint of collaborative education, under the current background of school enterprise cooperation and integration of production and learning, mental health education in higher vocational colleges is a systematic project. The system includes three departments: teaching, student work and logistics service, including four contents: psychological course teaching, psychological activities, psychological census, psychological counseling and psychological crisis intervention. It includes four teams: full-time psychological teachers, part-time psychological teachers (psychological work counselors), class tutors (class teachers) and full-time teachers.

Objective: To establish a long-term mechanism for mental health education, which is of great significance to coordinate the division of labor and cooperation of various departments, give play to the synergy of various systems, and explore the mental health education model with local characteristics and professional characteristics in combination with the actual situation of higher vocational colleges, so as to promote the sustainable development of mental health education in higher vocational colleges.

Research objects and methods: In order to alleviate the anxiety symptoms of college students, taking the production education integration mode of vocational education in the new era as the research method, 400 questionnaires were distributed to college students with anxiety in higher vocational colleges in a certain area to test their psychological characteristics. A total of 372 questionnaires were collected with a recovery rate of 93%. The subjects were divided into experimental group and control group, with 186 people in each group. The experimental group was given the teaching scheme of industry education integration mode of vocational education, and the duration of the experiment was 2 months. The control group did not receive special teaching within 2 months, but only routine teaching. A total of 210 males and 190 females participated in this project. The age range of all subjects remained between 18 and 23 years, with an average age of 20.6 ± 2.3 years.

Research design: After teaching, the Self-rating Anxiety Scale (SAS) was used to evaluate before and after training. The score limit was 50 points. More than 50 points indicated anxiety. The lower the score, the healthier the psychology. Judge the anxiety status of the two groups of subjects before and after training.

Methods: The relevant data were calculated and counted by Excel software and SPSS20.0.

Results: Before teaching, there was no significant difference in SAS score between the experimental group and the control group ($P > 0.05$). After teaching, the anxiety of the experimental group was significantly improved, and the number of people with severe and moderate emotions was significantly reduced ($P < 0.05$).

Table 1. Anxiety status of the two groups before and after training [n (%)]

Groups	Time	Without anxiety (%)	Mild Anxiety (%)	Moderate anxiety (%)	Severe anxiety (%)
Experimental group	Before teaching	40 (21.50)	98 (52.69)	34 (18.28)	14 (7.53)
	After teaching	114 (61.29)	62 (33.33)	10 (5.38)	0 (0.00)
Control group	Before teaching	46 (24.73)	94 (50.54)	36 (19.35)	10 (5.38)
	After teaching	80 (43.01)	68 (36.56)	32 (17.20)	6 (3.23)

Conclusions: Psychological education activities should be included in the psychological education curriculum and included in the curriculum management as a practical project. According to the task driven teaching model developed according to the constructivist teaching theory, the teaching reform of psychological education curriculum is not only in line with the requirements of project-based teaching reform of school enterprise cooperation in higher vocational colleges, but also in line with the concept and curriculum requirements of psychological education. The concepts of “caring for human nature” and “learner development oriented” of constructivism are consistent with the goal of mental health education to promote the growth and development of college students and the improvement of their personality. The task driven teaching mode is that under the guidance of the teaching theory of “students as the main body and teachers as the leading”, teachers create vivid scenes, stimulate students’ strong interest in learning and desire for knowledge, take a clear task as the goal, let students “do while learning while doing”, and give full play to students’ subjective initiative, it is a teaching form to stimulate students’ imagination and creativity to the greatest extent.

THE POSITIVE ROLE OF THE MIXED MODE OF PIANO TEACHING IN COLLEGES AND UNIVERSITIES IN IMPROVING STUDENTS’ PSYCHOLOGICAL DEVELOPMENT UNDER EDUCATIONAL PSYCHOLOGY

Xiaoxia Zhai

Department of Music, Jinzhong University, Jinzhong 030619, China

Background: Educational psychology is a social psychology that studies human learning, educational intervention, teaching psychology and school organization. Educational psychology can be used to design courses, improve teaching methods, promote learning motivation, and help students face difficulties and challenges in the process of growth. Based on the theory of educational psychology, the teaching model of students’ participatory learning is one of the hotspots of current educational reform research. Its biggest teaching features are: the establishment of a student-centered teaching concept, the change of the role relationship between teachers and students in traditional teaching, and the replanning of the use of classroom teaching time. In short, the student participatory teaching model based on educational psychology can solve teaching problems through the interaction, cooperation and discussion of the whole class, greatly improve students’ autonomous learning ability, make students internalize knowledge into their own knowledge, and then is of great significance to promote the comprehensive development of students. In recent years, with the development of educational psychology, in the teaching process of various disciplines, we should not only consider the teaching of knowledge, but also pay attention to the cognitive and psychological status of students. In the process of teaching, teachers play a leading role, and students are the main body of learning. The study of students’ psychological activities, such as learning motivation, emotional factors, cognitive structure and so on, is of great significance to teaching activities.

In view of this, this study designs a mixed model of piano teaching in colleges and universities based on educational psychology. In terms of the integrity of teaching activities, the mixed mode of piano teaching in colleges and universities based on educational psychology helps to summarize the teachers’ teaching methods and students’ learning methods, and is conducive to students’ timely mastery and evaluation of

their own learning and psychological state. At the same time, in terms of the cognitive structure theory of learning, the mixed mode of piano teaching in colleges and universities based on educational psychology can ensure that students have a more comprehensive learning cognitive structure by dividing the specific teaching content into basic knowledge, teaching methods and psychological components, so that students can give full play to their learning initiative and learning initiative, form an attitude of being willing to learn and wanting to learn.

Objective: To ensure that students can have a more comprehensive and objective understanding of their own learning state, cognitive state and psychological state in specific learning activities, cultivate their own autonomous learning ability, recognize the difficulties they are likely to encounter in learning activities, and update and improve teachers' ideas and teaching ideas in specific teaching activities, strengthen teachers' attention to students' psychological level, so as to implement a targeted and personalized modern piano education model in colleges and universities.

Research objects and methods: The research objects are two classes of students taught by the same piano teacher in a university. The control group adopts the preset teaching mode, and the experimental group adopts the mixed mode of piano teaching in colleges and universities based on educational psychology, and then compare and analyze the effects of the two classes on students' understanding of piano theoretical knowledge. Improve the effect of students' ability to analyze and solve problems, and stimulate students' learning enthusiasm and interest in learning.

Methods: Excel is used to count the learning effect of two classes of students, so as to analyze the teaching effect of the mixed mode of piano teaching in colleges and universities based on educational psychology.

Results: Table 1 comparison of teaching effects of different teaching modes between the two groups. On the whole, in terms of the effect of promoting students' understanding of piano theoretical knowledge, improving students' ability to analyze and solve problems, and stimulating students' learning enthusiasm and interest, the teaching scores of the mixed mode of piano teaching in colleges and universities based on educational psychology were higher than those in the control group, and there were significant differences between the two groups ($P < 0.05$). This shows that the mixed mode of piano teaching in colleges and universities based on educational psychology can significantly improve the actual effect of teaching activities.

Table 1. Comparison of teaching effects of two groups of different teaching modes

Survey dimension	Control group	Experience group	<i>P</i>
Promote students' understanding of theoretical knowledge	3.02	4.48	<0.05
Improve students' ability to analyze and solve problems	2.35	4.42	<0.05
Stimulating students' learning enthusiasm and interest	2.44	4.41	<0.05

Conclusions: The mixed mode of piano teaching in colleges and universities combined with educational psychology is the fundamental way to realize the educational ideal of "people-oriented", so that teachers pay attention to students' emotional factors and teaching language in teaching, so as to truly realize the teaching mode of teachers' leading and students' main body. Enable students to develop a scientific and rigorous way of thinking and develop students' creativity.

ALLEVIATING EFFECT OF SPECIAL ECOTOURISM MODEL FOR PATIENTS WITH COGNITIVE IMPAIRMENT

Xinle Shen

School of Ethnology and Anthropology, Inner Mongolia Normal University, Hohhot 010022, China

Background: In psychology, it is believed that cognition is to transform external information into internal psychological activities. In psychiatry, cognitive impairment is a mental disorder caused by human brain outside organic diseases. Psychiatry divides cognitive impairment into mental disorders such as perception disorder, memory disorder and thinking disorder. When mental patients have cognitive impairment, they

often show a weakening of sensitivity to the external environment, which leads to symptoms such as retardation and illusion. With the continuous development of medical treatment, the main means of cognitive therapy is also gradually enriched. However, from the current treatment status, the side effects of long-term drug use will affect the normal life of patients with cognitive impairment after drug treatment. In view of this, some scholars suggest that tourism relaxation can be used to alleviate individual cognitive impairment. In some studies, tourism is a way to change patients' cognition. In tourism, in the face of the landscape in the natural ecology, patients with cognitive impairment will show different physical expression in vision and perception. And it can be found from previous studies that patients with cognitive impairment are brain cognitive impairment. When facing simpler and natural objects, they can receive more comprehensive information, which has a significant positive impact on the remission of patients.

With the continuous development of China's tourism industry, tourists have more and more strict requirements for scenic spots. At the same time, with the continuous improvement of national social welfare, special ecotourism suitable for patients with cognitive impairment has gradually appeared in the public perspective. In addition, with the development of ecotourism, the continuous growth of economy further increases the possibility of sustainable development of the ecological environment. Therefore, the special ecotourism model for patients with cognitive impairment has begun to be recognized by psychiatrists. From the current situation of its development, the impact of the special ecotourism model for patients with cognitive impairment on patients with cognitive impairment is becoming more and more obvious. However, a large number of studies are not targeted, and few studies clearly point out the development prospect of the special ecotourism model for patients with cognitive impairment. At the same time, the specific changes caused by patients with cognitive impairment are unknown. Therefore, the research will analyze the application effect of the special ecotourism model for patients with cognitive impairment, and explore the impact of the model on patients with cognitive impairment, in order to provide theoretical support for tourism development and treatment of patients with cognitive impairment.

Objective: Explore the current situation of special ecotourism model for patients with cognitive impairment from the perspective of circular economy, analyze the specific impact of special ecotourism model for patients with cognitive impairment on patients with cognitive impairment, and the changes of small ecotourism of circular economy after the remission of patients with cognitive impairment.

Study design: Taking an ecological scenic spot as the research object, we investigated the changes in the number of patients with cognitive impairment in the scenic spot from 2018 to 2021. At the same time, we investigated the mitigation effect of cognitive impairment patients under the influence of the special ecotourism model for cognitive impairment patients in the four-year development, as well as the changes in tourism revenue under the premise of the increase in the number and participation of cognitive impairment patients.

Results: From 2018 to 2021, the number of tourists with cognitive impairment increased sharply. Among the patients who participated in the cognitive impairment relief of ecotourism, the proportion of patients with significant remission also increased gradually, and the growth rate of ecotourism revenue also increased significantly. The difference is statistically significant, as shown in Table 1.

Table 1. Economic growth under special ecotourism for patients with cognitive impairment

Particular year	Number of tourists with cognitive impairment	Number of people with cognitive impairment remission	Growth rate of ecotourism revenue (%)
2018	127	21	8.3
2019	144	46	7.2
2020	197	102	54.4
2021	306	219	38.3

Conclusions: The treatment of patients with cognitive impairment is one of the key points in psychiatry. It is feasible to use tourism to alleviate patients' cognitive impairment. In the study, the development status of special ecotourism model for patients with cognitive impairment is discussed, and the mitigation of patients with cognitive impairment under this model is analyzed. The results show that the number of tourists with cognitive impairment in the special ecotourism model for patients with cognitive impairment is increasing, indicating that patients with cognitive impairment pay more attention to ecotourism mitigation, and the number of patients with cognitive impairment who have been significantly relieved under this model is increasing, indicating that this model has a significant role in alleviating cognitive impairment. In the treatment of cognitive impairment in psychosis, we can increase the communication between patients with cognitive impairment and the environment from the perspective of ecotourism, gradually improve their cognitive level, help cognitive impairment understand the performance of external things, improve their cognitive ability, and achieve the purpose of alleviating cognitive impairment.

THE INFLUENCE OF LANDSCAPE ARCHITECTURE DESIGN ON RESIDENTS’ BEHAVIOR AND PSYCHOLOGY

Run Li

Academy of Fine Arts, Qujing Normal University, Qujing 655011, China

Background: In the process of social and economic development, people’s pace of life is faster and faster, and the pressure of competition is greater and greater. Therefore, many people suffer from mental anxiety symptoms. When these psychological problems are not solved for a long time, it will lead to psychological diseases, damage the patient’s body function, and even damage the patient’s cerebral cortex, resulting in cognitive impairment. Cognition refers to the process that the brain processes the acquired information and skills intelligently. The process of cognition will involve a series of complex social behaviors and activities such as learning, memory, emotion, thinking and so on. When the human cerebral cortex is damaged by various factors, the brain’s intelligent processing process will be limited and abnormal, which will lead to cognitive impairment. The learning, memory and life of patients with cognitive impairment will be affected, which reduces the quality of life of patients, increases the family economic burden of patients, and is not conducive to the harmonious development of society. Therefore, finding a way to alleviate people’s anxiety and then treat cognitive impairment is of positive significance to patients, their families and social development.

Residential garden buildings can provide residents with space for leisure, communication, entertainment, sports and other activities. At the same time, they are also places for residents to rest and watch the scenery. They can make residents feel relaxed, physically and mentally happy, and then alleviate the negative emotions of residents. However, nowadays, the garden architectural design of many communities simply pursues the landscape effect, ignores the psychological needs of residents, does not analyze the behavior psychology of residents, and ignores the people-oriented principle and concept in garden architectural design, which cannot alleviate the spiritual anxiety of residents. Behavioral psychology is a subject that studies the relationship between human behavior and psychological activities. Behavioral psychology holds that human behavior is an active and conscious behavior under the guidance of consciousness. Human consciousness is composed of intention and cognition, which is the result of the interaction of these two factors. Therefore, based on behavioral psychology, the research analyzes the behavior and psychological law of residents in the community, and then analyzes the impact of residents’ behavioral psychology on residents’ garden architectural design, so as to improve and innovate the garden architectural design, give better play to the landscape and viewing function of residents’ garden architecture, and improve the satisfaction and quality of life of residents in the community.

Objective: Nowadays, the garden architectural design of many communities simply pursues the landscape effect, ignores the psychological needs of residents, does not analyze the behavior psychology of residents, and ignores the people-oriented principle and concept in garden architectural design. Based on behavioral psychology, the research analyzes the behavior and psychological law of residents in the community, and then analyzes the impact of residents’ behavioral psychology on residents’ garden architectural design, so as to improve and innovate the garden architectural design and improve the satisfaction and quality of life of residents in the community.

Research objects and methods: Two residential areas were selected for landscape architecture design, and the SF-36 scale was used to evaluate the quality of life of residents. Self-rating Anxiety Scale (SAS) and Self-rating Depression Scale (SDS) were used to evaluate the mental health level of community residents.

Research and Design: Two communities were selected for landscape architecture design. One community was designed by using the improved landscape architecture design scheme based on behavioral psychology, which was recorded as the research group. Another community is designed with the traditional garden architectural design scheme, which is recorded as the control group. One month after the

completion of the garden building, 50 residents in each community were randomly selected to compare the quality of life and mental health of the residents in the two communities.

Methods: The relevant data were processed and analyzed by software SPSS17.0.

Results: One month after the completion of garden buildings, the anxiety level of residents in the study group was significantly lower than that in the control group ($P < 0.05$), as shown in Table 1.

Table 1. Anxiety level of residents in the two communities

Group	n	Time		t	P
		Before completion	After completion		
Research group	50	68.4±10.9	52.1±6.3	7.654	0.000
Control group	50	69.5±11.3	61.3±8.2	4.125	0.023
t	-	0.258	5.732	-	-
P	-	0.862	0.013	-	-

Conclusions: With the continuous development of China's economy and society and the accelerating process of urbanization, residential areas have become an indispensable and important part of the city and the living carrier of urban residents. Residential garden architecture is an important part of the residential area, which provides residents with a place to rest and view. However, nowadays, the garden architectural design of many communities simply pursues the landscape effect, ignores the psychological needs of residents, does not analyze the behavior psychology of residents, and ignores the people-oriented principle and concept in garden architectural design. Based on behavioral psychology, the research analyzes the behavior and psychological law of community residents and improves the garden architectural design scheme. The results showed that one month after the completion of garden buildings, the anxiety level of residents in the study group was significantly lower than that in the control group ($P < 0.05$).

THE INFLUENCE OF COLLEGE MUSIC EDUCATION REFORM ON STUDENTS' LEARNING COGNITIVE PSYCHOLOGY

Yingying Li

Department of Art and Design, Huanghe Jiaotong University, Jiaozuo 454950, China

Background: Cognitive psychology is based on human brain science. Therefore, in cognitive psychology, the process of generating ideas between external stimulation and self-response of human brain is the process of learning to achieve goals. The application of cognitive psychology in music education is also based on brain science. The operation mode of human brain has an important impact on the bias and development of individual music ability. Cognitive psychological learning method is also based on this foundation. Therefore, it has inherent advantages in the combination with music education. When we decompose the acquisition of music skills from the cognitive psychological level, we will find that in the process of cognitive formation, individuals often need to master skills through continuous orientation, decomposition and integration exercises. In practice, we need to allocate action skills and mental skills, including attention, sensation, perception, memory, imagination, thinking and other abilities. Therefore, in the long psychological cognitive process of music learning, new ideas and information may not be accepted by students' existing cognitive structure. In order to make students better accept new information, it is necessary to transform the existing cognitive psychological structure. This process of constantly transforming the cognitive structure and constantly absorbing new information includes not only rationality and insight, but also association and imitation. The more cognitive components in the learning process, the more planned and organized the whole learning subject will be, and the more effective the new information can be integrated into the old structure. Therefore, in the reform of college music education, we should not rely too much on the teaching experience of traditional music education methods. Although this teaching experience has certain effectiveness, there are also some misunderstandings. In the process of teaching reform, we should pay attention to the scientificity of cognitive psychology. Cognitive psychology can play a methodological role in college music education and teaching reform. Through the intervention of students' cognitive process and cognitive methods, we can help students actively use human cognitive characteristics in learning and achieve the purpose of improving learning results.

Objective: This study is based on cognitive psychology, through the psychological improvement of the

old college music education methods, to transform the parts of the old methods that are too dependent on teaching experience and lack of scientificity into more scientific and reliable teaching methods, so as to achieve the effect of teaching reform from the perspective of music education and improve the scientificity of teaching.

Subjects and methods: This study adopts two methods of dialectical sublation and fuzzy evaluation to transform the qualitative evaluation elements into quantitative evaluation elements, and uses the theory of cognitive psychology to scientifically improve the part of traditional music teaching that relies too much on empiricism, so as to retain the more effective part of the old methods. At the same time, through the data collection and statistics of psychological cognition, this paper analyzes the teaching effect of the improved cognitive psychological music teaching method.

Study design: This study mainly takes music majors as the research object, takes the skill music course which is easy to be combined with cognitive psychology as the starting point, carries out the trial operation of the new education method, analyzes the students' learning status under the new music education method by counting the students' learning course progress and psychological situation, and finally makes a quantitative analysis by using the fuzzy evaluation method.

Methods: When analyzing the learning and psychological status of students under the new music education method, this study uses Excel as an analysis tool to count and integrate the data, and then analyze the influence relationship between them.

Results: The impact of the new music education method based on cognitive psychology on students is shown in Figure 1.

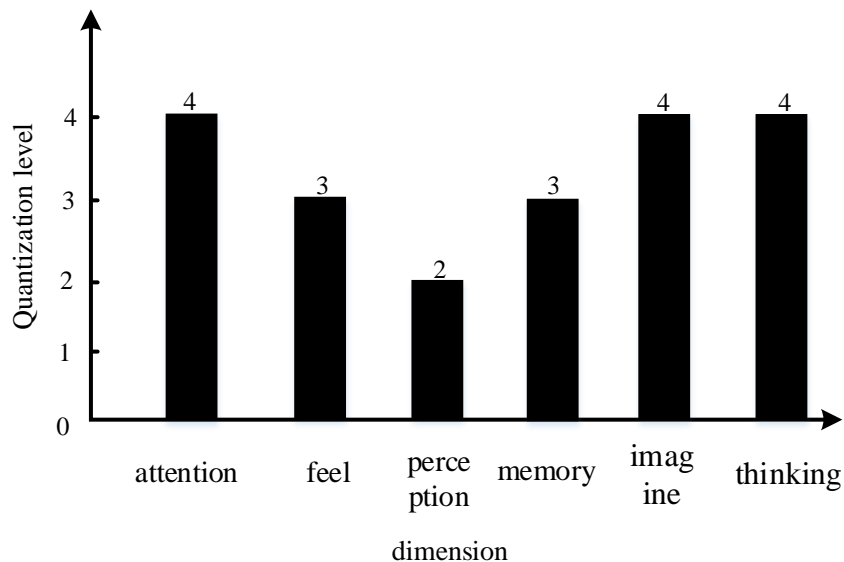

Figure 1. The influence of cognitive psychology on music education

In Figure 1, the new music education method of cognitive psychology has the most significant impact on music students in the three aspects of attention, imagination and thinking, reaching level 4, the impact on feeling and memory is more obvious, reaching level 3, and the impact on perception is more general, only level 2.

Conclusions: This study aims to provide more scientific and reasonable teaching methods for college education of music majors in the comprehensive teaching reform, and shape a teaching method more suitable for students' learning state by combining cognitive psychology with college music education. The new music teaching method based on cognitive psychology can create a scientific way for music learning from three aspects: perceptual cognition, rational cognition and fuzzy cognition, and then affect students from six aspects: attention, sensation, perception, memory, imagination and thinking, so as to improve students' learning state. At the level of psychological cognition, expand the learning system more quickly and effectively to achieve a more comprehensive effect of music teaching.

A NEW APPROACH TO THE CANONIZATION OF POPULAR CHILDREN'S LITERATURE IN THE CONTEXT OF COGNITIVE IMPAIRMENT - THE METAPHORS OF "DISCIPLINE" AND "ALIENATION" IN RABBIT TRAINING

Ying Fu^{1,2}

¹*School of Chinese Language and Literature, Lanzhou University, Lanzhou 730030, China*

²*School of Foreign Languages and Literatures, Lanzhou University, Lanzhou 730030, China*

Background: Children's psychology is extremely sensitive. When parents or families have problems in education, blindly emphasize "discipline" and lack family communication and care, children will fall into alienation, and may have autism, inferiority and other psychology, which will affect the healthy growth of children. When children are in the dilemma of alienation for a long time, their physical and mental health will be damaged, resulting in brain dysfunction, and then cognitive impairment. Cognitive impairment is a pathological process involving brain function. Patients with cognitive impairment are often accompanied by learning impairment, memory impairment, aphasia and so on, which seriously affects the daily life of patients, reduces the quality of life of patients, increases the family burden of patients, and also affects the harmony and stability of society. Therefore, we need to find an appropriate way to avoid children falling into the dilemma of alienation, improve children's mental health, alleviate children's anxiety and avoid cognitive impairment.

Preschool education psychology is a comprehensive subject combining psychology and preschool education, including cognitive psychology, emotional psychology and child development psychology. Among them, cognitive psychology can help teachers analyze children's cognitive laws, so as to obtain children's cognitive needs and feedback, so as to improve the pertinence and effectiveness of teaching and promote the improvement of children's cognitive ability. Emotional psychology is to let teachers learn to respect children's emotional needs and expression, so as to make children improve their cognition of emotion and emotion in a good teaching environment, and then improve children's emotional perception and emotional control, so that children can correctly face negative emotions such as tension, loss and anxiety. Children's developmental psychology requires teachers to teach around children's development needs, truly understand children, understand children, respect children and find children, so that children can gradually form personality and characteristics in the teaching process. Based on the psychology of preschool education, the research uses Zheng Yuanjie's rabbit training to carry out teaching activities for children, so that children can correctly face the dilemma of alienation, alleviate children's negative emotions, improve children's mental health level, and then avoid children suffering from cognitive impairment.

Objective: When children are in the dilemma of alienation for a long time, children's physical and mental health will be damaged, resulting in brain dysfunction, and then cognitive impairment. Based on the psychology of preschool education, the research uses Zheng Yuanjie's rabbit training to carry out teaching activities for children, so that children can correctly face the dilemma of alienation, alleviate children's negative emotions and avoid children suffering from cognitive impairment.

Research objects and methods: 80 children were selected from a kindergarten as the research objects. Self-rating Anxiety Scale (SAS), Self-rating Depression Scale (SDS) and Hospital Anxiety and Depression Scale (HADS) were used to evaluate children's mental health.

Study design: 80 children were randomly divided into study group and control group with 40 people in each group. Based on the psychology of preschool education, the research group added Zheng Yuanjie's rabbit training in the teaching system. The control group adopted the traditional teaching system. After a period of time, compare the mental health status of the two groups of children.

Methods: The relevant data were processed and analyzed by software SPSS23.0.

Results: After teaching, the SAS score, SDS score and HADS score of children in the study group were significantly lower than those in the control group ($P < 0.05$). The HADS scores of the two groups are shown in Table 1.

Conclusions: Children's psychology is extremely sensitive. When parents or families have problems in education, blindly emphasize "discipline" and lack family communication and care, children will fall into the dilemma of alienation, may have autism, inferiority and other psychology, and then suffer from cognitive impairment, which will affect the healthy growth of children. Based on the psychology of preschool education, the study uses Zheng Yuanjie's rabbit training to carry out teaching activities for children, so that children can correctly face the dilemma of alienation. The results showed that after teaching, the SAS score, SDS score and HADS score of children in the study group were lower than those in the control group, and the difference was significant ($P < 0.05$). Therefore, the rational use of preschool education psychology can alleviate children's negative emotions, improve children's mental health level, and then avoid children suffering from cognitive impairment.

INFLUENCE OF FLEXIBLE MANAGEMENT ON EMPLOYEE ANXIETY IN ENTERPRISE ECONOMIC MANAGEMENT

Changchun Yan¹ & Jiajia Zhang²

¹*National Demonstration Center for Experimental Education of Economics and Management, Xiangtan 411105, China*

²*School of Business, Xiangtan University, Xiangtan 411105, China*

Background: Anxiety disorder, also known as anxiety psychosis, is mainly characterized by fear and anxiety, muscle tension and exercise anxiety. From the perspective of the duration of the disease, anxiety disorder can be divided into acute and chronic anxiety. The causes of anxiety are related to personal personality characteristics and environment. People with introverted, quiet, sensitive and delicate emotions are more likely to have anxiety disorder. They will respond more strongly to the stimuli around them, and then show more obvious reactions. They will have a heavier burden on their hearts. They are more concerned about the evaluation of others and are used to burying their emotions in their hearts. Instead, they will keep accumulating their emotions, slowly change from quantity to quality, and then erupt one day to form anxiety, obviously showing different symptoms of anxiety disorder. Among the environmental factors causing anxiety disorder, they are heavy work tasks, fierce work competition, high learning pressure, individual pursuit of excessive perfection, tense relationship with roommates, long-term mental work and so on. Anxiety disorder will show different obvious symptoms due to different causes. For example, patients with lack of stability, slight movements will make them make a strong response, their heartbeat will accelerate rapidly, their expression will be alert and nervous, and they will quickly search around to find the source of movements. Patients with sense of urgency often feel that they have too little time. Too late to complete the set goals and tasks. There are still many things to do. You'll feel flustered. I want to do everything, but I can't finish anything. For patients with heavy life pressure, they will feel great pressure in life, and many things can only be done with a stiff head. Under great psychological pressure, you will feel psychological fatigue and want to stop, but you can't stop. You have a passive attitude towards work and life and don't have much enthusiasm and enthusiasm.

In enterprises, many employees have varying degrees of anxiety, especially those in large factories. Many of them are patients with heavy life pressure. In order to survive, they have to work continuously in the workshop for more than ten hours every day, with little rest time and great work intensity. After staying for a long time, most employees look numb, the atmosphere in the workshop is heavy, and their enthusiasm for work is not high. The anxiety of employees affects their work efficiency and is not conducive to the management of enterprises. At present, many scholars have conducted research on enterprise management in order to improve employees' work enthusiasm and initiative and improve enterprise performance. Among them, the research puts forward the concept of flexible management, that is, enterprise managers carry out completely humanized management of employees under the common spiritual atmosphere and value of the enterprise, and significantly improve the enthusiasm and creativity of employees through internal identity and driving. Therefore, flexible management is applied to enterprise economic management, and its impact on employee anxiety is studied.

Objective: To analyze the anxiety disorder of employees, understand the status and causes of employees at work, analyze its important role through the application of flexible management in enterprise economic management, and study the impact of flexible management on employee anxiety disorder. Under the people-oriented management thought, respect employees' self-development through democratic and independent management, mobilize employees' own enthusiasm and improve employees' anxiety.

Subjects and methods: The subjects of the study were employees with anxiety disorder. 100 employees with anxiety disorder were randomly selected from a large enterprise. These employees come from

different positions and ages, and their education and family circumstances are different. Understand their specific situation at work, analyze the causes of employee anxiety disorder, carry out flexible management on them, and record relevant data. The fuzzy evaluation method is used to evaluate the impact of flexible management on employee anxiety disorder in enterprise economic management. The quantitative score of relevant influencing factors adopts grade 1-5 score. The higher the score, the greater the impact. The data processing and analysis software adopts SAS software.

Results: In recent years, the competition between enterprises has gradually increased, and the pressure on employees has also increased significantly. Under the stimulation of various competitive pressures, employees have different degrees of anxiety, and their work efficiency is affected. In order to improve the enthusiasm and innovation of employees, flexible management is carried out in enterprise economic management. After flexible management, the anxiety of employees has been significantly alleviated, the recognition of employees to the enterprise has been improved to a certain extent, and they have the enthusiasm and motivation for work. In flexible management, reducing enterprise management level has a great impact on middle-aged patients with middle-aged anxiety disorder, with a score of 4 points. The results are shown in Table 1.

Table 1. The influence of flexible management on employee anxiety in enterprise economic management

Age group	Reduce enterprise management level	Salary incentive	Spiritual motivation
Youth	4	4	5
Young and middle-aged	4	5	5
Middle age	4	5	4

Conclusions: The flexible management of enterprises should be carried out under the people-oriented management thought. By streamlining the enterprise structure, ensuring the smooth horizontal circulation between departments, taking salary incentives, spiritual incentives and other measures to stimulate employees' positive innovation, further strengthen the cooperation of departments, improve employees' work initiative, gradually alleviate employees' anxiety and improve employees' comprehensive ability.

THE POSITIVE INFLUENCE OF CHU MUSIC ON CURRENT VALUE FROM THE EMOTIONAL DISORDER PERSPECTIVE

Qing Zhou

College of Performing and Fine Arts, China Three Gorges University, Yichang 443002, China

SUMMARY

Introduction: Affective disorder is a group of mental disorders with significant and continuous rise or decline of emotion as the main clinical characteristics, often accompanied by corresponding changes in thinking and behavior. There are great differences in the performance of affective disorders. The lighter may be the response to some negative life events, and the heavier may become a serious recurrent or even chronic disability disorder. Chu music art is an important part of Chu culture. Under the background of accelerating the social system engineering of cultural development and prosperity, how to inherit the Chu music culture that has lasted for 2000 years, make Chu music precipitate in history, develop in reality and move towards a prosperous future is an important research topic. The ethical connotation of "Tao follows nature", "eight tones win harmony", "human harmony" and "perfection" contained in Chu music art is full of aesthetic color, which plays an important role in guiding individuals to good, understanding and accepting themselves, understanding reality and facing adversity. In view of this, this study explores the construction of the Chu music culture intervention model for the treatment of patients with affective disorders, in order to carry forward the contemporary value of Chu music culture and expand its positive influence in the intervention and treatment of mental diseases.

Subjects and methods: In order to investigate the positive influence of Chu music culture on the treatment of patients with affective disorder, 80 patients with affective disorder admitted to our hospital from January 1, 2019 to June 30, 2020 were selected as the research object. They were randomly divided into control group and observation group, with 40 cases in each group. Both groups were treated with routine antipsychotic drugs, the control group was given routine psychiatric care, and the observation group was given Chu music culture intervention therapy on the basis of routine psychiatric care. Self-rating Anxiety Scale (SAS), Mania Rating Scale (BMRS) and Self-rating Depression Scale (SDS) were used to compare the anxiety, mania and depression of the two groups before and after the intervention, and the medication compliance and quality of life of the two groups before and after the intervention. The Social function Defect Screening Scale (SDSS) was used to compare the social function defects of the two groups before and after the intervention.

Results: The results showed that the scores of SAS, BMRS and SDS in the two groups after intervention were lower than those before intervention ($P < 0.05$), and those in the observation group were lower than those in the control group ($P < 0.01$). After the intervention, the medication compliance of the observation group was better than that of the control group ($P < 0.05$). After the intervention, the scores of qualities of life in the two groups were higher than those before the intervention ($P < 0.05$), and those in the observation group were higher than those in the control group ($P < 0.05$). After the intervention, the SDSS score of the two groups was lower than that before the intervention ($P < 0.01$), and that of the observation group was lower than that of the control group ($P < 0.01$).

Conclusions: Chu music culture intervention therapy can significantly improve the anxiety, mania and depression of patients with affective disorder, improve the compliance and quality of life of patients, reduce the occurrence of impulsive behavior, and reduce social function defects. Therefore, it can be said that Chu music culture has a positive impact on the treatment of emotional disorders, which is undoubtedly an important embodiment of the contemporary value of Chu music culture.

Key words: Chu music culture - affective disorder - intervention therapy - life governance - social function defects - value impact

* * * * *

INTRODUCTION

Affective disorder is a group of mental disorders with significant and continuous rise or decline of emotion as the main clinical characteristics, often accompanied by corresponding changes in thinking and behavior. There are great differences in the performance of affective disorders. The lighter may be the response to some negative life events, and the heavier may become a serious recurrent or even chronic disability disorder. In terms of symptoms and signs, the basic symptom of affective disorder is emotional change, which is usually manifested in two completely opposite clinical states: Depressive attack and manic attack. The state diagnosis of depressive

episode and manic episode is also the main basis for the classification and diagnosis of affective disorders. Therefore, it is of great significance to understand the characteristics of the extreme abnormal states of these two emotions and identify them (Nhab et al. 2020).

At the level of depression attack, core symptoms: the core symptoms of depression include depression, lack of interest and loss of fun. This is the main symptom of depression. The diagnosis of depression should include at least one of three symptoms. (1) Depression: the patient experiences depression and sadness. Depressed and gloomy. Patients often complain that they are in a bad mood and can't be happy. Patients with depression can usually distinguish between the pessimism and sadness they experience in

a depressed state and the sadness caused by bereavement. This is the “special nature of depression” often mentioned in the diagnosis of depression. It is one of the symptoms that distinguish between “endogenous” and “reactive” depression. On the basis of depression, patients will feel desperate, helpless and useless (Hui 2019). (2) Lack of interest: it refers to the patient’s lack of interest in various activities he previously liked, such as entertainment, sports activities, hobbies, etc. A typical person lacks interest in anything, good or bad, is isolated from the world and doesn’t want to see anyone (Latif et al. 2020). (3) Loss of happiness: refers to the patient’s inability to experience happiness from life or lack of happiness in daily life. The above three main signs are interrelated and can appear in patients at the same time, that is, causality. However, many patients emphasize only one or two of them. Some patients do not think they are in a bad mood, but they are not interested in the things around them. Some patients with depression sometimes participate in some activities when they are bored, mainly those they participate in alone, such as reading, watching movies, TV, engaging in sports activities, etc. Therefore, on the surface, the patient’s interest still exists, but further investigation can find that the patient has no fun in these activities. The main purpose of these activities is to kill time or hope to get rid of pessimism and disappointment. At the same time, depressive episodes also have typical psychological symptoms: they can be divided into psychological accompanying symptoms (anxiety, self-blame and psychotic symptoms, cognitive symptoms, suicidal thoughts and behaviors, self-knowledge, etc.) and psychomotor symptoms (psychomotor excitement and psychomotor excitement, etc.). It has typical physical symptoms: including sleep disorder, appetite disorder, sexual dysfunction, energy loss, nonspecific physical symptoms, such as pain, physical discomfort, autonomic nerve dysfunction and so on (Bojorquez et al. 2020).

At the level of manic episode, the core symptoms are: high emotion, runaway thinking and enhanced will and behavior. (1) The main symptom of irritability or irritability is mania. It usually shows relaxation, happiness, enthusiasm, optimism, complacency, openness and carefree. This emotional response is vivid, consistent with the inner experience and the surrounding environment, and has a certain appeal. Mild symptoms may not be considered abnormal, but people who know him can see the abnormality of this performance. Some patients also focus on irritable emotions and get angry because of trivial things. Especially when someone accused him of arrogance or unrealistic ideas, he heard no objection. In serious cases, he may have destructive or aggressive behavior. Patients tend to be happy in the early stage of the disease and become irritable in the later stage. Personal anxiety or depression can also occur. (2) Fast thinking: refers to the acceleration of thinking

association speed. The patient’s language is becoming more and more fluent. He feels that his language speed is far from keeping up with his thinking speed. Sometimes there may be phonetic association, that is, phonetic couplet or semantic couplet. May be inattentive and often change with the environment. (3) Will behavior enhancement: that is, coordinated mental movement excitement. Their internal experience and behavior, behavioral response and external environment are relatively unified. In contrast to mental retardation, patients are more active, busy, social and busy. Take the initiative to communicate with others, fall in love at first sight, like to joke or prank, meddle in matters, harbor resentment, and accomplish nothing. In conclusion, manic patients are usually accompanied by a decrease in sleep demand because they are increasing their activity and running tirelessly every day. Due to excessive physical exertion, diet can increase significantly. Some patients do not diet, overeat or overeat. Sometimes, they lose weight significantly because they can’t drink, eat and sleep normally, and even die of exhaustion. Especially elderly or frail patients. Manic patients often wear heavy make-up, especially brightly colored clothes. The patient has high sexual desire. Sometimes they are interested in sex. Sometimes, they will have too much intimacy, hugs and kisses with others on inappropriate occasions, regardless of other people’s feelings. Manic patients may maintain a certain self-awareness, while manic patients usually have incomplete self-awareness (Schwab et al. 2021).

With the progress of science and technology, people have a profound and scientific understanding of the etiology of affective disorder. Especially in the past 20 years, scientists all over the world have conducted a lot of research on the etiology of mood disorders around biological factors (including genetic factors, quality factors, physical factors, physiology, pathology, biochemistry and other aspects) and psychosocial factors, and accumulated a lot of valuable data. However, for the intervention treatment of patients with affective disorder, it is difficult to form a systematic, standardized and standardized scheme. Therefore, whether in theory or in practice, we should actively explore and expand the new direction and new ideas of clinical intervention treatment of affective disorder.

SUBJECTS AND METHODS

Study setting

Culture is the spirit and soul of a nation. It is the decisive factor of a country’s strength. It can profoundly affect the development process of a country and change the fate of a nation. The cultural form of Chu music is inclusive and reserved. Chu music refers to Chu music in the Warring States period, Qin and Han Dynasties. It also refers to the music of the middle reaches of the Yangtze River and the Han

River. It is also known as “Chu tune” or “Southern tone”. Chu music has the characteristics of nationality and integration, allowing the coexistence of Yi and Xia and enjoying both refined and popular tastes. Chu music has rich and complete forms of expression and artistic system. In the spring and Autumn period, the state of Chu set up music officials to be responsible for music affairs. At the same time, due to the lack of constraints and limitations of rites and music, Chu music also contains the “truth” of Chu people, which is not only the truth of temperament, but also the truth of aesthetics. It can be said that Chu music culture, as an important carrier of cultural inheritance, has an important impact on meeting the spiritual and cultural needs of the people. In short, Chu music art is an important part of Chu culture. Under the background of accelerating the social system engineering of cultural development and prosperity, how to inherit the Chu music culture that has lasted for 2000 years, make Chu music precipitate in history, develop in reality and move towards a prosperous future is an important research topic.

Modern physiologists have found that various rhythms of the human body, such as heartbeat, are affected by music and often synchronized with the rhythm of music. If you play slow music, your systolic blood pressure will also decrease. The reason is that music can affect brain waves, slow down physical activities and relax nerves. On the other hand, music therapy can alleviate the patient’s anxiety and other adverse emotions, significantly stimulate the cerebral cortex, stimulate the excitement of cerebral sympathetic nerve, improve the patient’s physical and mental coordination and improve the patient’s quality of life. Music therapy can also divert patients’ attention, keep them happy most of the time and eliminate their bad emotions. At present, it has been used in the treatment of nervous system diseases with remarkable curative effect. Chu music is a wonderful flower cultivated by the pre-Qin Chu people with Jiangnan Plain as their hinterland. With the changes of history and the development of war, it integrates the characteristics of different regions and nationalities, and the music form and artistic connotation are further enriched. The ethical connotation of “Tao follows nature”, “eight tones win harmony”, “human harmony” and “perfection” contained in Chu music art

is full of aesthetic color, which plays an important role in guiding individuals to be good, understanding and accepting themselves, understanding reality and facing adversity. In view of this, this study explores the construction of the Chu music culture intervention model for the treatment of patients with affective disorders, in order to carry forward the contemporary value of Chu music culture and expand its positive influence in the intervention and treatment of mental diseases.

Design

Research object: 80 patients with affective disorder admitted to our hospital from January 1, 2019 to June 30, 2020 were selected as the research object. They were randomly divided into control group and observation group with 40 cases in each group. Inclusion criteria: (1) patients with affective disorders who met the classification and diagnostic criteria of Chinese mental disorders. (2) Patients aged 18-50 years. (3) Informed consent of family members and patients. Exclusion criteria: (1) patients with severe liver, kidney, heart and lung disorders. (2) Emotional disorders caused by organic diseases. (3) Drug allergy or poor compliance. Research methods: both groups were treated with routine antipsychotic drugs, the control group was given routine psychiatric nursing, and the observation group was given Chu music culture intervention therapy on the basis of routine psychiatric nursing. Evaluation indicators: Self-rating Anxiety Scale (SAS), Mania Rating Scale (BMRS) and Self-rating Depression Scale (SDS) were used to compare the anxiety, mania and depression of the two groups before and after the intervention, the medication compliance and quality of life of the two groups before and after the intervention, and the social function Deficiency Screening Scale (SDSS) was used to compare the social function defects of the two groups before and after the intervention. Statistical analysis: SPSS25.0 statistical software was used for statistical analysis, with $P < 0.05$ as the difference, which was statistically significant.

Table 1 shows the comparison of SAS and BMRS scores between the two groups before and after intervention.

Table 1. Comparison of SAS and BMRS scores between the two groups before and after intervention

Group	SAS score		BMRS score	
	Before intervention	After intervention	Before intervention	After intervention

	After intervention	35.45±8.96	62.44±8.49*	32.46±6.87*	47.34±7.15*	9.42±1.15*

Note: Compared with the same group before the intervention, * $P < 0.05$; Compared with the control group after the intervention, # $P < 0.05$.

RESULTS

After the intervention, the scores of SAS, BMRS and SDS in the two groups were lower than those before the intervention ($P < 0.05$), and those in the observation group were lower than those in the control group ($P < 0.01$). After the intervention, the medication compliance of the observation group was better than that of the control group ($P < 0.05$). After the intervention, the scores of qualities of life in the two groups were higher than those before the intervention ($P < 0.05$), and those in the observation group were higher than those in the control group ($P < 0.05$). After the intervention, the SDSS score of the

two groups was lower than that before the intervention ($P < 0.01$), and that of the observation group was lower than that of the control group ($P < 0.01$).

DISCUSSION

Affective disorder is a group of mental disorders with significant and continuous rise or decline of emotion as the main clinical characteristics, often accompanied by corresponding changes in thinking and behavior. There are great differences in the performance of affective disorders. The lighter may be the response to some negative life events, and the heavier may become a serious recurrent or even

chronic disability disorder. In terms of symptoms and signs, the basic symptom of affective disorder is emotional change, which is usually manifested in two completely opposite clinical states: depressive attack and manic attack. The state diagnosis of depressive episode and manic episode is also the main basis for the classification and diagnosis of affective disorders. Therefore, it is of great significance to understand the characteristics of the extreme abnormal states of these two emotions and identify them. Modern physiologists have found that various rhythms of the human body, such as heartbeat, are affected by music and often synchronized with the rhythm of music. If you play slow music, your systolic blood pressure will also decrease. The reason is that music can affect brain waves, slow down physical activities and relax nerves. On the other hand, music therapy can alleviate the patient's anxiety and other adverse emotions, significantly stimulate the cerebral cortex, stimulate the excitement of cerebral sympathetic nerve, improve the patient's physical and mental coordination and improve the patient's quality of life. Music therapy can also divert patients' attention, keep them happy most of the time and eliminate their bad emotions. At present, it has been used in the treatment of nervous system diseases with remarkable curative effect. Chu music is a wonderful flower cultivated by the pre-Qin Chu people with Jiangnan Plain as their hinterland. With the changes of history and the development of war, it integrates the characteristics of different regions and nationalities, and the music form and artistic connotation are further enriched. The ethical connotation of "Tao follows nature", "eight tones win harmony", "human harmony" and "perfection" contained in Chu music art is full of aesthetic color, which plays an important role in guiding individuals to be good, understanding and accepting themselves, understanding reality and facing adversity. In view of this, this study explores the construction of the Chu music culture intervention model for the treatment of patients with affective disorders, in order to carry forward the contemporary value of Chu music culture and expand its positive influence in the intervention and treatment of mental diseases (Ygm et al. 2019).

Taking 80 patients with affective disorder in our hospital as the research object, they were randomly divided into control group and observation group, with 40 cases in each group. Both groups were treated with conventional antipsychotics, the control group was given routine nursing in psychiatric department, and the observation group was given Chu music culture intervention therapy on the basis of routine nursing in psychiatric department. The results showed that after the intervention, the scores of SAS, BMRS and SDS in the two groups were lower than those before the intervention ($P < 0.05$), and those in the observation group were lower than those in the control group ($P < 0.01$). After the intervention, the medication compliance of the observation group was better than

that of the control group ($P < 0.05$). After the intervention, the scores of qualities of life in the two groups were higher than those before the intervention ($P < 0.05$), and those in the observation group were higher than those in the control group ($P < 0.05$). After the intervention, the SDSS score of the two groups was lower than that before the intervention ($P < 0.01$), and that of the observation group was lower than that of the control group ($P < 0.01$).

The study applied Chu Music Culture Intervention therapy to patients with affective disorders. The results show that Chu music culture intervention therapy can reduce the SAS, BMRS and SDS scores of patients with affective disorders and improve their compliance, suggesting that emotional catharsis combined with music therapy can significantly improve the anxiety, mania and depression of patients and reduce the impulsive behavior of patients. Patients with affective disorders often show emotional instability and irritability. Emotional catharsis can eliminate or reduce patients' bad emotions through venting, help patients treat themselves correctly, control their bad emotions, and improve patients' ability to deal with the external environment (Jung et al. 2020). Chu music culture intervention therapy can increase patients' music experience, make patients enjoy life in music, divert patients' attention, eliminate adverse emotions such as anxiety and depression, encourage patients to exchange music experience, improve their interpersonal communication ability and stabilize their emotions (Abraham et al. 2020). At the same time, give patients positive energy to help them establish self-confidence and enhance social adaptability. The results of this study also show that Chu music culture intervention therapy can improve the quality of life of patients and reduce social function defects. Music therapy can adjust the functional coupling and connection between important brain nodes to reshape the whole emotional network, improve the emotional control ability of patients, increase the understanding of medical staff on the psychological state of patients, provide targeted guidance, solve the psychological problems of patients, alleviate negative emotions, correct the mentality of patients, improve the enthusiasm of patients' life, strengthen medical communication, help patients enhance interpersonal communication ability and increase positive energy. On this basis, Chu music culture intervention therapy stimulates the brain nervous system through sound wave vibration, so as to stimulate nerves and pleasant emotions, stimulate patients' enthusiasm for treatment and communication, improve patients' ability to face and deal with difficulties, promote physical and mental recovery, improve patients' quality of life and reduce social function defects (Camuso et al. 2020).

There are still some limitations and deficiencies in this study: (1) the sample size of this study is still small, so further large sample repeated trials are needed to verify the universality of Chu Le

intervention therapy for patients with affective disorder. (2) The observation time of this study is short, there is no long-term follow-up, and the long-term effect needs to be further studied. (3) This study did not study the factors that may affect the prognosis of the disorder, such as disease severity and intervention time, which need to be further studied in the future.

CONCLUSIONS

On the basis of previous studies, this study improved and innovated the experiment, adopted more careful experimental design and more accurate statistical methods, and evaluated the problem of affective disorder in many aspects. The conclusions include: Chu Music Culture Intervention therapy plays an important role in improving the symptoms of patients with affective disorder. In short, Chu Le culture intervention therapy, as a safe, non-toxic and effective treatment method, is worthy of popularization and application in the clinical treatment of affective disorders.

ANALYSIS OF PSYCHOLOGICAL FACTORS OF VIOLENT CRIME IN PATIENTS WITH SCHIZOPHRENIA

Liang Li

School of Law, Nanjing University of Finance & Economics, Nanjing 210023, China

SUMMARY

Introduction: Violent crime is a prominent problem in the development of modern society. This is a crime that does great harm to individuals and society and has extremely serious consequences. It accounts for a large proportion in criminal cases and has shown an upward trend year by year in recent years, leaving a shadow on individuals, families and society. It has become an increasingly serious global public health problem, which has attracted extensive attention of the whole society. Death and disability caused by violence have become the most important public health problem in the world. Therefore, the research on violent crime has become an active topic in the fields of criminology, psychology, epidemiology, sociology and so on. The incidence of schizophrenia is generally higher than that of normal patients (especially schizophrenic patients). In view of this, this paper analyzes the psychological factors of violent criminal behavior of schizophrenic patients, in order to clarify the psychological characteristics and risk factors of violent criminal behavior of schizophrenic patients, so as to provide a theoretical basis for timely prediction and intervention of violent criminal behavior.

Subjects and methods: In order to observe the differences and commonalities of relevant psychological factors between violent criminal behavior of SP patients and violent behavior of criminals, 49 violent criminals and 35 schizophrenic patients with violent crime were collected. Minnesota Multiphasic Personality Inventory (MMPI), Personality Diagnosis Questionnaire (PDQ4+), Family Environment Scale - Chinese Version (FES-CV) The early Bad Family Environment Questionnaire (BFEE) was investigated and tested, and then combined with logistic regression analysis to evaluate the differences and commonalities of relevant psychological factors between SP patients and criminals.

Results: The results of MMPI showed that the scores of F, D, HS, HY and PA in schizophrenia group were higher than those in criminal group ($P < 0.05$); The results of PDQ4 + showed that the scores of paranoid, schizoid, schizoid, acting, dependent, passive aggressive and depressive personality disorders in schizophrenia group were higher than those in criminal group, while the scores of antisocial personality disorders were lower than those in criminal group ($P < 0.05$); The results of FES-CV scale showed that there were significant differences in intimacy, emotional expression, success, entertainment and organization between the two groups ($P < 0.05$).

Conclusions: There are not only differences in relevant psychological factors between violent criminal behavior of SP patients and violent behavior of criminals, but also some common pathological personality characteristics.

Key words: schizophrenia - violent crimes - criminals - psychological factors - comparative analysis

INTRODUCTION

In the classification and etiology of schizophrenia, according to the third edition of Chinese classification and diagnostic criteria for mental disorders (CCMD-3), it is divided into paranoid schizophrenia, juvenile schizophrenia, tension schizophrenia, simple schizophrenia and terminal schizophrenia according to the dominant clinical manifestations. According to the disease stage and prognosis, it can be divided into: Post schizophrenic depression, schizophrenic remission, residual schizophrenia, chronic schizophrenia and schizophrenic decline. The pathogenic factors of schizophrenia include three levels: first, neurobiological factors (Li et al. 2020). (1) Neurobiochemical studies have shown that patients have abnormal functions of a variety of neurotransmitters, mainly involving dopamine, serotonin and glutamate. Central dopamine levels are elevated and hyper functional. Traditional antipsychotics are blockers of dopamine receptors in the central nervous system. Central serotonin level is

abnormal. In addition to fighting dopamine receptors, new antipsychotics also fight serotonin receptors. The level of central glutamate is low and the function is insufficient (Podichetty et al. 2021). (2) Neuroanatomical and neuroimaging studies show that the brain tissue of temporal lobe, frontal lobe and limbic system shrinks, ventricles expand and sulcus gyri widen. (3) Maternal virus infection during pregnancy, perinatal complications, adverse stress in childhood and physical diseases are related to neurological development defects, which have a certain impact on the pathogenesis of schizophrenia. Second, genetic factors. The genetic epidemiological survey of a large sample population shows that the prevalence rate among the relatives of patients is several times that of the general population (Biondo & Gerber 2020). The closer the blood relationship, the higher the prevalence. Molecular genetic studies have shown that susceptibility loci are associated with schizophrenia. At present, it is generally believed that schizophrenia may be polygenic, and its pathogenesis is caused by the superposition of multiple genes. Third,

social psychological factors, adverse life events, economic status, pre illness personality and other social psychological factors may play an inducing and promoting role in the pathogenesis of schizophrenia. In short, the etiology of schizophrenia has not been fully clarified. At present, there is no clear causal relationship between some identifiable influencing factors and the disease. It is generally believed that susceptible quality and external adverse factors lead to disease through the joint action of internal biological factors (Bojorquez et al. 2020).

In the clinical manifestations of schizophrenia, first, early symptoms: most patients have chronic onset, decline in work enthusiasm and ability, decline in students' academic performance, indifference to others, estrangement from others, lack of interest in external things, lack of care for their families, lazy life, sensitivity and suspicion, personality change, etc. Some patients may have insomnia, headache, dizziness, weakness, emotional instability and other discomfort and neurological symptoms. Some cases develop rapidly. Clinically, most of them are sudden excitement, impulse, speech disorder, behavior disorder, sporadic hallucinations and delusions. Second, thinking Association disorder: the most typical symptom of schizophrenia is the lack of coherence and logic in the process of thinking Association. The whole dialogue or writing content of the patient is lack of logic, the narration is not very relevant, and the meaning cannot be clearly expressed around the central idea of the dialogue. It's very difficult to talk to patients, which can be confusing (loose thinking). Lack of connection between sentences, language confusion (thinking confusion). Third, the obstacle of thinking content: mainly manifested in delusion. Delusion is a morbid and distorted belief, which is inconsistent with objective facts, educational level and cultural background, and even ridiculous. However, patients do believe this and cannot be persuaded or corrected through their own experience. Fourth, hallucination: hallucination refers to the patient's perception of his own existence when there is nothing in the objective reality. This is a common symptom of schizophrenia. The most common hallucination is auditory hallucination. There was no one talking around, but the patient heard a voice. Auditory hallucinations are common. Their content is critical, controversial, imperative or thinking voices. They are characteristic auditory hallucinations, and more persistent language auditory hallucinations also have diagnostic value. Fifth, affective disorder: manifested as the patient's lack of emotional response to the surrounding things. In the early stage, it is a specific lack of emotion, such as caring and considerate for relatives (emotional indifference), indifferent to major things involving their own interests, and no corresponding emotional response to things that ordinary people feel annoyed and painful (emotional indifference). It can also show

that the emotion is uncoordinated with the surrounding environment, laughing for no reason, and it is difficult to have emotional communication with the patient. The above symptoms are characteristic symptoms of schizophrenia. Sixth, will behavior disorder: patients are often helpless, negative withdrawal, lack of initiative and enthusiasm, do nothing all day, live a lazy life, have no advanced intention requirements (decreased will), have no interest in work, study and communication, significantly reduce their ability and damage their social function. There may also be stupidity, childishness, weird behavior, and violent crime (Mwb A et al.2020).

SUBJECTS AND METHODS

Study setting

In terms of the disease harm of schizophrenia, violent crime is a prominent problem in the development of modern society. This is a crime that does great harm to individuals and society and has extremely serious consequences. It is generally believed that the incidence of violence in psychiatric patients is higher than that in the general population, and is related to the type of mental disorder. Most studies have confirmed the statistical relationship between schizophrenia and violence, especially violence related to drug abuse. Some researchers report that the risk of violent crime in alcoholism combined with schizophrenia is 25.2 times higher than that in the normal population and 7 times higher than that in non-alcohol dependent schizophrenia. Relevant studies have pointed out that there is a moderate and important link between schizophrenia and violence, but this link is less than drug abuse and antisocial personality (Mwb et al. 2020). The increase of violence is limited to specific schizophrenic symptoms, indicating that violence is closely related to schizophrenic symptoms. At the same time, relevant studies have pointed out that hallucinations and delusions are related to the aggressive behavior of mental patients, that is, violent behavior is related to the sound, content and emotion of hallucinations. Most violent patients have the illusion of persecution, which will make patients feel angry and lead to violent crimes. In short, violent crime is the result of the interaction of psychological, social, biological and other factors. This is a very complex social phenomenon. The research should start from the aspects of demography, social psychology and biological factors, pay attention to the interaction of various factors, and make a comprehensive evaluation. In view of this, this paper analyzes the psychological factors of violent criminal behavior of schizophrenic patients, in order to clarify the psychological characteristics and risk factors of violent criminal behavior of schizophrenic patients, so as to provide a theoretical basis for timely prediction and intervention of violent criminal behavior (Ygm et al. 2020).

Design

49 violent criminals and 35 schizophrenic patients with violent violations were collected as the research objects. They were divided into crime group and patient group. The patient group (35 cases) were violent offenders diagnosed with schizophrenia, and the crime group (49 cases) were violent criminals of normal people without mental diseases, brain organic diseases and serious physical diseases. Among them, the inclusion criteria of the patient group: (1) patients who meet the diagnostic criteria of CCMD-III schizophrenia. (2) Male schizophrenic patients aged 18-50. (3) A schizophrenic accused of intentional homicide or injury. Inclusion criteria of crime group: (1) imprisonment for intentional injury or intentional homicide. (2) Male criminals aged 18-50. (3) No history of mental illness. Exclusion criteria: (1) patients with brain organic diseases and serious physical diseases were excluded. (2) Those who do not cooperate with the examination and cannot effectively complete the test.

Minnesota Multiphasic Personality Inventory (MMPI), Personality Diagnosis Questionnaire (PDQ4+), Family Environment Scale Chinese Version (FES-CV) and early bad family environment questionnaire (BFEE) were used to investigate and test, and then combined with logistic regression analysis to evaluate the differences and commonalities of related psychological factors between patients and criminals. MMPI scale: the Minnesota Multiphasic Personality Questionnaire Revised by song Weizhen of the Institute of psychology of the Chinese Academy of Sciences, with a total of 399 questions, which is divided into three validity scales: l (lie score), f (fraud score), K (correction score), HS (hypochondriasis), D (depression), HY (hysteria), PD (psychopathy), MF

(masculinity feminization), PA (paranoia), Pt (mental weakness), SC (schizophrenia), MA (hypomania) Si (social introversion) 10 clinical scales. PDQ4+ scale: including 107 items, used to evaluate 12 types of personality disorders in DSM - IV, including paranoid, schizoid, schizoid, performance, narcissistic, marginal, antisocial, avoidance, dependence, compulsion, passive aggression and depression. FES-CV scale: a total of 90 questions, including 10 factors: family members' intimacy, emotional expression, contradiction, independence, success, knowledge, entertainment, morality and religion, organization and control. BFEE questionnaire includes: incomplete family structure, criminal record of parents, drug or alcohol abuse of parents, maltreatment by parents, abandonment by parents and bad parenting style; Score 0-1.

All materials and data were input into excel and compiled into data tables. SAS statistical software package was used for statistical analysis. First, univariate analysis was performed, and then the violence of schizophrenic patients was taken as the dependent variable. The variables with statistically significant difference between the two groups were taken as independent variables by univariate analysis, and multivariate stepwise logistic regression analysis was performed.

Table 1 shows the comparison of MMPI measurement results between the two groups. Table 2. Shows the comparison of PDQ4+ determination results between the two groups. Table 3 shows the comparison of FES-CV measurement results between the two groups. Table 4 shows the comparison of BFEE measurement results between the two groups. Table 5 shows the results of multivariate logistic regression analysis.

PDQ-antisocial	-1.70	0.63	7.38	<0.01	0.18	0.05-0.62

RESULTS

Comparison of MMPI measurement results between the two groups

The scores of F (fraud), D (depression), HS (hypochondriasis), HY (hysteria) and PA (paranoia) in schizophrenia group were significantly higher than those in criminal group ($P < 0.05$), but there was no significant difference in other factor scores ($P > 0.05$).

Comparison of PDQ4+ measurement results between the two groups

The scores of paranoids, schizoid, schizoid, performative, dependent, passive aggressive and depressive personality disorders in schizophrenic group were higher than those in criminal group, and the scores of antisocial personality disorders in criminal group were higher than those in schizophrenic group, the difference was statistically significant ($P < 0.05$), and there was no significant difference in other factor scores ($P > 0.05$).

Comparison of FES-CV results between the two groups

The scores of intimacies, success, entertainment and organization of FES-CV in schizophrenia group were lower than those in criminal group, the difference was statistically significant ($P < 0.05$), and there was no significant difference in other factor scores ($P > 0.05$).

Comparison of BFEE measurement results between the two groups

In the schizophrenia group, the number of parents suffering from mental illness in the early years was more than that in the criminal group, while the number of parents suffering from parental abuse, poor parenting style and incomplete family structure in the early years was less than that in the normal criminal group, the difference was statistically significant ($P < 0.05$), and there was no statistical significance in the other factor scores ($P > 0.05$).

Results of logistic regression analysis

The risk factors of violent behavior in schizophrenic patients were the high scores of F and PA of MMPI and early parental mental history. The risk factors of criminal violence are early parental abuse, parents' bad rearing style and antisocial personality.

DISCUSSION

In terms of the disease harm of schizophrenia, violent crime is a prominent problem in the development of modern society. This is a crime that does great harm to individuals and society and has

extremely serious consequences. It is generally believed that the incidence of violence in psychiatric patients is higher than that in the general population, and is related to the type of mental disorder. Violent crime is the result of the interaction of psychological, social, biological and other factors. This is a very complex social phenomenon. The research should start from the aspects of demography, social psychology and biological factors, pay attention to the interaction of various factors, and make a comprehensive evaluation. In view of this, this paper analyzes the psychological factors of violent criminal behavior of schizophrenic patients, in order to clarify the psychological characteristics and risk factors of violent criminal behavior of schizophrenic patients, so as to provide a theoretical basis for timely prediction and intervention of violent criminal behavior (Contreras-Molina et al. 2020).

In the comparison of MMPI measurement results between the two groups, the results of this study showed that the scores of F (fraud), D (depression), HS (hypochondriasis), HY (hysteria) and PA (paranoia) in the schizophrenia group were higher than those in the criminal group, the difference was statistically significant ($P < 0.05$), and the difference of other factor scores was not statistically significant ($P > 0.05$). The high scores of HS and D scale reflect the depression, pessimism, excessive control, many vague physical discomforts, anxiety, self-centered, complaining and complaining of violent and illegal schizophrenic individuals. This may be the characteristic symptom of schizophrenic violent offenders. Most of these people have inexplicable psychological and physical pain, do not pity life, negative indifference. It may also be related to the situation of detention and judicial expertise. The high PA score of schizophrenic patients often suggests that the symptoms of patients are mainly systematic delusion, especially victim delusion. In adult mental patients, the increase of F score is a rough index of the severity of psychopathology. The higher the score, the more serious the mental disorder is. Combined with clinical analysis, it is suggested that the violent behavior of schizophrenic patients is related to psychopathology. In addition, the results of multiple stepwise regression analysis show that f and PA scores are related to schizophrenia violence, which further shows that the violence of schizophrenic patients is a disease state, and the motivation of violence is absurd and lack of reality (Amaa et al. 2020).

In the comparison of PDQ4 + measurement results between the two groups, the results of this study showed that the scores of paranoid, schizophrenic, schizophrenic, performing, dependent, passive aggressive and depressive personality disorders in the schizophrenic group were higher than those in the criminal group, the scores of antisocial personality disorders in the criminal group were higher than those in the schizophrenic group, the difference was

statistically significant ($P < 0.05$), and the differences of other factor scores were not statistically significant ($P > 0.05$). It is partially consistent with the results of MMPI in this study. In short, foreign scholars have proved that the personality diagnosis questionnaire (PDQ4+) has good specificity and sensitivity when applied to the criminal population, and is suitable for the screening of personality disorders in the criminal population (Branitsky et al. 2020).

In the comparison of the results of FES-CV and BFEE between the two groups, psychologists of all schools attach great importance to the psychological growth in childhood and believe that early experience has a great impact on the integrity of personality in adulthood. Family is the first place for individuals to accept socialization. People's behavior and psychology are directly or indirectly affected by the early family environment. Some studies believe that early parental violence, adverse family environment such as mental history and substance abuse history, and traumatic life experiences such as abandonment and abuse in childhood are related to adult violence. This study found that most of the parents in the schizophrenia group had a history of mental illness, while the violence in the criminal group was related to parental abuse and poor parenting style in their early years. At the same time, this paper found that the evaluation of family in schizophrenic patients was significantly lower than that in criminal group in terms of intimacy, success, entertainment and organization. In particular, the score of family intimacy is significantly lower than that of the criminal group, which reflects that such family members are not close enough, cannot fulfill their mutual commitments, and cannot help and support each other. It can also be understood that schizophrenic patients lack communication with their families and are not good at obtaining help and support from their families. It may be that disease factors undermine the patient's reality test ability, are sensitive to the surrounding environment and interpersonal communication, and cannot feel or make use of the support given by family and society (Seeman 2020).

Finally, in multivariate logistic regression analysis, the high scores of F and PA of MMPI and early parental mental history are the risk factors of violent behavior in schizophrenic patients, especially the high score of F of MMPI is an important risk psychological factor in this kind of patients. The high scores of PA and F are related to psychotic paranoid hostility, which reminds clinical workers and patients' families that schizophrenic patient with a history of aggressive behavior, serious paranoid hostility and high scores of F and PA of MMPI should be strictly supervised and treated in time. The results suggest that the high scores of F and pa of MMPI can be used to predict violent behavior of schizophrenic patients, but the predictive validity of MMPI on violent behavior needs to be further studied by expanding the sample size.

CONCLUSIONS

This study explores the differences and commonalities of psychosocial factors related to violent behavior between schizophrenic patients and criminals. The results suggest that both schizophrenic patients and criminals with violent behavior have pathological personality characteristics, namely impulse, self-centered, emotional instability and poor social adaptation. The reasons for the formation of this personality and how to carry out effective psychological and behavioral treatment for this kind of people will be the direction of further research in the future. At the same time, the high scores of F and PA of MMPI and the early mental history of parents are the risk factors of violent behavior in schizophrenic patients, especially the high score of F of MMPI is an important risk psychological factor in this kind of patients, which provides some reference basis for the prediction and intervention of violent behavior.

THE ROLE OF TRADITIONAL TOYS OF NORTHERN ETHNIC MINORITIES IN IMPROVING CHILDREN'S AUTISM

GEGENSAREN^{1,2}

¹Academy of Fine Arts, Inner Mongolia Minzu Universit, Tongliao 028000, China

²Horqin Intangible Cultural Heritage Research Center, Inner Mongolia University, Tongliao 028000, China

SUMMARY

Introduction: Autistic children are a special group. This group of children known as "star children" have abnormal development in society, language and behavior. The diseases carried by these children will accompany them for a lifetime. Perhaps current science cannot cure autistic children, but we can improve their symptoms in various ways and give them the opportunity to participate in normal life. Toys are produced for the fun of labor. It is not only an entertainment prop in leisure, but also an activity appliance in exercise and a teaching aid in education. Toys can promote people's physical and mental health development, enrich people's daily life, increase people's knowledge, cultivate sentiment and stimulate people's creativity. From the function of toys, its function can be summarized as developing intelligence, enhancing physique, cultivating aesthetics, experiencing life and so on. At the same time, toys have positive significance in improving children's autism. In view of this, this paper analyzes the role of traditional toys of northern ethnic minorities in improving children's autism, in order to help parents and doctors treat and raise autistic children better and more in place.

Subjects and methods: In order to observe the effect of traditional toys of northern ethnic minorities in improving children's autism, 96 children with autism who were clinically diagnosed in the children's Autism Center of the Fifth Affiliated Hospital of a university in our city from September 2020 to September 2021 were selected as the research object. The children were randomly divided into 48 cases in the observation group and 48 cases in the control group. The control group took routine intervention, while the experimental group added the traditional toy intervention of northern ethnic minorities on the basis of routine intervention, and the intervention cycle was 6 months. All children were scored by the Autism Behavior Checklist (ABC), the autism treatment assessment scale (ATEC) and the psychological education assessment scale for children with autism and related developmental disorders (c-pep) independently by two designated assessors.

Results: The results showed that after 3 and 6 months of treatment, the condition of the observation group and the control group was improved to varying degrees compared with that before treatment, and the difference was statistically significant ($P < 0.05$). After 3 and 6 months of treatment, the total scores of ABC scale and ATEC scale in the observation group were significantly lower than those in the control group, and the total score of c-pep was significantly higher than that in the control group ($P < 0.05$).

Conclusions: The therapeutic effect of traditional toys of northern ethnic minorities on children with autism is significantly better than conventional intervention. Therefore, it can be said that traditional toys of northern ethnic minorities have certain clinical application value in the treatment of children with autism.

Key words: ethnic minorities - traditional toys - children - autism - intervention

INTRODUCTION

Childhood autism is a subtype of generalized developmental disorder, which is more common in men. It began in infancy. It is mainly manifested in different degrees of speech development disorder, interpersonal relationship disorder, narrow interest and rigid behavior. About 3/4 of the patients were accompanied by obvious mental retardation. In the context of general mental retardation, some children have better abilities in some aspects. At the etiological level, the pathogenesis of autism is not clear, which may be related to the following factors: heredity, perinatal factors, immune system abnormalities, neuroendocrine and neurotransmitters (Holingue et al. 2021).

At the level of clinical manifestations, it mainly includes three aspects: first, language disorder. Language and communication disorders are an important symptom of autism and the main reason for

most children to seek medical treatment. Language and communication barriers can take many forms. Most autistic children have language retardation or impairment. They are usually unable to speak at the age of two and three, or language degradation occurs after normal language development. They have expressive language before the age of 2-3. With the growth of age, the expressive language gradually decreases or even completely loses, and they remain silent all their life, or use limited language in very few cases. There are some obstacles to their ability to feel and express language (Bratu & Linden 2020). Second, social communication barriers, patients cannot establish normal interpersonal relationships with others. When he was young, he had no eye contact with others, poor expression, lack of expression or posture expecting parents and others to hug and caress, no happy expression when enjoying caress, and even refused parents and others to hug and caress. We cannot distinguish between relatives and strangers. We

treat our relatives and others in the same way. It is difficult to establish a normal relationship with children of the same age due to the patient's attachment with their parents. Third, mental retardation. Among children with autism, the performance of intelligence level is very inconsistent (Anas 2020). A few patients are in the normal range, and most patients show varying degrees of intellectual impairment. Studies at home and abroad have shown that through the intelligence test of autistic children, it is found that about 50% of autistic children have intellectual defects above moderate (IQ less than 50), 25% have mild intellectual defects (IQ 50-69), 25% have normal intelligence (IQ greater than 70), and children with normal intelligence are called high functional autism.

At the level of clinical treatment, it mainly includes training intervention treatment and drug treatment. In terms of drug treatment, at present, drug treatment cannot change the course of autism, and there is a lack of specific drugs for the treatment of core symptoms. However, drugs can improve some emotional and behavioral symptoms of patients, such as emotional instability, attention deficit and hyperactivity, impulsive behavior, aggressive behavior, self-injury and suicidal behavior, convulsive and obsessive-compulsive symptoms and psychiatric symptoms, which is conducive to the smooth implementation of safety education, training and psychotherapy for patients themselves or others. In terms of training intervention treatment, although there are many intervention methods for autism, most of them lack evidence-based medical evidence (Bojorquez et al. 2020). At present, there is no best treatment scheme, and the best treatment method should be individualized treatment. Among them, education and training are the most effective and main treatment. The purpose is to promote the language development of patients, improve their social ability, and master basic life skills and learning skills. People with autism usually receive education and training in families, special education schools and medical institutions before school age, because they cannot adapt to the life of ordinary kindergartens. After school age, patients' language and social skills will be improved. Some patients can go to ordinary primary schools to receive education with children of the same age, and some patients may still stay in special education schools (Wijker et al. 2020).

Perhaps current science cannot cure autistic children, but we can improve their symptoms in various ways and give them the opportunity to participate in normal life. Toys are produced for the fun of labor. It is not only an entertainment prop in leisure, but also an activity appliance in exercise and a teaching aid in education. Toys can promote people's physical and mental health development, enrich people's daily life, increase people's knowledge, cultivate sentiment and stimulate people's creativity.

From the function of toys, its function can be summarized as developing intelligence, enhancing physique, cultivating aesthetics, experiencing life and so on. At the same time, toys have positive significance in improving children's autism (Manganaro et al. 2022). In particular, the traditional toys of northern ethnic minorities attract people with their unique attributes, stimulate people's natural curiosity, exercise people's ability to solve problems, cultivate people's autonomy, and become a connecting link between people. In addition, in some games that need many people to participate, toys can act as a bridge. They not only have the functions of beautifying life, treatment and health care, but also play an important role in the field of children's medical treatment. In view of this, this paper analyzes the role of traditional toys of northern ethnic minorities in improving children's autism, in order to help parents and doctors treat and raise autistic children better and more in place.

SUBJECTS AND METHODS

Study setting

The traditional toys of northern ethnic minorities not only have a long history, but also spread widely, and have become a key link in children's growing world. At the specific level, the traditional children's toys in the north are divided into ornamental toys, audio toys, educational toys, fitness toys and so on. Audio toys include: bone ring chain, drum, dombra, bell, whistle, windmill, etc. Ornamental toys include dolls, puppets, origami toys, wood carving toys, etc. Educational toys include gobang, jiuji, chess and so on. Fitness toys: leather rope swing, horse whip, zunzi, small weapons, arrows, gyroscopes, slingshots, children's saddles, skis, rocks, handkerchiefs, wing boards, rolling iron rings, rope skipping, sheepskin bags, sandbags, stones, etc. (Manganaro et al. 2022). It can be said that the creative styles of traditional children's toys are rich and diverse, the meaning is abstract and the color is standardized, which is mainly reflected in the image modeling characteristics, rich national connotation and beautiful decorative patterns. Therefore, children can freely process and convert materials according to their own interests and imagination, which plays an important role in children's early intellectual development. It can be said that the toy intervention model has been a mature means to treat children with autism. However, the toy treatment model, especially the model based on the traditional toys of northern ethnic minorities to treat children with autism, is less studied in China. In view of this, this study uses the traditional toy treatment mode of northern ethnic minorities to carry out intervention training for children with autism, and discusses its intervention effect and intervention effect.

Design

96 children with autism who were clinically diagnosed in the children's Autism Center of the Fifth Affiliated Hospital of a university in our city from September 2020 to September 2021 were selected as the research object. The children were randomly divided into 48 cases in the observation group and 48 cases in the control group. The inclusion criteria included: (1) the diagnosis met the diagnostic criteria of childhood autism in the 5th edition of the diagnostic and Statistical Manual of mental diseases; (2) autistic patients aged 3-12 years. (3) the guardian voluntarily receives treatment. Exclusion criteria: (1) children with physical disabilities and congenital malformations such as visual and auditory impairment; (2) children who have previously been treated in other institutions; (3) children with mental retardation caused by other diseases. The study was approved by

the ethics committee of the Fifth Affiliated Hospital of a university in our city, and the informed consent was signed with the consent of the family members. There were no adverse events during the study.

The control group took routine intervention, while the experimental group added the traditional toy intervention of northern ethnic minorities on the basis of routine intervention, and the intervention cycle was 6 months. All children were scored by the Autism Behavior Checklist (ABC), the Autism Treatment Evaluation Checklist (ATEC) and the psychological education assessment scale for children with autism and related developmental disorders (c-pep) independently by two designated assessors. The assessor did not understand the grouping of children and assessed them when they were in good mood and mental state.

Table 1. Comparison of ABC scores between the two groups before and after treatment

Group	Project	Before treatment	Treatment for 3 months	Treatment for 6 months	P
Control group	Total score	81.60±9.32	74.89±7.67	64.11±6.63	<0.05
	Feel	11.18±2.37	8.37±1.87	6.52±1.47	<0.05

Evaluation tool: ABC, which is a mature autistic screening and diagnosis scale. It has no difference in the use of different ages and genders, and has good sensitivity and specificity. ABC scale includes 57

items to observe five aspects of autistic children's feeling, movement, communication, language and self-care ability. The higher the score, the more severe the degree of autism. The ATEC is a scale to evaluate

the treatment effect. It can also measure the change of autism severity. It is composed of four subscales. The higher the score, the heavier the degree of autism. The child autism and related developmental disorders psychological education evaluation scale (c-pep) is applicable to the personalized evaluation and correction of children with autism and related developmental disorders, and provides information about the current development level of children. It is divided into 95 items of developmental function and 44 items of pathological scale. The higher the score, the higher the level of functional development.

In this experiment, ABC scale was used as the

diagnostic basis, ATEC scale was used to evaluate the efficacy before and after intervention, and c-pep scale was used to guide the formulation of treatment objectives. At the same time, the three scales were also used as the effect evaluation indicators of this study. SPSS25.0 statistical software was used for statistical analysis, and the difference was statistically significant ($P < 0.05$). Table 1 shows the comparison of ABC scores between the two groups before and after treatment.

Table 3 shows the comparison of c-pep scores between the two groups before and after treatment.

RESULTS

Comparison of ABC scores between the two groups before and after treatment

Before treatment, there was no significant difference in the scores and total scores of ABC scale between the observation group and the control group ($P > 0.05$). After 3 months of treatment, there was no significant difference in sensation, movement and self-care between the observation group and the control group ($P > 0.05$). Communication and speech were significantly lower than those in the control group ($P < 0.05$). After 6 months of treatment, the scores of the observation group were lower than those of the control group, and the difference was statistically significant ($P < 0.05$).

Comparison of ATEC scores between the two groups before and after treatment

Before treatment, there was no significant difference in the scores and total scores of ATEC scale between the observation group and the control group ($P > 0.05$). After 3 and 6 months of treatment, the scores and total scores of ATEC in the observation group were lower than those in the control group, and the difference was statistically significant ($P < 0.05$).

Comparison of c-pep scores between the two groups before and after treatment

Before treatment, there was no significant difference in the scores and total scores of c-pep scales between the observation group and the control group ($P > 0.05$). After 3 months of treatment, there was no significant difference in imitation, fine movement, gross movement and hand-eye coordination between the observation group and the control group ($P > 0.05$). The perception, cognitive function and oral cognition of the observation group were higher than those of the control group ($P < 0.05$). After 6 months of treatment,

the scores and total scores of c-pep scales in the observation group were lower than those in the control group ($P < 0.05$).

DISCUSSION

Analysis on the effect of traditional toys of northern ethnic minorities in the treatment of children with autism

The etiology of childhood autism is unclear. Most studies have shown that it is related to genetic and environmental factors. Worldwide, the prevalence of autism is rising. In addition, there are great differences in the prevalence of autism among countries. The prevalence of autism is rising. There is no doubt that it has brought obvious personal pain and heavy burden to families and society. Therefore, it is very important for individuals, families and society to explore the best treatment methods and treatment time of autism. The purpose of this study is to explore the clinical value of traditional toys in the treatment of autistic children, so as to provide some basis for the effectiveness of toys in the treatment of autistic children (Contreras-Molina et al. 2021).

The results of this study showed that there was no significant difference in the scores and total scores of ABC scale between the observation group and the control group before treatment ($P > 0.05$). After 3 months of treatment, there was no significant difference in sensation, movement and self-care between the observation group and the control group ($P > 0.05$). Communication and speech were significantly lower than those in the control group ($P < 0.05$). After 6 months of treatment, the scores of the observation group were lower than those of the control group, and the difference was statistically significant ($P < 0.05$). At the level of ATEC score comparison, there was no significant difference in the scores and total scores of ATEC scale between the observation group and the control group before treatment ($P > 0.05$). After 3 and 6 months of treatment, the scores and total scores of ATEC in the observation group were lower than those in the control group, and the difference was statistically significant ($P < 0.05$). At the level of c-pep score comparison, there was no significant difference between the observation group and the control group before treatment ($P > 0.05$). After 3 months of treatment, there was no significant difference in imitation, fine movement, gross movement and hand eye coordination between the observation group and the control group ($P > 0.05$). The perception, cognitive function and oral cognition of the observation group were higher than those of the control group ($P < 0.05$). After 6 months of treatment, the scores and total scores of c-pep scales in the observation group were lower than those in the control group ($P < 0.05$).

In short, it is difficult for people with autism to recognize or understand other people's different ideas,

plans and views, express and understand their emotions, and lack the necessary connection with the outside world. Therefore, theoretically, treatment should pay attention to connection and integration. Although the ultimate goal of many traditional autism intervention methods is to help children better integrate into society and improve their connection with others, in practice, the most effective intervention methods often have highly structured characteristics, which greatly increases the intervention cost (Amaa et al. 2019). The traditional toy intervention of northern ethnic minorities overcomes the structural characteristics of traditional intervention measures, reduces human intervention, and makes the treatment process more natural and harmonious (Liang et al. 2021). At the same time, in the process of using Northern Minority toys, autistic children also expressed their unique understanding of the surrounding world and realized expressive communication with therapists in the process of nonverbal play. This is a "special language", which increases the communication between autistic children and the outside world and improves their social skills (Ronnenberg et al. 2020).

Research prospect of intervention treatment of children's autism with traditional toys of northern ethnic minorities

Although there is evidence to support the effect of early intervention on improving the prognosis of autistic children, the mechanism of its effectiveness is still poorly understood. We believe that this phenomenon may be because the younger the age, the stronger the neural plasticity of the immature brain, which can promote the improvement of complex neural network and brain connectivity through intervention. Early learning is carried out by children through experiencing the environment. Self-generated experience, rather than observation or passive experience, so early learning is the most influential. Later, children diagnosed with autism may be greatly affected by the living environment and have more mandatory passive experience, so the learning effect is not as good as that of young children. In addition, some autistic children will have some degenerative changes with age, so the intervention effect before degenerative change is more ideal. Therefore, early treatment can reduce the cumulative effect of autism children's diseases, and is conducive to the reorganization of physiological functions and the compensation of various physiological functions. This is very important for the prognosis of autistic children.

There are still some limitations and deficiencies in this study: (1) the sample size of this study is still small, so further large sample repeated trials are needed to verify the universality of toy therapy for children with autism in northern ethnic minorities. (2) The observation time of this study is short, there is no long-term follow-up, and the long-term effect needs to

be further studied. (3) This study did not study the factors that may affect the prognosis of autistic children, such as disease severity and intervention time, which need to be further studied in the future.

CONCLUSIONS

On the basis of previous studies, this study improved and innovated the experiment, adopted more careful experimental design and more accurate statistical methods to evaluate the treatment time and various aspects of children's autism, so as to evaluate the efficacy of the northern minority toy intervention model. The conclusions include: the northern minority toy intervention model plays an important role in the improvement of ABC, ATEC and c-pep of children's autism. The therapeutic effect of toys in the North increased significantly with the time. In short, the northern minority toy intervention model, as a safe, non-toxic and effective treatment method, has an irreplaceable positive effect of traditional drug treatment, which is worthy of popularization and application.

MUSIC AND DANCE ON THE TREATMENT OF DEPRESSIVE PSYCHOSIS

Bin Liu

School of Music and Dance, Xuchang University, Xuchang 461000, China

SUMMARY

Introduction: People can also improve their rhythm and coordination through the training of their singing, dancing and body rhythm. Modern music and dance therapy research has confirmed that music + dance can directly or indirectly affect people's psychological, emotional and physiological functions. Moreover, music + dance is one of the important technologies for the treatment of depressive psychosis. Through the process of music and dance treatment, patients with depressive psychosis can be encouraged to participate in the treatment and change their bad emotions and abnormal behaviors, so as to alleviate and eliminate the clinical symptoms of depressive psychosis. In short, the treatment technology of combining music and dance is to use music and dance to open the psychological world of patients with depressive psychosis, and then change their ideological understanding, so as to achieve the goal of treating depressive psychosis.

Subjects and methods: In order to observe the effect of music + dance in the treatment of depressive psychosis, 64 patients with depressive psychosis in a class III class a psychiatric hospital were selected. Through the method of random sampling, they were divided into two groups: the intervention group of music + dance therapy (32 cases) and the control group of routine nursing (32 cases). During the 4-week clinical intervention, the patients in both groups received routine nursing measures, while the intervention group added music + dance mode for treatment, twice a week, 2 hours each time. By observing the Brief Psychiatric Rating Scale (BPRS), Hamilton Anxiety Scale (HAMA) and Hamilton Depression Scale (HAMD) in the two groups before and after intervention, they were used to evaluate the psychotic symptoms, anxiety and depression of patients, and statistical analysis was carried out to draw the conclusion of clinical research.

Results: The results showed that there was no significant difference in BPRS scale score, HAMA scale score and HAMD scale score between the two groups ($P > 0.05$). After 4 weeks of intervention, there were significant differences in BPRS scale score, HAMA scale score and HAMD scale score between the intervention group and the control group ($P < 0.05$).

Conclusions: After the implementation of music + dance therapy, the psychotic symptoms, anxiety and depression of patients in the intervention group were improved, while the psychotic symptoms, anxiety and depression of patients in the control group were not greatly improved. Therefore, it can be said that music + dance has a good effect on the treatment of patients with depressive psychosis. In short, music + dance therapy is a safe and low-cost intervention for depressive psychosis, which should be more widely used in clinical treatment.

Key words: music - dance - depression - psychosis-anxiety - psychological intervention

INTRODUCTION

Depressive Psychosis (DP) can be understood as psychological depression, anxiety and pessimism, and there is a certain deviation in the understanding of social things (Snmez et al. 2019). In severe cases, thoughts or behaviors of death will be generated to end the mental pain caused by DP disease (Li et al. 2019). Because there are many causes of DP, targeted therapy for DP disease also adopts different treatment methods according to the severity of the disease. Long-term clinical studies have found that the main inducing factors of depression are closely related to their own psychology. It is pointed out that DP diseases should be treated from the psychological level, so as to avoid additional side effects caused by drug treatment and misdiagnosis of DP patients without appropriate methods (Latif et al. 2020). Combined with many years of clinical research, the treatment of DP disease can be carried out through external psychological intervention, including music therapy, dance therapy, exercise therapy, reflex therapy, HRT experimental therapy, alternative therapy, etc. At the same time, a set

of treatment standards for DP disease - brain biogenic amine balance therapy (Bojorquez et al. 2020) is also summarized. In short, these external intervention therapies for DP diseases are scientific schemes for prevention and treatment according to the severity of DP patients, which are worthy of popularization and application in clinic.

For external psychological intervention in the treatment of DP diseases, music guided imagination (GIM), as a technology combining music and imagination, is committed to the study of in-depth psychotherapy and the state of consciousness transformation, and in the research process, it is found that classical music has the best effect in the deep transformation of visitors' consciousness (Chahal et al. 2021). In specific GIM treatment, different types of music need to be selected according to different stages of patients. Due to the differences of different ethnic cultures and therapists around the world, the choice and application of music are also changing and expanding. Therapists' choice and adjustment of music has been proved to be effective. However, the effect of music has two sides. Inappropriate music may

aggravate the situation, and appropriate music can promote the transformation and healing of visitors (Gao et al. 2019). Therefore, in the selection of music, the principles that should be followed are: the selected music can promote the formation of visual images, arouse the state of emotion and emotion, imply early memory, create positive feedback, promote physical relaxation and support spiritual experience. As a music therapy technology, music-guided imagination has different theoretical orientations, including behavior theory, humanistic theory, psychodynamic theory and so on. In conclusion, practice has proved that music guided imagination therapy plays an important and positive role in alleviating DP diseases (Contreras-Molina et al. 2021).

As a colorful art, it comes directly from life. Moreover, dance is also a new type of mass sports event integrating entertainment, fitness, competition, aesthetics and other functions. Relevant research points out that dance learning can not only enhance people's physical quality and improve people's external image and temperament. Dance learning can also promote unity, cooperation and emotional communication between people, which is then very important for people's physical and mental development (Amaa et al. 2019). In other words, people can communicate and cooperate with each other in dance learning, so as to strengthen the emotional connection between people, so as to relieve their own mental pressure, and then cultivate people's enthusiasm, creativity and flexibility, so as to help people develop healthily and harmoniously. With the popularization of dance, dance training and learning are becoming more and more scientific. At the same time, the research on physiological and biochemical indexes and mental health in dance learning has gradually become one of the research hotspots. Relevant studies have pointed out that adding psychological content intervention and support to dance teaching and training has a significant effect on the treatment of psychological diseases (Riley et al. 2019). In short, with the popularization and development of dance learning, the scheme and method of using dance to treat mental diseases have attracted more and more attention in clinical practice.

In view of the importance of music and dance in the treatment of DP diseases, this paper analyzes the effect of music + dance on the treatment of depressive psychosis. There are four procedures in the technical route (see Figure 1 for details). Firstly, in the introduction stage, introduce the specific content of music + dance therapy mode. At the same time, promote group members to know each other, and group members to talk about their problems and goals, so as to lay the foundation for subsequent music + dance therapy. Secondly, in the stage of music support, combined with the relaxation music in CD and the muscle gradual relaxation guidelines listed in receptive music therapy, we can relax the whole body, and then

use the music and guidelines to guide the imagination of group members. Thirdly, in the stage of dance support, stretch the patients in combination with receptive dance therapy, and perform group dance in combination with corresponding music, so as to give full play to the ability of mutual cooperation and cooperation of group members. Finally, in the discussion stage, the group members shared their feelings and ideas of music + dance therapy, and communicated and discussed. The therapist gave some discussion guidance, analysis, help and suggestions. In short, music + dance, as a medium, can fully explore the patients' inner subconsciousness and introduce the subconscious conflict and emotion into the conscious level in the treatment of DP. Then, through mutual cooperation and mutual support at the dance level, eliminate or dredge the inner negative emotions and anxiety psychology, and then help DP patients get rid of psychological depression, anxiety and pessimism, and promote DP patients to form correct values and rational judgment, so as to better have a normal dialogue with others and society.

Figure 1. Technical route of music + dance therapy mode

SUBJECTS AND METHODS

Study setting

Music + dance therapy mode is to combine music and dance, eliminate or dredge the inner depression and anxiety through the mutual cooperation and cooperation between DP patients. It is one of the important technologies for the treatment of DP diseases. Music + dance therapy mode, based on psychodynamics and Jung analytical psychology, uses music and dance as the media to open the door of the subconscious of patients with depressive psychosis, let the subconscious conflict and emotion enter the level of consciousness, and then strengthen the emotional communication and cooperation between DP patients through dance, so as to achieve the purpose of curing

psychological problems in the treatment relationship. It can be said that the music + dance treatment mode has been a mature technology for the treatment of DP diseases since its development. Its application involves clinical consultation, mental health, postoperative rehabilitation, psychological intervention of psychiatric patients and other aspects (Berze et al. 2020). However, there are few studies on music + dance treatment mode in China, especially the use of music + dance treatment mode to intervene in depressive psychosis. In view of this, this study used music + dance therapy mode to intervene DP patients, and discussed its intervention effect and intervention effect.

Design

64 patients with depressive psychosis in a class III class a psychiatric hospital was selected. Through the method of random sampling, they were divided into two groups: music guided imagination intervention group (32 cases) and routine nursing control group (32 cases). The diagnostic criteria of depressive psychosis, with the help of doctor-assisted diagnosis and with reference to the diagnostic criteria of depressive psychosis in the classification and diagnostic criteria of Chinese mental diseases (Third Edition), should meet 4 or more of the 9 symptoms.

The patients in the intervention group and the control group were given nursing care according to the routine treatment of psychiatry. According to the specific medication plan, the routine drug paroxetine

was given according to the doctor's advice. Control group: in the clinical process of 4 weeks of intervention, the patients were given oral antidepressant western medicine and routine psychiatric nursing according to the doctor's advice. Intervention group: in the clinical process of 4 weeks of intervention, on the basis of routine psychiatric nursing and treatment, music + dance treatment mode intervention (see Figure 1 for the specific process). The Brief Psychiatric Rating Scale (BPRS), Hamilton Anxiety Scale (HAMA) and Hamilton Depression Scale (HAMD) were observed before and after intervention, so as to evaluate the psychotic symptoms, anxiety and depression of the patients.

Evaluation tool: BPRS is applicable to most psychiatric patients with psychotic symptoms. It is not only a scale to evaluate the severity of psychotic symptoms, but also one of the professional evaluation scales widely used in psychiatry. It is divided into 18 and 20 versions, and 20 versions are used in this study. HAMA includes 14 evaluation items, and the boundary value is 14 points. Grading criteria: total score > 29 points means severe anxiety, > 21 points means obvious anxiety, > 14 points means certain anxiety, > 7 points means possible anxiety, and < 7 points means no anxiety. HAMD grading criteria: total score > 35 points is severe depression, > 20 points is mild to moderate depression, and < 8 points is no depression. Among them, the comparison of BPRS scores between the two groups at different times is shown in Table 1.

Table 1. Comparison of BPRS scores between the two groups at different times

Group	When joining the group	Intervention for 1 week	Intervention for 2 weeks	Intervention for 4 weeks
Intervention group	79.10±17.27	75.60±16.39	69.60±16.26	55.10±15.62
Control group	73.57±17.32	72.03±17.11	69.70±16.68	66.90±16.98

The comparison of HAMA scores between the two groups at different times is shown in Table 2.

Table 2. Comparison of HAMA scores between the two groups at different times

Group	When joining the group	Intervention for 1 week	Intervention for 2 weeks	Intervention for 4 weeks
Intervention group	32.03±8.98	30.40±9.39	27.27±9.07	19.27±7.79
Control group	31.97±8.97	30.77±8.92	29.33±9.09	27.77±8.96

The comparison of HAMD scores between the two groups at different times is shown in Table 3.

Table 3. Comparison of HAMD scores between the two groups at different times

Group	When joining the group	Intervention for 1 week	Intervention for 2 weeks	Intervention for 4 weeks
Intervention group	63.10±15.00	61.07±15.01	57.57±15.29	47.10±14.01
Control group	63.07±15.47	61.77±15.60	60.37±15.75	58.73±15.52

RESULTS

Comparison of BPRS scores between the two groups at different times

There was no significant difference between the intervention group and the control group ($BPRS > 0.05$, $P > 0.05$). After 4 weeks of intervention, the BPRS score of the intervention group decreased significantly compared with the control group. At the same time, the statistical analysis of single factor repeated measurement variance showed that there was an interaction between clinical grouping and time ($P < 0.05$). The treatment effect of BPRS between the two groups increased continuously with the treatment time ($P < 0.05$).

Comparison of HAMA scores between the two groups at different times

There was no significant difference in HAMA score between the two groups ($P > 0.05$). After 1, 2 and 4 weeks of intervention, HAMA score analysis showed that the scores of patients in both groups decreased. The statistical analysis of single factor repeated measurement variance showed that there was an interaction between clinical grouping and time ($P < 0.05$). The therapeutic effect of the intervention group and the control group increased with the treatment time, and there was significant difference ($P < 0.05$).

Comparison of HAMD scores between the two groups at different times

There was no significant difference in HAMD score between the two groups ($P > 0.05$). After 1, 2 and 4 weeks of intervention, HAMD score analysis showed that the scores of patients in both groups decreased. The statistical analysis of single factor repeated measurement variance showed that there was an interaction between clinical grouping and time ($P < 0.05$). The therapeutic effect of the intervention group and the control group increased with the treatment time, and there was significant difference ($P < 0.05$).

DISCUSSION

Effect analysis of music + dance in the treatment of depressive psychosis

DP disease has caused serious harm to people's mental and physical health. Its high prevalence and high recurrence rate are thorny problems in modern nursing treatment. For patients, the drug price is high and the toxic and side effects are large. Music + dance therapy has been widely used and studied all over the world, and there is a mature and standardized education system. In view of this, this study combined music + dance treatment model to treat DP disease. In terms of the influence of BPRS score on DP patients, the results showed that the BPRS score was

(76.33 ± 17.38) at the time of enrollment and (61.00 ± 17.24) after 4 weeks. The statistical analysis of the variance of single factor repeated measurement showed that there was an interaction between clinical grouping and time. With the extension of treatment time, the BPRS score of the intervention group and the control group was statistically significant ($P < 0.05$). The implementation of music + dance treatment mode has a good effect on patients' mental symptoms. In terms of the impact on the HAMA score of patients with depressive psychosis, the HAMA score was (32.00 ± 8.90) at the time of enrollment and (23.52 ± 9.36) after 4 weeks. The degree of anxiety changed from severe anxiety to obvious anxiety, and the anxiety symptoms improved significantly. With the extension of treatment time, the HAMA score of the intervention group and the control group was statistically significant ($P < 0.05$). This shows that the implementation of music + dance treatment mode has a good effect on patients' anxiety. In terms of the impact on the HAMD score of patients with depressive psychosis, the HAMD score was (63.08 ± 15.11) at the time of enrollment and (52.92 ± 15.79) after 4 weeks. With the extension of treatment time, the HAMD scores of the intervention group and the control group were statistically significant ($P < 0.05$), which showed that the music + dance treatment mode could assist the treatment of patients and improve the state of depression. To sum up, music + dance therapy mode plays an important role in the improvement of BPRS, HAMA and HAMD of DP diseases. Music + dance therapy mode can alleviate patients' psychotic, depression and anxiety. Through music, patients' self-awareness of treatment can be increased, and their tense mood can be relieved. Through dance, patients' emergency ability and sense of unity and cooperation can be improved, which is conducive to the improvement of patients' social function and quality of life.

From the perspective of modern medicine, the music + dance treatment mode is to use the different sound wave vibration of music to make the vibration of various organs of the body resonate with the sound wave, so as to make the tissue cells produce beneficial resonance, activate the excited parts of the nerve, and promote the coordination of the movement rhythm of various organs (Mieres et al. 2020). At the same time, through the mutual cooperation and communication of dance training, we can regulate neurohumoral and improve people's emotional state, and finally help patients recover and improve their health. A large number of foreign studies have confirmed that the music + dance treatment mode has achieved remarkable clinical experimental results in reducing blood pressure, slowing breathing, slowing heartbeat and improving microcirculation. It can eliminate the tension and depression caused by various factors, and can also relax and calm people's mood (Silva et al. 2021). Although the results of this study do not reflect

the above arguments, this clinical study is based on the above views, and the study is feasible.

Problems and prospects of music + dance therapy model

Throughout the development of depressive psychosis, it is not difficult to find that depressive psychosis is one of the diseases often studied by ancient and modern physicians. Although the western medicine treatment effect of depression is obvious, the drug cost is high, its side effects are large, long-term use is easy to produce drug resistance, dependence and certain damage to gastrointestinal tract, liver and blood system (Yldz 2020). The adverse reactions of drugs reduce the quality of life of patients. At the same time, patients' rejection is serious and it is difficult to adhere to medication, which limits its wide clinical application. Compared with traditional treatment methods, music therapy has the characteristics of non-intervention, non-invasive and painless, which makes patients more willing to accept (Waters et al. 2020).

At present, music + dance therapy mode is still an emerging discipline in the initial stage, and its clinical theoretical mechanism is not perfect. Through the analysis, it is found that there are still many deficiencies in the research of music + dance treatment mode. The treatment form of the existing music + dance treatment mode is relatively single, and some patients hold a skeptical attitude towards its treatment. They subjectively think that its curative effect is not as good as drugs, poor compliance and cannot adhere to the treatment, which increases the difficulty of clinical case collection (Hwang 2020). Due to the limited clinical research conditions, limited sampling and small sample size, the clinical research is still imperfect, and the conclusions also have certain limitations. In addition, although the development of music + dance therapy model in China is relatively late, music + dance therapy model has been applied and studied in various fields such as medicine, education, nursing and so on. The deficiency is that the research on music + dance treatment mode in China stays at the level of psychology, and there is a lack of systematic training system. In short, music + dance therapy mode is a promising development direction in the future because it can purify the soul and cultivate sentiment, and help to promote the development of physical and mental harmony and health.

CONCLUSIONS

On the basis of previous studies, this study improved and innovated the experiment, adopted more careful experimental design and more accurate statistical methods, and evaluated different treatment times and various aspects of depressive psychosis, so as to evaluate the efficacy of music + dance treatment mode. The conclusions include: music + dance

treatment mode plays an important role in the improvement of BPRS, HAMA and HAMD of DP disease. Moreover, with the increase of intervention time of music + dance treatment mode, the treatment effect is more and more significant. In short, as a safe, non-toxic and effective treatment method, music + dance treatment mode has an irreplaceable positive effect of traditional drug treatment, which is worthy of popularization and application.

SUMMARY

Background: Rural education in Western China facing many severe problems, among these, rural teacher quality control has sparked extensive debate; however, the previous study involved less on how to evaluate these rural teachers and how to develop the evaluating standard.

Subjects and methods: To get around this issue, the current identified the competency model of Western China rural teacher and developed an evaluation tool for them.

Results: Following the protocol of developing a measurement, we interviewed 22 rural teachers in Western China, and conducted two rounds of surveys in western rural areas (n=116/n=208), ran Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA), figured out the key competencies of Western China rural teacher. The evaluation tool for this kind of teacher consists of three factors: professional cognition, student education and guidance, and basic skills. The reliability and validity of the evaluation tool were verified.

Conclusions: Our work may contribute to rural education in Western China.

Key words: western China rural teacher - quality control - competency model - evaluation tool - evaluation standard

INTRODUCTION

Experiences of teacher quality control that target developing countries' rural area have sparked global debate. Historically, rural basic education has been referred as the "not forgotten but not valued enough" for public and policy makers (Meier & Edington 1983). However, more than 50% of school districts are considered as the rural education both in U.S. and mainland China (Reagan et al. 2019). Meanwhile, "education for all" need to solve the problems of the difference between urban and rural education. Students from rural communities tend to incapably accept inequitable admission opportunities, lower appropriate funds and less high-quality teachers who is willing to live in rural areas (Yarrow et al. 1999). Among these, teacher education and quality control become a crucial issue, given that rural teacher's quality determines the development of education in rural communities and students' academic performance, etc. (Rearden & Bertling 2019).

As rural education has grown in importance, rural teacher's quality has become a rising concern. Rural teacher's quality draws a greater awareness in teacher education (Corbett 2016), especially in developing countries, rural education faces various problems, e.g., parents are lack of interests in education, government's insufficient funding, limited resources, ineffective education outcome and underqualified teachers (du Plessis & Mestry 2019). Corresponding to those, teacher's wage, working condition are consistent with their performance and students' achievement (Hanushek & Rivkin 2007). Moreover, evidence shows that teacher's pre-service training and professional

development training are not related to teacher's productivity, but the working experience will promote student's achievement (Harris & Sass 2007). On the contrary, teacher in rural areas get qualified pre-service training, but the retention time and teaching experience are deficient.

Since there are various problems in rural teachers, reasonable evaluation and quality assurance mechanism become the necessary conditions for actual management. Although we can provide system-wide policies and enabling environment to control and improve rural teacher quality (Villegas-Reimers 2003), but there is still a gap between environment arrangement and quality control, for example, even after some training programs, some rural teacher is not motivated (Robinson & Yi 2008), and have low subjective well-being (SWB) (Tang 2018).

The competency perspective may fill the gap between theoretical ideology and actual situation. The competency concept was proposed by (McClelland 1973), referring that competency is a collection of several key attributes. Henceforth, to construct a competency model is helpful to guide individual career development (Enz & Siguaw 2000). Moreover, the competency model will help to guide, measure and rectify professional performance (Noe 2008). In this paper, we try to develop the targeted standard from competency perspective, so that we can formulate the qualified standards for Western China rural teacher, and provide standard comparison and quality control.

BACKGROUND AND THEORETICAL FRAMEWORK

Rural teacher quality in Western China context

Western China rural education and its teacher has changed dramatically along with China's economic development and social stratification. "During the late 1990s, China moved from a period of 'wealth creation' that benefited the majority of the population to a period of 'wealth concentration' that benefited a minority" (Biao & Shen 2009). What is more serious is that, economic development in the west is not as good as that in the eastern coastal areas. Hence, Western China's rural education is facing severe challenges. Rural teacher quality is gradually attracting attention, for instance, poor professional self-development awareness, low level of teacher resource, lack of scientific research ability and psychological problems (Liu 2017).

In order to improve teacher quality, Western China's rural education has been reformed in many aspects, but shows insignificant effect. The public and policy makers realized basic education could play the most important role in raising the income of rural family (Schultz 1961). With this academic consensus, the rural education management system started to reform from 2001 to 2004, which the basic education's responsibility was transferred from central government to county, and it seems that the teacher's incentive and rural student's achievement are not benefit from this managerial reformation (Liu et al. 2009). While the educational inequality is intensive from 2000s, "urban priority and urban oriented" is still widespread (Mok et al. 2009). In order to improve the rural Western China's teacher quality, the Rural School Mapping Adjustment (RSMA) policy was carried out from 2001, but the western rural teacher accompanied with several problems, for instance, low quality relationship between teacher and parents, increasing dissatisfaction from young graduates, etc. (Rao & Ye 2016).

How to improve rural teacher's quality and how to evaluate them in line with the actual situation of rural area has become rarely involved research field. At present, there are numerous studies to prove the important role of improving teacher quality; it is regarded as the key determinant for students' literacy skills, academic achievement, behaviors, etc. (Rowe 2003). Darling-Hammond (2000) proposes that state policy may make an important difference by regarding teacher education, licensing, hiring and professional development, while Borman & Kimball (2005) prove most students' academic performance is positively correlated with the quality of teachers. Higher level of teachers' quality will have positive impact on student learning and national economic growth (Hanushek 2012), and it can also infer that teacher-student interaction will affect the mobility of high-quality teacher (Goldhaber et al. 2011). From above, we can hold that the improvement and measurement of teachers' quality is not only related to external policies and

employment environment, but also closely related to teaching factors such as emotional fluctuation and teacher-student interaction.

To develop an evaluation tool for teacher quality control is a matter that needs to take into account a variety of internal and external factors. In view of the current research gap, we try to develop one competency model, which can identify the core competencies of Western China rural teacher. We conducted the research according to the protocol of developing measurement. We interviewed rural teachers from different regions in Western China to identify the core competencies, so that developed one scale based on those competencies, and developed the survey questionnaire to validate the scale. During this process, we try our best to ensure that the evaluation criteria for Western China rural teacher involves all aspects inside and outside the school, but to be concise and appropriate.

Developing a competency model for evaluating Western China rural teacher

After McClelland firstly put forward the concept of competency in 1973, researchers have carried out many beneficial explorations. The competency, include achievement motivation, personality traits, self-concept, career attitude and behavioral skill, which is essential to individual's success (Spencer & Spencer 1983). Some scholars also consider personality traits are the core of competence, which can lead high performance (Boyatzis 1983). In terms of individual's professional improvement, there are several core competencies decide the motivation, e.g., life value, knowledge system and practical skill, etc. (Friesen & Anderson 2004). Moreover, competency could also be associated with learning and knowledge process; it is a process that knowledge and competencies, learning design and delivery models are constructed in an integrated framework (Gilbert et al. 2006). It implies that a competency model can explain individual learning and work performance.

For Western China rural teacher, their competency meaning is to examine whether these teachers get the exact qualification that meet the actual work of Western China. Asame & Wakrim (2017) argued that a competency model is a set of personal characteristics, including working skills, professional knowledge and career attitude, etc., which will meet the requirement of actual work. Therefore, when we want to develop a Western China rural teacher's competency model, as mentioned above, we suppose the competency model should be different from urban teacher or coastal area. There are some mature competency models for different occupations, for instance, Chinese family firm's manager model, which is suitable for specific companies (Zhong & Shi 2007), and managing multiple projects model, which is designed for specific industries (Patanakul & Milosevic 2008). The model we want to develop is for evaluating and controlling the quality of Western China rural teacher.

The competency model for Western China rural teacher has its unique characteristics, given that the special working environment and career requirement. As we discussed before, Western China's basic education is lag behind the urban and coastal area, there are unbalanced development of regional education, and there is a significant divergence between rural and urban students in terms of intellectual & physiological development, meanwhile, high quality teachers are the minority in rural areas.

Considering the actual situation of rural education and the professional particularity of teaching career, with the interview materials, we assume that the main aspects of high-quality rural teacher should possess are as follows. As rural teacher in Western China, they should know working environment in rural community is worse than urban, the teacher-parent interaction may not easily compare with urban parents, students are different because of their imperfect growth environment, but as a teacher, caring for students and improving teaching skills must possess no matter in any region.

Key factors of Western China rural teacher's competency

As we thought before, rural teacher in Western China must obtain the idea that rural education faces multiple difficulties, but there are some key factors that must be stressed. For the key factors of professional competency, some researchers already defined with various points. Machado et al. (2015) believe that key factors of competency can be applied in a more general sense for everyday life, and should be competent in a context for a certain function. Machado's research indicates that the key factors of rural teacher in Western China should take fully consideration of special situation of rural basic education. In addition, key factors are also regarded as the role that meet the demand of organization or task (Gagné et al. 1997), and key factors are also defined as knowledge, skill, ethic, and independent judgement (Parkinson & Chew 2016). Similarly, Ron (2004) also affirm the key factors of competence are skill, knowledge and attitude. From above research, the key factors should fulfill the requirement of specific working context and focus on knowledge, skill and personal attitude. Since we focus on rural high-quality teachers in Western China, based on the previous literature review and our interview conceptualization, we assume that the key factors for Western China rural teachers are as follows, professional cognition, basic skills and student education & guidance.

Professional cognition

As an education practitioner, it is quite necessary to learn normal education, educational concept and history, and basic rural education knowledge. At the early stage of education development, the government controlled the recruitment of teacher, and the normal student

education were supported by public finance. Nevertheless, with the reform of managerial system and economic development, the free-market implementation and social stratification lead rural education to become disadvantaged part, unfortunately, this situation still exists (Murphy 2009). The main challenge for Western China rural education is the value conflict between professional ethics and the pursuit of improving personal quality of life (Wang & Gao 2013). Therefore, as a rural teacher in Western China, a rational and objective understanding of the problem of unfair education and the backward situation of rural education and life is the prerequisite for qualified teachers. Meanwhile, all the teachers should soberly realize that improving student performance is the uppermost priority because the utilitarian purpose of basic education in current China is to help student get further higher-grade education (Zhang et al. 2019).

Basic skills

The basic skill is a rich connotation domain that include educational management, student and class management, professional skill, etc. based on our interview material. First, rural teacher needs to recognize the difference between rural culture and urban culture and manage to balance this difference (Zhao & Fu 2018). Secondly, common sense of management, during our interview, most rural teachers were all mentioned that how to manage the students and learn rural education's managerial system were very important for their work. This point of view is also supported by previous research, for example, better teacher-student, teacher-parent, teacher-teacher, teacher-educational administrator relationship is essential for student academic performance (Wang et al. 2019; Zhao & Parolin 2014). In addition, Education reform and information education are also being carried out, it requires the rural teacher keep learning new educational means and methods (Zhao et al. 2008).

Student education & guidance

We may divide the education & guidance into two aspects, A, the common sense for all teachers, to educate students to understand the society objectively, form correct outlook on life values, and develop sound personality and fine nature; B, the special challenge for Western China rural teachers, students with special background in rural China. For instance, value the male child only (Hannum et al. 2009), left-behind children from farmer-workers' family (Wei et al. 2020), mental retardation students (Li et al. 2019) are ubiquitous. For rural teachers, the special situation of rural education is not involved in the teacher training, but a major challenge for them to carry out teaching work. In most cases, rural teacher's role is not only the lecturer, but also the guarantor to coordinate the relationship between all parties and ensure the students' further education. From this point of view, rural teachers shoulder more responsibility, which has a more

important impact on students' academic performance and personal characteristics. It is also suggested that high-qualified teacher will prevent low-achieving performance (Donald et al. 2005).

METHODOLOGY AND RESULTS

In the previous section, we have discussed the grim situation of rural teacher quality in Western China, and outlined the core characteristics of Western China rural education, defined the key factors of competency model. To operationalize the Western China rural teacher's model and contribute to the rural education, we develop the evaluating standards for rural teacher in Western China, as seen below. With the recommendation of Churchill (1979) and Hinkin (1998), our research took a three-session procedure to develop the evaluating standards. First, from the semi-interview material and the literature review, we generated the initial item pool and prepared the first version of scale. Second, we conducted the first round of survey, which included the first version of scale, and we then did item reduction so that formed one more accurate version of scale. Third, we conducted the second round of survey, which include the accurate scale, and we evaluated the reliability and validity.

Item generation and filtering

We conducted a series of semi-structured interviews with 22 rural teachers, who work in Western China basic education, to generate the initial item pool. These 22 rural teachers are all come from western province of China, including 4 in Chongqing, 5 in Sichuan, 2 in Shaanxi, 2 in Gansu, 2 in Guangxi, 3 in Yunnan, 1 in Ningxia, 1 in Inner-Mongolia, 2 in Guizhou. Their average age is 34.7 (SD=7.8) and their average tenure is 12 years (SD=8.6). Among these 22 rural teachers, 72.8% of them received a bachelor's degree, 13.6% of

them received a master's degree, and 13.6% of them only have associate degree.

All of the interviewees were required to answer the semi-structure interview outline according to their practical work experience, what they learned from their experience, and how to become a high-quality rural teacher, what's their opinion about the current rural education, and their reflection on teacher training, etc. In order to get more information, we also conducted the Behavior Event Interview (BEI).

We identified several subjects that related to rural teacher's competency by using text analysis techniques. According to our theoretical framework, the text analyzing subjects were clustered into three domains, which were the aforementioned three factors, professional cognition, basic skills and student education & guidance. Based on these three domains, we developed the item pool for Western China rural teacher's core competencies, and adding items retrieved from interview material and previous literature. Table 1 reveals the initial item pool, with defined three most crucial subjects.

After identifying these three critical subjects and generating the initial item pool, we needed to filter the appropriate items for competency model. Hence, we invited 10 rural teachers who worked in Western China to evaluate our initial items, and these 10 teachers were not involved in the interview before so that we can do a content adequacy test. The evaluators were required to assess the relevance and significance of each item to the main subject, and gave content evaluation and expression refining of items.

Finally, nine items were eliminated during this process, for the following reasons: the item was not suitable or not well defined in Western China context; the item had no relevant of being a rural basic education teacher; the item was not important to rural teacher's practical work; the item was beyond the capacity of most rural teachers.

Table 1. Initial item pool

	Item	Source	Remained
1.	As teacher, I pay attention to open up students' vision and cultivate their life ideal.	L	Yes
2.	I will focus on left-behind, one-parent family, and diffident student.	I	Yes
3.	I actively encourage students to develop their sound personality and good character.	I&L	Yes
4.	I will teach students to understand the society objectively and establish a correct outlook on life values.	L	Yes
5.	The theoretical and practical knowledge is of equal importance.	I&L	Yes
6.	Learning from front-line teachers with rich teaching experience is a good way to improve myself.	I&L	No
7.	I get tired sometimes, so something like "soul soother" works for me.	I	Yes
8.	The idea of school leadership is very important to a school.	I&L	No
9.	Home school connection and students' family background has great influence on their performance.	I&L	Yes
10.	I lay stress on the study and application of education laws and regulations.	I	Yes
11.	I believe teacher should follow up students' mental health, if condition permission, psychological consultation room can be set up.	I	Yes

12. As teacher, I am strict with students, supervise and urge them to improve their academic performance.	I&L	Yes
13. Students' performance and personal safety are equally important.	L	Yes
14. I always concern about student's mood.	I&L	Yes
15. The ability of organization, planning and communication is the basic skill that qualified teachers should possess.	I&L	No
16. As teacher, I will organize the teaching content and lesson design in a planned, organized and logical way.	I&L	No
17. Stress tolerance and crisis management are the essential qualities of excellent teachers.	I	Yes
18. As teacher, I evaluate students' performance reasonably and justly.	L	No
19. As teacher, I actively adjust their own mentality and keep teaching enthusiasm.	I&L	Yes
20. As teacher, I actively learn the knowledge and skills related to teaching.	I&L	Yes
21. Improving students' achievement is the most important thing for teacher.	I&L	Yes
22. As teacher, I take care of students in a proper way, instead of taking themselves as nannies.	I&L	Yes
23. Teaching is not only a career, but also need dedication.	I	Yes
24. Communicating reasonably with parents and refusing unreasonable demands of parents.	I	No
25. I carefully select students' test papers and other teaching materials.	I&L	No
26. As teacher, I fully understand the current education in urban and rural areas.	I	Yes
27. I can treat education unfairness rationally.	I	Yes
28. Beside my main subject, I will learn more about the basic knowledge of other disciplines.	I&L	No
29. In teaching practice, the knowledge of pedagogy and psychology is very important.	L	No

Note: The Column *Source* means where the item collected, Interview (I) or Literature review (L) or collected from both of these two ways (I&L). The column *Remained* means whether the item should be remained (Yes) or not (No) after the content adequacy test.

Initial item reduction and evaluation

Based on the previous step and participant's interview information, we developed the questionnaire. In our questionnaire, a 5-point Likert-type format was adopted for items, ranging from 1=strongly disagree to 5=strongly agree. The survey was administrated in Chongqing, a southwest city in Western China, and the questionnaire was distributed to nine western provinces by WeChat (a widely used smartphone application), email, and website. All the targeted rural teachers participated voluntarily and the participants' information were kept confidential. For this round of survey, 126 rural teachers completed the questionnaire effectively, with a valid rate at 92.1%. Among these rural teachers, 87.1% were female, 97.4% of them were Han people (China's main group). Their age ranged from 20 to 60, 87.1% of them were under the age of 40, 81.9% of them were not graduated from top-tier universities in China. All of these rural teachers had more one-year work experience in Western China, their teaching courses involve various subjects of current rural basic education. Note that our research goal is to develop the evaluation tool for Western China rural teachers; we required all the participants should work in rural basic education and answer the questionnaire according to their own actual work experience.

After collecting the data, we use SPSS Statistics24.0

to run Exploratory Factor Analysis (EFA), adopting the principal factor analysis to extract factors and using the varimax approach to rotate. The Kaiser-Meyer-Olkin (KMO) coefficients was 0.933, and the Bartlett's test of sphericity was significant, which indicate it was suitable for factor analysis. According to eigenvalue criterion in conjunction with a scree plot, three factors were emerged and total variance explained rate was 82.81%. The criteria to exclude one item was as follows: factors loading was less than 0.50 and the cross-loading was more than 0.50. Hence, seven items were excluded after checking the rotated component matrix. Table 2 shows the results of EFA, showing the factor loading of remained items.

Factor I contains the skills and requirements for teaching, as rural teacher in Western China, self-learning ability, educational management, professional skill etc. are all essential for them, which will help rural teacher to have basic qualified skills, thus, we term this factor as *Basic Skills*. Factor II points to the reality of rural students, given that the students in rural area are suffering several problems, for instance, the high dropout rate in rural areas, the problem of left behind children, etc. The rural teachers need to cultivate students' life ideal and broaden their view. Factor II is named as *Student Education and Guidance*. Factor III is something for rural teacher's interior quality; they should have sober cognition of rural-urban education,

and adjust themselves well. Therefore, we name Factor III as *Professional Cognition*.

Meanwhile, we also estimated the internal consistency. The Cronbach's alpha coefficient for Factor I is 0.962, Factor II is 0.974, and Factor III is 0.726. The overall Cronbach's alpha coefficient is 0.955. These results indicate that the scale is reliable.

Finally, we did the confirmatory factor analysis (CFA). With the result of EFA, we use AMOS 24 to construct the model: three factors belonged to the main

factor, the competency model for Western China rural teacher. Each factor, *Basic Skills*, *Student Education and Guidance*, *Professional Cognition* has several items. According to the result of CFA, the model fits our sample very well: $X^2 = 84.202$, $df = 51$, $X^2/df = 1.651$; comparative fit index (CFI)=0.981; and root mean square error of approximation (RMSEA)=0.075. Figure 1 demonstrates the standardized weights of these items on the belonging factors.

Table 2. Factor loading of explorative factor analysis

Item	I	II	III
10. I lay stress on the study and application of education laws and regulations.	0.775	0.421	0.219
5. The theoretical and practical knowledge is of equal importance.	0.764	0.433	0.304
9. Home school connection and students' family background has great influence on their performance.	0.761	0.483	0.237
13. Students' performance and personal safety are equally important.	0.758	0.364	0.274
19. As teacher, I actively adjust their own mentality and keep teaching enthusiasm.	0.725	0.450	0.329
20. As teacher, I actively learn the knowledge and skills related to teaching.	0.723	0.476	0.324
4. I will teach students to understand the society objectively and establish a correct outlook on life values.	0.418	0.852	0.170
3. I actively encourage students to develop their sound personality and good character.	0.461	0.837	0.176
1. As teacher, I pay attention to open up students' vision and cultivate their life ideal.	0.451	0.830	0.116
2. I will focus on left-behind, one-parent family, and diffident student.	0.393	0.828	0.223
7. I get tired sometimes, so something like "soul soother" works for me.	0.285	0.019	0.779
21. Improving students' achievement is the most important thing for teacher.	0.045	0.387	0.778
26. As teacher, I fully understand the current education in urban and rural areas.	0.355	0.097	0.695

Note: Factor I is named as *Basic Skills (BS)*; Factor II is named as *Student Education & Guidance (EG)*; and Factor III is named as *Professional Cognition (PG)*.

Replication

Even though our first round of survey's data provided some evidence that the measurement of Western China rural teacher's competency model was valid and reliable, for further proof and as the previous literature suggested, we did replication.

This was our second round of survey, the questionnaire was distributed again, and the participants were required to be different from the first round. As replication in similar situations, different participants can exclude the influence of different places or schools, which verifies the robustness of our competency model. All participants were voluntary, and their personal information & answer were confidential. For this round of survey, 226 rural teachers completed the questionnaire effectively, with a valid rate at 92.0%. Among these rural teachers, 87.0% were female, 97.6% of them were Han people. Their age ranged from 20 to 60, 87.0% of them were under the age of 40, 81.7% of them were graduated from non-key universities. Like the first round of survey, all of these rural teachers had more one-year work experience in Western China, their teaching courses involve various subjects of current

rural basic education.

After getting this round of survey data, we also did the CFA to verify the construct validity. The hypothetical model was the same as we described before, which showed good fit ($X^2 = 83.084$, $df = 62$, $X^2/df = 1.340$, CFI=0.991, NFI=0.966, NNFI=0.989, RMSEA=0.041). Figure 1 depicts each item's weight on the belonging factor.

In order to make the comparison, we also developed the alternative models: (A) one-factor model, all the items belong to one factor ($X^2 = 241.520$, $df = 65$, $X^2/df = 3.716$, CFI=0.925, NFI=0.900, NNFI=0.910, RMSEA=0.115); (B1) two-factors model, *Professional Cognition and Student Education & Guidance* belong to the first factor, *Basic Skills* as the second factor ($X^2 = 126.587$, $df = 64$, $X^2/df = 1.978$, CFI=0.973, NFI=0.928, NNFI=0.963, RMSEA=0.069); (B2) two-factors model, *Professional Cognition and Basic Skills* belong to the first factor, *Student Education & Guidance* as the second factor ($X^2 = 90.033$, $df = 64$, $X^2/df = 1.407$, CFI=0.989, NFI=0.963, NNFI=0.986, RMSEA=0.044); (B3) two-factors model, *Basic Skills and Student Education & Guidance* belong to the first factor, *Professional Cognition* as the second

factor ($X^2 = 232.662$, $df = 64$, $X^2/df = 3.635$, CFI=0.928, NFI=0.904, NNFI=0.912, RMSEA=0.113). Among these model's calculation results, as the Table 3 demonstrates that the three-factor model is the best model.

In conclusion, our replicated survey data provide evidence for the reliability and construct validity of this measurement method.

Table 3. Goodness-of-Fit Summary

Model	df	X^2	CFI	NFI	NNFI	RMSEA	90% Confidence interval RMSEA
Three-factor model	62	83.084	0.991	0.966	0.989	0.041	0.010 to 0.062
One-factor model	65	241.520	0.925	0.900	0.910	0.115	0.099 to 0.130
Two-factor model (B1)	64	126.587	0.973	0.948	0.968	0.069	0.051 to 0.086
Two-factor model (B2)	64	90.033	0.989	0.963	0.986	0.044	0.019 to 0.065
Two-factor model (B3)	64	232.662	0.928	0.904	0.912	0.113	0.097 to 0.129

Note: N=208. NFI=normal fit index; NNFI=nonnormal fit index; CFI=comparative fit index; EMSEA=root mean squared error of approximation.

Note: WCRTC=Western China Rural Teacher Competency; PC=Professional Cognition; EG=Student Education and Guidance; BS=Basic Skills; the first/second number on the path is the weight calculated based on the data of the first/second round of survey (N=116/208).

Figure 1. Structure of Western China rural teacher's competency

DISCUSSION AND CONCLUSION

For a quite long time, researchers on Western China rural education focused on policy-making, teacher quality and student academic achievement, rural basic education and national economic growth & human capital development (Brock 2009; Chen et al. 2019; Li et al. 2019). Some researchers noticed the close relationship between the quality of rural teachers and educational development, students' academic performance (Wang et al., 2020), some also proposed the new way to improve rural teacher's quality and intended to change the inequality of education between rural and urban areas (Robinson 2008). In most cases, Western China rural teacher's quality is largely depended on the Free Teacher Education Program (FTEP) for the pre-service training and National Training Program & Provincial Training Program for the in-service training, however, the above training program is not designed for rural teacher, even not for Western China. We agree that it is quite necessary to develop the quality control standard from competency perspective, and guide the in-service training if possible. We follow the protocol of competency model development, which based on the actual situation of Western China's real rural education; we apply the rural teacher's practical needs in the actual rural school environment.

Our study follows the protocol proposed by previous scholars (Churchill 1979; Hinkin 1998) to identify the core competencies of Western China rural teacher and develops the evaluation tool for rural teacher. Our measurement is in the light of real working environment of rural school; it includes three main factors, that is, *Professional Cognition*, *Student Education and Guidance*, *Basic Skills*. These three factors will play an important role in the work activities and career development of rural teachers.

Note that our interviewees and participants are all rural teachers, and all of them have more than one year work experience in rural school. Their age distribution, teaching subjects, politic countenance, gender, pre-service experience, nationality are the typical feature of Western China rural teacher. Yet, according to our interview, we notice that they are still full of uncertainty about their own work, and are full of doubts about the development of their own profession and the improvement of teaching quality. Therefore, based on the actual investigation of Western China rural education and the development of evaluation tools is particularly urgent, especially the educational reformation and rural education's higher expectation emerged (Vinovskis 2016).

As we mentioned above, three factors of the competency model are the main evaluation standard for Western China rural teacher. The *Professional Cognition* includes the recognition of China's current education, the purpose of utilitarian education, emotional cognition and psychological regulation; the *Student Education and Guidance* is regarded as one

teacher's qualification of basic purpose of education, including the cultivation of student's life ideal, personality and life value; the *Basic Skills* is stressed by both managerial department and school administrator, in terms of Western China's practical situation, it includes theoretical and practical knowledge, rural education characteristics, and educational law acknowledgement. All these three factors can be considered as the requirement of rural teachers' quality management and the standard of measurement & evaluation.

This study has some theoretical contributions. First, it followed the standard protocol of evaluation & measurement tool developing. This measurement grasps the core competencies of Western China rural teacher; this is a new evaluation tool that has rarely touched by other researchers. Given its reliability and validity, further research about rural teacher evaluation and management may take our measurement as a tool to analyze and explore more rural education research topic. Second, it may help to design targeted and practical evaluation decision system. Since our evaluation tool is developed based on the actual rural educational situation, the main problem of Western China rural education research is lacking of practical research, but focus on "office research". The current research could shed light on the improvement of teacher qualification's requirement design, and promote theoretical research of rural education.

The result can also contribute to the Western China rural educational practice. First, it may help the educational managerial department and normal university to establish a better training program based on our measurement, both for pre-service and in-service rural teacher. Second, the current rural teacher-training concept does not satisfy the actual needs of rural education, our study may help to revise this unsuitable concept. Third, with the guidance of key competencies for rural teacher, the study can also help the rural education policy-makers (Gandrud & O'Keeffe 2016) to revise rural education preferential policy, funding policy, teacher quality improvement policy.

Our research also has some limitations, which we will improve in further research. First, we should do a follow-up research design and collect data to observe the actual application effect of the evaluation tool. Through this procedure, the external validity of our research can be further confirmed. Second, this evaluation tool is only designed for Western China rural teacher, and it can only apply to the work setting of Western China. Rural teachers in other areas of mainland China or outside China, may have different core competencies.

In conclusion, this study identified the core competencies of rural teachers in Western China, and used it as an evaluation tool to improve the quality of rural teachers. Our work can contribute to the optimization design of rural teacher training program, provide a new perspective for the quality control of

rural teachers, and provide reference for the professional development of rural teachers in Western China.

ANALYSIS ON THE STRESS RELIEF OF COLLEGE STUDENTS BY PHYSICAL EXERCISE

Shu Qiao¹ & Gaosong Huang^{2*}

¹Institute of Physical Education, Liaoning Shihua University, Fushun 113001, China

²Institute of Physical Education, Huanggang Normal University, Huanggang 438000, China

SUMMARY

Introduction: In college, students have to face not only the changes of their own physical development, but also external pressures from environmental adaptation, interpersonal communication, academic achievement, economic hardship, emotional predicament and employment difficulties. In addition, the physical and mental development of college students is not yet mature. Their self-regulation ability is relatively weak, and the resulting psychological problems become more and more obvious. It has long been proven that physical exercise can promote individual physical and mental health, but the specific relationship between the two needs further research.

Subjects and methods: The paper adopts the random sampling method. 300 subjects were randomly divided into six groups with different exercise programs. Those subjects were tested via PSTR for eight times within two months. Using SPSS27.0 as statistical analysis tool, the effect of physical exercise on stress relief of college students was analyzed from two aspects of daily exercise time and continuous exercise days.

Results: Before and after the experiment, the pressure level of group one to group five decreased significantly. The pressure level of group four decreased the most ($t = 51.595$, $P < 0.001$). Group three came second ($t = 30.569$, $P < 0.001$). And the pressure level of group one decreased relatively lower ($t = 14.861$, $P < 0.001$).

Conclusions: Physical exercise has a positive effect on stress relief of college students. Daily exercise time should be suitable in length, and it should be 30 min to 45 min.

Key words: physical exercise - college students - mental stress - relief effect

* * * * *

INTRODUCTION

Stress, also known as pressure, was first proposed by Canadian physiologist Hans Selye in 1936. He considers stress to be a state with specific symptoms, which consists of nonspecific changes in the physiological system under stimulation (Lennartsson et al. 2013). Stress is necessary for human survival and development. Moderate stress is a required condition for maintaining normal physical and mental functions. It is essential for maintaining normal physical and mental functions and coping with life. But excessive stress, if not handled properly, can be detrimental to physical and mental health (Bartlett et al. 2016).

It is a transitional stage from adolescence to adulthood during college, as well as a specific stage from campus life to social life for students (Uliaszek 2021). They have to face not only the changes of their own physical development, but also external pressures from environmental adaptation, interpersonal communication, academic achievement, economic hardship, emotional predicament and employment difficulties. (Zhao & Campus 2006). The physical and mental development of college students is immature and their self-regulation ability is relatively weak. So, when dealing with relatively complex problems they often have strong psychological conflicts, which would cause greater psychological pressure (Bayram & Bilgel 2008). Excessive or prolonged stress can

lead to psychological disorders including anxiety, restlessness, and depression. Studies have shown that many diseases, such as coronary heart disease, high blood pressure, hypoglycemia, etc., are related to long-term psychological stress. Nowadays, research on the stress of college students has become a practical problem and the focus of public concern. (Fuente et al. 2020).

It has long been proven that physical exercise can promote individual physical and mental health. How to better promote individual mental health through physical exercise has always been a hot topic in the field of sports and psychology (Cocca et al. 2020). The results of relevant experimental studies have shown that regular physical activity reduces the number or sensitivity of adrenergic receptors, which can lower heart rate and blood pressure. Compared with means such as entertainment and music appreciation, physical exercise can promote individual recovery from intense stressful situations more effectively (Jewett et al. 2014). Both a single exercise and a long-term one can significantly improve the situation of anxiety, depression and other negative emotions caused by stress. It can be seen that physical exercise is an important factor affecting and relieving psychological stress. This research conducts an in-depth study on the internal relationship between physical exercise and the stress of college students. Through experiments, the paper focuses on the effect of time factor in physical exercise on stress relief of

college students. (Sutcliffe et al. 2021).

SUBJECTS AND METHODS

Research objects

This study selected 300 college students from Liaoning Province as the research objects, including 156 males and 144 females, with an average age of 21.11 ± 1.12 years old. All participants were informed and agreed to the related information including research background, research scheme, and questionnaire contents.

Research tool

- (1) Sojump (For data collection)
- (2) Excel 2019 (For data registry)
- (3) SPSS27.0 (For data analysis)

(4) PSTR stress test scale. The scale was compiled by Swiss psychologist Edworth in 1983 and based on the psychological stress factor theory proposed by German psychologist Murray in 1968. According to Dr. Murray, moderate stress helps to improve work efficiency. But excessive pressure can be counterproductive at work, and in the worst cases, it can affect physical health.

Research program

The paper adopts the random sampling method. 300 subjects were randomly divided into six groups, 50 people in each group. Among them, the control group did not do physical exercise. Group one did exercise for less than 15 min each time. Group two for 15-30 min, group three for 30-45 min, group four for 45-60 min, and group five for more than 60 min. The experiment lasted for two months. Related data tests were conducted by the PSTR stress test scale every other week. After excluding extreme data, the arithmetic mean of PSTR scores was taken for registration. A total of eight *t*-tests were performed in the entire experimental procedure. With the data, mental stress relief effect of physical exercise on college students was analyzed from two aspects of daily exercise time and continuous exercise days by SPSS27.0.

RESULTS

After the test and the original data were obtained, the abnormal data greater than $\mu + 3\sigma$ or less than $\mu - 3\sigma$ were removed according to the Rajda criterion. The deviation and standard deviation of the remaining values were recalculated and reviewed until the deviation was less than 3σ . The recorded data are shown in Table 1.

Table 1. PSTR score for control time variables

	Week one	Week two	Week three	Week four	Week five	Week six	Week seven	Week eight
Control Group	80	80	81	79	80	79	79	80
Group one	82	81	81	80	78	78	76	75
Group two	79	78	76	75	71	68	67	67
Group three	84	83	80	75	71	68	67	66
Group four	78	78	75	70	65	63	60	58
Group five	79	78	76	72	68	65	64	63

The overall average score of the PSTR stress test scale is 54, and each score interval is separated by half a standard deviation. Generally, a score greater than 93 indicates that the stress response seriously harms the individual's health and the help from a professional psychotherapist is required. Score of 82-92 indicates that the level of stress is too high, which is causing damage to personal mental health and problems in interpersonal relationships. Score of 71-81 indicates that the level of stress is medium, which may be starting to be detrimental to health, and the subject needs to reflect on how to handle stress. Score of 60-70 indicates that the amount of excitement and stress in life is quite moderate. There might be occasional excessive stress, but the subject can quickly return to a calm state. It causes no physical health threats. Score of 49-59 indicates that the subject can control his response to stress. He can

get along with others, and perform daily studies and work with no difficulties. Score below 48 indicates that the subject remains unmoved or indifferent to stress. This causes no negative impact on health, but might lead to loss of interest or motivation in life.

As shown in Table 1, before the experiment, the PSTR scores of the students are mainly distributed in the range of 71-92. The degree of stress is too high, and they are in a stage that may or are causing adverse effects on their mental health. After two months of physical exercise, except for the control group and group one, the PSTR scores of the other groups decreases significantly. The change of the PSTR score of the control time variables is shown in Figure 1, and the correlation coefficient between the arithmetic mean score and time of each group is shown in Table 2.

Figure 1. Line chart of PSTR score for control time variables

According to Table 1 and Table 2, the PSTR score of the control group hardly changed during the experiment. It indicates that the data has no significant correlation at the confidence level of 0.05 ($P = 0.310 > 0.05$). This is as expected. While, the data of Group One are significantly correlated at the 0.01 level ($P = 0.006 < 0.01$). The data of group two to group five are significantly correlated at the 0.001 level ($P < 0.001$). This indicates that during the two-month experiment, the stress levels of group one to group five all dropped significantly. But the effectiveness of group one is relatively inferior to the other four experimental groups.

Table 2. Correlation coefficient between PSTR score and time

	<i>n</i>	Correlation	<i>Sig.</i>
Control group	8	-0.412	0.31
Group one	8	-0.859	0.006
Group two	8	-0.977	0
Group three	8	-0.979	0
Group four	8	-0.986	0
Group five	8	-0.982	0

PSTR score of the experiment is collected and analyzed by SPSS27.0. The descriptive statistical results are shown in Figure 3. Paired sample *t*-test is conducted between the control group of the last *t*-test (the eighth test) and each experimental group. The results were shown in Table 4.

Table 3. PSTR score description statistics

	Range	Minimum	Maximum	Std. deviation	Variance
Control group	2	79	81	0.70711	0.5
Group one	3	79	82	0.91613	0.839
Group two	12	67	79	4.9839	24.839
Group three	18	66	84	7.32413	53.643
Group four	20	58	78	8.01672	64.268
Group five	16	63	79	6.50137	42.268

Table 4. *t*-test of paired samples of control group and experimental groups

	Mean	Std. Deviation	Std. Error mean	95% Confidence interval of the difference		<i>t</i>	<i>Sig.</i> (2-tailed)
				Lower	Upper		
Group one	5.091	1.136	0.343	4.328	5.854	14.861	0.000
Group two	13.273	1.737	0.524	12.106	14.440	25.339	0.000
Group three	13.727	1.489	0.449	12.727	14.728	30.569	0.000
Group four	22.000	1.414	0.426	21.050	22.950	51.595	0.000
Group five	17.000	0.775	0.234	16.480	17.520	72.790	0.000

According to Figure 4, *t*-test of paired samples is performed on the data of control group and five experimental groups. The specific results are as follows: group one, 95%CI: 4.328-5.854, $t = 14.861$, $P < 0.001$; group two, 95%CI: 12.106-14.440, $t = 25.339$, $P < 0.001$; group three, 95%CI: 12.727-14.728, $t = 30.569$, $P < 0.001$; group four, 95%CI: 21.050-22.950, $t = 51.595$, $P < 0.001$; group five, 95%CI: 16.480-17.520, $t = 72.790$, $P < 0.001$. There are significant differences in the data of each group on the basis of 0.001 confidence. This indicates that the stress level of students has changed significantly before and after the experiment. According to the data in Figure 3, the variances of each group in the descriptive statistics are expressed as σ_1 - σ_5 respectively. The result can be obtained as $\sigma_4 > \sigma_3 > \sigma_5 > \sigma_2 > \sigma_1$. This indicates that group four has the highest decline in the pressure index, followed by group three, and group one has a relatively low decline in the pressure index.

DISCUSSION

According to the above experimental data, it can be seen that physical exercise has a positive effect on stress relief of college students. First of all, in general, in two weeks after exercise, the stress relief effect of the students is not obvious, and the situation improves in the third to sixth weeks. At this stage, the effect of exercise on psychological stress relief is greatly improved. After more than six weeks, such an effect gradually weakens. The pressure of students at this time basically reaches the normal standard, but still higher than the standard value. This is an inevitable phenomenon. While exercise can relieve the psychological stress of the students, the overwhelming stressors faced by the student population today are impossible to eliminate. Therefore, the current situation of excessive stress can only be improved rather than eliminated.

Also, according to the experimental results, the stress relief effect is best when the daily exercise duration is 45 min to 60 min. This shows that continuous exercise for a long time is the primary way to relieve stress. But the exercise time cannot be too long. The data shows that after 60 min of exercise a day, there is a slight decrease in stress relief. Nowadays, students are increasingly busy with study and life, and it is difficult for them to devote more than an hour to exercise. So, it is not recommended. Too short exercise time (less than 15 min) has a certain effect, but the result is quite poor. So, it is not recommended either for stress relief purposes. Comparatively, exercise of 30 min to 45 min, not only ensures good effect on stress relief, but also can relatively save time, is the most suitable solution.

CONCLUSIONS

This study explores the influence of the time factor

in exercise on the stress status of college students, and reveals that physical exercise is an important factor in their stress relief. The cognitive theoretical model of stress believes that the generation of stress depends on the individual assessment of the situation and their own resources. Individuals would reduce stress coping ability due to control-losing, nervousness, or anxiety, and show weaker mental resilience (Steiner et al. 2003). Previous research points out that the senses of control and value are important internal resources to reduce individual risk factors. And physical exercise can increase the psychological resource, thereby promoting the individual psychological resilience (Donohue et al. 2019). The stress process model believes that the core of stress relief is to develop coping resources. Mental resilience can be used as a coping resource to relieve academic stress, and physical exercise is an effective way to improve resilience and develop coping resources (Dowell et al. 2021). College students with regular physical exercise can obtain more internal resources in academic activities. It is of great importance to improve mental resilience and relieve the academic pressure of college students in the process of dealing with an unbalanced state. This can help college students achieve a new balance of body and mind, and then promote their mental health (Fossati et al. 2021).

As mentioned above, although exercise can relieve the stress of college students, it cannot solve their intensive pressure problems. The solution of these problems requires the joint efforts of schools and relevant government departments (Garriott & Nisle 2018). Schools should reinforce the monitoring and management of teaching quality, continuously improve the quality of education and teaching, and attach great importance to the psychological problems of students. Once students with psychological problems are noticed, psychological counseling should be carried out in time, and attention should also be paid to them (Tubic 2019). Colleges and school psychological counseling departments should give full play to their professional advantages, and adopt both online and offline methods for psychological communication in order to reduce students' psychological pressure. Relevant departments should enhance employment and entrepreneurship guidance and improve relevant policies. Government should work with schools and make use of employment and entrepreneurship classes to enable students to master basic job-hunting skills. By doing so, students would cultivate entrepreneurial consciousness and improve entrepreneurial quality and ability for the success of employment and reduction of their employment pressure (Amanvermez et al. 2020).

Due to the limited time and conditions, there must be some inadequacies in this study. For example, the stress situations vary among the college students from different grades yet the research did not elaborate in

this regard. Moreover, the total time span of the research is only two months. Although most of the situation has been considered, there may still be new discoveries if more data can be collected based on a longer period of observation.

EFFECTS OF MUSIC REGULATION ON PATIENTS WITH ANXIETY DISORDERS

Junhui Zhao* & Peng Gao

School of Art, Hebei University of Economics and Business, Shijiazhuang 050800, China

SUMMARY

Background: By the end of 2021, the COVID-19 outbreak has led to an increase of 90 million patients with anxiety disorders worldwide, which has had a significant adverse impact on human mental health. Music Therapy is a treatment method that utilizes the huge influence of music on emotions, changes people's emotions through music, and finally achieves the purpose of psychological healing. This study starts with Music Therapy and selects patients with anxiety disorders from a hospital in Hebei Province, China as subjects to explore the therapeutic effect of Music Therapy on patients with anxiety disorders.

Subjects and Methods: The S-AI and T-AI scores of the subjects were tested before treatment, after five weeks of treatment, and after ten weeks of treatment. And both the variable correlation analysis and t-test were carried out, using SPSS22.0 as the statistical tool.

Results: The total STAI score of the experimental group was significantly higher than that of the control group after ten weeks of treatment ($t = 164.102, P < 0.001$). After five weeks of treatment, the STAI score of the experimental group decreased significantly compared with that before treatment ($t = 56.742, P < 0.001$). After ten weeks of treatment, the STAI score of the experimental group decreased significantly compared with that after five weeks of treatment ($t = 71.155, P < 0.001$).

Conclusions: Music Therapy improves the patients' physical conditions such as sleep and energy, eating, movement and feeling. It is pain-free, low-cost, simple and easy to implement. Furthermore, it can also improve patients' interpersonal skills, work and study efficiency, as well as leisure and entertainment life satisfaction. It is worthy of promotion in the treatment of patients with generalized anxiety disorders.

Key words: Music Therapy - anxiety disorder - COVID-19 - music regulation

* * * * *

INTRODUCTION

Anxiety disorder is a persistent mental illness, a brain dysfunction characterized by persistent fear, tension, and autonomic dysfunction. It is often accompanied by motor restlessness and physical discomfort (Carleton et al. 2009). It is usually manifested as inattention, nervousness, distraction, restlessness, loss of interest in anything, worry about one's own health, oversensitivity to minor physical discomforts; excessive sensitivity to others and pessimism about future judgments, indecision in doing things, thinking before and after, slow in adapting to new things and new environments, and in severe cases it will affect normal work and life (Grezo & Sarmany-Schuller 2018). Since December 2019, pneumonia caused by a new type of coronavirus infection was discovered in Wuhan City, Hubei Province. And it has gradually spread to the whole country, causing great impact and harm to the production, life and even people's lives in the whole society. (Mazza et al. 2020). Professor Lu Lin, a Member of the World Health Organization's global research team on COVID-19, pointed out that the pandemic of infectious diseases will cause post-traumatic stress disorder (PTSD) in medical staff, infected people and the general public, and the incidence rate can reach more than 20%. By the end of 2021, the COVID-19 outbreak has led to an increase of 70 million depressed patients and 90 million

anxiety patients worldwide, which has had a significant impact on human mental health. And this impact will last for at least 20 years. How to relieve and treat patients with anxiety disorders or depression has become the focus of attention from all walks of life (Starcevic et al. 2007).

Music Therapy is a new applied discipline, involving a wide range of disciplines, a wide variety of application fields, and rich school ideas. Therefore, in terms of the development of Music Therapy, there is no unified discipline definition standard (Koops & Kuebel 2021). Music culture is influenced by many factors such as region, culture, history, politics, ideology, cognition, etc. Therefore, the definition of music cannot reach a consensus conclusion (Sanfilippo et al. 2021). The World Music Therapy Federation once defined Music Therapy as, it is the fringe disciplines based on the theory and method of psychotherapy. It uses unique physical and psychological effects of music, through various targeted music behaviors and music experience, to remove psychological barriers and heal body and mind (McCaffrey et al. 2011).

Patients with anxiety disorders are mainly characterized by clinical symptoms such as frequent or persistent anxiety. The causes of anxiety are complex, and both biological and sociological factors play an important role (Silverman 2019). Existing clinical research results show that specific and regular music can resonate with human cells, directly act on the

brain, muscles, bones and internal organs, and relax the nervous system. Music Therapy stimulates the body to secrete chemicals such as acetylcholine by affecting physiological functions, increasing blood flow and exciting nerves, thereby invigorating the patient's spirit and eliminating loneliness, depression and anxiety (McCaffrey 2018).

In the development of our country's health care development, the psychotherapy of Music Therapy is rarely used, and domestic scholars have little research on Music Therapy. They lack systematic theoretical content and treatment case studies as research support. In this study, patients with anxiety disorders in a hospital in Hebei Province were selected as the research objects, and the therapeutic effect of Music Therapy on patients with anxiety disorders was studied through a controlled experimental study.

SUBJECTS AND METHODS

Research objects

This study selected 72 patients with anxiety disorders from a hospital in Hebei Province as the research objects, among whom 31 were male patients and 41 female patients, with an age range of 20-50, and an average age of 32.11 ± 1.56 years. All patients were informed and consented to the background and protocol of this study.

Research tools

General information questionnaire

It mainly involves name, gender, age, education level, marital status, family economic level, etc.

State-Trait Anxiety Inventory (STAI)

The scale, developed by Charles D. Spielberger et al., consists of 40 descriptive items divided into two subscales. One is the State Anxiety Inventory (S-AI), including items 1-20. State anxiety describes an often transient, unpleasant emotional experience such as tension, fear, apprehension, and nervousness, accompanied by hyperactivity of the nervous system. The other is Trait Anxiety Inventory (T-AI), including items 21-40. Trait anxiety describes relatively stable, individual-specific anxiety tendencies as a personality trait (Fonseca-Pedrero et al. 2012).

Trait anxiety refers to a relatively stable behavioral tendency of an individual to react anxiously to a wide range of threatening stimuli; while state anxiety is a transient emotional state produced by the perception of dangerous stimuli, including individual tension, worry, anxiety, disturbance and hyperexcitability of the autonomic nervous system. The State-Trait Anxiety Questionnaire distinguishes two different types of anxiety, state anxiety and trait anxiety, in order to provide a more effective measurement tool for clinical practice and research (Perpina-Galvan et al. 2011).

STAI uses a four-point scoring method. 1=not at all,

2=somewhat, 3=moderately, 4=very obvious, 10 of which are reverse scoring. The original author conducted a test-retest reliability test for the scale, and found that the stability of T-AI was high, and the correlation coefficient between the two scores was 0.73-0.86; while the stability of S-AI was low, and the correlation coefficient was 0.16-0.62. Its internal consistency coefficient was determined by KR20 formula: T-AI was 0.86-0.92, S-AI was 0.83-0.92. The validity test results show that the scale is satisfactory in terms of concurrence, convergence, divergence and structure (Vitasari et al. 2011).

Research plan

72 subjects were randomly divided into two groups, the experimental group and the control group were 36 people each. The experimental group was treated with Music Therapy, and the control group was not given special treatment. The S-AI and T-AI scores of each group were tested before treatment, after five weeks of treatment, and ten weeks of treatment to evaluate the anxiety of the testers in the past week.

Treatment principles

First, Music Therapy should play music step by step according to the psychological characteristics of the client. From the point of view of the choice of music, it should be gradual step by step. For example, music that guides sadness can be divided into mild, moderate and severe ones. The choice of music generally starts with mild music and gradually transitions to moderately sad music. From the perspective of volume of music playing, the volume should also be gradually increased to allow visitors to gradually adapt (Moucek & Berankova 2020).

Second, during Music Therapy, clients who do not understand music should be educated and guided. And the background of music creation and the artistic conception that musicians want to express should be introduced to the clients. Before treatment, the psychotherapist can try to let the client listen to a piece of music and experience the artistic conception of the music with heart. If the client does not understand the artistic conception of the music, the psychotherapist should provide some explanations to help the client understand the meaning of the music (Silverman & Leonard 2012).

Third, during the music treatment, the treatment time should be controlled between one to two hours each time, and the appropriate treatment plan should be selected according to the different conditions of the subject to make the treatment effect appear.

Fourth, in the process of Music Therapy, we should not only pay attention to the inner feelings of the subject, but also observe the external performance and behavioral characteristics of the subject.

Fifth, in the process of treatment, attention should be paid to the use of language such as suggestion and

guidance. And the timing of its use should be grasped. In addition, subjective thoughts should not be mixed in the process of suggestion.

Sixth, during Music Therapy, if the subject has abnormal emotional reactions or bad emotions, it should be terminated in time.

In the course of Music Therapy, Receptive Music Therapy can be used for patients with anxiety disorders. The patient's mood can be stabilized and quieted by playing hypnotic music. Then anxiety-type music can be played to mobilize the patient's anxiety, so that it can find the cause of anxiety and guide the patient to be treated. After repeated training, the subject can gradually control his emotions, thereby inhibiting the generation of anxiety, and finally

achieving the goal of psychotherapy (Golden et al. 2022).

RESULTS

SPSS22.0 was used to perform Spearman bivariate correlation analysis on the data of the experimental group and the control group before treatment. According to the test results, $P = 0.720 > 0.05$, and there was no correlation between the data between the two groups. The S-AI and T-AI scores of the experimental group and the control group were tested before the treatment, after five weeks of treatment, and after ten weeks of treatment. The mean values are shown in Table 1.

Table 1. S-AI and T-AI data statistics

	Before the treatment		After five weeks of treatment		After ten weeks of treatment	
	Control group	Experimental group	Control group	Experimental group	Control group	Experimental group
S-AI	56.98	56.29	55.89	45.63	54.23	39.56
T-AI	49.32	48.95	50.23	44.36	50.12	39.52

The test-retest reliability test results of the State-Trait Anxiety Scale showed that the stability of the T-AI test was relatively high, and the T-AI data was selected as the observation data. The data of the two groups were tested by *t*-test, and the test results are shown in Table 2. *t*-test was performed on the data

of the experimental group before treatment and after five weeks of treatment, and *t*-test was performed on the data of the control group. Similarly, the data of each group after five weeks of treatment and after ten weeks of treatment were tested, and the results are shown in the Table 3 and Table 4.

Table 2. *t*-test result for T-AI data

	M	S	95% CI		<i>t</i>	<i>df</i>	<i>P</i>
			Lower	Upper			
After five weeks of treatment	6.015	0.424	5.872	6.159	85.037	35.000	0.000
After ten weeks of treatment	10.647	0.389	10.515	10.778	164.102	35.000	0.000

Table 3. *t*-test result of T-AI data before treatment and after five weeks of treatment

	M	S	95% CI		<i>t</i>	<i>df</i>	<i>P</i>
			Lower	Upper			
Control group	-0.963	0.428	-1.108	-0.818	-13.508	35.000	0.060
Experimental group	4.585	0.485	4.421	4.749	56.742	35.000	0.000

Table 4. *t*-test of T-AI data after five weeks of treatment and after ten weeks of treatment

	M	S	95% CI		<i>t</i>	<i>df</i>	<i>P</i>
			Lower	Upper			
Control group	0.121	0.413	-0.019	0.261	1.761	35.000	0.087
Experimental group	4.753	0.401	4.617	4.888	71.155	35.000	0.000

The results of this study (From Table 2 to Table 4) showed that after 10 weeks of Music Therapy in patients with generalized anxiety disorders, the quality of life and anxiety symptoms of the patients were

significantly improved. Compared with the control group, after excluding the influence of conventional psychiatric treatment, the STAI total score of the experimental group was higher than that of the control

group after five weeks of treatment ($t = 85.037$, $P < 0.001$), and was significantly higher than that of the control group after ten weeks of treatment ($t = 164.102$, $P < 0.001$). It shows that Music Therapy improves the patients' physical conditions such as sleep and energy, eating, movement and feeling. It can also relieve the patients' psychological pressure, reduce anxiety and depression and other negative emotions, and experience more positive emotions such as happiness in life. Furthermore, it improves patients' cognitive function and self-esteem (Gold et al. 2017). After five weeks of treatment, the STAI score of the experimental group decreased significantly compared with that before treatment ($t = 56.742$, $P < 0.001$). After ten weeks of treatment, the STAI score of the experimental group was still significantly lower than that after five weeks of treatment ($t = 71.155$, $P < 0.001$), indicating that the long-term healing effect of music therapy was good. The STAI test results of the control group after five weeks of treatment were $t = -13.508$, $P > 0.05$, and the STAI test results of the control group after ten weeks of treatment were $t = 1.761$, $P > 0.05$. The results of the two groups were in line with the experimental expectations.

CONCLUSIONS

This study demonstrates that Music Therapy is effective in short and medium-term (within ten weeks) treatment for patients with anxiety disorders. Music Therapy has neither pain suffering nor adverse reactions with a low cost. It is simple and easy to implement, while improving the patient's interpersonal skills, work and study efficiency, and leisure and entertainment life satisfaction. At the same time, it makes patients more willing to help and easier to integrate into the society and family. It deserves more promotion in the treatment of patients with generalized anxiety disorders (Golden et al. 2021). In addition, music can also have a greater impact on people's emotions. In the process of Music Therapy, there is also a situation where the subject's mood suddenly loses control. The subject who has mental health problems cannot effectively control their emotions. The therapist needs to gradually awaken the subject's emotions and choose the appropriate treatment modality to maintain the effectiveness of the treatment process (Orjasaeter et al. 2017).

In addition to the Receptive Music Therapy used in this study, other mainstream music therapies include Participatory Music Therapy and Improvisational Music Therapy (Gavrielidou & Odell-Miller 2017). Patients in Participatory Music Therapy do not need to have specialized musical training or have any musical skills, so it does not matter whether the music played or sung is good or bad (Rahman et al. 2021). Likewise, the learning of musical skills, depending on the therapeutic purpose, may or may not be musically oriented. The instruments used in Improvisational

Music Therapy are mostly simple, rhythmic and melodic percussion instruments that can be played without training, such as various drums, xylophones, triangles, etc. The therapist often plays with the piano or guitar. In the group improvisation, the patients are instructed to sit in a circle, with various musical instruments placed in the middle of the circle, allowing the patients to try one by one and choose their musical instruments freely. The patient's choice of instrument reflects his personality, his role in interpersonal relationships, and the position he is prepared to occupy in this performance. The performance often starts by a volunteer, and other members can join the performance at any time, or even not participate in playing. Therapist may decide to participate or not to participate depending on the purpose of the treatment, while in most cases they do (Gold et al. 2017). In the individual therapy of improvisation, the main purpose of therapy is to establish a good doctor-patient relationship that patients can rely on, and to help patients express and vent their emotions through spontaneous and casual performances. Improvisation can be themed, that is, the patient first decides a theme, and then everyone performs according to their own understanding. Or it can be unthemed, that is, to follow a completely free style to play (McFerran & Saarikallio 2014). The results of improvisation may be harmonious or disorganized, reflecting the interpersonal state of the entire treatment group. In most cases, the treatment model has three steps, i.e., harmony, disorder, and new harmony (Cohen & Bodner 2019). When therapists use Music Therapy methods for mental health treatment, they need to formulate coping plans and programs in advance, so that the work of music therapy can be carried out in an orderly way.

RESEARCH ON THE ANXIETY RELIEF OF COLLEGE STUDENTS BY MUSIC THERAPY

Xiaomei An

College of Art, Huzhou University, Huzhou 313000, China

SUMMARY

Background: Stress is an important psychosocial factor influencing college students during their university education, while anxiety and depression are the common consequent mental health disorders. Music can affect our emotions. When people are in different moods, the content and emotions they perceive from music vary significantly. There are numerous cases of music therapy for anxiety or depression abroad. However, in China, relevant clinical practice or specific research is still quite scarce. Therefore, this study analyzes the efficacy of music therapy.

Subjects and methods: All 34 subjects were tested before the experiment, and their SAS standard score and GSES total scale score were recorded. After music therapy of one month and a half, their SAS standard score and GSES total scale score were retested and recorded respectively. Descriptive statistics and correlation analysis were conducted with statistical tools.

Results: After half a month's music therapy, the subjects' SAS standard score decreased ($t = 9.027, P < 0.001$), and the GSES total scale score increased ($t = -8.047, P < 0.001$). After one month's music therapy, the SAS standard score of the subjects continued to decline ($t = 7.985, P < 0.001$), and the GSES total scale score continued to rise ($t = -6.889, P < 0.001$). The average SAS standard score of the students decreased to 57.373, which reached the level of mild anxiety. The average GSES total scale score increased to 2.267, which was significantly higher than before treatment.

Conclusions: Music therapy has a good effect on relieving students' anxiety and increasing self-efficacy, which is worthy of publicity and promotion. Self-efficacy is negatively correlated with symptoms such as anxiety and depression. Compared with male students, female students are more vulnerable to anxiety. Psychological counseling departments in colleges and universities should pay more attention to the psychological problems of female students.

Key words: music therapy - anxiety disorder - college students - education - self-efficacy

INTRODUCTION

In general, higher education places high demands on student performance, which can lead to excessive stress, anxiety, and even depression and negatively impact their academic performance and personal well-being (Shah & Pol 2020). According to the National Education Statistics of the United States, 70% of new adults in North America have received higher education. Based on this, a statistical survey of individuals with life-long mental illness finds that three-quarters of mental illness occurs before the end of higher education (Prevatt et al. 2015). Mental health problems in students can lead to severe impairment of psychological, social, and emotional functioning, and then increase the risk of dropout, lower educational attainment, and suicidal behavior. In the educational process, stress is an important psychosocial factor for students, while anxiety and depression are common consequent mental health disorders. Music can affect our emotions. Anxiety and depression affect 20 % and 30 % of humans in their lifetime respectively, and they also bring high economic costs (Canu et al. 2017). Although mental health problems are very common among college students, few students receive professional help. In the first half of 2020, due to the COVID-19 epidemic, colleges and universities around the world adopted various network tools to carry out online teaching, and students received online education at home. During the

period of home study when it is impossible to return to school, factors such as the development trend of the COVID-19 pandemic and long-term interpersonal alienation have brought a significant psychological impact on college students. (Teeters et al. 2020). For students in school, the main external manifestations of mental health problems are anxiety and depression. How to understand the anxiety and depression of students and formulate effective strategies has positive significance for the management of students in colleges and universities (Bettmann et al. 2008).

According to domestic and foreign research and some physiological experimental reports, music therapy has a positive effect on the improvement of anxiety and depression symptoms. Specifically, music therapy has physical, psychological, and physiological effects. Physical effect means that through the stimulation of music, the human brain can receive the signal transmitted by the music to generate a sense of excitement and inhibit adjacent pain centers. The improvement of excitement can realize the regulation and control of the body and eliminate physical fatigue (Raglio et al. 2011). The main manifestation of the psychological effect is that the subject can have a deeper understanding of the objective world and establish a correct outlook towards the world, human life, and values through music psychotherapy (Aalbers et al. 2017). At the same time, music can also affect human emotions. Different moods lead to obvious

changes in human responses and emotions to music. The results of physiological effects are more complicated, and they are as follows. First, musical stimulation can affect the release of certain brain transmitters such as acetylcholine and norepinephrine, thereby improving cerebral cortex function (Lauzon 2020). Second, the ventral hypothalamus, limbic system, and brainstem reticular structures are closely related to the autonomic nervous system and are also the controllers of the activities of human internal organs and endocrine glands. Therefore, emotional tension can directly lead to the pathological changes of some internal organs and thus result in mental illness. Music can directly act on the emotional centers of the human brain, such as the hypothalamus and limbic system. It can regulate human emotions and relieve the above symptoms (Gooding & Springer 2020). Third, the auditory center and the pain center are in the temporal lobe of the brain. Music stimulates the auditory center and has an interactive inhibitory effect on pain. At the same time, music can also increase the concentration of pituitary enkephalins, and enkephalins can inhibit pain. Therefore, music has an analgesic effect (Gallagher et al. 2018).

There are numerous studies on music therapy abroad. But in China, clinical practice or specific research related to it is still quite rare. This study selects individuals suffering from anxiety among college students to analyze and study the effect of music therapy.

SUBJECTS AND METHODS

Subjects

The method of field investigation is adopted. In November 2021, 34 students suffering from anxiety disorders from a university in Zhejiang were selected as the research objects. Among them, there were 17 boys (50%) and 17 girls (50%). All students participated in the experiment voluntarily. They were informed and consented to the background and protocol of the experiment.

Tool

Self-rating Anxiety Scale (SAS)

Self-rating Anxiety Scale is compiled by William W.K. Zung. Foreign studies believe that SAS can better reflect the subjective feelings of patients with anxiety tendencies. Anxiety is a common mood disorder in psychological counseling clinics, so SAS has become a commonly used evaluation tool to understand anxiety symptoms in recent years (Dunstan & Scott, 2020).

SAS uses a 4-level score, which mainly evaluates the frequency of symptom occurrence. Its standard is: "1" means no or rarely; "2" means sometimes; "3" indicates most of the time; "4" means almost all of the time. The main statistical index of SAS is the total score. After the evaluation, the scores of 20 items are added together and then multiplied by 1.25 to obtain the

integer part as the standard score. The same calculation can be referred to as the "rough score standard score conversion table". The higher the standard score, the more serious the symptoms. According to the Chinese Norm, the cut-off value of SAS standard score is 50 points, of which 50-59 is mild anxiety, 60-69 is moderate anxiety, and over 70 is severe anxiety (Olatunji et al. 2006).

General Self-Efficacy Scale (GSES)

Self-efficacy is a core concept in Bandura's theory of social cognition. Self-efficacy is different from outcome expectations which refers to individuals' perceptions of the consequences of their actions. But self-efficacy refers to individuals' control or dominance over their actions (Schutte & Malouff 2016). According to Bandura's theory, people with different self-efficacy feel, think, and act differently. In thinking, self-efficacy promotes cognitive processes and performance in a variety of contexts, including decision-making quality and academic achievement. Self-efficacy can strengthen or weaken an individual's level of motivation. Those with high GSES values would choose more challenging tasks. They may set higher goals and stick to them. Once started, those with high self-efficacy put in more effort and persist for longer. They can quickly recover from setbacks. According to the previous research, self-efficacy is often associated with depression, anxiety, and helplessness (De las Cuevas & Penate 2015).

GSES has a total of 10 items, which are in the form of a 4-point Likert scale. Each item is scored from 1 to 4. For each item, the subjects should answer with "completely incorrect", "somewhat correct", "mostly correct" or "exactly correct" according to their actual situation. GSES is a one-dimensional quantity without a subscale. So only the total scale scores are counted. All scores for all 10 items are added together and divided by 10 to get the total scale score. The Chinese version of the GSES has good reliability and validity, with an internal consistency coefficient of 0.87. Its retest reliability at a one-week interval was 0.83. In terms of validity, the correlation between the 10 items of GSES and the total scale score is between 0.60 and 0.77 (Nel & Boshoff 2016).

Statistical process

Descriptive statistics and correlation analysis are performed on the data of this study with SPSS19.0, including independent sample *t*-test, single-factor ANOVA test, and paired sample *t*-test.

RESULTS

Before the experiment, all 34 subjects were tested, and the SAS standard score and the GSES total scale score were recorded. After half a month and one month of music therapy, the SAS standard score and the GSES total scale were tested and recorded again. Statistical

tools were used for data analysis.

During the experiment, the music therapy adopted follows the following three principles:

(1) Principle of systematization. Music therapy requires that music should be played step by step according to the psychological characteristics of the subject. The choice of music should be gradual. For example, music for sadness can be divided into mild, moderate, and severe. The choice starts with mild music and gradually changed into moderate music. The volume should also be gradually increased for the gradual adaptation of subjects.

(2) Principles of learning and inspiration. In the course of music therapy, explanation and guidance are necessary for clients who do not understand music, including the related background and the artistic

conception. Before treatment, subjects can try listening to a piece of music first and appreciate its artistic conception. If the subjects cannot understand the mood of the music, the psychotherapist should provide some explanations to help them understand the meaning of the music.

(3) Principle of Experience. During music therapy, subjects are instructed to experience their own emotions or feelings according to the musical atmosphere.

The subjects are divided into two groups based on gender. According to the experimental data, the independent sample *t*-test is performed on the SAS standard scores of the different gender subjects. Also, the one-way ANOVA test is performed on the GSES total scale scores of the different gender subjects. The results are shown in Table 1 and Table 2.

Table 1. SAS standard *t*-test with independent samples

	<i>t</i>	<i>df</i>	<i>P</i>	Mean difference	Std. error difference	95% CI	
						Lower	Upper
Value	-4.834	32	0.000	-5.117	1.058	-7.273	-2.961

Table 2. GSES total table is tested by single-factor ANOVA

	Sum of squares	<i>df</i>	Mean-square	<i>F</i>	<i>P</i>
Between groups	2.226	1	2.226	23.370	0.000
Within groups	3.048	32	0.095	-	-
Total	5.274	33	-	-	-

According to Table 1 and Table 2, among the 34 test samples in this experiment, there is a significant difference between male and female SAS standard scores ($t = -4.834, P < 0.001$). At the same time, there is also a significant difference between male and female GSES total scores ($F = 23.370, P < 0.001$). This result indicates that, among the participants in this experiment, females generally have higher levels of anxiety than men, and generally had lower self-efficacy and higher levels of in-confidence. To verify whether there is a connection between anxiety level and self-efficacy, a bivariate correlation test is performed on SAS and GSES data, and the results are shown in Table 3.

According to Spearman's Rho test result, SAS standard score is negatively correlated with GSES total score at 0.01 level ($P < 0.001$). This indicates that the higher the level of anxiety, the lower the level of self-

efficacy. Paired sample *t*-test is firstly performed on SAS standard scores before the experiment and half a month after, and secondly on SAS standard scores half a month after the experiment and one month after. GSES scores of each experiment are subjected to the same statistical test. The results are shown in Table 4, and the statistical results are shown in Table 5.

Table 3. Bivariate correlation test

		SAS	GSES
Spearman's rho	Correlation coefficient	1.000	-0.944**
	Sig. (2-tailed)	-	0.000
	N	34	34

Note: ** means that correlation is significant at the 0.01 level (2-tailed).

Table 4. *t*-test results of paired samples

	Mean	Std. deviation	Std. error mean	95% CI		<i>t</i>	<i>df</i>	<i>p</i>
				Lower	Upper			
SAS 1-SAS 2	2.265	1.463	0.251	1.754	2.775	9.027	33.000	0.000
SAS 2-SAS 3	2.088	1.525	0.262	1.556	2.620	7.985	33.000	0.000
GSES 1-GSES 2	-0.236	0.156	0.035	-0.278	-0.175	-8.047	33.000	0.000
GSES 2-GSES 3	-0.219	0.162	0.027	-0.262	-0.156	-6.889	33.000	0.000

Table 5. Descriptive statistics

	N	Minimum	Maximum	Mean	Std. deviation	Variance
SAS 1	34	55.00	69.00	61.676	3.997	15.983
SAS 2	34	52.00	68.00	59.411	4.397	19.340
SAS 3	34	50.00	66.00	57.323	4.456	19.862
GSES 1	34	1.10	2.50	1.832	.399	0.160
GSES 2	34	1.20	2.80	2.058	.439	0.193
GSES 3	34	1.40	3.00	2.267	.445	0.199

According to the paired sample *t*-test data, after half a month of music therapy, the SAS standard score of the subjects decreases ($t = 9.027, P < 0.001$), while the GSES total score increases ($t = -8.047, P < 0.001$). After one month of therapy, subjects' SAS standard scores continue to decrease ($t = 7.985, P < 0.001$) and their GSES total score continues to increase ($t = -6.889, P < 0.001$). According to the statistical data in Table 5, after one month of music therapy, the average SAS standard score of the students decreases to 57.373. It reaches the level of mild anxiety. The average total GSES score increased to 2.267, which is close to the normal level. The above data indicate that music therapy has a good effect on relieving students' anxiety and increasing their sense of self-efficacy.

CONCLUSION

This study shows that music therapy has a good effect on relieving students' anxiety and increasing their sense of self-efficacy. Music therapy has no side effects and is easy to operate. With these advantages, it is worth advocating and promoting. Studies have also shown that GSES is positively correlated with self-esteem and optimism, and negatively correlated with anxiety and depressive symptoms (Malinauskas 2017). Besides, the results of this study indicate that female students are more prone to anxiety than male students. During the epidemic period, female students may be more sensitive to the pressure of employment, education, and exams. Psychological counseling institutions in colleges and universities should pay more attention to the psychological problems of female students (Faize & Husain 2021). In addition, the results of this study show that although music therapy can relieve students' anxiety problems, the effect is limited. It is suggested to use it accompanied by other means of relieving anxiety, for example sports. The advantage of sports is that there are relatively no side effects, and it can also improve health, such as weight loss and blood pressure reduction. Studies have found that long-term physical exercise can promote the formation and extension of new blood vessels in the brain, thus improving the brain's ability to concentrate. Compared with those who do not exercise, exercisers have less psychological stress and are less prone to depression. Just 30 to 60 minutes of exercise can reduce psychological stress and 45 minutes of exercise is the optimal duration (Johnston 2021). At the same time, a higher frequency of exercise is not always a better choice. Regardless of the frequency of

exercise, 3 to 5 times per week is the best for optimal mental health (Herguner 2018).

In addition, students' anxiety currently is directly related to the epidemic in most cases. Therefore, colleges must improve the cultivation of students' independent thinking and discrimination ability, and issue in a prompt way clear official notices to avoid students falling into the trap of epidemic rumors (Feng 2021). Meanwhile, they should improve information transparency in terms of the popularization of sciences, the dispelling of rumors, and the release of official consultation in a timely manner. To prevent students from guessing and being confused with specious information, it is of great importance to properly and accurately interpret the official news related to COVID-19 pandemic for the improvement of their judgment and trust. Only by eradicating the spread of rumors can we better prevent the spread of panic and reduce the adverse effects of false news and rumors on students.

THE INFLUENCE OF FOOTBALL EXERCISE ON THE REHABILITATION OF CHINESE COLLEGE STUDENTS WITH MENTAL ILLNESS

Gang Jin

Physical Education Department, Northeastern University, Shenyang 110819, China

SUMMARY

Introduction: With the development of society, people's life quality is gradually improved, which leads to increased social competition pressure. Meanwhile, undergraduate students are facing great pressure and serious mental health problems. Some college students' mental illness can be effectively treated by sports, which has been widely recognized by society. From the perspective of football, this study analyzes the specific impacts of football on the rehabilitation of college students' mental illnesses.

Subjects and methods: This paper selects students from a university in Liaoning Province, China as the research subjects. The subjects are randomly divided into two groups. The experimental group is given relaxation therapy, supplemented with football exercise. The control group is only given relaxation therapy. The SCL-90 scores of each group are re-tested every ten days. The paper adopts correlation analysis, variance analysis, regression analysis, and other research methods.

Results: Relaxation therapy positively affects the rehabilitation of college students' mental illness. Supplemented with football exercise, the rehabilitation effect is significantly improved. On the last time of the test, the arithmetic mean of SCL-90 scores in the experimental group is 162.42, which reaches the normal level. The results of the sample t-test show that the SCL-90 scores of the experimental group and the control group are significantly different at the level of 0.01 ($t = -3.933$, $P = 0.008 < 0.01$).

Conclusions: Football exercise has an important impact on the rehabilitation of patients with mental illness. The causes of mental illness among college students are complex. To alleviate this problem, schools and all sectors of society shall take relevant measures to play their guiding roles in this regard.

Key words: football exercise – sports - mental illness - college students – rehabilitation

* * * * *

INTRODUCTION

With the development of society, the eastern and western cultures converge and collide. The market is becoming more competitive, and the big era is coming with profound changes in ideas and lifestyles. Under the background and the joint effects of external and internal factors, college students' psychological development is facing various uncertainties. In addition, most contemporary college students are the only child in their families, with strong self-awareness, diversified thoughts, as well as complex and wayward reactions to external influences. Therefore, academics, employment, interpersonal communication, love, and family pressure may all become the main factors that induce mental illness among college students (Sabourin et al. 2019). According to a survey by the World Health Organization, a quarter of college students in China admit that they have suffered from mental illnesses including depression. Therefore, it is particularly important to prevent and intervene in mental illness among college students (Yang et al. 2018).

Existing psychological experiments show that the information between the human brain and muscles is bidirectionally transmitted. Nerve excitation can be transmitted from brain to muscles, and from muscles to brain. When the human body is active, the motor system transmits impulses to the central brain, affecting the excitability of the brain, thereby controlling emotional changes. The more activities there are in the motor

system, the more nerve excitation it transmits, and the emotion will be soaring (Wu et al. 2015). Otherwise, the emotion will be down. People's emotions can be effectively adjusted by physical exercises. (Ramzi & Besharat 2010). Psychologist Chen Zhonggeng reckons that social support and sports are the two most prominent factors, factors that have been found to reduce the incidence of psychological stress in an individual's life. Compared with people who are accustomed to sitting, people who exercise regularly have fewer physical stress responses. If there is any, he or she can recover from it as soon as possible (Zhou et al. 2021). A study from The Lancet also points out that compared with people who do not exercise, people who exercise regularly have less psychological stress and are less likely to become depressed. Among various sports, the team sport, like football, is the most effective way in reducing psychological stress, the second is cycling, and the third is cardio or gym exercise (Chekroud et al. 2018).

Football is a form of sport with a strong collective nature. In the whole process of the game, all players participate in the sport, with common interests and goals. Only through effective cooperation among all players, can they win the game. (Sullivan et al. 2019). The success of a team is directly related to all players, which can cultivate students' sense of teamwork, responsibility, and competition. The basic characteristics of football are as follows. The exercise

intensity is high. Players need to move fast, their whole body is in a high degree of excitement, and their muscles will contract faster. And during the exercise, the brain can enhance nerve impulses, promote the secretion of dopamine in the body to make people feel happy and emotional. Therefore, football has a remarkable effect on the regulation of psychological disorders and the alleviation of mental illness (Eganov et al. 2018). At present, the impact of football on college students' mental illness still lacks research through experimental comparison and mathematical statistics, not specific and standardized. This paper, based on statistical tools, studies the relationship between mental health and football with the use of correlation analysis, variance analysis, regression analysis, and other methods.

SUBJECTS AND METHODS

Research object

This paper selects students from a university in Liaoning Province as the research subjects. The study is carried out through online questionnaires. A total of 2,000 questionnaires are distributed, and 1,850 questionnaires are collected. Among those, 1,705 valid questionnaires are obtained, with an effective rate of 92.2%, excluding those whose answer time is less than 150 seconds and whose option similarity is more than 80%. All the students surveyed are informed and consented to the research background, research plan, questionnaire content, and other information.

Research tools

This study uses the Questionnaire Star to conduct an online questionnaire survey. The SCL-90 is used to test the psychological status of subjects, and SPSS26.0 is used for data analysis.

The SCL-90, also known as the Symptom Self-Rating Scale or Hopkin's Symptom Checklist, is compiled in 1975 by L.R. Derogatis. The scale comprises a wide range of psychiatric symptoms, a total of 90 items, including feeling, emotion, thought, consciousness, behavior, living habits, interpersonal relationships, diet, sleep, etc. 10 factors in this scale is used to reflect 10 aspects of psychological symptoms. According to the national norm results, if the total score of SCL-90 exceeds 160, the number of positive items exceeds 43, or any factor score exceeds 2, further examination is required.

Research proposal

In statistics and analysis, this study selects research subjects whose two or more factors with scores greater than 3 and a total score greater than 220 in the questionnaire. A total of 56 subjects are randomly divided into two groups, including 28 subjects in the experimental group and 28 in the control group. The experimental group is given relaxation therapy, supplemented with football. The control group is only given relaxation therapy. SCL-90 scores of each group are re-tested every ten days, and data is recorded and analyzed.

RESULTS

The scores of ten factors, including somatization, compulsion, interpersonal relationship, depression, anxiety, hostility, terror, paranoia, psychosis, and additional factors, are counted among students who participated in the questionnaire survey. Factor items with a score greater than 2 are selected, counted, and recorded. The overall distribution of factors is shown in Figure 1.

Figure 1. SCL-90 factor distribution

A single factor with a score greater than 2 indicates that there may exist mental illness, and further analysis

is required. According to Figure 1, among the single factors with a score greater than 2, anxiety, depression

and additional factors account for far more than other items. Anxiety refers to the unpleasant and complex emotional states, such as tension, anxiety, worry, annoyance, etc., which may result from an individual when he or she faces an imminent and possible danger or threat (Christy 2021). Nowadays, depression is the most common mental illness, with continuous and long-term low mood as the main clinical feature. Other symptoms include slow thinking, decreased volitional activity, cognitive impairment, and somatic symptoms (Dalky & Gharaibeh 2019). Additional factors mainly reflect the sleep and diet condition of subjects. Symptoms such as anxiety and depression may affect subjects' sleep quality. Anxiety, depression, and additional factors are the three main mental illnesses of current college students. The three main items are interrelated and cross-influenced, which is consistent with current research results at home and abroad

(Karatekin 2018).

Individuals whose two or more factors with scores greater than 3 and a total score greater than 220 in the questionnaire are selected as research subjects. 56 subjects are finally screened, including 30 males and 26 females, and are randomly divided into two groups, with 28 subjects in the experimental group and 28 in the control group.

The experimental group is given relaxation therapy, supplemented with football exercise, 30-60 minutes per day and 3-5 times per week. The control group is only given relaxation therapy. The SCL-90 scores of each group are retested every ten days, and data is recorded seven times a total.

In this experiment, $n_1=n_2=28$. According to the Grubbs criterion, the original data is sorted and the abnormal data is eliminated. The arithmetic mean of each group is shown in Table 1.

Table 1. The arithmetic mean of SCL-90 scores

	1st time	2nd time	3rd time	4th time	5th time	6th time	7th time
Experimental group	236.15	230.49	210.56	198.22	176.01	165.12	162.42
Control group	238.88	235.59	230.46	221.39	214.99	208.18	201.45

SPSS26.0 is used to perform statistical analysis on the data of each group. The results of the one-way ANOVA test from the control group and the

experimental group in the 1st test (without relaxation therapy or physical therapy) are shown in Table 2.

Table 2. One-way ANOVA test of control group & experimental group

	Sum of squares	df	Mean Square	F	Sig.
Between groups	2.474	1	2.474	1.286	0.262
Within groups	103.886	54	1.924	-	-
Total	106.359	55	-	-	-

According to the *F* test data in Table 2, in the 1st test, there is no significant difference in SCL-90 scores between the experimental group and the control group ($F = 1.286, P = 0.262 > 0.05$), which was in line with the experimental expectation. Linear analysis is performed on the 7th test data between the experimental group and the control group, respectively. The fitting degree analysis of the two groups is shown in Table 3 and Table 4.

According to Table 3 and Table 4, $R_1^2=0.971$, $DW_1=1.954$, the linear fitting degree of the experimental group's data to the time variable is good.

$R_2^2=0.990$, $DW_2=1.570$, the linear fitting degree of the control group data to the time variable is good. SPSS26.0 is used to linearly fit the data of two groups respectively. The *t*-test is performed on paired samples. The results are shown in Table 5.

According to the *t*-test results of paired samples, the SCL-90 scores of the two groups are significantly different at the level of 0.01 ($t = -3.933, P = 0.008 < 0.01$). According to the SPSS fitting results, $B_1=-13.803$, $B_2=-6.521$, the SCL-90 scores of the experimental group decreased significantly.

Table 3. Experimental group model data

	R	R square	Adjusted R square	Std. error of the estimate	Durbin-watson
Value	0.986	0.971	0.966	5.61831	1.954

Table 4. Control group model data

	R	R square	Adjusted R square	Std. error of the estimate	Durbin-watson
Value	0.995	0.990	0.988	1.55638	1.570

Table 5. Paired sample *t*-test between the experimental group and the control group

	Mean	Std. Deviation	Std. Error Mean	95% CI		<i>t</i>	Sig. (2-tailed)
				Lower	Upper		
Value	-24.56714	16.52501	6.24587	-39.85023	-9.28406	-3.933	0.008

CONCLUSION

According to the above research, anxiety and depression, and additional factors are three main mental illnesses that current college students are facing (Tahara et al. 2021). Relaxation therapy has a certain positive effect on treating college students' mental illness, but the therapeutic effect is limited. Therefore, only relying on this way can merely improve the status quo to some extent, while the mean score of SCL-90 among college students remains at a high level. By contrast, the therapeutic effect supplemented with football exercise can be improved significantly. According to the data, the therapeutic effect of 30-day relaxation supplemented with football exercise exceeds the effect of 60-day relaxation therapy only. Based on the results of variance and regression analysis as well as the questionnaire survey of students' daily status, it can be seen that football exercise has an important positive impact on people's mental health. It also has a significant effect to maintain mental health and to deal with psychological disorders from the perspectives of attitudes, behaviors, and skills (Gaiotto et al. 2021).

Due to the limitation on time and conditions, this study also has some shortcomings. For example, the SCL-90 scale measures a person's symptom in a certain period, which reflects a person's self-perceived psychological state at that time. It is easily affected by many factors, especially life events. If someone has a high score, we can only reckon that he or she may have some kind of psychological symptoms, not a mental illness or psychological disorder. The diagnosis of any mental illness or psychological disorder should take into consideration of a certain amount of time, instead of a short period (Wilkes et al. 2019). In addition, measurement errors exist especially in psychological measurement. When the subjects know that they participate in the experiment, they may be affected by the placebo effect or may develop psychological prevention. All these will affect the data collection in the Scale survey, leading to more errors (Adilay et al. 2018). Although strict data screening has been carried out in this study, relevant issues may not be avoided completely. The study hereby mentions it with hopes that other researchers can learn from the experience and avoid similar issues.

In the questionnaire survey of this study, a large number of students with mental illness are screened out, which reflects that current universities pay less attention to related problems. Therefore, to take what measures to improve the current conditions is an issue that needs the society to think over. Universities should carry out regular school-wide psychological counseling with

goals including adaptive counseling and developmental counseling. Adaptive counseling is mainly aimed at students with certain psychological and behavioral problems yet in physical and mental health. Psychological counseling should be carried out throughout the years of college students' campus life. Their physical and mental health needs constant attention, and support to help them adapt to different stages of university life and guide them to achieve self-development (Wong et al. 2021). Developmental counseling is aimed at all students, to help students improve their mental quality and their ability to adapt to the environment. Counseling should cover study, life, character cultivation, and career guidance by group counseling and individual counseling. Group counseling can take the form of psychological knowledge lectures, mental quality training activities, theme class meetings and team activities, salon dialogues, column counseling, etc. (Ma et al. 2020). In addition, Universities can also establish students' mental health files to make mental health education more targeted and effective. By doing so, universities can thoroughly understand the overall psychological status of students from the macro perspective, and accurately grasp the conditions of students with psychological disorders from the micro perspective, to track and control them to prevent accidents. The government should issue relevant policies to ensure the privacy and safety of college students with mental problems, to increase financial support and capital investment to mental hospitals and aid stations, and to provide care and assistance to college students with psychological disorders (Fu et al. 2021). Hospitals and scientific research institutes should strengthen the tracking and investigation of college students with mental illness, promote the research and development speed of drugs for mental illness, and improve the treatment techniques and methods in hospitals, to effectively help college students with mental illness to have a speedy recovery.

RESEARCH ON THE INFLUENCE OF CONSUMER PSYCHOLOGY ON THE PROTECTION OF TRADEMARK LAW

Ke Wu^{1,2}

¹Law School, University of International Business and Economics, Beijing 100029, China;

²Law School/Intellectual Property School, Zhongyuan University of Technology, Zhengzhou 450000, China

SUMMARY

Introduction: Nowadays, enterprises are facing unprecedented fierce competition. The market is evolving from seller monopoly to buyer monopoly. The era of consumer-led marketing has come. As the country pays more and more attention to intellectual property rights, the protection of trademark law has gradually raised the important agenda. Based on consumer psychology, this paper studies and designs the commodity protection law, which aims to urge producers and operators to ensure the quality of goods and services and protect the interests of consumers and producers and operators, not to promote the development of socialist market economy.

Subjects and methods: Starting from reality, this study adopts an interview questionnaire survey for consumers, through effective face-to-face interview, deeply understands consumers' cognition of trademark law protection, and carries out correlation analysis and multiple regression analysis between consumers' psychological factors and trademark law protection, so as to evaluate the impact of consumers' psychology on trademark law protection.

Results: The analysis results show that at the level of the basic situation of the survey samples, the proportion of men and women is basically the same, the age distribution is relatively uniform, the average monthly income is relatively balanced, the level of education is universal, and it is more reasonable to be included in the professional field. According to the basic characteristics of the survey sample, it is more in line with the main body of consumer research and representative, so as to ensure that the research results are as realistic as possible. At the correlation analysis level, the correlation coefficients of consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are greater than 0.700. Consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are positively correlated with trademark law protection. At the level of regression analysis, the regression analysis coefficients of consumers' age, gender, monthly income, occupation and education are greater than 0.400, which has a corresponding relationship with the protection of trademark law. At the same time, the regression analysis coefficients of consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are greater than 0.700.

Conclusions: On the basis of previous studies, this study has made improvements and innovations, adopted a more careful experimental design and more accurate statistical methods, and carried out research on the impact of consumer psychology on trademark law protection, so as to evaluate the value and significance of consumer psychology in trademark law legislative protection. The conclusions include: consumer cognition, attitude, norms, consumer behavior tendency and purchase psychology are positively correlated with trademark law protection, the higher the degree of positive attitude and consumption intention of consumers, the better. Therefore, in the legislative protection of trademark law, we should fully consider the psychological factors of consumers, so as to strengthen trademark management, protect the exclusive right to use trademarks, urge producers and operators to ensure the quality of goods and services, protect the interests of consumers and producers and operators, and promote the development of the socialist market economy.

INTRODUCTION

Consumer psychology is a science that studies consumer behavior and is committed to exploring consumers' unique psychological phenomena and their development and change laws (Harman et al. 2020). According to the combination of consumer participation and commodity differences, consumer purchase mainly has four types: (1) complex purchase. It occurs when consumers first buy goods with high participation and great brand differences. Most consumers know little about these goods, but because they are expensive and durable consumer goods, they are very cautious in their choice before buying. It takes time to collect a lot of information, select and compare from multiple directions. This purchase decision is the most complex (Sett et al. 2020). (2) Harmonious

purchase. This happens when consumers buy goods with high participation but small brand differences. As long as the commodity prices of different brands are within the same level, there is little difference in quality and function, so there is no need to collect a lot of information or evaluate. The high degree of involvement is mainly due to high commodity prices or infrequent purchases. The focus of decision-making is whether to buy, what grade to buy, rather than what brand to buy, more concerned about whether to obtain price concessions, whether the purchase time and place are convenient, etc. (Dubé & Wen 2022). (3) Multi variety purchase. It occurs in commodities with large brand differences and low participation. Consumers often change the brand of the goods they buy, mainly because they try new things to avoid

monotonous randomness. Before purchasing such goods, consumers generally do not actively collect relevant information, but passively receive information through advertising and other publicity media. The evaluation of goods also occurs after purchase. Even if they feel good about the goods they buy, they may still change the brand at the next purchase (Saxena et al. 2021). (4) Habitual purchase. When consumers buy goods with low involvement and small brand differences, it is a habitual reaction behavior formed after multiple purchases. Consumers often buy fixed brands, not out of loyalty, but out of habit. When there is no such product on the shelf, consumers will not hesitate to buy another product that looks very similar (Mishra et al. 2020). Factors affecting consumers' purchase decision: (1) environmental factors such as cultural environment, social environment and economic environment; (2) price, quality, performance, style, service, advertising, purchase convenience and other stimulating factors; (3) personal and psychological factors of consumers. Personal factors include age, gender, occupation, economic status and personality. Among them, the psychological factors of consumers are also called black boxes, because they cannot be seen directly. Incentives start with enterprises and then enter into the black box of consumers. Through the psychological activity process of consumers, they become the decision-making output of purchase (Paulino et al. 2022). Psychological factors include: (1) motivation and willingness. Any purchase activity is dominated by a certain motivation, which comes from the internal motivation of consumers and reflects the physiological, psychological and emotional needs of consumers. (2) Feeling and perception. Two consumers with the same motivation will make different purchase decisions because of their different feelings and perceptions. (3) Learning and growth. Learning is a psychological process, a relatively lasting change in personal behavior caused by experience. It is a process in which consumers gradually gain and accumulate experience through use, practice or observation, and adjust their purchase behavior according to experience. Enterprises should create conditions to help consumers complete the learning process. (4) Beliefs and attitudes. Consumers form beliefs and attitudes in the process of purchasing and using goods, which will affect their future purchase behavior. It is better for enterprises to change their products to meet the existing attitude of consumers, rather than trying to change the attitude of consumers (Shen et al. 2021).

China's trademark law protects the exclusive right of trademark. The exclusive right to use a registered trademark is limited to the trademarks approved for registration and the goods approved for use. This is an important boundary to distinguish and judge whether infringement. "Approved registered trademark" refers to the visual signs registered by the trademark office. "Goods approved for use" refers to specific goods

approved and filed by the Trademark Office (Huang et al. 2021). The owner of a registered trademark has no right to change the constituent elements of the trademark or expand the scope of use of the trademark without authorization. Any use that does not involve the scope of trademark protection shall not be investigated as an infringement. Trademark infringement mainly includes two types: first, trademarks that are the same or similar to registered trademarks. Among them, similar trademarks refer to trademarks that are easy for consumers to mistakenly identify the source of goods or services in the font, pronunciation, meaning, composition and color of words or graphics, or the overall structure of words and graphics. Second, goods that are the same as or similar to those approved for use as registered trademarks. Similar goods refer to goods that are related or specifically related in terms of function, purpose, consumption object, sales channel, etc. If there is a specific connection between goods and services, the use of the same or similar trademarks may lead consumers to mistakenly recognize that they are goods or services provided by the same trademark registrant, and goods and services shall be regarded as similar. The types of trademarks protected by the trademark law are: first, commodity trademarks and service trademarks. This is divided according to different objects of trademarks. A commodity trademark is a sign indicating the source of a commodity, while a service trademark is a sign indicating the service of a service provider and distinguishing it from other services (Saxena et al. 2021). In China's trademark law, the provision of service trademark began in 1993, which means that the division of trademark use objects is more in line with reality, which confirms the necessity of using trademark in the field of service. Of course, this also shows that the expansion of the scope of trademark protection meets the needs of modern economy. Therefore, the trademark law stipulates: "if a natural person, legal person or other organization needs to obtain the exclusive right to use a trademark for the goods it produces, manufactures, processes, selects or distributes, it shall apply to the Trademark Office for the registration of a commodity trademark; if a natural person, legal person or other organization needs to obtain the exclusive right to use a trademark, it shall apply to the Trademark Office for the exclusive right to use a trademark. According to its provisions, it shall apply to the Trademark Office for the registration of a service trademark. These two legal provisions show that the biggest difference between commodity trademarks and service trademarks lies in the different objects of use. Second, collective trademarks and certification trademarks. This is divided according to the different purposes of trademark use. It is only incorporated into the legal provisions when the trademark law is revised for the second time: the term "collective trademark" as used in this Law refers to a

mark registered in the name of a group, association or other organization for use by members of the organization in commercial activities, indicating that the user is a member of the organization. The term “certification trademark” as used in this Law refers to an organization that can supervise a certain commodity or service and is used by units or individuals other than the organization to prove the origin, raw materials, manufacturing methods, quality or other marks of specific quality of the commodity or service. The purpose of using the two trademarks, that is, their respective characteristics, is determined by law and cannot be confused. Obviously, collective trademarks are only used by collective members, and non-collective members are not allowed to use them. However, the certified trademark cannot be used by the registrant himself, but only by others who meet certain conditions (Saxena R et al. 2021). In view of this, this paper launches the research and design of commodity protection law based on consumer psychology. Figure 1 shows the technical route of the research on the impact of consumer psychology on trademark law protection.

Figure 1. Technical route of research on the impact of consumer psychology on trademark law protection

SUBJECTS AND METHODS

Study setting

Nowadays, enterprises are facing unprecedented fierce competition. The market is evolving from seller monopoly to buyer monopoly. The era of consumer led marketing has come. In the buyer’s market, consumers will face more complex commodity and brand choices. This change makes contemporary consumer psychology present new characteristics and trends compared with the past. The psychological demand of consumers is endless, and the demand closely follows the previous demand; People’s different growth

experiences lead to the diversity of needs. The development of productive forces and changes in life will change the psychology of consumers and give them the characteristics of the times. In other words, the psychological activity of consumers is a complex thinking phenomenon, and various psychological factors affect and restrict each other. It should be pointed out that these tendencies are intertwined, and their manifestations are prominent in one aspect, weakened in the other, and change at any time. As the country pays more and more attention to intellectual property rights, as special trademark law, what are the provisions of China’s trademark law on the protection of trademarks? Article 13 of the Trademark Law of the people’s Republic of China stipulates that if a trademark applied for registration for the same or similar goods is a copy, imitation or translation of a well-known trademark not registered in China, which is easy to cause confusion, it shall not be registered and its use shall be prohibited. A trademark applied for registration on similar goods is a copy, imitation or translation of a well-known trademark registered in China, which misleads the public. If it damages the interests of the well-known trademark registrant, it will not be registered and its use is prohibited (Ainiwaer 2021). In view of this, this paper studies the impact of consumer psychological factors and trademark law protection.

Design

Starting from reality, this study adopts an interview questionnaire survey for consumers, through effective face-to-face interview, deeply understands consumers’ cognition of trademark law protection, and carries out correlation analysis and multiple regression analysis between consumers’ psychological factors and trademark law protection, so as to evaluate the impact of consumers’ psychology on trademark law protection. This survey questionnaire is divided into the basic situation of consumers, the cognition of trademark law protection, the attitude towards trademark law protection, and the normative awareness of trademark law protection, etc. based on this, the impact of consumer psychological factors and trademark law protection is studied and analyzed. The respondents mainly collected the basic information and individual characteristics of consumers, such as gender, income, education, occupation, etc., and conducted sample analysis from the perspective of demography. Specifically, 235 questionnaires were distributed, 230 were recovered and 223 were effective, reaching an effective rate of 94.89%. Table 1 shows the basic situation of the survey sample.

Table 2 shows the correlation analysis results between consumer psychological factors and trademark law protection.

Table 3 shows the regression analysis results of consumer psychological factors and trademark law

protection.

Table 1. Shows the basic information of the survey sample (n=223)

Sample characteristics	Index	Number of samples (n)	Proportion (%)
Gender	male	109	48.88
	female	114	52.12
Age	18-30	58	26.02
	31-40	64	28.69
	41-50	46	20.63
	Over 50	55	24.66
	1000-3000	82	36.77
Average monthly household income	3000-5000	76	34.08
	5000-8000	55	24.66
	Over 8000	10	4.49

Average monthly household income	0.559	0.064	0.446	2.321	0.000
Educational level	0.486	0.073	0.487	2.479	0.000
Occupation	0.546	0.078	0.561	2.224	0.000

RESULTS

Basic information samples

As shown in Table 1, at the basic level of the survey sample, the proportion of men and women is basically the same, the age distribution is relatively uniform, the average monthly income is relatively balanced, the level of education is universal, and it is more reasonable to be included in the professional field. According to the basic characteristics of the survey sample, it is more in line with the main body of consumer research and representative, so as to ensure that the research results are as realistic as possible.

Correlation analysis results

As shown in Table 2, the correlation coefficients of consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are greater than 0.700. Consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are positively correlated with trademark law protection.

Regression analysis results

As shown in Table 3, the regression analysis coefficients of consumers' age, gender, monthly income, occupation and educational background are greater than 0.400, which has a corresponding relationship with the protection of trademark law. At the same time, the regression analysis coefficients of consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are greater than 0.700.

DISCUSSION

At the level of strengthening trademark management. A trademark is a sign that distinguishes the source of goods or services. It is an intellectual achievement and belongs to the category of intellectual property rights. It needs to be protected by the state to

promote its healthy development. At the same time, there are a large number of trademarks in social and economic life. In order to ensure the normal function of trademarks and give full play to the positive role of trademarks in the modern economy, they need to be managed by the state. At the level of urging producers and operators to ensure the quality of goods and services. Providing qualified products to society is a social obligation undertaken by commodity producers, operators and service providers according to law. Trademark is an important symbol for people to distinguish the sources of different goods and services. It is not only an important factor for people to recognize and recognize a certain commodity or service, but also an important condition for consumers to buy a certain commodity or service. The trademark of goods or services is directly related to their quality. In order to protect the legitimate rights and interests of consumers and ensure the quality of goods and services, this paper will urge producers and operators to take ensuring the quality of goods and services as one of the legislative purposes of Trademark Law (Mieres et al. 2020). Therefore, the administrative departments for industry and commerce at all levels should stop cheating consumers through trademark administration. At the level of protecting the interests of consumers, producers and operators. Whether it is to strengthen trademark management, protect the exclusive right to use trademarks, or urge producers and operators to ensure the quality of goods and services and maintain the reputation of trademarks, one of its purposes is to safeguard the interests of consumers and producers and operators, so that their interests can be equally protected according to the law (Chen & Liu 2020). At the level of promoting the development of the socialist market economy. With the development of China's social economy, trademarks are playing a more and more important role in economic life. Giving full play to the role of the trademark system can better promote the development of the socialist market economy. Therefore, the fundamental purpose of formulating the trademark law is to promote the development of a socialist market

economy (Lee 2020).

Nowadays, enterprises are facing unprecedented fierce competition. The market is evolving from seller monopoly to buyer monopoly. The era of consumer-led marketing has come. This change makes contemporary consumer psychology present new characteristics and trends compared with the past. (1) Personalized consumption: with the development of the consumer goods market today, most products are abundant in quantity and variety, and initially have practical conditions. Consumers can choose and buy goods or services according to their psychological needs (Zhang 2020). In addition, they are not only able to make choices but also eager to make choices. They have more needs and changes. Gradually, consumers began to set their own standards. (2) Active consumption: under the trend of the increasingly detailed and specialized social division of labor, even when purchasing many daily necessities, most consumers lack sufficient professional knowledge to identify and evaluate products, but their psychological needs to obtain commodity-related information and knowledge have not disappeared, but are increasing day by day (Murbiantoro & Safa'at 2020). With the changes in consumption characteristics and consumer psychology in the new era, this paper studies the impact of consumer psychology on the protection of trademark law. The results show that the correlation coefficients of consumers' cognition, attitude, norm, consumption behavior tendency and purchase psychology are greater than 0.700, indicating that consumers' cognition, attitude, norm, consumption behavior tendency and purchase psychology are positively correlated with trademark law protection. At the same time, the regression analysis coefficients of consumers' cognition, attitude, norms, consumption behavior tendency and purchase psychology are greater than 0.700, indicating that the higher consumers' cognition, attitude, norms, consumption behavior tendency, and consumption intention, the better the protection of trademark law. Therefore, in the legislative protection of trademark law, we should fully consider the psychological factors of consumers, so as to strengthen trademark management, protect the exclusive right to use trademarks, urge producers and operators to ensure the quality of goods and services, protect the interests of consumers and producers and operators, and promote the development of the socialist market economy.

CONCLUSIONS

On the basis of previous studies, this study has made improvements and innovations, adopted more careful experimental design and more accurate statistical methods, and carried out research on the impact of consumer psychology on trademark law protection, so as to evaluate the value and significance of consumer psychology in trademark law legislative protection. The conclusions include: Consumer

cognition, attitude, norms, consumer behavior tendency and purchase psychology are positively correlated with trademark law protection. The higher the degree of positive attitude and consumption intention of consumers, the better. Therefore, in the legislative protection of trademark law, we should fully consider the psychological factors of consumers, so as to strengthen trademark management, protect the exclusive right to use trademarks, urge producers and operators to ensure the quality of goods and services, protect the interests of consumers and producers and operators, and promote the development of the socialist market economy.

ANALYSIS OF TRANSLATION ANXIETY AND RELIEF METHODS OF TRANSLATORS

Yanming Ren

The Faculty of Foreign Languages, Zhoukou Normal University, Zhoukou 466001, China

SUMMARY

Background: In recent years, more and more international enterprises flood into China. The relevant English materials, websites, and software need translation and result in a huge market. Translators often encounter certain obstacles in the process of translation and feel psychological anxiety. It is very detrimental to the translations the translators' physical and mental health. This study investigates and analyzes the status quo and causes of translation anxiety of professional translators for appropriate solutions.

Subjects and methods: 55 professional translators from Henan Province participated in the experiment. The subjects were divided into five groups, with 11 people in each group. The four experimental groups adopted different methods to relieve translation anxiety respectively including physical therapy, music therapy, relaxation therapy, and positive behavior. The control group did not receive any treatment. SAS standard scores of each group were tested before and after the experiment, and SPSS 24.0 was used for data analysis.

Results: Physical therapy, music therapy, and relaxation therapy can significantly improve translation anxiety. Positive behavior also has a good effect on the improvement of translators' anxiety, but the significance level is lower than the above three methods ($t_4 = 4.923, P_4 < 0.01$).

Conclusions: In terms of relieving translation anxiety, physical therapy has the best effect. While regarding the stability of the effect, music therapy is the best. It is recommended to choose physical exercise or music therapy to relieve translation anxiety.

INTRODUCTION

In recent years, with the continuous development of economic globalization, the demand for information exchange has continued to increase. There are more and more demands of international companies for relevant translations of English materials, websites, and software. International trades, technical exchanges, and cultural exchanges have become more frequent. Such factors have formed a huge translation market (Muies et al. 2011). In 2012, the total global output value of translation was about 33.5 billion US dollars, of which Europe and North America accounted for the largest proportion of 49.38% and 34.85% respectively (Krajcso 2018). At the end of 2015, the translation market value was estimated at US \$ 47.3 billion, an increase of about 40% compared to 2012 (Chan & Liu 2013). In China, translation services also have the characteristics of high output value and high growth rate. According to *China Language Service Industry Development Report 2012* published by the China Translators Association and the China Translation Industry Development Strategy Research Institute, by the end of 2011, the total production value of translation services created in China is about 157.6 billion yuan. Based on the data provided by the China Translators Association, there are currently about 1.19 million translation professionals in China, and 29372 companies provide translation services.

Anxiety is characterized by excessive and persistent pressure and worries about daily trifles. It is spiritually

manifested as excessive worry and fear of uncertain events, including worries about family illnesses, mistakes at work, minor financial problems, relationships, etc. This is often called anticipatory anxiety with various contents. Anxiety can be accompanied by insomnia, dreaminess, difficulty in concentration, reduced work efficiency, irritability, restlessness, and other symptoms (Rudaizky & MacLeod 2014). Translation anxiety refers to the fear and behavior of translators during the conversion of two languages. It is one of the important factors affecting the emotional change of translators (Weiner et al. 2015). In the process of Chinese-English translation, translators may feel psychological anxiety due to some translation obstacles. This latent unhealthy state is extremely detrimental to translation activities and has serious adverse effects on translators' physical and mental health (Vieira 2020). This study investigates and analyzes the status quo and causes of translation anxiety of professional translators for appropriate solutions.

SUBJECTS AND METHODS

Survey method

In this study, the main factors causing anxiety in translators were collected through online questionnaires. A total of 3,000 questionnaires were distributed and 1,992 were recovered with a recovery rate of 66.4%. After the invalid questionnaires were excluded, there were 1,820 valid ones with an effective rate of 91.4%.

Invalid questionnaire: the answer time does not exceed 20 seconds, and the repeated choices exceed 80%.

Questionnaires

(1) How much anxiety does your current English language basic knowledge (vocabulary and grammar) cause in the translation process?

(2) How anxious does the background knowledge of the subject cause in translation?

(3) How much anxiety does your current language comprehension and expression ability cause in translation?

(4) How much anxiety do your basic translation skills cause in translation?

(5) Whether your technical mastery of translation tools have an impact on translation anxiety?

(6) How much anxiety does the social, cultural, and historical knowledge cause in translation?

(7) To what extent do translation strategic factors (planning, evaluation, and formulation steps) affect your psychological anxiety in translation?

(8) How do interest, attention, and curiosity affect translation anxiety?

(9) What is the impact of workload on translation anxiety?

(10) What is the impact of teamwork ability on translation anxiety?

The answers for each question are rated at five levels: "Very high", "High", "Average", "Low", and "Almost no impact".

Psychological scale

Self-rating Anxiety Scale (SAS), compiled by W.K. Zung, is a measure for anxiety assessment. It is a psychological scale used to measure the severity of anxiety and its changes in the course of treatment. At present, the scale has become one of the most commonly used psychological measurements by counselors, psychologists, and psychiatrists (Dunstan & Scott 2020).

SAS uses a 4-level scale, which mainly evaluates the frequency of symptom occurrence defined by the following criteria: "1" for seldom; "2" usually; "3" sometimes; "4" always ("1", "2", "3" and "4" refer to the score). The main statistical indicator of SAS is the total score. After self-evaluation of the subjects, the scores of the 20 items are added together and then multiply by 1.25 to get an integer. This integer would be the standard score. The same conversion can be referred to in the "rough score standard score conversion table". The higher the standard score, the more severe the symptoms (Olatunji et al. 2006). In general, an anxiety score below 50 is normal; 50 to 60 is mild, 61 to 70 is moderate, and over 70 is severe. The number of negative items indicates how many items the subjects do not respond to, and the number of positive items indicates how many items the subjects do respond

to (Ramirez & Lukenbill 2008).

Experiment design

Fifty-five professional translators from Henan Province participated in the experiment, including 26 males and 29 females. All subjects were informed and consented to the research background and research protocol. Fifty-five subjects were divided into five groups, with 11 in each group. The four experimental groups adopted different methods to relieve translation anxiety respectively including physical therapy, music therapy, relaxation therapy, and positive behavior. The control group did not receive any treatment. SAS standard scores of each group were tested before and after the experiment, and SPSS24.0 was used for data analysis.

Relief methods

Physical therapy studies have found that exercise can promote endocrine changes in human bodies. The brain produces substances called endorphins after exercise, and human mood is related to the number of endorphins secreted by the brain. (Bourbeau et al. 2020). Exercise can stimulate the secretion of endorphins. With certain exercise, the secretion of endorphins increases. Under the stimulation of endorphins, the human body and mind would be in a relaxed and happy state. Endorphins are therefore also known as "pleasure hormones". They can make humans happy and satisfied, and help to relieve stress and unhappiness. In this experiment, subjects take exercises 3-4 times a week for 40 minutes each time (Mircea 2013).

Music therapy is an emerging approach. Based on the theory and method of psychotherapy, music therapy is to enable the subjects to experience a variety of specially designed music appreciations with the joint participation of music therapists. Its purpose is to eliminate psychological barriers, restore or enhance physical and mental health (Matokhniuk et al. 2021). In this experiment, the method of pure listening therapy was adopted.

Relaxation training has a good anti-stress effect. In a relaxed state, sympathetic nerve activity is reduced, manifested as a decrease in systemic skeletal muscle tone. This refers to muscle relaxation, a slowdown in breathing rate and heart rate, a decrease in blood pressure, a feeling of warmth in the limbs, a clear mind, a relaxed and happy mood, and a comfortable feeling in the whole body. At the same time, it strengthens the active function of the parasympathetic nervous system and promotes the secretion of anabolism and related hormones. Through the regulation of nerve, endocrine, and autonomic nervous systems, relaxation therapy can affect all aspects of the body functions, so as to achieve the purpose of improving physical and mental health and preventing and curing diseases.

Active behavior. This method is not specific to psychological therapy but refers to the positive

behaviors that the translator completes the translation task through positive actions such as seeking help and strengthening communication with others.

RESULTS

The statistical results of translation anxiety factors of 1820 valid questionnaires are shown in Figure 1. It can be seen that three factors have the most serious impact on the anxiety of translators including the master of background knowledge related to the topic; knowledge of society, culture, and history; and the workload. Academic articles are often more difficult to translate, especially the professional terms and vocabulary (Kaspere & Motiejuniene 2021). In addition, translators without related backgrounds may find it difficult to understand the specialized knowledge and experimental methods involved. In such translations, translators may spend more time looking up related materials. Even so, it is difficult to ensure the professionalism of the translation. This situation can cause great psychological anxiety (LeBlanc 2017). Lack of knowledge about society, culture, and history is another problem in translation. It is difficult for translators to master the cultural and historical backgrounds in different countries, which leads to great psychological pressure when they meet relevant tasks. Finally, an excessive workload can cause great psychological stress for translators all the time. (Lopez et al. 2021).

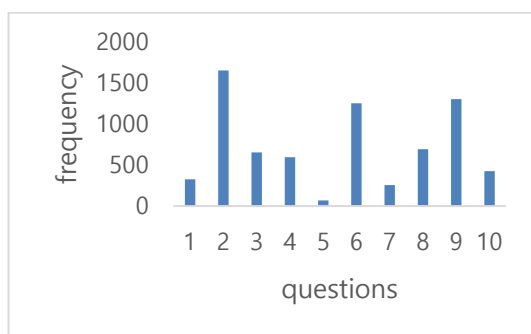

Figure 1. Results of translation anxiety factors among 1,820 professional translators

The translation tools and translation strategies at present rarely lead to translation anxiety. This shows that most translators can use network tools proficiently in their work. At the same time, most translators can complete the planning and evaluation of translation tasks.

Fifty-five subjects were divided into five groups, 11 in each group. The four methods of physical therapy, music therapy, relaxation therapy, and positive behavior were used to relieve translation anxiety. The control group did not do any treatment.

Fifty-five subjects were divided into five groups, with 11 in each group. The four experimental groups adopted different methods to relieve translation anxiety respectively including physical therapy, music therapy, relaxation therapy, and positive behavior. The control group did not receive any treatment. SAS standard scores of each group were tested before and after the one-month experiment, and SPSS24.0 was used for data analysis. The data descriptive statistics of each group before and after the experiment are shown in Table 1, and the *t*-test results of each group before and after the experiment are shown in Table 2.

According to the data in the tables, physical therapy, music therapy, and relaxation therapy can significantly improve the translator's translation anxiety ($t_1 = 15.849, P_1 < 0.001; t_2 = 16.193, P_2 < 0.001; t_3 = 10.674, P_3 < 0.001$). Positive behavior also has a good effect on the improvement of translator anxiety, but the significance level is lower than the above three therapies ($t_4 = 4.923, P_4 < 0.01$). There is no significant difference between the translators in the control group after the experiment ($t_5 = 0.083, P_5 > 0.05$). According to Table 2, it can be seen that $M_1 > M_2 > M_4 > M_3, S_4 > S_1 > S_3 > S_2$. This shows that physical therapy has the best effect on the relief of translation anxiety. Its SAS standard score tested after the experiment is significantly larger Lower, followed by music therapy. Positive behavior and relaxation therapy come third and fourth. In terms of the stability of efficacy, music therapy is the best, physical therapy, relaxation therapy, positive action is the second, third and fourth respectively.

Table 1. Descriptive statistics of each group before and after the experiment

		Minimum	Maximum	Mean	Std. deviation	Variance
Physical therapy	Before the experiment	56	70	62.73 ± 1.81	6.002	36.018
	After the experiment	42	62	51.36 ± 2.16	7.173	51.455
Music therapy	Before the experiment	59	72	66.27 ± 1.21	4.027	16.218
	After the experiment	49	65	59.09 ± 1.48	4.908	24.091
Relaxation therapy	Before the experiment	56	72	64.64 ± 1.70	5.626	31.655
	After the experiment	51	66	59.18 ± 1.59	5.269	27.764
Positive behavior	Before the experiment	55	75	65.36 ± 2.13	7.061	49.855
	After the experiment	45	73	59.55 ± 2.72	9.015	81.273
Control group	Before the experiment	57	75	63.73 ± 1.81	6.002	36.018
	After the experiment	58	74	63.67 ± 1.77	5.884	34.618

Table 2. *t*-test results of each group

	M	Std. deviation	Std. error mean	95% CI		<i>t</i>	Sig. (2-tailed)
				Lower	Upper		
Physical therapy	11.364	2.378	0.717	9.766	12.961	15.849	0.000
Music therapy	7.182	1.471	0.444	6.194	8.170	16.193	0.000
Relaxation therapy	5.455	1.695	0.511	4.316	6.593	10.674	0.000
Positive behavior	5.818	3.920	1.182	3.185	8.451	4.923	0.001
Control group	0.061	1.183	0.357	-0.776	0.795	0.083	0.923

CONCLUSIONS

According to the data, item 2 (the background knowledge of the subject), item 6 (the social, cultural, and historical knowledge), and item 9 (workload) have the most serious impact on the anxiety of translators. Currently, the translation tools and translation strategies seldom lead to translation anxiety (Zou 2015). Translators' basic English language knowledge, language understanding and expression ability, basic translation skills, teamwork ability, attention and curiosity, and other related abilities may cause different effects on translation anxiety (Martiny et al. 2011).

In the experiment, physical therapy, music therapy, relaxation therapy, and positive behavior all show a certain degree of anxiety relief effect. Among the four methods, physical therapy relieves anxiety most obviously. After the experiment, the mean value of the SAS standard score in the experimental group is reduced to 51.36 ± 2.16 . Its experimental individuals generally return to a state of no anxiety or mild anxiety. The related effect of relaxation therapy is relatively weak. After the experiment, the mean value of the SAS standard score of the experimental group was reduced to 59.18 ± 1.59 . Meanwhile, music therapy has the most stable effect, and positive behavior has the worst stability. This indicates that some translators can solve anxiety problems better by seeking help and other means, while some translators are not good at this method. The individual differences are large. Taking the experimental results into consideration, it is suggested to alleviate translation anxiety through physical exercise or music therapy (Contreras-Molina et al. 2021). The four methods to relieve translation anxiety listed in this study are all common and practicable solutions for translators to self-heal under limited conditions. Moreover, if the anxiety problem is too serious to self-regulate, it is still necessary to seek timely help from professional psychologists.

RESEARCH ON GENERALIZED ANXIETY IN THE CONTEXT OF THE COVID-19 PANDEMIC—TAKING IDEOLOGICAL AND POLITICAL EDUCATORS AS AN EXAMPLE

Ying Men

School of Marxism, Bengbu University, Bengbu 233030, China

SUMMARY

Background: Affected by the rapid spread of the COVID-19 pandemic, teachers have experienced extremely general anxiety or depression. This article takes ideological and political educators as an example to study the generalized anxiety problem in the context of the COVID-19 pandemic from a demographic perspective. The influencing factors are analyzed and mitigation strategies are proposed accordingly.

Subjects and methods: A total of 231 ideological and political educators from different colleges or middle schools in Anhui Province of China were selected and the survey was carried out through online questionnaires. Using SPSS26.0 as the tool, the Chi-square test and cross-analysis were conducted to study the influencing factors of anxiety of ideological and political educators.

Results: The age factor was significantly correlated with anxiety at the 0.001 level ($\chi^2 = 33.067, P < 0.001$). The gender factor was significantly correlated with anxiety at the 0.01 level ($\chi^2 = 11.591, P < 0.01$). The highest educational level was associated with anxiety at the 0.01 level. There was a significant correlation at the 0.001 level ($\chi^2 = 22.653, P < 0.001$). There was a significant correlation between physical health and anxiety at the 0.001 level ($\chi^2 = 22.653, P < 0.001$). The degree of attention to the pandemic also significantly affected the level of individual anxiety ($\chi^2 = 46.430, P < 0.001$).

Conclusions: This study conducted a survey analysis of 231 ideological and political educators in different universities or middle schools in Anhui Province of China. The results show that factors such as age, gender, highest education, health, and attention to the pandemic will all affect the anxiety level of individuals. Therefore, educators should combine their own conditions and determine whether professional psychological counseling is needed according to the severity of anxiety.

Key words: COVID-19 - anxiety - ideological and political education - educators

INTRODUCTION

General anxiety disorder (GAD), a type of anxiety disorder, is a chronic psychiatric disorder characterized by extensive and excessive worrying about life events (Belon 2019). Such patients often live in a relatively continuous state of tension, worry and anxiety. The core feature of it is chronic, persistent and uncontrollable worry. The patient is excessively worried about economic, family, health, future and other things that are difficult to control. Most are accompanied by nonspecific psychological and physical symptoms (Deacon et al. 2008). This persistent excessive worry is beyond the control of the individual, as this uncontrollability is precisely one of the reasons for the formation of generalized anxiety disorder (Stefan et al. 2020). The latest research on the burden of mental disorders and health service utilization in China shows that among all types of mental disorders, anxiety disorders have the highest prevalence, with a lifetime prevalence of 7.6% and a 12-month prevalence of 5.0%.

Affected by the rapid spread of the COVID-19 pandemic, the ministry of education issued the “Guiding Opinions on Doing a Good Job in the Organization and Management of Online Teaching in Ordinary Colleges and Universities during the Period of Epidemic Prevention and Control” in February 2020. It is required to adopt a government-led, college-based, and socially involved approach to jointly implement

and ensure online teaching in colleges and universities during the epidemic prevention and control period, so as to achieve “suspended classes without stopping teaching, and suspended classes without stopping learning” (Ang et al. 2021). The guiding opinions emphasize that colleges and universities should choose the plan that matches the actual situation of the school and the network environment conditions and closely cooperate with the course platform to standardize management and strengthen the supervision of course content, teaching process and platform operation, which will facilitate to prevent and stop the spread of harmful information and guarantee online teaching is running safely and smoothly. Although online teaching, “Internet + education”, live classes and other teaching modes have been carried out for many years (Saiyad et al. 2020), this is the first time that conventional offline teaching content has been transferred to online on a large scale nationwide. Due to lack of experience, many teachers are not familiar with the online teaching process, and lack experience in dealing with some unexpected situations, such as network freezes, screen sharing, audio and video switching, etc. (Beason-Abmayr et al. 2021). Coupled with the lack of on-site communication and interaction in offline teaching, teachers cannot make judgments based on students’ real-time lectures and adjust the rhythm of teaching. All kinds of situations have led to teachers’ frustration in

teaching (Pressley & Learn 2021). In addition, during the outbreak of COVID-19, government departments required people from all walks of life to live at home by self-isolation. During the process of home isolation, teachers' face-to-face interactions with the outside world also decreased (Khoshaim et al. 2020). Although it is possible to use online platforms or telephones to communicate with family members and friends through video, voice, text and other means, in the process of emotional communication between people, images, words, sounds and other content are far less easily perceived than face-to-face contact. This has led to many teachers experiencing a decline in interpersonal relationships during the outbreak of the COVID-19 pandemic, which indirectly has adverse effects on mental health (Asl 2021).

In addition to teaching tasks, teachers also undertake a lot of non-teaching tasks. In 2017, the New Education Research Institute released a survey report on "reducing teachers' non-teaching work", which pointed out that the time teachers really spend on teaching and related preparation accounted for less than 1/4 of the entire working time, and the remaining 3/4 is a more time-consuming and labor-intensive non-teaching task. Cumbersome non-teaching transactional work consumes a lot of teachers' energy (Lyneham et al. 2008). In 2019, the China Association for Teacher Education Development analyzed through interviews and questionnaires that 32.4% of the teachers surveyed felt very stressed at work. 72% of teachers suffer from mental illness in Central Asia, of which 61.2% of primary and secondary school teachers have symptoms of anxiety, manifested as poor social adaptability, interpersonal tension, narrow-mindedness, self-isolation, emotional instability, full of complaints, too low self-esteem or conceited et al (Mkhize 2019). The outbreak of the COVID-19 pandemic has caused extremely general anxiety or depression among teachers who belong to a group with a high incidence of psychological problems. Taking ideological and political educators as an example, this paper studies the generalized anxiety problem in the context of the COVID-19 pandemic, analyzes its influencing factors from a demographic perspective and proposes mitigation strategies accordingly.

SUBJECTS AND METHODS

Questionnaire

A total of 231 ideological and political educators from different colleges or middle schools in Anhui Province of China were selected and the survey was conducted through online questionnaires (Questionnaire Star). A total of 231 questionnaires were distributed, 195 valid questionnaires were recovered, and 190 valid data were obtained after excluding the samples whose answering time was less than 30 seconds, with an effective rate of 82.25%. The content of the questionnaire includes basic information such as

age, gender, highest education, physical condition, and the frequency of patients' attention to the pandemic. The GAD-7 Generalized Anxiety Scale is attached at the end. Using SPSS26.0 as the tool, Chi-square test and cross analysis were conducted to study the anxiety status and influencing factors of ideological and political educators.

Psychological scale

The GAD-7 Generalized Anxiety Scale is one of the most concise and effective ways to assess generalized anxiety disorder in clinical practice. The seven items were: (1) feeling restless, worried and irritable; (2) unable to stop or control worrying; (3) worrying about many different things; (4) very nervous and difficult to relax; (5) Very restless to sit still; (6) becomes easily annoyed or irritated; (7) feels as if something terrible is about to happen. Each item is 0-3 points, and the result is calculated by total score, that is, the scores of seven items are added together, and the total score range is 0-21 points. Among them, 0-4 points represents no anxiety, 5-9 points mild anxiety, 10-13 moderate anxiety, and 14 points and above moderate to severe anxiety symptoms.

RESULTS

Statistical and summary questionnaire data were obtained, and the demographic characteristics of the sample population were obtained as shown in Table 1.

The question options of the demographic questionnaire were used as the grouping basis and the anxiety level was used as the measurement state. The frequency is set as the basis for case weighting. Using SPSS26.0 for case weighting, the Chi-square test is selected in the statistical items to perform cross-tab analysis. Taking the age factor as an example, the results of the Chi-square test are shown in Table 2. However, since the subjects of this survey are distributed in multiple age groups, in order to study whether there are differences in anxiety among different age groups, SPSS26.0 was used to perform the *t*-test. The *P* value was adjusted using the Bonferroni correction, and the cross-analysis results are shown in Table 3. Similarly, data on gender, highest education, physical condition, and frequency of attention to the epidemic were handled in the same way. The results are shown in Tables 4 to 10.

According to Table 2 and Table 3, the age factor was significantly correlated with anxiety at the 0.001 level ($\chi^2 = 33.067, P < 0.001$). In each age group, there was no significant difference in anxiety levels between individuals aged 30-45 and 46-59. The anxiety levels of 20-29 years old, 30-59 years old, and 60 years old and above are significantly different. In contrast, young teachers of 20-29 years old are more likely to be affected by the epidemic and have anxiety problems. According to Table 4, there is a significant correlation between gender and anxiety at the 0.01 level ($\chi^2 =$

11.591, $P < 0.01$). The anxiety index of women is higher than that of men, which indicates that women are more easily affected by the pandemic and become anxious. This result is consistent with existing research. According to Table 5 and Table 6, there is a significant correlation between the highest degree of education and anxiety at the 0.001 level ($\chi^2 = 22.653$, $P < 0.001$). According to the cross-analysis results, there is no significant difference in the degree of anxiety between the undergraduate degree and the master degree. Individuals with a doctorate or above have lower

anxiety levels than those with a bachelor's degree or a master's degree. According to Table 7 and Table 8, there is a significant correlation between physical condition and anxiety at the 0.001 level ($\chi^2 = 22.653$, $P < 0.001$) and individuals with good health condition are less susceptible to anxiety problems. According to Table 9 and Table 10, the degree of attention to pandemic will also significantly affect the level of individual anxiety ($\chi^2 = 46.430$, $P < 0.001$). From the statistical data, individuals who pay more attention to the pandemic are more likely to suffer from the pandemic.

Table 1. Demographic characteristics of the sample population

Items	Options	Frequency	Percentage (%)	Percentage of patients with anxiety (%)
Gender	Male	102	54	41
	Female	88	46	66
Age	20-29	33	17	88
	30-45	68	36	60
	46-59	52	27	40
	60 and above	37	19	24
Highest degree of education	Bachelor's degree	32	17	63
	Master's degree	101	53	64
	PhD degree and above	57	30	26
Physical condition	Healthy	46	24	24
	Not bad	109	57	51
	Poor	35	18	94
Frequency of attention on pandemic	Occasionally	6	3	0
	Generally	120	63	38
	Frequently	51	27	84
	Always	13	7	92

DISCUSSION

The COVID-19 pandemic is a major public health emergency, and the work and life of ideological and political educators will be affected to varying degrees, usually with psychological reactions such as panic, excessive anxiety, and irritability (Shafran et al. 2021). Some individuals will pay too much attention to the body, repeatedly check information about the epidemic on the Internet, excessively wash hand and protect themselves, and even go through panic attacks. The emotional stress response is physiologically manifested as dizziness, headache, indigestion, insomnia and other discomforts Symptoms (Warren et al. 2021). Most people's psychological stress response will gradually ease as the epidemic is controlled, but if the response is excessive or persistent, it often leads to irrational behavior (Elhai et al. 2020).

For anxiety situations that have arisen, educators should combine their own circumstances and determine whether professional psychological counseling is needed according to the severity of anxiety (Mennin et al. 2000). Existing statistical data show that most patients with pandemic anxiety are moderately to mildly anxious. Anxious patients need to be treated with appropriate means under the advice of a psychiatrist. Currently, commonly used psychotherapy methods include Hypnotherapy, Psychodynamic Methods, Sandbox Therapy, Painting Therapy, Music Therapy, Gestalt Therapy, and Rational Emotion Therapy (Rational-Emotive Therapy), Morita Therapy, etc. (Jablonka et al. 2012).

CONCLUSIONS

This study conducted a survey analysis of 231 ideological and political educators in different

universities or middle schools in Anhui Province of China. The results show that factors such as age, gender, highest degree of education, health level, and attention to the pandemic will affect the level of anxiety of individuals. In general, young teachers are more prone to anxiety, women are more anxious than men, teachers with doctoral degrees or above have lower levels of anxiety, and health has a great impact on anxiety. Among individuals with poor physical condition, 94% said they were affected by anxiety. Anxiety is also related to the level of attention to the epidemic, and individuals who are overly concerned about the pandemic are most affected by anxiety (Nowakowski et al. 2016).

This study also has certain limitations. The primary problem is the number of samples. It can be seen that the frequency of some questionnaire options is much lower than that of other options. Therefore, the analysis of such data will bring greater errors. In addition, the questionnaire used in the study has no norm reference, and the evaluation of anxiety is based on general scoring standards, and its accuracy is questionable. However, this study is mainly based on demographic analysis. The scale is sufficient to reflect the general anxiety level of ideological and political education practitioners.

IMPROVEMENT OF ENGLISH TEACHING FROM THE PERSPECTIVE OF EDUCATIONAL PSYCHOLOGY

Wei Zhang

School of Foreign Languages, Chang'an University, Xi'an 710061, China

SUMMARY

Background: Educational psychology is the product of the theory integration of contemporary education and psychological science, aiming at handling contradictions between subjects engaged in teaching and learning activities. Currently, with the integration and development of multi-cultures, college students' bodies and minds are impacted by various viewpoints and factors, which makes college students face greater resistance to learning. Therefore, using innovative teaching methods in educational psychology is not only an inherent need to reform the educational model, but also an inevitable requirement to promote students' lifelong development.

Subjects and methods: This paper explores the influence of using educational psychology on English teaching from the perspective of cognitivism, behaviorism, and constructivism. The Foreign Language Classroom Anxiety Scale and the Academic Self-efficacy Scale are used as survey tools. A university in Shaanxi Province is selected as the experiment pilot with the use of educational psychology. The statistical tool SPSS27.0 is used to perform descriptive statistics and t-tests on the data.

Results: Before and after the experiment, the anxiety level of the foreign language classroom in the experimental group has a significant change ($t = 7.249, P < 0.001$), with the average score of anxiety decreasing from 104.690 to 81.448. The academic self-efficacy of the experimental group is significantly different ($t = -3.895, P < 0.01$), with the average score of academic self-efficacy increasing from 62.241 to 72.069. There is no significant change in the control group.

Conclusions: The English teaching model using educational psychology can significantly reduce foreign language anxiety of college students, increase their academic self-efficacy, and benefit their lifelong development.

Key words: educational psychology - English teaching - classroom anxiety - self-efficacy

* * * * *

INTRODUCTION

Educational psychology is a branch of psychology, which studies the psychological activities of educators and the educated, as well as generation and change in psychological activities during the process of education. (Spinath et al. 2012). Educational psychology has a dual-task with two natures, both pedagogy, and psychology. Educational psychology researches and reveals the nature, characteristics, and types of learning in the educational system, as well as various learning processes and conditions, thereby psychology is developing both in scope and depth in the education field (Richter et al. 2020). The particularity of research objects in educational psychology determines that it is closely related to learning and teaching practice, so it has great significance in the application. Some people also think it is an applied discipline (Toland & Carrigan 2011). On the other hand, the theoretical research and construction of educational psychology are continuously developed during the process of education service and teaching practice. A relatively complete subject theoretical system comes into being with various learning and teaching theories, so educational psychology is also recognized as a highly theoretical discipline (Schad & Arnold 2019).

As an indispensable discipline in the modern education industry, educational psychology is an important way to study the relationships between

education and psychological education, ideological education and moral education, as well as behavior and habits in the context of education in the new era (Greig et al. 2019). To a certain extent, educational psychology can help teachers improve the quality and effect of teaching activities, as well as better understand students, teaching laws, and teaching purposes in universities. Then, teachers may constantly adjust the teaching methods to help students adjust their learning status. On this basis, students could improve learning efficiency and grow rapidly (Hilpert & Marchand 2018).

In the era of the knowledge economy and Internet economy, a second language is becoming more and more important. Meanwhile, there exist obvious problems in acquiring and teaching a second language. In China, anxiety is common among students who are learning English (Fydrich et al. 2019). Jakobofits points out that emotional factors account for 33% of all factors affecting language acquirement, and anxiety is regarded as one of the most critical psychological variables. Anxiety is one of the abnormal emotions, also known as psychological abnormalities. It generally refers to the emotional reflection generated by people when there appears serious deterioration in the value of characteristics of reality or future things. The emotional reflection may frustrate a person's self-esteem and self-confidence, or aggravate his or her sense of failure and guilt so that he or she becomes nervous and fearful. The anxiety for learning a foreign

language can be subdivided into three interrelated language-behavioral anxiety, namely communication fear, test anxiety, and negative evaluation fear. Communication fear is a kind of shyness, which mainly features that a person may feel fearful when communicating with others. Test anxiety is a kind of language-behavior anxiety expressed by a person when he or she is fear of failure. Negative evaluation fear refers to a kind of anxiety, including the fear of others' evaluation, the avoidance of evaluation situations, and the psychological expectation for possible negative evaluations. Foreign language anxiety is not a simple combination of the above kinds of fears. Rather, it is a combination of a person's self-feeling, concept, emotion, and behavior related to the foreign language classroom, caused by the uniqueness of foreign language learning. (Zhao 2012). This study attempts to explore the specific application of educational psychology in teaching and to evaluate its role in English teaching through comparative experiments.

SUBJECTS AND METHODS

Educational psychology applications

In the development of educational psychology, three paradigms have a great influence on it, namely cognitivism, behaviorism, and constructivism.

Cognitivism theory of learning, derived from the cognitivist learning theory of the Gestalt school, reckons that learning lies in the change of internal cognition, and learning is a much more complex process than the S-R connection. The theory focuses on explaining the intermediate process of learning behavior, like purpose and meaning, and advocating the creation of human learning and an inquiry-based approach. It requires students to observe, explore and experiment by themselves, to develop their creative spirit. Students need to think independently, reorganize materials, discover knowledge, and master principles by themselves. Cognitivism theory of learning emphasizes developing students' intellectual potential, regulating and strengthening their learning motivations, firmly grasping knowledge, and forming innovative skills through discovery learning (Alexander 2018).

Behaviorist learning theory, also known as stimulus-response theory, means that human thinking is the result of interacting with the external environment, namely stimulus-response, and the direct connection between stimulus and response is called reinforcement (Gonzalez et al. 2019). The essence of learning is to establish a direct connection between stimulus and response through reinforcement. In behaviorist teaching programs, the program must be behaviorist-oriented (Tomic 1993). Throughout his work, Skinner has identified some general guidelines for improving teaching based on behavioral principles. First, know what to teach. Second, start from the easiest. Third, encourage students to progress at their

own pace. Fourth, identify the project theme. Fifth, construct the content appropriately during the learning process, depending on the presentation (stimulus-response-result) instead of only on its complexity or abstraction. Sixth, provide reinforcements for students when answering questions. Seventh, set realistic goals together with students, as big goals may discourage them and small goals may bore them.

Specifically, English teachers should set up achievable and progressive goals one after another in each class according to the learning progress of students. Positive stimulation should be given in due course to help students achieve the most ideal learning effect. In addition, behaviorism holds that people are good at observational learning and learning by imitation. The role model may be a teacher or any peer the student expects to learn from. Imitation learning may have good effects whether the imitation subject is the skills or attitudes of the role model. Meanwhile, English teachers should encourage teamwork to make sure that each student can meet their expectations and students can obtain support from peers around them. Teachers should also ensure that students will engage in active learning when they see positive behavior from role models, which in turn can actively internalize learning outcomes and seek cooperation among peers. By doing so, teachers can reach a higher teaching efficiency and achieve sustainable progress (Imenda 2018).

From the perspective of constructivism, instead of depending on the teacher's classes, learners may obtain knowledge with the help of necessary learning materials and others, including teachers and learning partners. They may acquire new knowledge through meaning construction within a certain context, namely social and cultural background (Schweitzer & Stephenson 2008). Learning is a process of meaning construction achieved with the help of others, namely interpersonal collaborative activities, under a certain situation, namely a social and cultural background. Therefore, the cognitivism theory of learning believes that there are four major elements or attributes in the learning environment, namely situation, collaboration, conversation, and meaning construction (Brcic et al. 2015). Constructivism advocates learner-centered learning under the guidance of teachers, that is, it not only emphasizes the cognitive subject role of learners but also attaches importance to the guiding role of teachers. Teachers are helpers and facilitators of meaning construction, instead of imparters and installers of knowledge. Students are the main subject of information processing and the active builder of meaning, rather than passive recipients and indoctrinated objects of external stimuli. Students need to become active meaning constructors (Kosnik et al. 2018).

Specifically, English teachers should pay attention to helping students construct meaning, stimulating

students' interest in English learning, and cultivating students' learning motivation in English. They could help students construct the meaning of English knowledge through certain situations that meet the requirements of teaching content and through clues that indicate the connection between new and old knowledge. To make sense construction more effective, teachers should organize collaborative learning, such as discussion and communication, under possible conditions. They could also guide the collaborative learning process to make it develop in a direction conducive to meaning construction. The guidance methods include three aspects. First, provide appropriate questions to arouse students' thinking and discussion. Second, gradually deepen the discussion of the problem to strengthen students' understanding of what they have learned. Third, inspire and guide students to discover laws, correct and supplement mistakes or one-sided understanding by themselves. (Kosnik et al. 2018).

Cognitivism, behaviorism, and constructivism have their emphases and can be used as guiding theories in English teaching. This study comprehensively uses the above three paradigms.

Scale selection

Foreign Language Classroom Anxiety Scale (FLCAS)

Reasons for selection: A large number of anxiety experiences will interfere with the input, output, and learning process of foreign language learning, which may affect foreign language learning and further disintegrate learners' self-confidence. Unscientific education models will contribute to the severity of foreign language anxiety. Therefore, this study selects this scale as one of the evaluation indicators (Bjalkebring 2019).

The FLCAS scale is compiled by Horwitz. The scale has 38 items, and the answer to each item is divided into 5 levels, including 1 Completely Disagree, 2 Seldom Agree, 3 Part agree, 4 Basically Agree, and 5 Completely Agree. The five levels are scored from 1 to 5 points respectively. This study adopts the questionnaire survey method, inputs the data into the computer, and uses the SPSS27.0 software for processing.

Academic Self-efficacy Scale

Reasons for selection: The concept of self-efficacy is proposed by the famous American psychologist Bandura in 1977, which refers to an individual's perception or belief of the ability to effectively control all aspects of his life (Schutte & Malouff 2016). It is the central mechanism of human motivation and an important basis of human actions. People accept and integrate efficacy information from the mastery experience of practice, vicarious experience, verbal persuasion, and physiological and emotional states during activities to form the self-efficacy sense.

Self-efficacy modulates human activity by affecting individual cognitive, motivational, emotional, and choice processes (Nel & Boshoff 2016). Learning self-efficacy refers to an individual's belief in academic ability, a subjective judgment of an individual's ability to control his learning behavior and academic performance, and the performance of self-efficacy in the learning field. There are very close relationships among learning self-efficacy and attribution, goal setting, learning interest, learning and test anxiety, self-regulation, and other important learning variables. Researches show that appropriate education methods can significantly improve students' academic self-efficacy. Therefore, this study adopts this scale as one of the evaluation indicators (Stojanovic et al. 2021).

The Academic Self-Efficacy Scale is compiled by Liang Yusong and Zhou Zongkui from Central China Normal University, concerning the relevant dimensions of the Academic Self-efficacy Questionnaire compiled by Pintrich and De Groot. The overall Cronbach's alpha coefficient of the questionnaire is 0.88, among which the Cronbach's alpha coefficient of the learning ability self-efficacy subscale is 0.82, the Cronbach's alpha coefficient of the learning behavior self-efficacy subscale is 0.75. The Academic Self-Efficacy Scale has five-level points and 11 items for each of the two factors, a total of 22 items. Among them, reverse score questions are 7, 11, 14, 20, and 22. The higher the total score or the two-factor score, the stronger the corresponding academic self-efficacy, and vice versa.

Research proposal

Two liberal arts classes in the second year of a university in Shaanxi are selected as the research subject. One class, as the experimental group, adopts the teaching method of educational psychology, and the other class, as the control group, adopts the normal teaching methods. The number of the experimental group is 29, including 12 males and 17 females. The number of the control group is 29, including 14 males and 15 females.

This research project conducts the test at the beginning (September 2021) and the end (January 2022) of the semester respectively to evaluate the teaching results under different education modes.

RESULTS

SPSS27.0 is used for the experimental data. The descriptive statistics of foreign language classroom anxiety are shown in Table 1, and the descriptive statistics of academic self-efficacy are shown in Table 2. The data on foreign language classroom anxiety before and after the experiment is tested by the *t*-test, and the results are shown in Table 3. The data on academic self-efficacy before and after the experiment is tested by the *t*-test, and the results are shown in

Table 4.

Table 1. Descriptive statistics of foreign language classroom anxiety

	1st test		2nd test	
	The control group	The experimental group	The control group	The experimental group
Range	46	48	50	38
Mean	104.276	104.690	103.862	81.448
Std. Deviation	13.926	14.619	13.781	11.005
Variance	193.921	213.722	189.909	121.113

Table 2. Descriptive statistics of academic self-efficacy

	1st test		2nd test	
	The control group	The experimental group	The control group	The experimental group
Range	37	39	37	27
Mean	64.138	62.241	59.103	72.069
Std. Deviation	11.889	11.122	11.226	7.755
Variance	141.337	123.690	126.025	60.138

Table 3. *t*-test on foreign language classroom anxiety

	M	S	<i>t</i>	<i>df</i>	<i>P</i>
The control group	0.414	22.011	0.101	28	0.920
The experimental group	23.241	17.266	7.249	28	0.000

Table 4. *t*-test on academic self-efficacy

	M	S	<i>t</i>	<i>df</i>	<i>P</i>
The control group	5.034	16.037	1.691	28	0.102
The experimental group	-9.828	13.586	-3.895	28	0.001

According to Tables 1-4, there is no statistical difference in the foreign language classroom anxiety of the control group ($t = 0.101$, $P = 0.92 > 0.05$), but significant difference in language classroom anxiety of the experimental group ($t = 7.249$, $P < 0.001$). The average anxiety score decreased from 104.690 to 81.448, which is significantly different from the average score of 103.862 in the control group.

Before and after the experiment, there is no statistical difference in the academic self-efficacy of the control group ($t = 1.691$, $P = 0.102 > 0.05$), but a significant difference in the academic self-efficacy of the experimental group ($t = -3.895$, $P < 0.01$). The average score of sense increased from 62.241 to 72.069, which is significantly different from the average score of 59.103 in the control group.

CONCLUSION

The experimental results of this study show that the English teaching mode using educational psychology can significantly alleviate students' foreign language anxiety and increase their academic self-efficacy, which is of great benefit to their life-long development. There are also some shortcomings in this experiment. According to Kleinmann's research, anxiety is not all

harmful to learning. He proposes that anxiety can be divided into two types, facilitating anxiety and debilitating anxiety. The former is conducive to learning, and the latter may hinder learning. However, the relationship between anxiety and learning is not sufficiently explored in the foreign language classroom anxiety scale in this study, which needs to be further supplemented in future research (Andreatta & Pauli 2017).

In the 21st century, educational psychology has achieved fruitful results, and the breadth and depth of research in this field are also increasing. The current research trends in educational psychology involve different aspects, including studying the subjectivity and initiative of learners, the influence of social environment, the actual influence of context, the influence of cultural background, the study of learning environment design and effective teaching model, and the study of the use of information technology and so on. Educators should establish the concept of lifelong learning, constantly explore the most cutting-edge academic areas to improve education methods. In addition, teachers should combine educational psychology theory with classroom practice, so that the education model in the new era will keep pace with the times, and then cultivate innovative talents for society.

RESEARCH ON THE EFFECT OF BASKETBALL ON MENTAL REHABILITATION OF DEPRESSED PATIENTS

Shun Shan¹, Pei Luo^{2*}, Haiting Xiao³, Xiaofen Ding¹ & Caifen Hu¹

¹Institute of Physical Education, Hunan First Normal University, Changsha 410205, China

²College of Physical Education, Hunan Normal University, Changsha 410012, China

³School of Physical Education, Huizhou University, Huizhou 516007, China

SUMMARY

Introduction: Statistics from the Global Health Data Exchange (GHDx) show that 5.0% of the adults in the world suffer from depression, especially among Chinese college students. According to the World Health Organization, a quarter of Chinese college students have admitted to having depressive symptoms. Studies have shown that aerobic exercise has a good therapeutic effect on depression. This paper takes basketball as an example to explore its effect on the mental rehabilitation of Chinese college students with depression.

Subjects and methods: The subjects were divided into four groups. Experimental group 1 received basketball therapy once or twice a week, experimental group 2 three to five times a week, and group 3 six or seven times a week. The study lasted for two months, and the BDI total score was tested once a week for a total of 9 tests. Then data analysis was performed using SPSS24.0.

Results: The BDI scores of the control group and the experimental group 1 were significantly different at the 0.01 level ($t = 5.526, P < 0.01$). The BDI scores of the control group and the experimental group 2 were significantly different at the 0.05 level ($t = 3.022, P < 0.05$). The BDI scores of the control group and the experimental group 3 were significantly different at the 0.05 level ($t = 2.0873, P < 0.05$). After the treatment with basketball exercise therapy, the patients' depression levels decreased significantly.

Conclusions: After treatment supplemented with basketball exercise therapy, it significantly improved the treatment effect of depression in patients. Under the condition of ensuring the amount of exercise, it has the most obvious improvement effect on depression when the patients play basketball three to five times a week or as much as possible.

Key words: basketball - sports - depression - treatment - mental rehabilitation - college students

INTRODUCTION

“Depression” in a broad sense refers to a large group of mental disorders collectively referred to as “mood disorders”. According to the Global Health Data Exchange (GHDx), 5.0% of adults worldwide suffer from depression. Depression is distinct from the usual mood swings and short-lived emotional responses to challenges in everyday life (Ionescu et al. 2013). Especially when depression recurs and reaches moderate or severe levels, it can become a serious health condition. Patients can be greatly affected, perform poorly at work, at school and at home, and at worst, depression can lead to suicide (Halbreich & Kahn 2007). So far, the cause of depression has not been very clear. However, it is certain that many aspects of biological, psychological, and social environmental factors are involved in the pathogenesis of depression. Biological factors mainly involve genetics, neurobiochemistry, neuroendocrine, and neurodegeneration. The psychological predisposition qualities that are closely related to depression are pre-morbid personality traits, such as depressive temperament (Goldberg 2014). Stressful life events in adulthood are important triggers for clinically significant depressive episodes. These factors do not act individually but have a very complex interaction (Ashaie et al. 2019).

During a depressive episode, the patient is depressed (feeling sad, irritable, empty) most of the day, almost every day for more than two weeks, and loses pleasure or interest in any activities. Other symptoms may include poor concentration, excessive guilt or self-deprecation, hopelessness about the future, thoughts of death or suicide, sleep disturbances, changes in appetite or weight, and feeling particularly tired or lacking energy (Parker & Roy 2001). Patients have significant difficulties in personal, family, social, educational, occupational, or other important functional areas. College students are in a necessary period of transition to maturity. Their physical, psychological, and social adaptation is in an important development period. On the one hand, students are immature and more malleable, on the other hand, they begin to move towards social and step into a complex social life (Gonzalez-Forteza et al. 2019). For these two reasons, young college students are prone to react strongly to many things but do not deal well with them, thus increasing their psychological burden and prone to a series of psychological and behavioral problems (Vieira et al. 2021). A survey by the China University Media Alliance found that 39.9% of the interviewed college students had suspected depression, and 34.38% of the respondents said that even if they suffer from depression, they would not choose to seek help from a psychiatrist. The World Health Organization has also pointed out that a quarter

of Chinese college students have admitted to having depressive symptoms (Liao et al. 2010).

The exact mechanism by which physical activity improves mental health is largely unknown, but so does psychotherapy and medication. Antidepressant therapy is likely to work due to a combination of effects, including changes in thought, emotion, and brain pathways, and may also have a placebo or desired effect (Monteiro et al. 2021). A study by the University of California found that intense exercise for half an hour to an hour can significantly increase the levels of neurotransmitters glutamate and GABA in the brain. Glutamate and GABA are the most common neurotransmitters in the brain and are important for signal communication between neurons in the brain (Koo & Kim 2020). The increase in these two neurotransmitters in the brain after exercise may also be one reason why exercise can treat depression. Aerobic exercise not only treats but also prevents depression, and even very small amounts of exercise (such as a 20-minute walk per day) can significantly prevent depression and can be effective in people of any age (Ashdown-Franks et al. 2017). By studying the therapeutic effect of basketball on patients with depression, this paper provides some references for the improvement and solution of depression among students.

SUBJECTS AND METHODS

Subjects

This study selected 84 undergraduates suffering from depression from a university in Hunan Province of China as the research subjects. All subjects were informed and consented to the research background and protocol.

Characteristics of subjects

By gender: 38 males and 46 females.

By grade: 35 freshmen, 23 sophomores, 19 juniors, and 7 seniors.

Scale

Depression self-rating questionnaire (BDI), also known as the Beck depression rating scale, was compiled by the famous American psychologist Beck AT in the 1960s and has been widely used in clinical epidemiological surveys (Hong & Wong 2005).

The BDI is composed of 13 items, and the corresponding symptoms are depression, pessimism, sense of failure, lack of satisfaction, self-guilt, self-disappointment, negative tendencies, social withdrawal, indecision, self-image changes, fatigue, loss of appetite. Items are scored in four grades, with no symptoms as 0; mild as 1; moderate as 2; severe as 3. Specifically for each item (question), there are 4 short sentences, and the subject is asked to choose the one that best matches

his mood or situation at the time. For example, the descriptive phrases for item 1 depression are: "0. I don't feel blue", "1. I feel blue or depressed", "2. I feel blue all day and I can't get rid of it", "3. I Feeling very depressed, I can't stand it anymore", the subjects need to choose one item from 0-3. The BDI has only two statistical indicators, a single score, and total score. Beck proposed that the presence and severity of depressive symptoms can be distinguished by a total score, 0-4: (basically) no depressive symptoms; 5-7: mild depression; 8-15: moderate depression; 16-39 points: severe depression (Svanborg & Asberg 2001).

Scale notes

1. Like other self-assessment scales, this scale requires the subjects to have a clear understanding of the assessment method before starting the assessment.

2. Be sure to emphasize the time frame of the assessment. This scale assesses the current (today or present) situation or mood.

3. Generally speaking, this scale is not suitable for illiterate and low-educated people.

4. The scale is completely anonymous.

Research process

The subjects were divided into four groups, the control group and the experimental group 1, the experimental group 2, and experimental group 3. According to the diagnosis results of psychiatrists, the control group was treated with normal depression treatment methods (such as drug treatment, etc.), and the experimental group was supplemented with basketball exercise therapy on the basis of normal treatment. Experimental group 1 was administered 1-2 times a week, 30-60 minutes of basketball exercise treatment each time. Experimental group 2 took 3-5 times a week, 30-60 minutes each time. Experimental group 3 took 6-7 times a week, 30-60 minutes each time. The study lasted for two months and the BDI total score was tested once a week for a total of 9 tests.

RESULTS

In the data processing link after the experiment, according to the Dixon Criterion, f_0 is compared with $f(n, \alpha)$, if $f_0 > f(n, \alpha)$, the data is determined to be abnormal data to be excluded. The effective data are classified and counted, the arithmetic mean of each group of data is shown in Table 1, and the line graph of BDI score changes is shown in Figure 1.

A total BDI score of 5-7 is mildly depressive. The patient may feel anxious, pessimistic, and misanthropic to a certain extent, which may affect normal interpersonal communication and cause underlying diseases.

The total BDI score of 8-15 is moderately depressive. The patient has a low and bad mood, obvious symptoms of insomnia, slow thinking and

action, obvious anxiety symptoms, and depressive symptoms are already very obvious. When conditions permit, it is necessary to contact a psychiatrist or relevant experts for treatment in a timely manner in order to improve their living environment and sleep quality and strengthen communication with family members while cooperating with drug treatment.

The total BDI score of 16-39 is severely depressive. The symptoms are very serious and must be actively cooperated with the doctor's treatment. Patients with a

severe depressive disorder are depressed most of the time, lose interest in activities of ordinary interest, significantly loss or gain weight, significantly reduce or increase appetite, sleep insomnia or sleep too much every day and other symptoms, and are highly likely to commit suicide. The patient's family members should take safety precautions, actively cooperate with the doctor's treatment, create a good living environment for the patient and help the patient recover as soon as possible.

Table 1. Statistics of BDI scores in each group

	1st time	2nd time	3rd time	4th time	5th time	6th time	7th time	8th time	9th time
Control group	16.17	15.56	15.01	14.66	14.31	14.24	13.39	12.40	11.66
Experimental group 1	16.07	15.26	14.28	14.04	13.34	13.27	12.89	11.18	10.38
Experimental group 2	16.91	16.06	14.47	13.59	11.95	9.03	8.94	8.37	7.21
Experimental group 3	16.27	16.24	15.35	13.42	12.75	11.31	9.93	9.61	8.21

Figure 1. Line chart of changes in BDI score

From Table 1, Figure 1, and the original data, it can be seen that before the treatment, the depression degree of the patients was generally between moderate and severe, and the symptoms were obvious, which requires the intervention of a psychiatrist. After the synergistic

treatment of psychology and sports, the degree of depression of the patients generally decreased. The *t*-test results of the BDI scores of the control group and each experimental group are shown in Table 2, and the details of the data of each group are shown in Table 3.

Table 2. *t*-test of BDI scores in the control group and each experimental group

	M	S	95% CI	<i>t</i>	<i>P</i>
Control group & experimental group 1	0.743	0.404	0.433-1.054	5.526	0.001
Control group & experimental group 2	2.319	2.302	0.549-4.088	3.022	0.017
Control group & experimental group 3	1.590	1.660	0.314-2.866	2.873	0.021

Table 3. Data details of each group

	R	Min	Max	M	S	S ²
Control group	4.51	11.66	16.17	14.156	1.455	2.118
Experimental group 1	5.69	10.38	16.07	13.412	1.806	3.263
Experimental group 2	9.7	7.21	16.91	11.837	3.593	12.911
Experimental group 3	8.06	8.21	16.27	12.566	2.999	8.996

CONCLUSION

The results of this experiment prove that, on the basis of general depression treatment, supplemented with basketball exercise therapy can significantly improve the depression treatment effect of patients. Under the condition of ensuring 30 to 60 minutes of daily exercise, the depression relief effect of exercising three to five times a week is the most prominent. The depression relief effect of exercising six or seven times a week is basically close to that of exercising three to five times a week, but slightly lower than the latter. Exercise once or twice per week was less effective in reducing depression than three to seven times a week. Even so, it was better than no exercise at all. Through this experiment, the result that can be drawn is that under the condition of ensuring the amount of exercise (30 to 60 minutes a day), trying to play basketball three to five times a week has the most obvious improvement effect on depression symptoms.

The research results of this experiment should not be rigidly interpreted. We also need to focus on the individual differences of different people. During the specific experiment process, we found many subjects that did not conform to the overall data. For example, some individuals' depressive symptoms were greatly improved after prolonged exercise seven times per week, but some individuals experienced physical discomfort due to high-intensity exercise, which led to poor relief of depressive symptoms (Haltenhof & Brack 2004). From the viewpoint of exercise physiology, people who are slightly less physically fit or who have participated in physical exercise for the first time should not adopt an excessively frequent physical exercise mode. They can wait a few weeks or months after exercising, and then increase the frequency of exercise according to their physical conditions. People who are overweight and physically weak are prone to respiratory, circulatory, digestive and other systemic reactions and muscle soreness, so they should be especially cautious when increasing the frequency of exercise (Panza et al. 2020).

Exercising can be challenging for anyone. Developing a daily exercise program can be especially difficult for someone battling depression. Low motivation, lack of fun, difficulty planning, and fatigue are real barriers to physical activity. In these situations, simple behavioral strategies or techniques can help patients incorporate more physical activity into their daily lives (Dinoff et al. 2018). First, patients can take psychological cues to help themselves become more positive and remove cues that make them less positive. Examples of positive cues are marked, such as sneakers placed prominently, notes on a calendar, an app on a phone, etc. Second, patients can set schedules and goals that match their needs and preferences. Motivation is likely to be an issue for someone with depression. A simple and easily realistic goal, like shooting 30 times a day, can help the sufferer get started. Make sure not to set too many goals at once. Focus on one physical

activity first, and try new ones when you reach your set goals. In addition, strong social support is equally important as lack of support is a risk factor for depression. Support can take many forms, including having someone to encourage oneself, or having someone who can help with a physical activity program. Multiple different sources of social support are the ideal situation.

GUIDELINES FOR AUTHORS

General considerations

Psychiatria Danubina is a peer-reviewed open access journal of the Psychiatric Danubian Association, aimed to publish original scientific contributions in psychiatry, psychological medicine and related science (neurosciences, biological, psychological, and social sciences as well as philosophy of science and medical ethics, history, organization and economics of mental health services). Its scope includes mental health in general and all psychological aspects of any branch of medicine, surgery, or obstetrics; and any subspecialty of psychiatry and related clinical and basic sciences.

The specific aim is to promote psychiatry in Danube region countries as well as to stimulate collaboration and joint projects.

Manuscripts are published in English language only. All submitted manuscripts are given equal consideration, irrespective of the country they originate from, as long as the following main criteria are met:

A manuscript is written and prepared according to the Journal's Instructions for authors.

Throughout the entire editorial process, Psychiatria Danubina follows the best practice guidelines given by the Committee on publication ethics (COPE) (available at: http://publicationethics.org/files/Code_of_Conduct.pdf) and Recommendations for the Conduct, Reporting, Editing, and Publication of Scholarly work in Medical Journals by International Committee of Medical Journal Editors (ICMJE) (available at: <http://www.icmje.org/recommendations/>)

Editors at Psychiatria Danubina are committed to ensure the integrity and promote innovative and evidence-based sources of information in order to maintain the quality and ensure the impact of the papers published in our Journal, according to the principles set by Sarajevo Declaration on Integrity and Visibility of Scholarly Publications communication (<http://www.cmj.hr/2016/57/6/28051276.htm>).

Instructions for authors

Manuscripts must be written in standard and grammatical as well as clear and concise scientific *English*. It is the responsibility of the authors to ensure the quality of the language. The acceptance criteria for all papers are the quality and originality of the research and its significance to our readership.

Submission of the manuscript

Submission of a manuscript implies:

- that the work described has not been published before (except in the form of an abstract or as part of a published lecture, review or thesis);
- that it is not under consideration for publication anywhere else;
- that its publication has been approved by all co-authors, if any, as well as by responsible authorities – tacitly or explicitly – at the institute where the work has been carried out.

This must be stated in the *Covering letter*.

Manuscripts submitted for publication must contain a statement to the effect that all human studies have been approved by a suitably constituted Ethics Committee of the institution within which the work was undertaken and that it conforms to the provisions of the Declaration of Helsinki in 1995 (as revised in Edinburgh 2000). All investigations on human subjects must include a statement that the subject gave informed consent and patient anonymity should be preserved. Any experiments involving animals must be demonstrated to be ethically acceptable. This should be stated in the Subjects sections of the manuscript (see below).

Authors are asked to refrain from submitting papers which have overlap in content with previously accepted papers by the same authors. If the differences between the two are substantial enough that the papers should be considered as distinct, authors are advised to forward copies of both to the Editorial Office.

The editors reserve the right to reject manuscripts that do not comply with the above-mentioned requirements. The author will be held responsible for false statements or for failure to fulfil these requirements.

The manuscript, together with the Covering letter, should be uploaded electronically to the official page of Psychiatria Danubina: http://www.hdbp.org/psychiatria_danubina/about.html.

By accessing the online submission at <http://journal.sdewes.org/psych-dan> you will be guided stepwise through the creation and uploading of the various files. The Editorial Office will acknowledge the receipt of the manuscript and provide it with a manuscript reference number. The reference number of the manuscript should be quoted in all correspondence with the Chief Editor and Editorial Office. Each manuscript will be assigned to at least two peer reviewers. Where revisions are sought prior to publication, authors are advised to incorporate any suggestions which they agree would improve their paper. The response letter (separate Word file) should thoroughly respond to each reviewer's comment (numbered), indicating where in the text it has been dealt with, or why the authors disagree or cannot incorporate it. After the assessors' further comments have been received, the editors will make the final decision, including priority and time of publication, and the right to modify and, if necessary, shorten the material for publication.

Types of papers

Types of accepted papers are given below. Word count for the manuscript includes only the plain text (not tables, figures, abstracts or references). Contributions will be considered for the following categories:

- **Original research;**
- **Review/Mini-review;**
- **Brief report;**

- **Viewpoint;**
- **Letter to the Editor: 600-800 words, up to 10 references, 1 figure/table;**
- **Case report;**
- **Book review;**
- **Invitation/Announcement.**

Preparation of the manuscript

- Submit the manuscript as an editable Word (preferred) or rich text format (rtf) document.
- Use Times New Roman in 12 point size and double line spacing.
- All pages should be numbered.
- Use a clear system of headings to divide up and clarify the text, with not more than three grades of headings.
- Figures should be submitted as separate TIF or EPS format files and the desired position of figures and tables should be indicated in the manuscript.
- Footnotes to the text are not allowed.
- All measurements must be given in standard SI units.
- Abbreviations should be used sparingly and only where they ease the reader's task by reducing repetition of long terms. Initially use the word in full, followed by the abbreviation in the parentheses. Thereafter use the abbreviations.
- Drugs should be referred to by their generic names. When a brand name is used, it shall begin with a capital letter and the manufacturer's address details should be given.
- Do not use pejorative labels such as 'schizophrenics', instead refer to 'patients with schizophrenia'.

Manuscripts should be presented in the following order:

1. Title page

The first page should contain:

- the title of the paper - should be short, informative and contain the major key words;
- the full names of the authors and position titles at the respective institutions;
- the addresses of the institutions at which the work was carried out (addresses for authors other than the correspondence author should contain the department, institution, city and country);
- indicate all affiliations with superscript number after the author's name and in front of the appropriate address;
- corresponding author - the full postal and email address, plus facsimile and telephone numbers, the department, institution, city and country.

The title page should be uploaded separately. The rest of the manuscript should not contain personal information of the authors.

2. Summary and Key words

The second page should carry on a Summary in the region of 300 words, followed by a list of 3-5 key words or short phrases drawn, if possible, from the medical subject headings (MeSH) list of *Index Medicus* (<http://www.nlm.nih.gov/mesh/meshhome.html>). The Summary should state, whenever applicable, very specifically, the main purposes, procedures, findings, and conclusions of the paper, emphasizing what is new or important.

For original papers and review articles, a structured Summary using the headings is preferred:

- **Background** (questions addressed; principal aims of a review);
- **Subjects and Methods** (design, setting, sample, interventions, chief outcome measures; for reviews sources of data and criteria for their selection);
- **Results** (main findings together with their statistical significance, if possible);
- **Conclusions** (those related to results, limitations as appropriate, clinical and research implications; for reviews principal conclusions and clinical and research implications).

3. Text

It should be divided by subheadings into the following sections:

- **Introduction** (authors should provide an adequate background and end with the aims of the study);
- **Subjects and methods** (*Subjects* with ethical considerations and informed consent, *Methods*, *Statistical Analyses*; *authors should provide sufficient detail to enable possible reproduction of the study*);
- **Results** (the results section should simply state the findings of the research arranged in a logical sequence without bias or interpretation);
- **Discussion** (the discussion section should contain interpretation of the results and their comparison with previous studies, also include limitations of the study);
- **Conclusions** (needs to summarize the content and purpose of the paper).

4. Acknowledgements

The source of financial grants and other funding should be acknowledged. The contribution of institutions, colleagues, technical writers or language editors should be noted. Thanks to anonymous reviewers are not needed. If there are no acknowledgements please state so by putting 'None' in the respective section.

5. Conflict of Interest

Authors are requested to disclose any commercial or other associations that might pose a conflict of interest in connection with the submitted articles. If there is no conflict of interest please put 'None to declare' in the respective section.

6. Contributors

It is required to declare every author's individual contribution to the manuscript. Every author should be mentioned for his exact work (e.g. design of the study, literature searches and analyses, statistical analyses, interpretation of data).

7. References

- In the text give the author last name and publication year within parentheses (e.g. Jakovljevic 2008, Sartorius 2009).
- If there are two authors, both should be named (e.g. Svrakic & Cloninger 2010, Sher & LaBode 2011).
- If there is an article with more than two authors, only the first author's name plus 'et al.' need to be given (e.g. Sartorius et al. 1996, Stinson et al. 2008).
- *If there is more than one reference by the same author or team of authors in the same year, differentiate between papers by adding a, b, c, etc. to the publication year, both in the text and the list of references.*

All references cited in the text are to be listed in the References section at the end of the text, in alphabetical and chronological order under the last name of the first author.

Where there are more than six authors, list the first six authors and use 'et al.'. All works cited must be listed at the end of the paper, ordered alphabetically by first author's name. Names of journals should be abbreviated in the style used in *Index Medicus*.

References should be listed in the following form:

1. *Svrakic DM & Cloninger RC: Epigenetic perspective on behavior development, personality, and personality disorders. Psychiatr Danub 2010; 22:153-66*
2. *Grant BF, Hasin DS, Blanco C, Stinson FS, Chou SP, Goldstein RB et al.: The epidemiology of social anxiety disorder in the United States: results from the National Epidemiologic Survey on Alcohol and Related Conditions. J Clin Psychiatry 2005; 66:1351-61*
3. *Reiter RJ & Robinson J: Melatonin. Bantam Books, New York, 1995*
4. *Doghramji K, Brainard G & Balaicuis JM: Sleep and sleep disorders. In Monti DA & Beitman BD (eds): Integrative Psychiatry, 195-339. Oxford University Press, 2010*

8. Tables

Tables should be included on separate pages and numbered consecutively with Arabic numerals (e.g. Table 1). Column headings should be brief, with units of measurement in parentheses. All abbreviations and symbols should be defined in the legend. The table and its legend should be understandable without reference to the text. Desired position of tables should be indicated in the text.

9. Figures

Illustrations such as graphs, diagrams or photographs should also be numbered consecutively with Arabic numerals (e.g. Figure 1) on separate pages, after the Tables. They should contain a short title followed by a concise description. All abbreviations and symbols should be defined in the legend. The figure and its legend should be understandable without reference to the text. Provide a letter stating copyright authorization if figures have been reproduced from another source. Photographs of persons must be made unidentifiable or the subject's written permission must be obtained. Desired position of figures should be indicated in the text. The cost of reproducing colour illustrations is charged to the authors. Please contact the publishers for an estimate of this cost (marketing@medicinskanaklada.hr).

Copyright

All materials sent for publication will become the property of the Journal until, and if, publication is refused. The material so referred should not be sent elsewhere for publication.

Galley proofs

Unless indicated otherwise, galley proofs are sent to the corresponding authors as Acrobat PDF files and should be returned with the least possible delay. Authors are advised that they are responsible for proof-reading of the text, references, tables and figures for absolute accuracy. Major alterations made in galley proofs, other than essential correction of errors, are unacceptable at this stage and authors may be charged for excessive alterations.
